HISTORY OF SOYMILK AND OTHER

NON-DAIRY MILKS (1226 TO 2013):

EXTENSIVELY ANNOTATED

BIBLIOGRAPHY AND SOURCEBOOK

Including Infant Formulas, Calf Milk Replacers,
Soy Creamers, Soy Shakes, Soy Smoothies,
Almond Milk, Coconut Milk, Peanut Milk, Rice Milk, Sesame Milk, etc.

DEDICATION AND ACKNOWLEDGMENTS

This book is dedicated to Dr. Harry W. Miller, K.S. Lo, Raj Gupta, and Steve Demos - pioneers in this field.

Part of the enjoyment of writing a book lies in meeting people from around the world who share a common interest, and in learning from them what is often the knowledge or skills acquired during a lifetime of devoted research or practice. We wish to give deepest thanks...

Of the many libraries and librarians who have been of great help to our research over the years, several stand out:

University of California at Berkeley: John Creaser, Lois Farrell, Norma Kobzina, Ingrid Radkey.

Northern Regional Library Facility (NRLF), Richmond, California: Martha Lucero, Jutta Wiemhoff, Scott Miller, Virginia Moon, Kay Loughman.

Stanford University: Molly Molloy, who has been of special help on Slavic-language documents.

National Agricultural Library: Susan Chapman, Kay Derr, Carol Ditzler, John Forbes, Winnifred Gelenter, Henry Gilbert, Kim Hicks, Ellen Knollman, Patricia Krug, Sarah Lee, Veronica Lefebvre, Julie Mangin, Ellen Mann, Josephine McDowell, Wayne Olson, Mike Thompson, Tanner Wray.

Library of Congress: Ronald Jackson, Ronald Roache.

Lane Medical Library at Stanford University.

Contra Costa County Central Library and Lafayette Library: Carole Barksdale, Kristen Wick, Barbara Furgason, Sherry Cartmill, Linda Barbero.

Harvard University's Five Botanical Libraries (especially Arnold Arboretum Library): Jill Gelmers Thomas.

French translation: Martine Liguori of Lafayette, California, for ongoing, generous, and outstanding help since the early 1980s.

Japanese translation and maps: Akiko Aoyagi Shurtleff.

Loma Linda University, Del E. Webb Memorial Library (Seventh-day Adventist): Janice Little, Trish Chapman.

We would also like to thank our co-workers and friends at Soyinfo Center who, since 1984, have played a major role in collecting the documents, building the library, and producing the SoyaScan database from which this book is printed:

Irene Yen, Tony Jenkins, Sarah Chang, Laurie Wilmore, Alice Whealey, Simon Beaven, Elinor McCoy, Patricia McKelvey, Claire Wickens, Ron Perry, Walter Lin, Dana Scott, Jeremy Longinotti, John Edelen, Alex Lerman, Lydia Lam, Gretchen Muller, Joyce Mao, Luna Oxenberg, Joelle Bouchard, Justine Lam, Joey Shurtleff, Justin Hildebrandt, Michelle Chun, Olga Kochan, Loren Clive, Marina Li, Rowyn McDonald, Casey Brodsky, Hannah Woodman, Elizabeth Hawkins, Molly Howland, Jacqueline Tao, Lynn Hsu, Brooke Vittimberga, Tanya Kochan.

Special thanks to Tom and Linda Wolfe of Berwyn Park, Maryland. And to Lorenz K. Schaller of Ojai, California.

■ For outstanding help on this soymilk book we thank: K.S. Lo, Raj Gupta, Steve Demos, Keith H. Steinkraus, Hervé Berbille, Ed Bisalski, Bill Bolduc, Glen Blix, Robert A. Boyer, Billy Bramblet, Ford R. Bryan, Francis Calvert, Bernd Drosihn, Eric. C. Fehlberg, Steve Fiering, Terrence Foley, Bob Gerner, Charlotte Van Gundy Holmes, Eric Howse, H.T. Huang, Kim Jenkins, Ken Lee, Anders Lindner, Yvonne Lo, Lukoskie, Alexander Lyon, John Mahlich, Philip Marshall, Mark Messina, Clarence Miller, Willis Miller, Jim Morano, A.I. Nelson, Robert Nissenbaum, Ted Nordquist, Kathleen O'Bannon, Yuko Okada, Charles Perry, Michael Pierce, Michael Potter, Laurie Praskin, Tim Redmond, Robert Rich, Ron Roller, Richard Rose, Seemo & Kairava, Francois de Selliers, Robert A. Smith, Steve Snyder, Peter Speck, Bernard Storup, Bruce Sturgeon, Gene Tally, Kanji Tsuchiya, Philippe Vandemoortele, Alfred B. Webber, Harry Webber, John C. Wilson, Sam Yoshimura.

■ Finally our deepest thanks to Tony Cooper of San Ramon, California, who has kept our computers up and running since Sept. 1983. Without Tony, this series of books on the Web would not have been possible.

This book, no doubt and alas, has its share of errors. These, of course, are solely the responsibility of William Shurtleff.

INTRODUCTION

Scope for Soymilk: This book focuses on the use of soymilk as a beverage. Soymilk has long been the most widely consumed non-dairy milk worldwide. Soymilk also appears as a step in the process for making tofu, yuba, soy yogurt, soy ice cream, soy cheese, fermented soymilk (incl. soy acidophilus milk), etc. Each of these soy products is or will be the subject of a separate book.

Amazaké, a thick fermented non-dairy rice beverage from Japan, usually served hot, topped with a dab of grated gingerroot, is also the subject of a separate book.

Use in East Asia: Only in China has soymilk (*doujiang*) long been used as a beverage. Traditionally it was been served hot, ladled from a caldron for breakfast, at the place where it was made either sweetened or as the base of a salted soup served with deep-fried crullers. It was not used to feed infants or as an infant formula.

Starting in the 1920s, a small number of companies in China started to make and sell bottled soymilk.

In Hong Kong, Vitasoy was launched in 1940 by K.S. Lo as a nutritious food for refugees fleeing during World War II. By 1968 it had captured 25% of the Hong Kong soft drink market, second only to Coca-Cola.

In Japan, bottled soymilk arrived in about 1957. The first soymilk boom started in about 1980; the many brands of soymilk were all sold in 180 ml aseptic cartons.

In the United States and Europe, soymilk started to become popular in the 1980s. The first two brands sold nationwide were Vitasoy and Edensoy, both aseptically packaged so they did not need refrigeration. The first superstar of soymilks, Silk, was launched by White Wave of Boulder, Colorado, in early 1996. It was sold in the dairy case in gable-top cartons that looked like typical milk cartons.

The first widely popular rice milk was Rice Dream, launched in June 1990 by Imagine Foods of Palo Alto, California.

Brief chronology of soymilk and other non-dairy products.

1226 – *Kitab al-tabik* [*A Baghdad Cookery Book*], by al-Baghdadi et al. is the earliest document seen that mentions a non-dairy milk – almond milk.

1365? – *Yiya Yiyi* [*Remnant Notions from I Ya*], by Han Yi is the earliest document seen that mentions soymilk, which it calls *doufujiang*.

1390 – "Almond milk" is first mentioned in English in *The Forme of Cury*. It came to be widely used in Europe during Lent – the first popular non-dairy milk in the Western world.

1640 ca. – Soymilk is probably in use in China by the beginning of the Qing dynasty (H.T. Huang 2006).

1704 – Soymilk is first mentioned in English by Domingo Fernandez Navarrete in his book *A Collection of Voyages and Travels*. Navarrete served as a Dominican missionary in China.

1790? – An undated painting of hawkers selling soymilk (*doujiang*) in China, by Yao Wenhan, is from the Qing dynasty.

1790 – Soymilk is mentioned by Juan de Loureiro in his book *The Flora of Cochin China*. Loureiro was a Portuguese Jesuit missionary who lived in what is now Vietnam. He notes that soymilk is part of the process for making tofu.

1866 – Soymilk is first discussed as a drink in its own right by the Frenchman Paul Champion, who traveled in China. In a French-language article he stated that the Chinese had taken their cups to tofu shops to get hot soymilk, which they drank for breakfast.

1896 June – Soymilk is first referred to in the United States by Henry Trimble in the *American Journal of Pharmacy*.

1897 July 7 – The term "soy-bean milk" (or any cognate / relative thereof) first appears in a USDA or U.S. government publication: C.F. Langworthy. 1897. "Soy beans as food for man." *USDA Farmers' Bulletin* No. 58. p. 20-23. July 7. The table, titled "Comparison of the composition of soy-bean milk and cows' milk," gives the nutritional composition of the two liquids. The same term next appeared in Dec. 1916 in a USDA Bulletin by Piper & Morse, and then on 7 Feb. 1917 in a USDA Weekly News Letter.

1897 Nov. 16 – Peanut cream and peanut butter are now being made in Kokomo, Indiana by Lane Bros. (*Kokomo Daily Tribune*, p. 4). This is the earliest document seen that contains the term "peanut cream."

1899 – Almeda Lambert of Battle Creek, Michigan, in her book *Guide for Nut Cookery*, describes how to make "peanut butter,… peanut cream, peanut milk, raw peanut milk and cream, almond milk, hickory milk, pine-nut milk, chufas milk and cocoanut milk" at home. This is the earliest document seen that contains the term "peanut milk" or the term "cocoanut milk."

1906 April – Kayatama, in Japan, reports that he has made "A condensed vegetable milk" from soy-beans.

1909 – The first soy-based infant formulas and soymilk made from full-fat soy flour are developed in the United States by John Ruhräh, a pediatrician. He reports his results in the *Archives of Pediatrics* (July 1909).

1910 – The world's first soy dairy, named Caséo-Sojaïne, is founded by Li Yu-ying, a Chinese citizen, biologist and engineer, at 46-48 Rue Denis Papin, Les Vallées, Colombes (near Asnières), a few miles northwest of Paris. In December 1910 he applies for the world's first soymilk patents (British Patents No. 30,275 and 30,351). The first patent is titled "Vegetable milk and its derivatives." He is issued both patents in Feb. 1912.

1913 June 13 – Li Yu-ying is issued the first U.S. soymilk patent (No. 1,064,841), titled "Method of manufacturing products from soja." He filed the application on 10 Oct. 1911.

1914 – Maria M. Gilbert, in her book *Meatless Cookery*, gives a recipe for "Rice milk." – the earliest know use of this term.

1917 – Soymilk (Soy Lac) is being produced commercially in the U.S. by J.A. Chard, Soy Products in New York City.

1921 Sept. 23 – Vita Rice Products plans to build a factory to make "rice milk products," including Vita Rice Milk, in San Francisco (*San Francisco Business*, p. 20).

1921 – Leon Rouest of France gives the first detailed discussion (in French) of calf-milk replacers based on soymilk.

1929 Nov. – T.A. Van Gundy, founder of La Sierra Industries in Arlington, California, launches La Sierra Soy Milk, and becomes the first Seventh-day Adventist worldwide to make soymilk commercially. The product was canned and the beany flavor removed by live steam processing.

1929 Dec. – Bottled soy bean milk is now widely made and sold in China. "One large factory in Peking now makes and distributes over a thousand bottles of [soy] milk daily; in Shanghai two factories each meet an even greater daily demand. The industry is bound to grow rapidly to greater dimensions" (Adolph and Wang 1929).

1931 – Madison Foods of Madison, Tennessee,

introduces Madison Soy Milk – the world's earliest known soymilk to be fortified with calcium and the second commercial soymilk product made by Seventh-day Adventists in the USA. Madison Foods is a company run by students and faculty within Madison College, a pioneering work/study school.

1936 Jan. – Dr. Harry W. Miller and his son, Willis, start making Vetose Soya Milk, sold in natural or chocolate flavors in sterilized half pint or quart bottles at their Vetose Nutritional Laboratories in Shanghai, China. Dr. Miller is a Seventh-day Adventist physician, a student of Dr. John Harvey Kellogg, and a medical missionary living in China. The world's first "soy dairy," this company also made soy ice cream and Acidophilus Vetose (a cultured soya milk) – both launched in Jan. 1936. But Japan was invading China. Within months after the soy-milk business began booming, a Japanese bomb blew up the soy dairy.

1936 April – The earliest known English-language document to contain the modern word "soymilk" is: Miller, Harry W.; Wen, C. Jean. 1936. "Experimental nutrition studies of soymilk in human nutrition." *Chinese Medical Journal* 50(4):450-59. April.

1936 June – Sobee, the world's earliest known branded soy-based infant formula, is launched by the American Soya Products Corp. of Evansville, Indiana.

1939 autumn – Dr. Harry W. Miller, forced by the war in China to return to the USA, starts making soymilk at Mt. Vernon, Ohio, in a large brick plant which he and coworkers built from the ground up. The first two products are canned liquid soymilk (made in a pressure cooker and fortified with vitamins and minerals) and malted soymilk (Soy-A-Malt). Pressure from the powerful U.S. dairy industry and the USDA convinced Miller not to call his product 'soymilk,' so he latinized the name to Soya Lac. This term was first used in late 1939 for Miller's first American soymilk.

1940 March - K.S. Lo, founder and managing director of the Hong Kong Soya Bean Products Co. Ltd. starts to make soymilk in Hong Kong. His product, originally named Vita Milk (*Wai-ta-nai* in Chinese) was fortified with calcium, cod-liver oil, and vitamins, and sold in milk bottles, primarily as a nutritious, affordable beverage for refugees. In June 1940 the product was renamed Sunspot, and in 1953 it was renamed Vitasoy.

1949 – Bob Rich first learned about soymilk in 1943 from employees of Henry Ford, who were making soymilk at the Carver Laboratory in Dearborn, Michigan, for use in the Ford Hospital. In April 1945 Rich Products Corp. launched Whip Topping – a non-dairy product. The first lawsuit against Whip Topping (1949) charges that this is an imitation dairy product – and thus illegal. Bob Rich and Rich Products (Buffalo, New York) mount an aggressive defense, contending that their product is not an imitation (which implies inferiority to the real product) but a replacement. By 1974 Rich Products (which now also made non-dairy Coffee Rich) had won 40 cases. That year the Kansas Supreme Court declared Coffee Rich "a new and distinct food" and the dairy lobby gave up. Were it not for Bob Rich and his lead attorney, Ellis Arnall (former attorney general and governor of Georgia, 1943-47), non-dairy products might still be illegal in the USA!

1950s – Soymilk enters the modern era as it begins to be marketed in bottles like soft drinks, largely due to work by K.S. Lo of Vitasoy in Hong Kong and Yeo Hiap Seng in Singapore.

1956 Dec. – The Plantmilk Society has its first annual general meeting in London. Mr. C.A. Ling is in the chair. This report in *The Vegan* is the earliest English-language document seen that uses the word "plantmilk" to refer to soymilk and other non-dairy milks – a nice short word.

1957 – Japan's first commercial soymilk, sold in bottles, named *Tônyu*, is introduced by the Ueda Tofu Shop in Hachioji, Tokyo. Dr. Harry Miller was the inspiration for and helped to establish the shop.

1960s – In Japan, soymilk slowly increases in popularity. New manufacturers are: Nihon Tanpaku Kogyo (1962). College Health Foods (later renamed San-iku Foods) in Chiba prefecture with its Soyalac (1969, also inspired and aided by Dr. Harry Miller). Luppy Tanpaku (House Shokuhin) in Saitama prefecture with its Luppy soymilk (1969).

1965 – ProSobee, the world's earliest known non-dairy infant formula based on soy protein isolates, is launched by Mead Johnson & Co. of Evansville, Indiana.

1966 - The enzyme lipoxygenase is discovered by scientists at Cornell University [Ithaca, New York] to be responsible for the "beany" flavor in soymilk. They develop a process which can be used to help eliminate this "beany" flavor.

1967 – Soymilk begins to be packaged aseptically in Tetra Pak cartons. This allows it to be sold without refrigeration for six months or more. The first such product was Beanvit, made by Yeo Hiap Seng Ltd. in Singapore and packaged in a disposable tetrahedron-shaped container.

1970s and 1980s – Soymilk becomes a popular beverage throughout Asia, spreading to Europe, Australia and the United States.

1979 – Hong Kong Soya Bean Products Co. Ltd. starts to export Vitasoy, packed in Tetra Brik cartons, to selected countries throughout the world. By the early 1980s exports were going to over 20 countries, both developed and developing. Exports to the USA began in 1980.

1980 Jan. - DE-VAU-GE Gesundkostwerk, a Seventh-day Adventist food company near Hamburg, Germany, launches GranoVita Soja Drink in 500 ml Tetra Brik cartons; this soymilk product is made by N.V. Vandemoortele (one of Europe's largest oilseed crushers, founded in 1934) in Izegem, Belgium.

1980 June – N.V. Alpro is founded by Vandemoortele to take over production of this soymilk. Inspired and headed by Philippe Vandemoortele, Alpro purchased the land on which it was located from Vandemoortele, and became an independent manufacturer. Alpro quickly became Europe's leading producer of soymilk, making private-label brands for scores of companies.

1983 July – Edensoy brand soymilk is launched by Eden Foods of Clinton, Michigan. Imported from Japan (where it is made by Marusan-Ai Co.), it is sold in plain and carob flavors in stand-up foil retort pouches.

1984 Feb. – The first comprehensive study of the soymilk market in the U.S. is published by Soyfoods Center of Lafayette, California. It estimates that total soymilk consumption in the U.S. in 1983 (not including soy-based infant formulas) was 2.68 million gallons (26% of this was imported), and total production of soy-based infant formulas was 32 million gallons.

1984 March – Vitasoy (USA) introduces the first soymilk whose flavor is described as "Original" – meaning dairylike or resembling (as much as possible) dairy milk.

1984 Aug. – Westsoy Natural brand soymilk is launched by Westbrae Natural Foods of Emeryville, California. Imported from Japan (where it is made by San-Iku Foods), it is sold in one flavor in stand-up foil retort pouches.

1984 Oct. – Westbrae Natural Malted's, a thick soymilk resembling a milk shake, are launched in many flavors by Westbrae Natural Foods, imported

from Japan.

1986 Nov. – Edensoy starts to be made in America by American Soy Products (ASP) at a large, modern plant in Saline, Michigan, and sold in Tetra Brik aseptic cartons. ASP is a joint venture of 4 Japanese companies and Eden Foods.

1986 – Raj Gupta (of ProSoya Foods International, Ottawa, Ontario, Canada) applies for two patents on the oxygen-free, cold-grind process and equipment that he has invented. The first U.S. patent is issued on 17 May 1988. This process soon becomes widely used to make good-tasting soymilk. ProSoya becomes a major manufacturer of systems used to make soymilk worldwide.

1988 Nov. – Pacific Foods of Oregon launches its first soymilk product, Naturally Northwest Soy Beverage [Plain], in a 1-quart Tetra Brik Aseptic carton. The company's new factory is in Tualatin, Oregon.

1990 April – WestSoy Lite, America's first "lite" soymilk, with a low fat content, is introduced in plain, vanilla, and cocoa flavors by Westbrae Natural Foods. Made by adding water to regular soymilk, the product is less expensive to make, but also contains less nutrients.

1990 June – Alpro opens a new soymilk plant at Wevelgem, Belgium. Costing about US$15 million and having a capacity of 45 million liters a year, it is reputed to be the largest in the world. Alpro now makes about 70% of the soymilk in Europe.

1990 June – Rice Dream, a non-dairy beverage, is launched in a Tetra Pak aseptic carton by Imagine Foods of Palo Alto, California. It is made by California Natural Products of Manteca, California, using an innovative patented process, in which the ground rice is digested by enzymes. Many prefer its flavor to that of soymilk.

1990 Sept. 24 – The company name is changed to Vitasoy International Holdings Ltd. from Hong Kong Soya Bean Products Co. Ltd.

1991 – There are at least 35 processors or marketers of soymilk in the U.S., increasing production to approximately 9.8 million gallons. Consumption is estimated to be growing at between 15 and 20% per year since 1984.

1993 – More than 200 scientific journal articles about soymilk have been published in English, and at least 80 English-language patents on soymilk have been issued between 1912 and 1993.

1994 Jan. – Soy-Um, a low-priced and attractively packaged soymilk, is launched by J&G Inc., a product developer and distributor in Chicago, Illinois. The product is made in Oregon by Pacific Foods. It soon becomes widely sold at Trader Joe's food stores.

1995 – A market study is published, estimating that $108 million of soymilk was sold in the U.S. in 1994. This equates to approximately 13.5 million gallons of soymilk. By 1995 sales are projected to have risen to over $130 million, or approximately 16.3 million gallons.

1996 Jan. – Silk – soymilk sold refrigerated in quart or half-gallon ESL (Extended Shelf Life) gable-top cartons – is introduced by White Wave, Inc. of Boulder, Colorado. It is the first U.S. soymilk to be sold refrigerated in the dairy case in a carton that looks like a typical milk carton, but that has a longer shelf life. It soon becomes the superstar of American soymilks.

1999 Aug. 18 – White Wave and Dean Foods Co. (Franklin Park, Illinois; a leading dairy milk company) announce a new alliance, in which Dean Foods acquires a minority stake (about 25%) in White Wave in exchange for money to market Silk soymilk. Silk is now in 6,000 supermarkets and chain stores – not counting natural foods chains like Whole Foods market. In 1999 sales of

refrigerated Silk increased 600 percent.

1999 Oct. 26 – The U.S. Food and Drug Administration (FDA) authorizes a health claim stating that consumption of 6.25 grams of soy protein per serving, as a part of a healthy diet, low in saturated fats and cholesterol, may reduce the risk of heart disease by lowering cholesterol levels. This claim soon appears on the front of many products that meet these requirements. It leads to the creation of many new soy products (including soymilks) and generates major public interest.

2002 May 8 – Dean Foods, Inc. (Dallas, Texas), one of America's largest dairy milk companies, acquires the remaining 64% of shares of White Wave, Inc. of Boulder, Colorado for $189 million. But the total value Dean Foods pays for White Wave is $295 million – largely to win the morale of the management and to give them an incentive to stay for at least 2 more years.

The many names of soymilk (for digital searching):

Alternative to milk
Artificial milk
Dairy analog or dairy analogues
Dairylike
Dairy like or dairy-like
Milk analog or milk analogue
Milk alternative
Milk replacer(s)
Milk substitute
Milklike beverage
Milklike flavor
Milklike product(s)
Milky drink
Milky emulsion
Milky filtrate
Milky fluid
Milky liquid
Milky liquor
Milky substance
Plantmilk
Plant milk or plant-milk
Protein beverage
Protein beverage base
Soja milk or soja-milk
Soya Lac
Soyabean beverage
Soya bean beverage or soya-bean beverage
Soyabean milk
Soya bean milk or soya-bean milk
Soya bean vegetable milk
Soyamilk
Soya milk or soya-milk
Soybase
Soy base or soy-base
Soybean beverage
Soy bean beverage or soy-bean beverage
Soybean beverage base
Soybean milk
Soybean "milk" or soybean 'milk'
Soy bean milk or soy-bean milk
Soy dairy
Soymilk
Soy milk or soy-milk
Soy "milk" or soy 'milk'
Substitute for milk
Synthetic milk
Vegetable milk
Vegetable protein beverage base

ABOUT THIS BOOK

This is the most comprehensive book ever published about the history of soymilk or of non-dairy products. It has been compiled, one record at a time over a period of 35 years, in an attempt to document the history of these ancient and interesting beverages. It is also the single most current and useful source of information on this subject.

This is one of more than 100 books compiled by William Shurtleff and Akiko Aoyagi, and published by the Soyinfo Center. It is based on historical principles, listing all known documents and commercial products in chronological order. It features detailed information on:

- 96 different document types, both published and unpublished.
- 6557 published documents - extensively annotated bibliography. Every known publication on the subject in every language.
- 1148 original Soyinfo Center interviews and overviews never before published, except perhaps in our books
- 1043 unpublished archival documents.
- 1304 commercial non-dairy products.

Thus, it is a powerful tool for understanding the development of this subject from its earliest beginnings to the present.

Each bibliographic record in this book contains (in addition to the typical author, date, title, volume and pages information) the author's address, number of references cited, original title of all non-English language publications together with an English translation of the title, month and issue of publication, and the first author's first name (if given). For most books, we state if it is illustrated, whether or not it has an index, and the height in centimeters.

All of the graphics (labels, ads, leaflets, etc) displayed in this book are on file, organized by subject, chronologically, in the Soyinfo Center's Graphics Collection.

For commercial soy products (CSP), each record includes (if possible) the product name, date of introduction, manufacturer's name, address and phone number, and (in many cases) ingredients, weight, packaging and price, storage requirements, nutritional composition, and a description of the label. Sources of additional information on each product (such as advertisements, articles, patents, etc.) are also given.

A complete subject/geographical index is also included.

ABBREVIATIONS USED IN THIS BOOK

A&M = Agricultural and Mechanical
Agric. = Agricultural or Agriculture
Agric. Exp. Station = Agricultural Experiment Station
ARS = Agricultural Research Service
ASA = American Soybean Association
Assoc. = Association, Associate
Asst. = Assistant
Aug. = August
Ave. = Avenue
Blvd. = Boulevard
bu = bushel(s)
ca. = about (circa)
cc = cubic centimeter(s)
Chap. = Chapter
cm = centimeter(s)
Co. = company
Corp. = Corporation
Dec. = December
Dep. or Dept. = Department
Depts. = Departments
Div. = Division
Dr. = Drive
E. = East
ed. = edition or editor
e.g. = for example
Exp. = Experiment
Feb. = February
fl oz = fluid ounce(s)
ft = foot or feet
gm = gram(s)
ha = hectare(s)
i.e. = in other words
Inc. = Incorporated
incl. = including
Illust. = Illustrated or Illustration(s)
Inst. = Institute
J. = Journal
J. of the American Oil Chemists' Soc. = Journal of the American Oil Chemists' Society
Jan. = January
kg = kilogram(s)
km = kilometer(s)
Lab. = Laboratory
Labs. = Laboratories
lb = pound(s)
Ltd. = Limited
mcg = microgram(s)
mg = milligram(s)
ml = milliliter(s)
mm = millimeter(s)
N. = North
No. = number or North
Nov. = November
Oct. = October
oz = ounce(s)
p. = page(s)
photo(s) = photograph(s)
P.O. Box = Post Office Box
Prof. = Professor
psi = pounds per square inch
R&D = Research and Development
Rd. = Road
Rev. = Revised
RPM = revolutions per minute
S. = South

< = less than

HOW TO MAKE THE BEST USE OF THIS DIGITAL BOOK - SEARCH IT

Most Important Thing: The **KEY** to using this digital book, which is in PDF format, is to **SEARCH IT** using Adobe Acrobat Reader: For those few who do not have it, Google: **Acrobat Reader** - then select the **free** download for your type of computer. Then...

Type [Ctrl+F] to "Find." Near the top right of your screen a white box will appear.
Click the small down-pointing arrow just to the right of that box to get a menu.
Click "Open Full Acrobat Search."
At the left side of your screen a "Search" box will open.
When asked: "What word or phrase would you like to search for?" type that word or phrase in the box. For example: Edensoy or White Wave. No need to use quotation marks. Then click "Search."
At "Results" click any line that interests you.

For those using a Mac without Acrobat Reader: Safari is often the default browser. Click "Edit" in the toolbar at top. In the dropdown click "Find," then click "Find..." again. A search bar will open across top of screen with a search box at right. In this box type a word or phrase you would like to search, such as Edensoy or White Wave. Click "Done" then scroll through the various matches in the book.

Chronological Order: The publications and products in this book are listed with the earliest first and the most recent last. Within each year, references are sorted alphabetically by author. If you are interested in only current information, start reading at the back, just before the indexes.

A Reference Book: Like an encyclopedia or any other reference book, this work is meant to be searched first - to find exactly the information you are looking for - and then to be read.

How to Use the Index: A subject and country index is located at the back of this book. It will help you to go directly to the specific information that interests you. Browse through it briefly to familiarize yourself with its contents and format.

Each record in the book has been assigned a sequential number, starting with 1 for the first/earliest reference. It is this number, not the page number, to which the indexes refer. A publication will typically be listed in each index in more than one place, and major documents may have 30-40 subject index entries. Thus a publication about the nutritional value of tofu and soymilk in India would be indexed under at least four headings in the subject and country index: Nutrition, Tofu, Soymilk, and Asia, South: India.

Note the extensive use of cross references to help you: e.g. "Bean curd. See Tofu."

Countries and States/Provinces: Every record contains a country keyword. Most USA and Canadian records also contain a state or province keyword, indexed at "U.S. States" or "Canadian Provinces and Territories" respectively. All countries are indexed under their region or continent. Thus for Egypt, look under Africa: Egypt, and not under Egypt. For Brazil, see the entry at Latin America, South America: Brazil. For India, see Asia, South: India. For Australia see Oceania: Australia.

Most Important Documents: Look in the Index under "Important Documents -."

Organizations: Many of the larger, more innovative, or pioneering soy-related companies appear in the subject index – companies like ADM / Archer Daniels Midland Co., AGP, Cargill, DuPont, Kikkoman, Monsanto, Tofutti, etc. Worldwide, we index many major soybean crushers, tofu makers, soymilk and soymilk equipment manufacturers, soyfoods companies with various products, Seventh-day Adventist food companies, soy protein makers (including pioneers), soy sauce manufacturers, soy ice cream, tempeh, soynut, soy flour companies, etc.

Other key organizations include Society for Acclimatization (from 1855 in France), American Soybean Association, National Oilseed/Soybean Processors Association, Research & Development Centers (Peoria, Cornell), Meals for Millions Foundation, and International Soybean Programs (INTSOY, AVRDC, IITA, International Inst. of Agriculture, and United Nations). Pioneer soy protein companies include Borden, Drackett, Glidden, Griffith Labs., Gunther, Laucks, Protein Technologies International, and Rich Products.

Soyfoods: Look under the most common name: Tofu, Miso, Soymilk, Soy Ice Cream, Soy Cheese, Soy Yogurt, Soy Flour, Green Vegetable Soybeans, or Whole Dry Soybeans. But note: Soy Proteins: Isolates, Soy Proteins: Textured Products, etc.

Industrial (Non-Food) Uses of Soybeans: Look under "Industrial Uses ..." for more than 17 subject headings.

Pioneers - Individuals: Laszlo Berczeller, Henry Ford, Friedrich Haberlandt, Artemy A. Horvath, Englebert Kaempfer, Mildred Lager, William J. Morse, etc. Soy-Related Movements: Soyfoods Movement, Vegetarianism, Health and Dietary Reform Movements (esp. 1830-1930s), Health Foods Movement (1920s-1960s), Animal Welfare/ Rights. These are indexed under the person's last name or movement name.

Nutrition: All subjects related to soybean nutrition (protein quality, minerals, antinutritional factors, etc.) are indexed under Nutrition, in one of more than 70 subcategories.

Soybean Production: All subjects related to growing, marketing, and trading soybeans are indexed under Soybean Production, e.g., Soybean Production: Nitrogen Fixation, or Soybean Production: Plant Protection, or Soybean Production: Variety Development.

Other Special Index Headings: Browsing through the subject index will show you many more interesting subject headings, such as Industry and Market Statistics, Information (incl. computers, databases, libraries), Standards, Bibliographies (works containing more than 50 references), and History (soy-related).

Commercial Soy Products (CSP): See "About This Book."

SoyaScan Notes: This is a term we have created exclusively for use with this database. A SoyaScan Notes Interview contains all the important material in short interviews conducted and transcribed by William Shurtleff. This material has not been published in any other source. Longer interviews are designated as such, and listed as unpublished manuscripts. A transcript of each can be ordered from Soyinfo Center Library. A SoyaScan Notes Summary is a summary by William Shurtleff of existing information on one subject.

"**Note**:" When this term is used in a record's summary, it indicates that the information which follows it has been added by the producer of this database.

Asterisks at End of Individual References:

1. An asterisk (*) at the end of a record means that Soyinfo Center does not own that document. Lack of an asterisk means that Soyinfo Center owns all or part of the document.

2. An asterisk after eng (eng*) means that Soyinfo Center has done a partial or complete translation into English of that document.

3. An asterisk in a listing of the number of references [23* ref] means that most of these references are **not** about soybeans or soyfoods.

Documents Owned by Soyinfo Center: Lack of an * (asterisk) at the end of a reference indicates that the Soyinfo Center Library owns all or part of that document. We own roughly three fourths of the documents listed. Photocopies of hard-to-find documents or those without copyright protection can be ordered for a fee. Please contact us for details.

Document Types: The SoyaScan database contains 135+ different types of documents, both published (books, journal articles, patents, annual reports, theses, catalogs, news releases, videos, etc.) and unpublished (interviews, unpublished manuscripts, letters, summaries, etc.).

Customized Database Searches: This book was printed from SoyaScan, a large computerized database produced by the Soyinfo Center. Customized/personalized reports are "The Perfect Book," containing exactly the information you need on any subject you can define, and they are now just a phone call away. For example: Current statistics on tofu and soymilk production and sales in England, France, and Germany. Or soybean varietal development and genetic research in Third World countries before 1970. Or details on all tofu cheesecakes and dressings ever made. You name it, we've got it. For fast results, call us now!

BIBLIO: The software program used to produce this book and the SoyaScan database, and to computerize the Soyinfo Center Library is named BIBLIO. Based on Advanced Revelation, it was developed by Soyinfo Center, Tony Cooper and John Ladd.

History of Soybeans and Soyfoods: Many of our digital books have a corresponding chapter in our forthcoming scholarly work titled History of Soybeans and Soyfoods (4 volumes). Manuscript chapters from that book are now available, free of charge, on our website, www.soyinfocenter.com and many finished chapters are available free of charge in PDF format on our website and on Google Books.

About the Soyinfo Center: An overview of our publications, computerized databases, services, and history is given on our website.

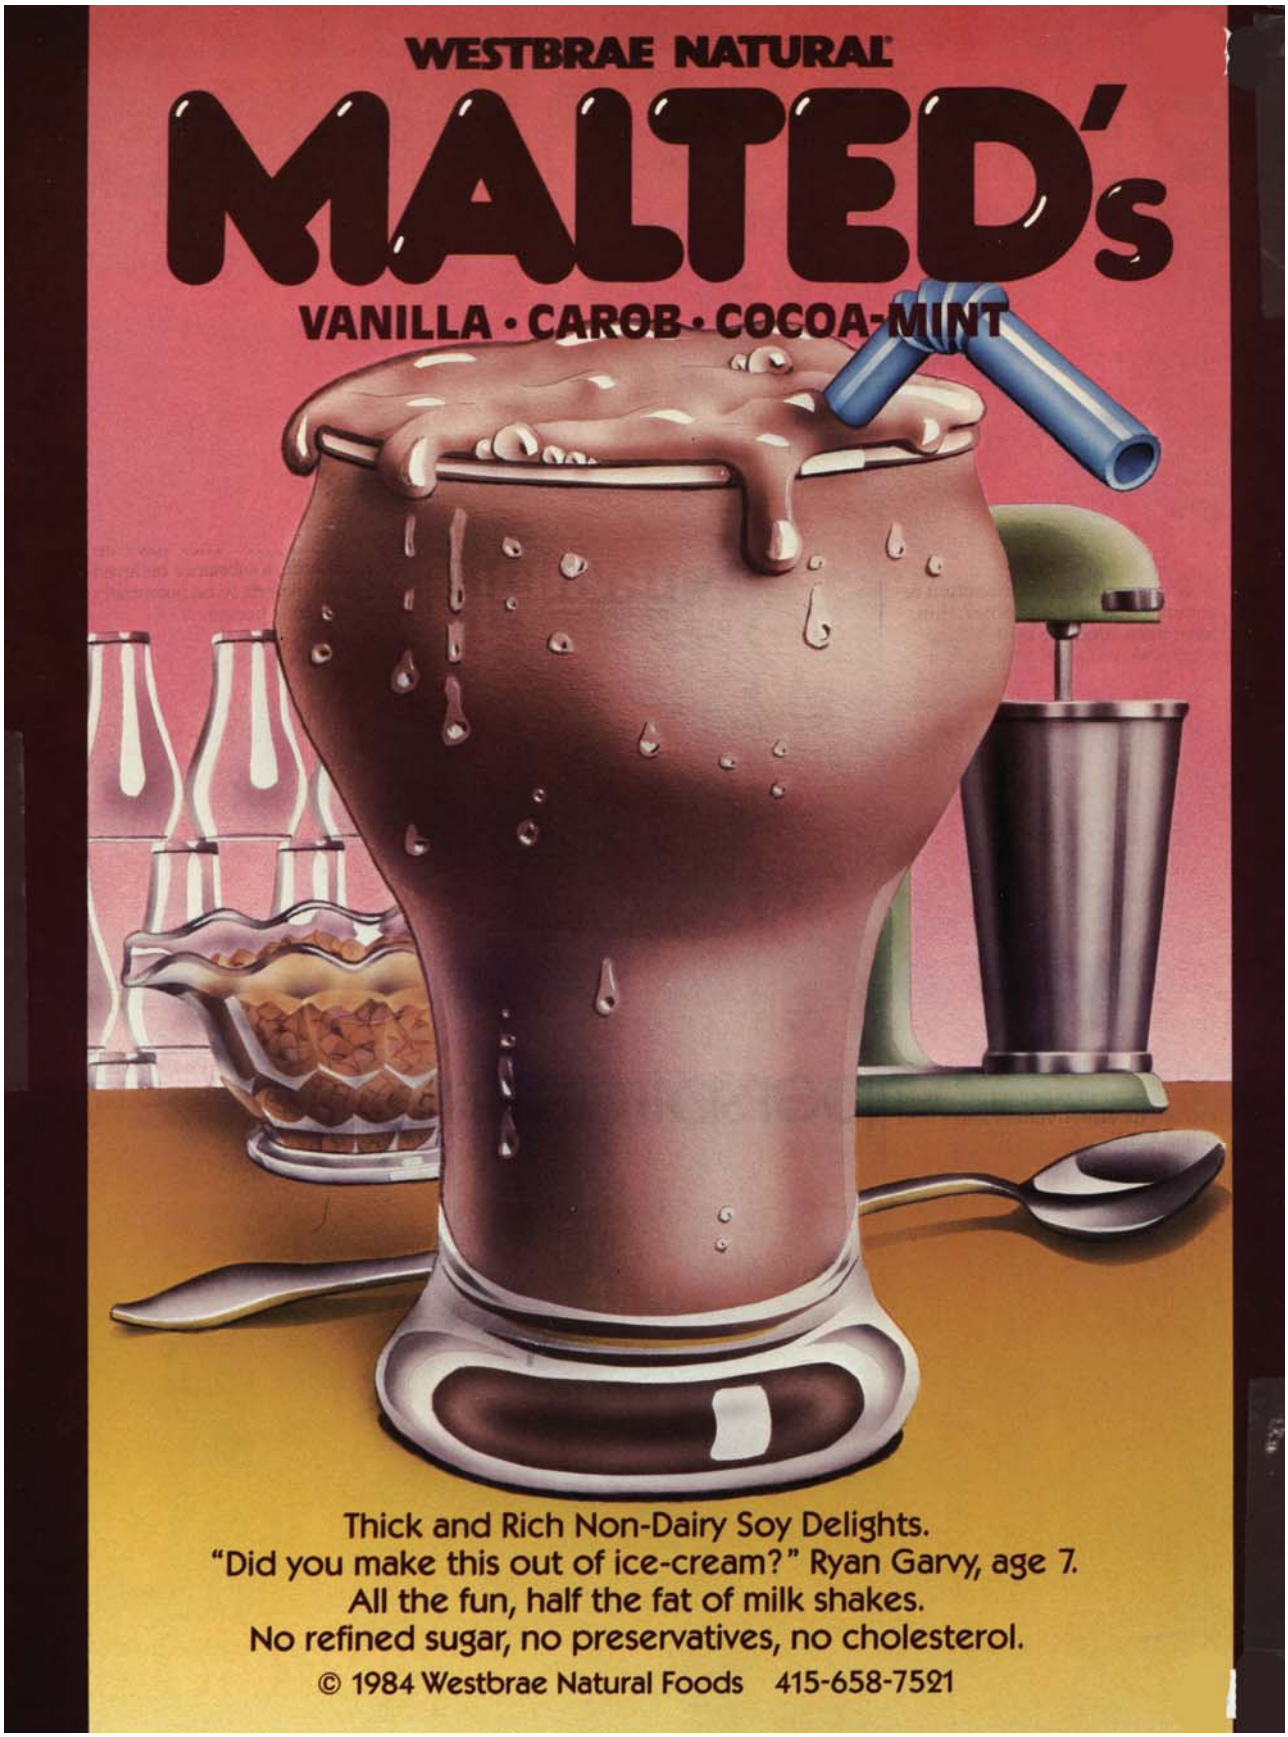
Soy Dairy



HISTORY OF SOYMILK AND OTHER NON-DAIRY MILKS

1. al-Baghdadi, Shams al-din Muhammad b. al-Hasan. 1226. Kitab al-tabikh [A Baghdad cookery book]. Baghdad, Iraq. [Ara]

• ***Summary:*** An English translation (by A.J. Arberry) of this important medieval Arabic cookbook was first published in the periodical *Islamic Culture* (1939, vol. 13); this was the first translation of medieval Arab recipes into a European language since the Middle Ages. Nearly all the recipes had been extinct for centuries. It was published again in 1985 in *Petits Propos Culinaires* (No. 21), and a third time in: Rodinson, Maxime; Arberry, A.J.; Perry, Charles. 2001. *Medieval Arab Cookery: Essays and Translations.* Totnes, Devon, England: Prospect Books. 527 p. See p. 19-89.

Almonds ("sweet almonds)" are called for throughout this book; they are often peeled, finely chopped or ground, and soaked in water. In several recipes they are "milked" or made into milk: "Peel sweet almonds and grind, then mix with a little water: flavor [the recipe] to taste with the water and milk of the almond (p. 44). "Take a portion of sweet almonds, peel, grind fine, stir in water, and add to the saucepan, making a broth as desired of the milk of almonds. Before putting in the milked almond, one may also add cabobs... (p. 55; see also p. 56, 58-59). Almond oil is called for in one recipe (p. 81).

Note 1. In each recipe in which the almonds are ground, they are immediately mixed with some water; they are apparently never used as almond paste.

Sesame oil appears in 9 recipes, but olive oil is considered to be of better quality. Sesame seeds are used in 3 recipes (p. 77, 78, 86).

Some of the recipes also call for *murri,* a liquid seasoning made from fermented barley, for which Chinese soy sauce makes an excellent substitute. Interesting, sometimes exotic-sounding ingredients are used throughout the book: mastic, Medina dates, mint, pomegranate seeds, poppy flour, rose-water, saffron, sugar, and sumach juice.

Note 2. This is the earliest document seen (Jan. 2005) that mentions almonds. Note 3. This is the earliest document seen (Aug. 2013) that mentions almond milk, or any non-dairy milk other than soymilk.

Note 4: This is the earliest document seen (Jan. 2005) that mentions almond oil.

Note 5: This is the earliest document seen (Sept. 2007) that mentions olive oil (or olives). Address: Baghdad.

2. Han Yi. 1365? Yiya yiyi [Remnant notions from *I Ya*]. China. Undated. [Chi]

• ***Summary:*** Wade-Giles reference: *I Ya I I,* by Han I. H.T. Huang (2000, p. 322, 617) who cites this book gives its date as "the late Yüan." Note 1. The Yüan (Mongol) dynasty in China lasted AD 1260-1368. Note 2. This is the earliest document seen (Aug. 2013) worldwide that mentions soymilk. Dr. Huang states that this is also the earliest Chinese-language document seen (Aug. 2013) that mentions soymilk, which it calls *doufujiang.* As of Aug. 2013 *doujiang* is the modern Chinese word for soymilk, but that word does not appear in this document. While discussing the preparation of a thick puree (*fu,* the same character as in *doufu / tofu*) of poppy seed and mung bean powder, this book mentions in passing that the poppy seed extract should be cooked in a way similar to that for cooking *doujiang.*

Dr. Huang comments: The statement above implies that soymilk must have been known in China for quite a long time. It also implies that although soymilk had been readily available, it was not itself of much interest as a food or beverage. It probably did not become popular in China until the late Qing (Manchu) dynasty (1644-1912), when the sale of *doujiang* by hawkers became a sight common enough to prompt an artist named Yao Chih-Han [sic, Yao Wenhan] to record the scene in a drawing now owned by the National Palace Museum in Taipei, Taiwan. An excellent reproduction of this illustration appears in Huang's book (p. 323). During the Qing, the Chinese apparently discovered that prolonged, slow heating rendered soymilk more digestible by and acceptable to adults. Infants, however, have plenty of the enzyme lactase which enables them to hydrolyze lactose (milk sugar). Lactose is an alpha-galactoside. Therefore, by inference, infants should be able to hydrolyze the alpha-galactosides (raffinose and stachyose) found in soymilk. However, Chinese traditionally did not feed soymilk to their infants–probably because adults could not tolerate it. Surprisingly, this discovery is never mentioned in the literature; it seems to have been treated like a trade secret. However, western researchers (see footnote 2) later found, that during slow heating, the oligosaccharides are gradually hydrolyzed.

Huang (p. 322) then gives several possible reasons for soymilk's lack of popularity in early China: (1) It had an unpleasant beany taste, especially when made using the cold-extraction method. (2) The presence of protease inhibitors (lipoxygenase) and oligosaccharides (complex sugars that cause flatulence) make soymilk less than easily digestible. Cooking the soymilk inactivates the lipoxygenase. A major advantage of making tofu from the cooked soymilk is that most of the flatulence-causing oligosaccharides go off in the whey.

In one footnote on this page, Huang adds that the term next appears in the literature in the *Bencao Gangmu Shi Yi* (Supplemental Amplification of the *Bencao Gangmu*) (+1765, p. 365).

In a second footnote on this page, Huang notes that after prolonged heating, up to 90 minutes, significant amounts of stachyose and raffinose are removed from soymilk (Pires-Bianchi et al. 1983).

Note 3. The term "alpha-galactoside" appears (as of Nov. 2003) in only 3 records in the SoyaScan database (two in 1965 and one in 1988). However the term "alpha-galactosidase" (the enzyme absent in the human digestive tract) is found in 8 records from 1965 to 1998. In 1970 it was found that most of the oligosaccharides (complex sugars which cause flatulence in adults) in soymilk can be eliminated by adding a commercial preparation of alpha-galactosidase to the milk. This enzyme hydrolyzes (breaks down) the oligosaccharides into simple sugars, which the body can digest.

A full-page table (Huang, p. 372) shows the "Usage of soy condiments in food recipes from the Han to the Qing dynasties." Only seasonings based on jiang (fermented soybean paste) are used in this book; none are based on fermented black soybeans (*shi*). Jiang itself is used in 10 recipes, soy sauce made from jiang (*jiangyou*) is used in 1, and another type of soy sauce made from jiang (*jiangshui*) is used in 1 recipe.

Page 52 mentions *fu cha* (tossed gluten salad) and *chien fu* (pan-fried gluten slices). Address: China.

3. Kitab wasf al-at'ima al-Mu-tada [The description of familiar foods]. 1373. Cairo, Egypt. [1 ref. Ara]
• ***Summary:*** For an excellent, colorful translation of this book see: Rodinson, Maxime; Arberry, A.J.; Perry, Charles. 2001. *Medieval Arab Cookery: Essays and Translations.* Totnes, Devon, England: Prospect Books. 527 p. See p. 273-465. Almonds (in various forms) appear in many of the recipes in this medieval Arabic cookbook, as peeled sweet almonds (e.g., p. 305, 312, 315, 325), blanched sweet almonds (p. 328), sweet almonds pounded to a paste (p. 306-07, 309, 311-14, 337, 339), sweet almonds pounded and milked with water (i.e., almond milk, p. 319, 322, 336), and sweet almond oil (p. 308, 332). See also marzipan in the index. Milk is also made from safflower seeds ("pounded fine and milked with water," p. 316, 318-19, 336), and walnuts ("walnut meats, pounded fine and milked in water," p. 309). Sesame oil is used in many recipes and sesame seeds in a few (p. 317). Soy sauce is used as a substitute for murri (fermented barley) in quite a few recipes (p. 308, 310, 317, 328).

Note 1. This is the earliest document seen (Aug. 2013) concerning a non-dairy milk made from safflower seeds, or from walnuts.

Interesting, sometimes exotic-sounding ingredients are used throughout the book: apricot, chufa, camphor, Ceylon cinnamon, a race of ginger, jujubes, kishk (dried yogurt), mastic, mint, noodles, Persian yogurt (*laban farsi*, p. 314), pistachios (pounded, p. 316), pomegranate seeds, purslane stalks, quince, rose-water, rue, saffron, spikenard, sugar, tiger nut, verjuice, tahineh [tahini, sesame butter] (p. 312-13).

Note 2. This is the earliest document seen (May 2011) that mentions tahini (which it calls *tahineh*). Centuries later it also came to be known as "sesame butter."

Note 3. This is the earliest document seen (Jan. 2005) concerning a non-dairy nut or seed butter, *tahineh*, made by grinding sesame seeds until smooth.

Note 4. This is the earliest document seen (Dec. 2012) that mentions almonds pounded to a paste [almond paste]; centuries later it also came to be known as "almond butter." Address: Cairo, Egypt.

4. The forme of cury: a roll of ancient English cookery, compiled, about A.D. 1390, by the master-cooks of King Richard II... 1390. London, England. [Eng]
• ***Summary:*** Page 124: "Almandes. page 17 [and 18]. very variously written at this time, Almaunde, Almandy?, Almaundys, Almondes, all which occur in MS. Ed. and mean Almond or Almonds.

"Almahd my Ike. 9. Almonds blanch'd and drawn thickish with good broth or water, Nº 51. is called thyk mylke, 52. and is called after Almande mylke, first and second milk, 116. Almands unbleached, ground, and drawn with good broth, is called mylke, 62. Cow's milk was sometimes used instead of it, as MS. Ed. 1. 13.

"Creme of Almands how made, 85. Of it, Lei. Coll. VI. p. 17. We hear elsewhere of Almond-butter, v. Butter."

First published: London: Printed by J. Nichols, printer to the Society of Antiquaries, 1780 [i.e. 1785].

Note: Charles Perry (2013/08) says this is the earliest English-language book he has seen that mentions almond milk. Address: London, England.

5. Furnival, Frederick J. ed. 1430. The babees' book: Medieval manners for the young. London: *
• ***Summary:*** A recipe in this book states: "Take Almaunde Milke & yolkys of Eyroun."

In modern English, this reads: "Take almond milk and egg yolks." The first character of the word *yolkys* (pronounced YO-kus) is not actually a *y* but an ancient orthographic character called a "yogh," that looked liked somewhat like the number 3 and was sounded like a guttural *y. Eyroun* means "eggs" in a dialect of English.

Note: This book was the earliest cited by the *Oxford English Dictionary* under "almond milk." Address: England.

6. Harleian MS. 279 (ab. 1430) [about cookery in England]. 1430.
• ***Summary:*** This manuscript, which is presently (Aug. 2013) in the British Museum, was published in *Two Fifteenth-Century Cookery Books*, edited by Thomas Austin (1888). It is found on pages 1-64 of that book.

This MS. [Manuscript] is divided into three Parts, the

first, headed *Kalendare de Potages dyuers*,–containing 153 recipes: the second Part, *Kalendare de Leche Metys*, has 64 recipes, and the third Part, *Dyuerse bake metis*, 41 recipes.

Almond milk is mentioned many times throughout this book, however the words "Almond" and "milk" are spelled in many different ways. Here are some examples from the 1888 published book:

Page 19: "Bruet of Almaynne–Take Almaundys, & draw a gode mylke ther-of with Water; take Capoun [capon], Conyngys [conys = rabbits older than 1 year] or Pertriches [partridges]; smyte ye Capoun, or kede, or Chykonys, Conyngys: ye Pertriche shal ben hol: pan blaunche ye Fleyssh, an caste on ye mylke... take pouder Gyngere, Galyngale, Canel, & temper ye pouder wyth Vynegre, & caste ther-to; sesyn it with salt, & serue forth."

"Bruet of Almaynne in lente–Take fyne thikke Mylke of Almaundys; take datys, an mynce hem smal ther-on; take Sugre y-nowe, & straw ther-on, & a lytil flowre of Rys; sylt [mix] & serue forth whyte, & loke Pat it be rennyng." Address: England.

7. Su Ping. 1500. Doufu [Ode to tofu? (Document part)]. Quoted by Wai 1964, p. 91-92. [Chi; eng]

• ***Summary:*** In an English-language article about fermented tofu titled "Soybean cheese, Nganshou Wai (1964, p. 92) notes that Su Ping of the Ming Dynasty (1500) wrote:

"The best is King Wainan's skill, you see the beauty when you peel.

"Ground in mortar and milk flows.

"Boil in water and it turns to snow.

"Soak in the jar and white curds show.

"Cut apart with a knife yet the jade is sound.

"Who knows the delicacy of the curd? Only the Buddhist and Taoist."

Note 1. This is the earliest document seen (April 2012) clearly linking tofu and Buddhism.

Note 2. This is the earliest document seen (April 2013) that mentions soymilk curds–before they become tofu.

Note 3. Dr. H.T. Huang found in a bibliography the original Chinese name of Su Ping, who flourished in about 1435. He has no further information about this poem or its source.

8. Iseno, Teijo. 1525? Teikun ôrai [Teikun ôrai]. Japan. [Jap]*

• ***Summary:*** Ohta (1975, p. 226) states that this book was written during the Muromachi (Ashikaga) period [ca. 1336-1573] in Japan. It contains recipes for using fermented black soybeans (*shiokara nattô*).

K. Tsuchiya (Soymilk, 1982, p. 30) states that in this book, written during the Muromachi (Ashikaga) period in Japan, the word *tofu-kan* appears in the section titled *Shojin Ryori* (Buddhist Vegetarian Cookery). That word used to mean "tofu soup" but it actually refers to what Japanese today call soymilk (*tônyû*).

Toyo Shinpo. 1983. Jan. 1. "Tonyu no rekishi wa furui" [Soymilk has a long history]. Based on new book by Kanji Tsuchiya.

9. Boorde, Andrew. 1542. The fyrst boke of the introduction of knowledge made by Andrew Boorde, of physycke doctor. A compendyous regyment; or, A dyetary of helth... London: N.T. Truber & Co. Published for the Early English Text Society. 396 p. Illust. 22 cm.

• ***Summary:*** Boorde, attributes therapeutic value to almond milk: "Almon mylk doth comforte the brest, and it doth mollyfe the bely, and provoketh uryne." Note: This is the 4th earliest document seen (Aug. 2003) that mentions almond milk. It was first cited by Lorna J. Sass in her book *To the King's Taste* (1975). Address: Physycke Doctour.

10. Hakluyt, Richard. 1589-1600. The principall navigations, voiages, traffics and discoueries of the English nation. 3 vols. London. See vol. 1, p. 97. Reprinted in 1965. Cambridge, Published for the Hakluyt Society and the Peabody Museum of Salem at the University press. *

• ***Summary:*** Page 97 states: "It leaueth behind it a taste like the taste of almond milke." This statement appears in a section of the book about alcoholic beverages. The author writes that "cosmos" leaves behind it a taste like the taste of almond milk. Since "cosmos" is made by fermenting mare's milk, it is probably today's koumiss–which is a beverage of fermented mare's milk made originally by the nomadic people's of central Asia." According to *Webster's Dictionary* (1998) the word koumiss was first used in English in 1598! It is derived from the Russian *kumys*, which is of Turkik origin and akin to the Turkish word *kumiz*.

Note 1. Richard Hakluyt (lived ca. 1552-1615) was an English geographer and historian.

Note 2. This passage about "almond milke" does not appear in the 1589 edition of this book.

Note 3. This is the third earliest document seen (March 1999) that mentions almond milk. It was first cited by the *Oxford English Dictionary* under "almond milk."

11. Chen Maoren. comp. 1644. Shuwu yimingshu [Compilation of common things with unusual names]. China. Passage on soy reprinted in C.N. Li 1958 #158, p. 103. [Chi]

• ***Summary:*** Wade-Giles reference: *Shu Wu I Ming Shu*, by Ch'ên Mao-gun. The first passage states: "Soybean milk (*shuru*) is the same as tofu (*doufu*). If you cook the beans, you will get the milk."

The second and last passage states: "A Sanskrit (*fanwen*) quotation says that you use soybeans and azuki beans (*daxiaodou*) as a nut or fruit." (Translated by H.T. Huang, PhD, Nov. 2002). Dr. Huang adds: The first passage about soymilk and tofu is garbled and doesn't make much sense. The first passage is from the *Qing Yilu* [Anecdotes, simple

and exotic] (+965), but this source is not cited in this work of 1644, and Li (1958) was also unaware of it, because he never cited or mentioned the *Qing Yilu.*

Schlegel (1894, p. 136) (1) "The *Tao-fu* or Bean-curd was also called 'Leguminous milk,' and was prepared by boiling curds or milk from beans." (2) Dr. Huang comments: Schlegel was the first to cite this early reference to tofu, but he did not realize that this passage actually comes from a much earlier source, the *Qing Yilu,* which appeared almost 680 years earlier, at the end of the Tang dynasty!

This work consists of 30 bound volumes of 30 chapters. The wood blocks were carved during the reign period of Chong Zhen, the last Ming emperor, who hung himself on Cold Mountain as the Qing Manchus were conquering his dynasty and preparing to establish the Qing dynasty (1644-1911).

Note 1. This is the earliest document seen (Nov. 2002) which states that the soybean was mentioned in an early Sanskrit source.

Note 2. This is the earliest Chinese-language document seen (Aug. 2013) that uses the term *shuru* to refer to soymilk.

12. Fernández Navarrete, Domingo. 1665. [Journal]. In: Awnsham Churchill and John Churchill, comps. 1704. A Collection of Voyages and Travels. London: Published by the author. 4 vols. See vol. 1, p. 251-52. Chap. 13. [Spa; Eng]
• ***Summary:*** This passage in Fernández Navarrete's journal, written in 1665 in Spanish, first published in Spanish in 1676, but not published in English until 1704 by Churchill & Churchill, appears in Chapter 13 of the Journal, titled "His Journey to Che Kiang" (p. 251-52). The following is from the 1704 translation; the unnamed translator may have been Captain John Stevens:

"16. Before I proceed to the next chapter, because I forgot it in the first book, I will here briefly mention the most usual, common and cheap sort of food all *China* abounds in, and which all men in that empire eat, from the emperor to the meanest *Chinese,* the emperor and great men as a dainty, the common sort as necessary sustenance. It is call'd *teu fu* [tofu], that is, paste of kidney-beans [*Llamase Teu Fu, esto es, masa de frixoles* {*frijoles*}]. I did not see how they made it. They draw the milk out of the kidney-beans, and turning [curding] it, make great cakes of it like cheeses [*quesos*], as big as a large sieve, and five or six fingers thick. All the mass is as white as the very snow, to look to nothing can be finer. It is eaten raw, but generally boil'd and dressed with herbs, fish, and other things. Alone it is insipid, but very good so dressed and excellent fry'd in butter. They have it also dry'd and smok'd, and mix'd with caraway-seeds, which is best of all. It is incredible what vast quantities of it are consum'd in *China,* and very hard to conceive there should be such abundance of kidney-beans. That *Chinese* who has *teu fu,* herbs and rice, needs no other sustenance to work; and I think there is no body but has it, because they may have a pound (which is above twenty ounces) of it any where for a half-penny. It is a great help in case of want, and is good for carriage. It has one good quality, which is, that it causes the different airs and seasons, which in that vast region vary much, to make no alteration in the body, and therefore they that travel from one province to another make use of it. *Teu fu* is one of the most remarkable things in *China,* there are many will leave pullets for it. If I am not deceiv'd, the *Chineses* of *Manila* [Philippines] make it, but no *European* eats it, which is perhaps because they have not tasted it, no more than they do fritters fry'd in oil of *Ajonjoli* ([sesame seed] a very small seed they have in *Spain* and *India,* which we have not) which the *Chineses* make in that city and is an extraordinary dainty."

Note 1. Friar Domingo Fernández Navarrete was born in 1618 in Castrogeriz, Spain (he was Castilian), and he died in 1686 on the island of Santo Domingo, where he was Archbishop and Primate of the Spanish Indies. He wrote in Spanish, and served as a Dominican missionary in China (where he observed soyfoods) from 1658 to 1669.

Note 2. This is the earliest document seen in the Western world, or written by a European, that mentions soymilk, although it is described as a step in the process of making tofu rather than an a beverage. It is the third earliest that mentions soya or tofu.

Note 3. This is the earliest Spanish-language document (April 2013) seen that mentions tofu, which it calls *Teu Fu* or *masa de frixoles* {*frijoles*}. The author is not certain that Chinese in Manila made tofu. If they did, this would be the earliest document seen (April 2013) concerning soybean products (tofu) in the Philippines. This document would also contain the earliest date seen for soybean products in the Philippines (1665); soybeans as such had not yet been reported by that date. Yet if the Chinese were making tofu at this time in Manila, they must have had soybeans. Therefore, this would be the earliest document concerning soybeans in the Philippines. And these soybeans were probably being cultivated at this time in the Philippines.

Note 4. This is the earliest document seen concerning soybeans in connection with (but not yet in) Spain.

Note 5. This is the earliest document seen (Jan. 2002) concerning soybeans in Southeast Asia. This document contains the earliest date seen for soybeans in Southeast Asia (1665).

Note 6. This is the earliest document seen (April 2013) that mentions smoked tofu. It is interesting that a European mentions smoked tofu, which he apparently saw in China, before it is mentioned in any known Chinese document–in 1680.

Note 7. This is the earliest European-language document seen (Aug. 2007) that mentions sesame oil, which it calls "oil of Ajonjoli."

Note 8. This is the earliest European-language document seen (April 2013) that mentions dry / dried tofu ("They have

it also dry'd") in China. This probably refers to *doufu-gan* (which literally means "tofu dry" but which we call "pressed tofu").

Note 9. Navarrete's 1665 journal is the earliest Spanish-language document seen (Jan. 2000) concerning soy. When it was published in 1676 in Spanish, it was the earliest Spanish-language publication seen concerning soy.

Note 10. For a biography of Domingo Fernández Navarrete (1610-1698), see J.S. Cummins (1962). In the National Union Catalog, his surname is given as "Fernández Navarrete" (i.e. his name is indexed under "F," not under "N"). In May 1677, long after leaving China, he was nominated Archbishop of Santo Domingo (an early name for the Dominican Republic); he arrived there on 20 Sept. 1677. He learned about food uses of soybeans in about 1665 while he served as a Dominican missionary in China (1658-1669). The island on which he was archbishop, called Hispaniola in English or Española in Spanish, was visited by Christopher Columbus in 1492 and settled in 1493; it became the center of Spain's rule in the West Indies and the base for Spain's expansion to the American mainland. Its capital constitutes the oldest continuous European settlement in the Americas. The natives were soon exterminated by the Spanish and replaced by negro slaves. During the 1600s, the western third of the island (known today as Haiti) was occupied by French buccaneers and ceded to France by Spain in 1697, after Navarrete wrote about soya; it came to be known by the French as the colony of Saint Domingue, while the eastern two-thirds of the island where Navarrete lived (Santo Domingo, known today as the Dominican Republic) remained under control by Spain. Hymowitz and Newell (1981) noted that this was the earliest accurate European description seen for the use of soybeans as a food. Thus the first two European references to soyfoods were both about tofu.

For a good biography of Fernández Navarrete, see Cummins 1962.

13. Fernández Navarrete, Domingo. 1676. Tratados historicos, politicos, ethicos, y religiosos de la monarchia de China... [An account of the empire of China, historical, political, moral, and religious]. Madrid, Spain: En la Imprenta Real, por Juan Garcia Infancon. A costa de Florian Anisson, Mercador de Libros. [18] + 518 + [25] p. See p. 347-48. 30 cm. [Spa]

• ***Summary:*** This is the earliest published Spanish-language edition of Fernández Navarrete's journal, written in 1665. It was printed/published in 1676 in Madrid by Juan Garcia Infanon. Book VI (*Tratado sexto*), titled "The author's travels" [1646-1674] (*De los viages, y navigaciones que el autor deste libra ha hecho*) begins on p. 289. We are interested in Chapter XIII, titled "My journey to Che Kiang and stay there till the persecution," which begins on p. 344. We will give below an exact transcription of part of this 17th century Spanish document, but we will adapt the original letter forms to their contemporary equivalents. Near the end of this chapter, Part 16 (p. 347) begins: *"Antes de passar al capitulo siguiente, escribo aqui con breuedad* [*brevedad*], *por averseme* [*averme*] *olvidado in en Tratado primero, el manjar usadisimo, comunisimo, y muy barato de que abunda toda la China, y que comen quantos ay en aquel Imperio, desde el Emperador, hasta el China mas ordinario, el Emperador, y señores, por regalo, la gente ordinaria por sustento, y necesidad. Llamase Teu Fu, esto es, masa de frixoles* [*frijoles*]. *El modo come se haze* [*hace*] *no le vi, sacan la leche de los frixoles, y quaxada* [*cuajada*] *hazen* [*hacen*] *uno como quesos tan grandes como un arnero, y de gruesso cinco y seis dedos. Toda la masa tan blanca como la mesma nieue* [*nieve*]. *Tiene la vista quanto se puede desear."*

The following translation is from A. Churchill and J. Churchill, comps. 1704. *A Collection of Voyages and Travels* (London): "Before I proceed to the next chapter, because I forgot it in the first Book, I will here briefly mention the most usual, common and cheap sort of food all *China* abounds in, and which all men in that empire eat, from the emperor to the meanest *Chinese*, the emperor and great men as a dainty, the common sort as necessary sustenance. It is call'd *teu fu*, that is, paste of kidney-beans [*masa de frixoles*]. I did not see how they made it. They draw the milk out of the kidney-beans, and turning [curding] it, make great cakes of it like cheeses, as big as a large sieve, and five or six fingers thick. All the mass is as white as the very snow, to look to nothing can be finer."

Note 1. This is the earliest published Spanish-language document (April 2013) seen that mentions tofu, which it calls *Teu Fu;* the author refers to soybeans as simply *frijoles*.

Thanks to Javier Alvarez-Mon of Spain, a student and employee at the Graduate Theological Union Library in Berkeley, for help in transcribing and interpreting this passage in old Castilian (the language of Castile–an ancient kingdom in central and northern Spain–that became the modern official and literary language of Spain). Javier notes that today in Spain beans are no longer called *frijoles.* Rather, they are called *judías* (pronounced hu-DEE-as), a word apparently (for unknown reasons) related to the word "Jews."

Note 2 This is the earliest Spanish-language document seen (Aug. 2013) document seen that mentions soymilk, which it calls *la leche de los frixoles.*

For a good biography of Fernández Navarrete, see Cummins 1962. He was born in 1618 in Castrogeriz, Spain (he was Castilian), and he died in 1686 on the island of Santo Domingo, where he was Archbishop and Primate of the Spanish Indies.

14. Marvell, Andrew. 1678. An account of the growth of the growth of popery and arbitrary government in England. Amsterdam. 68 p. Reprinted in Westmead, England, by

Gregg International (156 p., 20 cm). *
• ***Summary:*** A letter from Andrew Marvell to Dr. Witty states: "The doctor doth stint [confine] them to cordials, almond-milk and broth."

Note: *Merriam-Webster's Collegiate Dictionary* (1998) defines popery (a noun, first used in about 1534) as "Roman Catholicism–often used disparagingly."

15. Fernández Navarrete, Domingo. 1704. An account of the empire of China, historical, political, moral, and religious. Vol. 1. In: Awnsham Churchill and John Churchill, comps. A Collection of Voyages and Travels. London: Published by the author. 4 vols. 424 p. See p. 251-52. Chap. 13. [Eng]
• ***Summary:*** The subtitle of the entire volume reads: "Some now printed from original manuscripts. Others translated out of foreign languages, and now first pub. in English. To which are added some few that have formerly appear'd in English, but do now for their excellence and scarcity deserve to be reprinted."

At the bottom of the title page of this chapter is written: "Written in Spanish by R.F.F. Dominick Fernandez Navarette [sic, Navarrete], Divinity Professor in the College and University of St. Thomas at Manila, Apostolick Missioner in China, Superior of those of his Mission, and Procurator General at the Court of Madrid for the Province of the Rosary in the Philippine Islands, of the Order of Preachers." Domingo Fernández Navarrete lived 1610-1698. Many curious observations are contained in this work, which is a translation of *Tratados historicos, politicos, ethicos, y religiosos de la monarchia de China* (1676). In this collection it appears as the first item in Volume I, which bears out the tendency for travel literature of this period to be of less significance for geography and history than for literature. The name of the translator is not mentioned, but Cummins (1962, p. cxvi) speculates that it may have been Captain John Stevens. The *Tratados* appears in all the Churchill editions.

The author's exact description of tofu in China, which first became available in English in 1704 in this book as compiled/edited by Churchill and Churchill is as follows:

"16. Before I proceed to the next chapter, because I forgot it in the first book, I will here briefly mention the most usual, common and cheap sort of food all *China* abounds in, and which all men in that empire eat, from the emperor to the meanest *Chinese*, the emperor and great men as a dainty, the common sort as necessary sustenance. It is call'd *teu fu*, that is, paste of kidney-beans [*Llamase Teu Fu, esto es, masa de frixoles* {*frijoles*}]. I did not see how they made it. They draw the milk out of the kidney-beans, and turning it, make great cakes of it like cheeses, as big as a large sieve, and five or six fingers thick. All the mass is as white as the very snow, to look to nothing can be finer. It is eaten raw, but generally boil'd and dressed with herbs, fish, and other things. Alone it is insipid, but very good so dressed and excellent fry'd in butter. They have it also dry'd and smok'd [dried and smoked], and mix'd with caraway-seeds, which is best of all. It is incredible what vast quantities of it are consum'd in *China*, and very hard to conceive there should be such abundance of kidney-beans. That *Chinese* who has *teu fu*, herbs and rice, needs no other sustenance to work; and I think there is no body but has it, because they may have a pound (which is above twenty ounces) of it any where for a half-penny. It is a great help in case of want, and is good for carriage. It has one good quality, which is, that it causes the different airs and seasons, which in that vast region vary much, to make no alteration in the body, and therefore they that travel from one province to another make use of it. *Teu fu* is one of the most remarkable things in *China*, there are many will leave pullets for it. If I am not deceiv'd, the *Chineses* of *Manila* [Philippines] make it, but no *European* eats it, which is perhaps because they have not tasted it, no more than they do fritters fry'd in oil of *Ajonjoli* ([sesame seed] a very small seed they have in *Spain* and *India*, which we have not) which the *Chineses* make in that city and is an extraordinary dainty."

Note 1. This is the earliest English-language document seen (Feb. 2006) that uses the term "kidney- beans" to refer to soybeans.

Note 2. This is the earliest English-language document seen (April 2013) that uses the word "teu fu" (or "teu-fu") to refer to Chinese-style tofu, or that uses the word "cakes" or "cheeses" ("make great cakes of it like cheeses") in connection with tofu. This is also the earliest English-language document that mentions tofu in connection with China. Benjamin Franklin in London read the English translation and in 1770 wrote his friend John Bartram in Philadelphia, Pennsylvania, about tofu and Chinese Garavances / Caravances.

Note 3. This is the earliest English-language document seen (April 2013) that mentions smoked tofu or that uses the word "smoked" (actually smok'd) in connection with tofu.

Note 4. This is the earliest English-language document seen (May 2011) that mentions sesame seeds, which it calls *Ajonjoli*.

Note 5. This is the earliest English-language document seen (April 2013) that mentions dry / dried tofu ("They have it also dry'd") in China. This probably refers to *doufu-gan* (which literally means "tofu dry" but which we call "pressed tofu").

Note 6. This is the earliest book chapter seen (Oct. 2001) that mentions soy.

For a good biography of Fernández Navarrete, see Cummins 1962. Address: Divinity Professor in the College and University of St. Thomas at Manila, Philippines.

16. Zhao Xuemin. 1765. Bencao Gangmu shiyi [Supplemental amplification of the *Bencao Gangmu*]. China. [Chi]

• ***Summary:*** Wade-Giles reference: *Pên Ts'ao Kang Mu Shih I*, by Chao Hsüeh-Min. H.T. Huang (2000, p. 322, 621) who cites this Qing dynasty book, says of its date: "Begun ca. +1760; first prefaced +1765, prolegomena added +1780, last date in text 1803. First published 1871." Huang says that this is the 3rd earliest Chinese-language document seen in which a term for soymilk (*doujuang*) appears (See p. 365 of the 1971 edition {Comm. Press, Hong Kong}). Address: China.

17. Yao Wenhan. 1790? [Painting of hawkers selling soymilk in China]. China. Undated. Reproduced in H.T. Huang 2000, p. 323. [Chi]

• ***Summary:*** Painted during 1736-1796. Qing dynasty. Original in the National Palace Museum (Taipei, Taiwan). Reproduced (with permission) on page 323 of H.T. Huang. 2000. Science and Civilisation in China. Vol. 6, Biology and Biological Technology. Part V: Fermentations and Food Science. Joseph Needham series. Cambridge, England: Cambridge University Press.

Letter (e-mail) from H.T. Huang, PhD. 2005. Aug. 25. "As far as I can see it is a team of hawkers. The one on the far left is preparing the soymilk. The one on the far right is dispensing soymilk from a pail into a bottle, and the one in the center is pouring it from a bottle into a cup. People are buying it in bottles to take home or in cups to drink on the spot."

Letter (e-mail) from H.T. Huang. 2006. Sept. 7. This illustration was painted by Yao Wenhan (Chinese characters given) (probably not Yao Zhihan as the inscription on the Needham Research Institute copy says), a painter at the court of Emperor Qianlong who reigned from AD 1736 to 1796. "Yao Wenhan was a well-known court painter. His dates are unknown... We are indebted to Dr. James Lin, a curator of the Fitzwilliam Museum, University of Cambridge, for this information. His friend has seen the original in the National Palace Museum [Taipei, Taiwan] and recognized the painting and painter instantly. He also thinks this may be a copy of a Song [W.-G. Sung dynasty, 960-1279] painting since many of the paintings in Qianlong's collection were copies of classical Song works. I'm not so sure, since soymilk is not mentioned in Song literature [although it is first mentioned in about 1365, late Yüan dynasty]. I do think it is painted in Song style. The attire of the hawkers in the painting is like those seen in Song paintings and not like those in Qing paintings. Thus, we can surmise that soymilk was in use in China by the beginning of the Qing dynasty (c. 1640). It was sold as a street food in the 18th century."

18. Glasse, Hannah (Mrs.). 1796. The art of cookery made plain and easy; which far exceeds any thing of the kind ever yet published. London: J. Fairburn. xl + 419 p. See p. 173-74. Index. 22 cm. Facsimile edition reprinted in 1971. [Eng]

• ***Summary:*** On the title page, after the table of contents, we read: "in which are included, One Hundred and Fifty new and useful Receipts [recipes], not inserted in any former edition."

In Chapter X, "Fish," the last receipt [recipe], "To dress White-bait," is almost identical to that in the 1784 edition– except it is in a different chapter and it lacks two commas. It states (p. 173-74): "Take your white-bait fresh caught and put them in a cloth with a handful of flour, and shake them about till they are separated and quite dry; have some hog's lard boiling quick, fry them two minutes, drain them and dish up with plain butter and soy."

Note 1. The last word, "soy," refers to soy sauce. It does not appear in the index, and we can find no other use of it in this book.

Note 2. "Price: five shillings, bound."

Note 3. Chapter XIV, "For Lent, or a fast dinner..." (p. 205-64) contains several recipes in which almonds

are pounded to a paste in a mortar then mixed with other ingredients and used in place of or with dairy milk or cream, including Almond soup (p. 209-10), Almond fraze (p. 218, sweet pancakes with pounded almonds, sweet cream, eggs, sugar, and grated white bread, pan-fried in butter), How to make a hedge-hog (p. 224; with 2 lb of almonds instead of meat), Almond pudding (two types, p. 243-44), and Ipswitch almond pudding (p. 251). In other chapters, almonds are also used to make Almond cheesecakes (p. 319), Almond custards (p. 320), Almond butter (p. 321), Almond cream (p. 324), and Almond rice (p. 339). In these Lenten recipes, eggs, butter, cream, and cheese are used quite often and liberally. Meat is never used, but eels, fish (flounder, herring, salmon, scate / thornback), and shellfish (crawfish, lobsters, mussels, oysters) are all used.

Note 4. This is the earliest English-language document seen (Aug. 2013) calling for the use of almond milk at Lent in Europe in place of or with dairy milk or cream.

Note 5. This is the earliest English-language document seen (Dec. 2012) that contains the term "Almond butter" (p. 321) or gives a recipe: "Take a quart of cream, put in some mace whole, and a quartered nutmeg, the yolks of eight eggs, well beaten, and three quarters of a pound of almonds well blanched, and beaten extremely small, with a little rose-water and sugar; and put all these together, set them on the fire, and stir them till they begin to boil; then take it off, and you will find it a little cracked; so lay a strainer in a cullender [colander] and pour it into it, and let it drain a day or two, till you see it is firm like butter; then run it through a cullender, and it will be like little comfits, and so serve it up."

Note 6. Other interesting ingredients and recipes: Walnut catchup (p. 156). Sago puddings (p. 244, 254). To boil sago [for the sick] (p. 268). To make catchup to keep twenty years (for captains of ships, using mainly strong stale beer, large mushrooms, pickled anchovies, shallots, mace, cloves, pepper, and ginger–no tomatoes or soy, p. 271). To make catchup (two ways, using mainly mushrooms, salt, red wine, and spices–no tomatoes or soy, p. 371-72).

Note 7. This is the earliest document seen (Jan. 2006) that contains a recipe for a type of "catchup" in which mushrooms are the main solid ingredient. Address: England.

19. Kinsei shokuhin zukushi ekotoba [Abundant food illustrations and captions of the early modern period]. 1805. Japan. [Jap]

• ***Summary:*** A large, superb illustration shows tofu being made in a commercial tofu shop. The basic steps are unchanged to this day. A lady with a baby on her back, grinds the next batch of soaked soybeans in a hand-turned stone mill. She turns the mill with her right hand while ladling in soaked soybeans using a shallow spoon with her left. She is wearing raised wooden shoes (*geta*) to keep her feet dry and clean. The smooth white puree runs down into a wooden barrel beneath the mill. Puree from the last batch of soybeans she ground has been cooked with water (in front of her) in a large iron caldron covered with a wooden lid. That cooked puree was ladled out into a pressing sack.

A man, probably the tofu maker (with his back to us) is sitting on a lever press (a sturdy board attached to a fulcrum on the wall) pressing a white sack so that the soymilk runs down into a curding barrel and okara remains in the sack.

After a coagulant (nigari or calcium sulfate or both) is added to the hot soymilk in the curding barrel, the milk is transformed into white curds and yellow whey. The whey is ladled off (see two ladles hanging on wall) and the curds are scooped into the cloth-lined perforated wooden forming box that rests atop a wooden tub next to the wall just to the left of the ladles. The curds in the forming box are pressed to make tofu.

A previous batch of tofu is now under cold water in a wooden sink near the left front of the illustration. A knife, used to cut blocks of tofu into smaller cakes, rests on that part of the sink which is covered. A potential customer (far left), with a fan in his left hand, stands on the street.

At the far right of the illustration, thinly sliced pieces of tofu are draining on a mat on a long table, in preparation for deep frying. At the top right, an elderly person from the tofu maker's extended family (probably a parent of the tofu-maker or his wife), kneeling on the tatami mats in the home–one step up from the tofu shop, appears to be deep-frying–probably to make deep-fried tofu pouches (aburagé).

An adjacent room (to the left) is a fish shop where fish are being cut into smaller pieces and deep-fried (perhaps to make cakes or patties of *Satsuma agé*).

On the illustration of the tofu shop are three groups of old, hard-to-read Japanese characters, handwritten in script format. (1) At the top right is written *Ne no hi no.* "Ne no hi" is a word somewhat like "Tuesday," the name of one of the days of the week in old Japan under the lunar calendar system–even though there was no idea of a "week" in Japan at this time. "Ne ho hi" occurred roughly 3 times each lunar month of 28 days, typically at 12-day intervals.

(2) Below the feet of the women with the baby on her back is written: *Tamatama ni Edo no hito* [*?*] *mo saburafu ya,* which may mean "Sometimes people from Edo visit here."

(3) Below the man sitting on the pole that is pressing the sack of okara is written *Inaka* [*?*] *hito wa kataki tofu o konomeruga okashiki,* which may mean "It's funny that country folks prefer firm tofu."

20. O'Shaughnessy, W.B. 1841. The Bengal dispensatory and pharmacopoeia: Chiefly compiled from the works of Roxburgh, Wallich, Ainslie, Wight and Arnot, Royle, Pereira, Lindley, Richard, and Fee; and including the results of numerous special experiments. Calcutta: Bishop's College Press. xxiii + 794 p. Index. 21 cm.

• ***Summary:*** Vol. I, "The Dispensatory," discusses: Gluten

and vegetable albumen (p. 72-73). Fixed oils, "obtained by expression chiefly from seeds, as the almond, castor, croton, arachis, sesamum, &c." Also: linseed, poppy, walnut, and hemp seed (p. 74-75). Linum–linseed mucilage and linseed oil (p. 212-13). *Arachis hypogæa* (Earth pistachio; p. 304). *Pueraria tuberosa* (p. 316). *Amygdalus communis*–Almonds, incl. common almond, oil of sweet almonds, almond milk, the bitter almond (p. 318-22). *Sesamum orientale*–Sesamum, gingilie oil (p. 479). *Cannabis sativa* or *C. Indica*–Hemp (p. 579-604). *Cyperus esculentus*–Esculent cyperus (p. 628). Algae–Sea-weeds (p. 667-71).

Note 1. This is the earliest English-language document seen (Aug. 2006) that mentions *Cyperus esculentus.*

Note 2. This is the earliest English-language document seen (June 2003) that contains the word "linseed." Address: M.D., Asst. Surgeon, Prof. of Chemistry and Materia Medica, Medical College, Calcutta.

21. Medhurst, Walter Henry. comp. 1842-1843. Chinese and English dictionary: Containing all the words in the Chinese Imperial Dictionary, arranged according to the radicals. 2 vols. Batavia: Printed at Parapattan.

• ***Summary:*** In volume I (1842): At radical 37 (p. 145-46), *ta,* meaning "big," the soybean, *tatou,* is not mentioned. But *tama,* meaning "hemp" is mentioned.

At radical 82: *Maou* (p. 432-33, hair of brute animals), *maoutow* [*maodou, edamame*] does not appear.

At radical 85 ("water"): *Tsëang* is defined (p. 482) as: "A thick fluid water of a certain consistence, water in rice has been steeped..." Note 1. This character (pinyin *jiang*) can also mean "milk." *Doujiang* ("bean + milk") means soymilk.

In volume II (1843): At radical 151 (p. 1072), *tow,* meaning "pulse" or "bean" we find: *Ta tow* is large beans [soybeans], and *seaou tow* is small beans [azuki]. But *tow fu* [tofu, doufu] does not appear. *Shé* (p. 1072, four strokes) means "Pickled pulse; any thing pickled in brine" [today's "fermented black soybeans"].

Note 2. This is the earliest English-language document seen (July 2009) that uses the term "pickled pulse" to refer to fermented black soybeans.

Wan (p. 1073, five strokes) means "A bean, read yuh, soy." *Tsae* (p. 1073, six strokes) means "Pickled pulse; soy." *K'he* (p. 1073, eight strokes) means "Bean stalks." *Han* (p. 1074, ten strokes) means "Beans in a cake."

At radical 164: *Tsëang* (p. 1197, eleven strokes) means "Pickle, brine; the brine in which meat is salted. *Shé tsëang* means "a soy made of pulse."

At radical 201: *Hwang* (p. 1457) means "Yellow." But *Hwang tow* meaning "soybean" or "yellow soybean" does not appear.

Also discusses: At radical 200: *Ma* (p. 1455) means "Hemp." Walter Henry Medhurst lived 1796-1857. Address: Missionary.

22. Wang Rizhen. 1850? Huya [Lakeside elegance]. China. Passages on soy reprinted in H.T. Huang 2000, p. 319-20, 324-25. Undated. [Chi]

• ***Summary:*** Wade-Giles reference: *Hu Ya,* by Wang Jih-Chên. H.T. Huang (2000, p. 319-20), in the section titled "Products associated with tou fu," notes that by the 19th century many products derived from soymilk had been developed. The most complete discussion of these appears in this book, published in about 1850: Tofu (*doufu*) is prepared by grinding soybeans finely [with water], cooking the milk in a caldron, then coagulating it with gypsum or nigari. Before coagulation, the soymilk is called *doufu jiang* ("tofu + thick liquid").

Note 1. This is the earliest Chinese-language document seen (Aug. 2013) that uses the term *doufu jiang* to refer to soymilk.

The curds are wrapped in a piece of cloth then placed in a wooden box, where excess water is drained off.

The soft product is called watery tofu [*shui-doufu, shuidofu,* which is made like soft Japanese tofu {*momen-goshi, with separation of curds and whey*} and *not* like Japanese kinugoshi, which is made without any separation of curds and whey].

The soft curds (before they are pressed into blocks of tofu) are called *doufu hua* ("tofu flowers") or *doufu nao* ("tofu brain").

Note 2. This is the earliest document seen (April 2013) that mentions soymilk curds, which it calls *doufu hua* or *doufu nao.*

Curds which have been placed in layers between sheets of cloth, then pressed, are known as *qian zhang* ("thousand leaves") or *baiye* ("hundred sheets / leaves").

Note 3. This is the earliest document seen (April 2013) that mentions pressed tofu sheets, or the names *qian zhang* or *baiye.*

When soymilk is heated, a film forms on the surface. When it is lifted off, it is called *doufu i* ("tofu robes") or *doufu pi* ("tofu skin") as noted in the *Bencao Gangmu* (The great pharmacopoeia) (+1596).

Note 4. This film is called yuba in English.

When small pieces of tofu are deep fried, giving a golden-brown outer surface surrounding a hollow interior, they are called deep-fried tofu (*you doufu,* literally "oil tofu").

Note 5. This is the earliest document seen (April 2013) that mentions deep-fried tofu or *you doufu.*

When firmly pressed tofu is cut into small pieces then simmered in soy sauce, the product is known as *doufugan.*

Note 6. Soyinfo Center believes that pressed tofu is now called *doufugan* and that pressed tofu simmered in soy sauce is now called *jiangyou doufugan.* When pressed tofu is marinated in soy sauce with "five spices" then baked, it is called five-spice pressed tofu (*wuxiang doufugan*).

The plain pressed tofu is known as *bai doufugan* ("white

tofu dry").

When dried tofu is smoked by burning shavings it becomes smoked tofu (*xun doufu*).

When pressed tofu is soaked in brine and fermented, the product is called *chou doufugan* ("stinky pressed tofu" / "foul-smelling pressed tofu").

Note 7. This is the earliest document seen (Oct. 2011) that clearly mentions a type of *chou doufu* ("stinky tofu") or that mentions *chou doufugan* ("stinky pressed tofu").

Talk with H.T. Huang. 2001. Feb. 20. Tofu was seasoned and flavored long before the first description of the products in this book in about 1850. The use of five-spice was already in common use in China during the Ming dynasty (1368-1644), if not earlier. Five-spice tofu, made by simmering pressed tofu (*doufugan*) in a sauce seasoned with five spice, has the advantage of a longer shelf life than regular tofu.

23. *Punch* (*London*). 1854. A vegetarian eating house. 27:53. Aug. 12.

• ***Summary:*** "The immense success of the late Vegetarian Banquet at Leeds has induced an enterprising enthusiast to start an Eating House conducted entirely without assistance of the Butcher" as well as the Fishmonger and the Poulterer "for not even eggs are tolerated: it being considered cruel to rend the tie which exists between them and hens, if not cocks also:..." Recourse is not even had to the Dairyman; to drink the cow's milk is to rob calves: and if the cow has no calf, to milk her is to weaken her, by creating an artificial drain upon her constitution. Milk quite sufficient for the composition of puddings and pies is obtained from various plants, and the requirements of the tea and breakfast-table are completely met by the milk of the cocoa nut."

"The beverages–for the establishment is teetotal as well as vegetarian–essentially consist of the unfermented juice of the pump [water].

"We have honored this Vegetarian Eating House with a visit, and on inquiring what there was ready, were informed by the waiter that there was 'some very nice grass just up.'" A humorous conversation with the waiter follows. He explains that they have no butter or cheese, because they are animal substances, and they use no animal substances.

Note: It is not clear whether this vegetarian restaurant was real or fictitious. In either case, this is the earliest document seen (Aug. 2005) concerning a vegetarian restaurant.

24. Kemeseye, Johannes de. ed. 1855. A roll of the household expenses of Richard de Swinfield, bishop of Hereford, during part of the years 1289 and 1290. Ed. by the Rev. John Webb... 2 vols. London: Printed for the Camden Society, o.s. 23 x 17 cm. Vol. 59.

• ***Summary:*** The Preface states: "The value of such materials is fully appreciated in this age of investigation. They are as subsidiary to private memoirs and biography as those in their turn are to more expanded history; and they lead us into the halls and dormitories of our ancestors. We see much of the man and his mode of life, if we can ascertain how his pecuniary resources were employed. Details of this kind, recorded by a faithful hand, disclose more graphically than any studied narrative the character of an individual and the manners of his time; and there can be no question as to the authenticity and fidelity of those which are before us."

Note: The printed text of this document cannot be read by an educated modern speaker of English. Thus, the Preface and footnotes are very helpful.

Page 53: Footnote (d): "An unusual quantity of milk, with cheese, almonds, figs, and raisins, and the absence of flesh, exhibit a change in their diet, and indicate the season [Lent] upon which they were entering."

Page 115: Almonds are mentioned twice in the 2nd footnote.

Note: Almond milk is also mentioned in this book. Address: England.

25. Burr, Fearing, Jr. 1865. The field and garden vegetables of America: Containing full descriptions of nearly eleven hundred species and varieties; with directions for propagation, culture, and use. Boston, Massachusetts: J.E. Tilton. xv + 667 p. See p. 499-500. Illust. Index. 20 cm. [25* ref]

• ***Summary:*** Pages 499-500 state: "Japan. *Hov. Mag.* [*The Magazine of Horticulture, Botany, and Rural Affairs.* By C.M. Hovey. Boston [Massachusetts]. Monthly. 1834 to the present time].

"Cajanus bicolor. The Japan Pea is a native of the East Indies, and also of Japan, as implied by the name. The plant makes a strong, erect growth, with numerous spreading branches; the leaves are large, light green and downy beneath; the flowers are small, yellow at the centre,–the upper petal purple; the seed-pods are small and downy, and are produced in profuse abundance,–growing in clusters over the entire plant; the seeds are small, roundish, or pea-form, and of a cream-yellow color when ripe." Note: This is the earliest English-language document seen (Sept. 2004) that uses the term "cream-yellow" to describe the color of soybean seeds.

"Propagation and Culture.–It is raised from seed, which, as the plant requires the entire season for development, should be sown as soon as the ground is warm and settled. Make the drills about 20 inches apart, and drop the seeds ten or twelve inches apart in the drills, covering half or three fourths of an inch deep. The plants will blossom the last of July or beginning of August, and the seeds will be suitable for use in their green state, from the 20th of August until destroyed by frost, the crop being seldom fully perfected in the Northern States.

Use.–The seeds are the only parts of the plants eaten, and these, while young, are tender and delicate. The ripe

seeds if soaked for an hour in moderately hot water, take the form and appearance of the Common White Bean, become quite soft and tender, and have a pleasant, nutty, and oily flavor. The whole plant with the seeds, is also used for feeding stock.

"A variety occurs with green seeds, which is not only considered superior to the Common Yellow-seeded just described, but is two weeks earlier."

Note 1. The plant referred to here is actually the soybean, which Mr. Teschemacher incorrectly identified as the pigeon pea *Cajanus bicolor* in Feb. 1853. Note 2. No reference to the Japan Pea appears in the 1863 edition of this book.

Also discusses: Chufa or earth almond (*Cyperus esculentus*, edible cyperus, nut rush, p. 32. When dried and pulverized, the tubers "are said to impart to water the color and richness of milk"). Note 3. This is the earliest English-language document seen (Sept. 2002) concerning a non-soy, non-dairy milk–made from chufa or earth almonds. Amaranthus (Chinese amaranthus, Chinese spinach, p. 279-80). Quinoa (*Chenopodium quinoa*, p. 292-93. Varieties: white-, black-, or red- seeded, from Mexico or Peru. Goosefoot). Pea-nut (Ground bean, earth nut, pindar nut, ground-nut, *Arachys hypogea*, p. 544-46. Varieties: African, Wilmington {North Carolina}, and Tennessee). Winged pea (*Lotus tetragonolobus*, Red birdsfoot trefoil, p. 547. Pods 3½ inches long, with four longitudinal leafy membranes, or wings; seeds globular, slightly compressed, yellowish-white. *Use*.–"The ripened seeds are sometimes used as a substitute for coffee; and the pods, while young and tender, form an agreeable dish, not unlike string beans"). Bene-plant (Oily grain, *Sesamum* sp., p. 548-49. This medicinal plant {which is "cooling and healing"} may be used for food or oil. Varieties: biformed-leaved, oval-leaved, trifid-leafed {having three parts}). Address: Hingham [Massachusetts].

26. Champion, Paul. 1866. Sur la fabrication du fromage de pois en Chine et au Japon [On the production of tofu in China and Japan]. *Bulletin de la Societe d'Acclimatation* 13:562-65. Oct. Meeting of June 1. [Fre]

• ***Summary:*** "The Chinese and the Japanese eat considerable quantities of a white material rather analogous in its appearance to the French product named *fromage à la pie* (quark), and which they make with a particular type of soybean (*Pois oléagineux*) which is also used for food and from which one can extract a rather expensive and very good quality oil. The production of this cheese [tofu] is simple, but it requires care and rather extensive practice to produce a white product."

The author then gives a detailed 3-page description of how tofu (*fromage de pois*, literally "pea cheese") is made–though he never mentions its name in either Chinese or Japanese.

Note. This is the earliest French-language document seen (April 2013) that uses the term *fromage de pois* to refer to tofu.

It is coagulated with magnesium chloride, and will keep for 1 day in summer and 1 week in winter. It is also often salted and it is mixed with various sauces which allow it to keep for several years. In the process of making tofu, the hot soymilk is poured into a second tub and allowed to cool before the coagulant is added. The foam is removed using a copper scoop. After several minutes, a skin / film (*une peau*) [yuba] forms on the surface of this liquid. It can be lifted off by passing a stick (*baguette*) underneath it and hung up to dry by inserting one end of the stick into one of many holes that have been deliberately created in the wall. This film, by the way, has a rather agreeable taste, and is eaten either fresh or dried; a second film is often formed and is lifted off in the same manner.

Note 1. This is the earliest French-language document seen (Oct. 2012) that mentions yuba, which it calls *une peau*.

After the tofu has been pressed, so that the volume has been reduced by half, it is removed from the forming box, or the tofu (cheese) is sometimes shipped out to a great distance. To transport them, it is sufficient to close the box with planks, nailed with the aid of bamboo pegs. Arriving at the destination, it is cut into small pieces by means of a large metal knife.

Tofu (pea cheese) is generally a grayish white and looks like a jelly. It does not keep for more than a day during the hot months, and to preserve it from rapid deterioration, it is generally mixed with salt or sauces of various types. It can then be kept for several years. A piece of tofu the size of a fist sells for 2 Cash (i.e., 1 centime).

He then (p. 564) describes shops in China selling hot soymilk for breakfast. "Generally, the shops where this cheese (*ce fromage* = tofu) is made are filled with Chinese, who bring cups to get some of the hot liquid (*le liquide chaud*), which is used to make the cheese and which has not yet been coagulated; they drink this beverage (*ce breuvage*), which has an insipid but not disagreeable taste, just like we enjoy coffee with tea. For many of the poor, the morning meal consists of a cup of this liquid, in which they dip various types of deep-fried crullers" (*des espèces de gâteaux frits à l'huile*).

"I will send with this note some samples of soybeans which, according to the analysis that I am in the process of making, contain more than 10% oil, and all the materials employed in this industry as well as some small preserved dried cheeses (*des petits fromages secs conservés*), of which I have spoken above. I have seen this production established on a large scale in many ports of China from the south to Peking, and also in various ports of Japan which I have visited. This cheese, when well prepared, has a very agreeable flavor. Deep-fried it makes a delicious dish. It is widely consumed among the Chinese and would be able to be employed, I believe, to advantage in Europe."

Note 2. This is the earliest document seen (Oct. 2011) worldwide–in any language or in any country–that discusses the use of soymilk as a beverage. We find this quite surprising! Why are there no earlier references to its use as a beverage in Chinese documents? This is also the earliest French-language document seen (Aug. 2013) that mentions soymilk, which it calls *le liquide chaud* and *ce breuvage*.

Note 3. This is the earliest document seen (April 2013) that describes how to make tofu on a commercial scale. Address: France.

• ***Summary:*** Contains a chapter about tofu titled "Fabrication du fromage de pois en Chine et Japon," by Champion and Lhôte (p. 185-89), which is cited separately. Address: Champion: Prof. of Chemistry at the Polytechnic Assoc. Former delegate of the Society for Acclimatization in China and Japan.

28. Champion, Paul; Lhôte, M. trans. 1869. Fabrication du fromage de pois en Chine et au Japon Fabrication du fromage de pois en Chine et au Japon [Production of tofu in China and Japan]. In: P. Champion and S. Julien, eds. 1869. Industries Anciennes et Modernes de l'Empire Chinois... Paris: Eugene Lacroix. xiii + 254 p. See p. 185-89. [Fre]
• ***Summary:*** This chapter gives a detailed description of the production of tofu, but also mentions soymilk and yuba. "Tofu (*Le fromage de pois*, literally "pea cheese") which is regarded in China and Japan as a very important food, looks similar to *fromage à la pie* (a smooth cottage cheese or soft cream cheese; quark). It is made from a particular variety of soybeans (*pois oléagineux*, literally "oil peas"), which are also consumed directly and which can be used, in addition, to make an oil of very good quality and rather high price.

"The production of tofu is simple, but it demands much care. The soybeans are first soaked for about 24 hours, then they are drained in a wicker basket. Next they are ground in a mill, while mixing them with the soak water, which had been set aside. The mill used for this purpose is made of horizontal discs of hard stone. The upper stone is pierced with a conical hole. The apparatus is rotated by means of a connecting rod, connected by joints, that a worker rotates with one hand while the other hand is used to throw the soybeans into the hole of the upper stone with a spoon / scoop (*cuiller*). With each addition of the soybeans, a certain amount of water for grinding is added. The soybeans, ground by the action of the mill, are transformed into a liquid slurry (*bouillie liquide*), which collects between the millstones, falls into a circular channel, and accumulates in a tub. This slurry is poured onto a filter formed of a linen cloth attached to an overhead frame; when the filtration is very slow, the material is mixed. To facilitate this operation, the frame / chassis is suspended from the ceiling at the height of a man.

"The liquid filtrate (*Le liquide filtré*), mixed by hand, is collected in a wooden vat and poured into a cooking pot, where it is cooked slowly. This cooking pot is formed of a deep, wide pan of cast iron, surrounded by a type of wooden tub (frame?); the metallic surface presenting a limited area, permits the person cooking the liquid, without fear, to raise the temperature briskly; this can alter the material. This apparatus is almost always used by the Chinese for cooking organic materials. A second cooking pot is located next to the first one on the same stove, in the form of a parallelepiped (a six-sided polyhedron all of whose faces are parallelograms lying in pairs of parallel planes) and receives the direct action of the fire-box. The liquid which has flowed from the mill starts to be covered with foam at about 100ºC. It is kept boiling for about 10 minutes, then is decanted into the second cooking pot, where it is subjected to a lower cooking temperature, because of the disposition of the stove. The first cooking pot, once empty, is refilled immediately with a new quantity of liquid filtrate; the drained pulp (*la pulpe égouttée*) [okara] on the filter cloth is washed with water, and the liquid which runs out is used to wet the beans which undergo grinding. This wash water carries with it a significant quantity of usable material.

Note 1. This is the earliest French-language document seen (June 2013) that mentions okara, which it calls *la pulpe égouttée*.

"When the liquid (*la liquer*) has been heated for a few moments in the second pot, it is poured into a large tub and allowed to cool. One is careful to agitate it with the aid of one's hand, causing it to rotate. The foam which forms gathers in the middle of the surface and is removed with the aid of a copper scoop. After standing for several minutes, the liquid becomes covered with a thick film

pellicle (*pellicule épaisse*) [yuba], which is removed with a stick (*baguette*) without tearing it. The film is hung up to dry by affixing the stick in the wall. Sometimes a second film is formed; it is treated in the same manner. The material thus solidified at the surface of the liquid is employed in foods. It is eaten either fresh or dried and its flavor is not disagreeable.

Note 2. This is the earliest French-language document seen (Oct. 2012) that uses the term "pellicule épaisse" to refer to yuba.

"The liquid which remains in the vat is destined to produce the tofu (*fromage de pois*). One first adds to it a small quantity of water mixed with plaster (*plâtre*) [calcium sulfate], which has probably been baked in the cooking

stove. Finally one adds a few drops of a concentrated solution from a salt marsh. (According to our analysis, this is nothing but magnesium chloride.) The liquids are mixed slowly to form a homogeneous mass, which soon coagulates and becomes a solid. The plaster is certainly added to coagulate the casein of the soybeans (*pois*). As for the magnesium chloride, it is rather difficult to define the role that it plays; it is used in only a few cities in China.

"Once formed, the tofu curds are poured, while still hot, into a square forming box, 40 cm on a side and 5 cm deep. These boxes, stacked up double, are placed side by side on a long stone table, having gutter drains along the two sides. The boxes on the table are closed at their lower part by a fine-weave linen, through which the water trapped in the cheese (*fromage*) can flow out. When the tofu (*fromage de pois*) is sufficiently drained, it is compressed in the box where it is trapped, by putting on the top a plank laden with weights. When the volume is reduced by half, the box is removed and the cheese it contains is sometimes shipped out to a great distance. To transport them, it is sufficient to close the box with planks, nailed with the aid of bamboo pegs. After arriving at the destination, it is cut into small pieces by means of a metal knife.

"Tofu is generally a grayish white and looks like a jelly. It does not keep more than a day during the hot months, and to preserve it from rapid deterioration, it is generally mixed with salt or sauces of various types [especially soy sauce]. It can then be kept for several years.

"A piece of tofu the size of a fist sells for 2 Cash, i.e., one centime. Sellers of tofu also offer for consumption the hot uncoagulated liquid (*le liquide chaud non coagulé*) [soymilk], of which we have spoken previously. Poor Chinese nourish themselves on this substance, which has a dull flavor but is not disagreeable. The shops where this cheese is sold present a curious aspect at certain times of the day. Chinese workers come in great numbers to buy a portion of liquid cheese (*de fromage liquide*), which they carry away in small cups; others consume the coagulated cheese on the spot.

"For many people of the poorer class, the morning meal consists solely of a cup of soymilk (*une tasse de fromage de pois liquide*) in which they soak some cakes [crullers] that have been deep-fried in oil."

Note 3. This is the earliest French-language document seen (Aug. 2013) that uses the term *fromage de pois liquide* to refer to soymilk.

"The production of tofu ("pea cheese") is executed on a grand scale in most of the ports of China through which we have traveled, from the south to Peking, and in the few towns in Japan that we have been able to visit.

"Tofu is rather agreeable in flavor. It could render a great service to the feeding and nourishment of Europeans if they are able to cultivate the seeds... Tofu, deep-fried like french-fried potatoes, makes a very delicious dish.

"The seeds used to make tofu usually contain 17% of a clear oil, whose flavor is not disagreeable."

"We will add to the above information some analytical results that our colleague, Mr. Lhôte, and we, have obtained on the soybeans (*pois oléagineux*, literally "oil peas") and tofu (*le fromage*)." A table (p. 189) gives: (1) The percentage composition of soybeans (now called *Pois de Chine*, or Chinese Peas) on an as-is basis and on a moisture-free basis: Water 15.07/ -, ash 4.63/5.45, lipids (*matières grasses*) 12.98/15.28, and nitrogen 5.79/6.81.

(2) The percentage composition of tofu (called *Fromage de pois*, or pea cheese) on an as-is basis and on a moisture-free basis: Water 90.37/ -, ash 0.76/7.89, lipids 2.36/24.50, and nitrogen 0.78/8.09.

(3) The percentage composition of yuba (called *Matière coagulée pendant la préparation du fromage*, or "The material coagulated during the preparation of tofu") on an as-is basis and on a moisture-free basis: Water 9.36/ -, ash 4.01/4.42, and nitrogen 9.70/10.71.

From 120 gm of soybeans on obtains 184 gm of tofu.

One full page (frontispiece, facing the title page) contains a specimen of the Chinese text translated by Mr. Stanislas Julien. The characters are written with handsome calligraphy. Address: China & France.

29. Ritter, H. 1874. Tofu, Yuba, Ame [Tofu, yuba, ame]. *Mittheilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* (*Yokohama*) 1(5):3-5. July. [Ger]

• ***Summary:*** The discussion begins with tofu: Tofu (*Das Tofu*), one of the foods that is rather widely enjoyed by Japanese, is made from beans. It can be described most simply as 'bean cheese (*Bohnenkäse*)*;'* the literal translation of the two characters, 'beans rotten,' seems to give us the first glance of its earlier meaning as a cheese–which is a product of fermentation. However, this only appears to be so, since tofu is definitely fresh and unfermented. Perhaps the earlier name signifies that the tofu essentially consists of legumin (*Legumin;* a legume protein), not considered as a portion but as a fermentation product of the beans.

The preparation is very simple. White soybeans (older beans are preferred to newer) are soaked for about 12 hours in cold water or 8 hours in hot water, then ground with water between the stones of a handmill to form a slurry (*Brei*). The slurry is filtered through a silk or very fine-meshed sieve. The larger particles remaining in the sieve are reground in the mill. The amount of water used during grinding is such that from one measure [volume] of beans about 10 measures of slurry are obtained. This slurry is then poured into a kettle, which contains an amount of boiling water equal to about one-third the volume of the slurry; it is simmered over a low / weak fire. It is best, when the kettle is only half full, because the foam will suddenly starts to rise; this rise can be moderated by the addition of some oil. As soon as the contents of the kettle comes to a boil, it is removed from

the fire and the slurry is filtered through a cotton sack [over a vat], then pressed with a lever. The pressed residue in the sack (*Der Pressrueckstand* [okara]) is often cooked again with half the amount of water. Note 1. This is the earliest German-language document seen (June 2013) that mentions okara, which it calls *Der Pressrueckstand.*

"The filtered liquid (*Die filtrirte Fluessigkeit* [soymilk]), which now consists of a solution of legumin, is carefully freed of its foam, and then the precipitation of legumin is brought about using nigari (*shio no nigari, Salzbitter*) as the coagulant. Nigari is the mother-liquor which drips out of [a sack of] sea salt in humid / wet weather, consists mainly of calcium- and magnesium salts. The nigari is added in three steps. First, about ½% of the liquid id added and only on the surface, while stirring slightly, since too much stirring would be disadvantageous. Then a somewhat larger amount is added, and without disturbing the first precipitation, stirred lightly. Finally, after most of it [the curd] has settled, a little more nigari is added, as much for the formation of the final curds and to obtain the right consistency. If you add too little nigari, you won't get any cakes (*Kuchen*) [of tofu], but too much nigari will give you a hard cake; soft tofu is preferred.

The author concludes by noting: "One cannot deny that most of the dishes made from tofu are rather nice, even for the European palate."

Note 2. This is the earliest German-language document seen (April 2013) which contains a description of tofu by a German living in Japan or East Asia.

Note 3. This is the earliest German-language document seen (April 2013) that uses the word *Bohnenkäse* ("bean cheese") to refer to tofu.

Note 4. This is the earliest document seen written by a Westerner (Nov. 2003) that uses the word *Nigari.*

Note 5. This is the earliest German-language document seen (Aug. 2013), that mentions soymilk, which it calls *Die filterte Fluessigkeit.*

Yuba (*das uba*) and *ame* (*das Ame*) are then described briefly. "Yuba is a peculiar preparation made from the legumin of the soybean [Note: *Webster's Third New International Dictionary* (1963) defines legumin (a term derived from the French *légumine*) as "a globulin [a type of protein] found as a characteristic constituent of the seeds of leguminous plants."] This thin yellow or brownish leathery tough film or skin is formed and consists of legumin which has become insoluble through cooking in contact with the air. It is prepared in the manner described above from the legumin solution in the soybean with addition of wood ashes [which raise the pH], cooked in an open kettle. As is the case with all alkaline protein solutions, there forms on the surface an insoluble film, which is then lifted off with a skewer and dried. Yuba is prepared as a food in various ways, but is used mostly as an addition to other foods."

Note 6. This is the earliest German-language document seen (Oct. 2012) that mentions yuba, which it calls *uba.*

Ame (grain syrup or *Midzuame*) is a widely used delicacy and sweet, loved by Japanese children. It consists of glucose (starch sugar) and dextrin that results from the malting of millet (*Hirse*) or rice. The *ame* made from millet is the sweetest, while that made from rice, especially from glutinous rice (*mochi kome*), has the advantage of being whiter." The process of making *ame* is then described in detail.

Dr. Rein adds to these proceedings that tofu is used in place of protein in lacquered or japanned work, in order to produce a more plastic product.

Note 7. This is the earliest document seen that mentions rice syrup (*ame* or *midzuame*) in Japan.

Note 7. The name of this journal varies. This issue was titled *Mittheilungen der Deutschen Gesellschaft für Natur und Voelkerkunde Ostasien's* and also known as the *Transactions of the German Asiatic Society of Japan.* The place of publication is Yokohama. This article actually has no title. Address: PhD, Japan.

30. Imperial Japanese Commission to the International Exhibition at Philadelphia (1876). 1876. Official catalogue of the Japanese section: And descriptive notes on the industry and agriculture of Japan. Philadelphia, Pennsylvania: Published by the Japanese Commission. 130 p. 24 cm.
• ***Summary:*** The Preface (p. 3) begins: "Never until the year 1873, had Japan participated to any great extent in the various European International Exhibitions. Up to that time she had been merely represented by some of the provincial governments, acting independently of the central Government. However, the Government determined to be worthily represented at the Vienna International Exhibition of 1873,..." But Japan was well prepared for the Philadelphia Centennial Exhibition.

Under classes of "Agricultural products" (p. 32, 34): Class 621–Peas, beans, etc. (incl. Soya, adzuki). Class 650–Sea weeds (incl. Vegetable isinglass [agar, kanten]). Class 657–Flour and starch (incl. Kudzu {*Pueraria thunbergiana*}). Class 659–Wines and other kinds of drinks (incl. Sake, Soy {a kind of sauce}).

Page 71 discusses relief painting in lacquer: "The lacquer can even be carved, and, finally, the artisan can incrustate mother-of-pearl shell, ivory, thin metal, or anything he likes into the lacquer. By mixing a sort of paste made of [soy] bean powder, or the white of eggs, with the lacquer, he can thicken it to such an extent as to give it a kind of plasticity, admitting the possibility of making impressions which remain visible after hardening."

In the long chapter titled "Descriptive notes on the industry and agriculture of Japan (p. 37-117) is section on "Agricultural products. Classes 620-21–Cereals, vegetables, etc." (p. 104-06). Beans, generally referring to soy beans, are mentioned many times. "Manures of a mineral nature consist of marls, shells and ashes; those of vegetable origin

of inferior kinds of beans and peas or their residues, of [soy bean] oil-cakes, the residues of sake-brewing,..."

"The excellent kinds of beans and peas, which are made into a kind of cheese [tofu] and a peculiar mixed dish called 'misso' [miso] afford the necessary nitrogenous substances, and to a certain extent form the substitute for meat; the Soyu [shoyu; soy sauce] also belongs to this kind of food, and is frequently mixed with other dishes. With regard to animal food, it is limited almost exclusively to fish, poultry and eggs. But a change has already been effected to a certain extent in the larger towns, where butcheries have been established. An experiment of sheep farming was commenced one or two years ago" (p. 106).

Note: This is the earliest English-language document seen (April 2012) that uses the word "Soyu" (regardless of capitalization) to refer to shoyu or soy sauce.

Under "Class 657, 658–Flour, starch, etc. we read (p. 110-11): "It has been mentioned above that the various kinds of beans constitute a very important element of the national diet. Some of the preparations made of beans and peas are worthy of a short notice. In preparing the 'Tofu,' white beans are soaked in water, ground between two stones, strained through a sieve and afterwards boiled. The contents of the kettle are then filtered through cotton cloth and the residue pressed out. The liquid [soymilk], which may be considered as an alkaline solution of legumine, is precipitated by successive additions of the bitter lye [nigari] which runs off from sea-salt by deliquation, and which is mostly composed of magnesium salts. The precipitate is legumine with a small percentage of legumine-composits [-composites] and a large proportion of water. The 'yuba' is also made by boiling the above-mentioned legumine solution in an open kettle, with a slight addition of ash-lye. The insoluble skins which form upon the surface of the boiling liquid, are taken off and dried. Another kind of preserved food is the 'misso' [miso]. White beans are first boiled, pounded in a mortar to form a paste, then mixed with fermenting rice and salt, whereupon the whole mixture is placed in tubs and left in some cool place; at the end of a month it is ready for use. In mentioning the various preparations made of beans, the 'Soy' or, as the Japanese call it, 'Soyu' [shoyu] should not be omitted; but as it belongs rather to the produce of fermentation, the process will be described under the head of Class 660 [Alcohol and malt liquors].

One page 112 we read: "The soy, or 'soyu,' is made of a small bean, the 'Dolichos soja,' or 'Soya hispida,' to which are mixed wheat, salt and water. The beans are first boiled, and the wheat bruised and steamed; both are then mixed with a small addition of fermenting wheat, placed in flat wooden boxes and kept for several days at a fixed temperature in a special room. At the end of three days, the mass [koji] is all covered with fungi and partly with roots of germination. After having been mixed with a salt-lye, which has been prepared hot and allowed afterwards to cool down, and to depose certain impurities, the mashings are now removed to enormous coops [vats] in which they are kept for several years. Experience has shown that the best soy is produced by mixing equal quantities of mashings of three years and five years' standing. This mixture is transferred into bags of thick cotton-cloth, placed in large boxes, and then submitted to pressure–at first only to a slight pressure, which yields the best soy, and afterwards, however, to a gradually increasing pressure, the separation of the last portions being assisted by an addition of salt water.

"The soy forms a very important condiment for all kinds of dishes, and is consumed in large quantities. In 1874 the production amounted to 1,506,402 hectolitres."

An interesting term in the Index (p. 129) is "Bean-cheese," which refers to tofu (p. 110).

Also: Use of hemp (*asa*) for manufacture of cloth (p. 77, 113). The tea ceremony (p. 108). Sea weeds, incl. cultivated nori and Asakusa nori in Tokio bay, kanten or vegetable isinglass, and fu (that resembles carragheen [carrageenan] moss and is used in the sizing of the warp of silk goods) (p. 109). Kudzu (p. 110). Sake (p. 111). Address: Japan.

31. Paillieux, Auguste. 1880. Le soya, sa composition chimique, ses variétés, sa culture et ses usages [The soybean, its chemical composition, varieties, culture, and uses (Continued–Document part I)]. *Bulletin de la Societe d'Acclimatation* 27:414-49. Sept. 28 cm. [73 ref. Fre]

• ***Summary:*** Introduction (p. 414): At the moment, when according to all appearances, a precious plant is going to take the place in our culture to which it has the right, we consider it our duty to bring back to light the previous efforts of the Society for Acclimatization, to introduce and propagate this plant in France. We will publish, therefore, word for word excerpts of everything soya in the records, reports with articles, letters and notes published in the bulletins of our society during the past 25 years. Our study, it seems to us, cannot be proceeded by an introduction more interesting than this.

From 1855 until the present (1880), the Society has not ceased to receive and distribute soybean seeds, and to make known its cultivation and utilization. It has rewarded successful trials by recognition and publication, and described the production processes of the industries that use soybeans.

We might have tried to refer the reader to past bulletins of the Society, but not everyone has access to these old documents, and besides looking up these articles on soy takes time and care. These motives led to our decision.

The question of soy has been dormant for a long time. But it awakens today with cultural experiments, which have been carried out for seven years in Etampes, using seeds given by the Society, with tests of tofu making which have been conducted in Marseilles; it was finally highlighted with the introduction of the plant in Austria-Hungary, in Bavaria,

in Italy, etc. The question is ripe for a solution.

We do not know, whatever our own hopes may be, what the future holds for soy, but if its cultivation may render one day great service to the country, all the honor would belong to the Society, which, during a quarter century, has not ceased to facilitate and to encourage it.

Written on the 25th anniversary of Society's work with soy. We will divide this work into 6 chapters, starting with excerpts from past bulletins of the Society.

Chapter 1. Linnaeus gave our plant (*Le Soya*) the name *Dolichos Soja* (*Species plantarum,* 1621). Jacquin mentioned it later in his *Icones plantarum rariorum,* p. 143. Moench gave it the name Soja hispida. Moench gave it the name Soja hispidia (*Method plant. hort. bot. et agri Marburgensis,* 1794, p. 153).

Messrs. Bentham and Hooker have not admitted this genre; for them the plant is nothing but a veritable Glycine. This is also the opinion of almost all modern botanists. Miquel affirms that there are two species of *Soja* in Japan, *Prolusio florae Japonicae.* These are: (1) *Glycine hispida* (*Soja hispida,* Moench). (2) Glycine Soja, Sieb. et Zucc.

Note 1. In 1880 Paillieux called it Soja Hispidia.

Chapter 2. The soybean (*Le Soya*) in Japan. Begins with the full story of Englebert Kaempfer [see our chapter on Kaempfer], including translations into French of his writings on miso and shoyu.

There follows a list of Japanese soybean varieties of which they possess the names, 19 names, 22 species (see previous record, table, p. 435), with nomenclature taken from a Japanese work entitled Explications, with figures, of trees and plants newly determined, with the last 3 names taken from a work entitled Japan at the World's Fair of 1878, written in French by a Japanese. (Note that only in 1880 did Paillieux change the name of soybean to Le Soya). Then come descriptions of the characteristics of some of the various beans. "In short we can say that the various types of Mame can be used to make miso, shoyu, or to-fu." The Japanese do not make soybean oil (*huile de Soja*). They use sesame oil for cooking and rapeseed oil to burn in lamps... Soybean straw is given to animals. In Satsuma, in the far south of Japan, horses are given soybeans (*graines de Daizu*) at the end of their rations and it is claimed that this is good nourishment and not as expensive as naked barley. (Confusion about Mame and Daizu). Here is what is said about soybeans in the work entitled *Japan at the World's Fair of 1978:* The Mame serves numerous usages; it can be cooked, ground to a meal or flour, and used to make shoyu, miso, and tofu. The soybean, its pods, its leaves, and its stalks serve to nourish horses and sheep; tests show that this is the best nourishment available... Shoyu, after being filtered, is boiled, then cooled. The lees / dregs are then removed and it is stored in small kegs. The reside of first grade shoyu is used as follows. One takes 5 *to* of this residue and one ads one *to* of water. It is mixed, pressed, and boiled, Then one ads 2 *to* of salt, lets it rest and decants it. This second product is then added in larger or smaller quantities to various qualities of shoyu (p. 440). There follows a detailed practical recipe for making shoyu in France by an unnamed correspondent. He recommends substituting peas for soybeans in France. He uses the word *Daizu* for soybean (1½ page description). Here is the recipe for the sauce I have learned in Japan. He made it in France, using 2 parts by volume of naked barley and 3 parts of soybeans (*Daizu*).

Page 441: In Japan, there is no village, no matter how small, that does not have a shoyu maker. It is also made in private homes. The correspondent says: During my stay in Japan, the price of shoyu varied, according to the quality, from 8 to 12 sen, 40 to 60 centimes per *masu,* that is to say per 1.8 liters. To-fu (*Fromage de Daizu*). Note that they now call soybean Daizu. This is a detailed description of how tofu is made in Japan.

Page 442: Key points. Cold extraction of the slurry. The residue is used as fodder for livestock–from beef to rabbits. Soymilk (which he calls "the albuminous liquid" {*Le liquide albumineux*}) is put on the fire. Coagulate it with nigari (*eau de mere*) which contains magnesium chloride. Put the tofu in a basin of running water. To-fu is usually eaten fresh (he says *To-fu* for Japanese tofu and *Teou-fou* for Chinese). It is very frequently cooked with shoyu and dried fish, sometimes fried, more often grilled. Sometimes during the winter it is frozen, then dried to give it a spongelike consistency. In this state it lasts a long time and is cooked / prepared in various ways. In its fresh state, this vegetal cheese (*fromage végétal*) has a very delicate consistency, but it has a certain taste of raw beans that is not pleasant / agreeable.

Note 2. This is the earliest French-language document seen (April 2013) that mentions dried frozen tofu.

Chapter 3. Le Soya in Cochin China (p. 442). France has long been involved in Indochina as a Colonial power. There follows a report from the Committee on Agriculture and Industry in Cochin China. Siebold et Zuccarini. There is a long excerpt (Corroy 1878) from an article about "The feeding of horses and mules imported into Cochin China" from *Bulletin du Comite Agricole et Industriel de la Cochinchine* 1:449-58. For the year 1877. Series 2. See p. 456-58. It is about using black soybeans (*Glycine Soja*) as feed.

Glycine soja is cultivated in India up to the Himalayas and down to Ceylon, in Philippines, Java, etc. The seeds, boiled or lightly roasted are agreeable to the taste and to the stomach. Soy sauce is used to stimulate the appetite. The people also make a white pâté resembling coagulated milk, called Teu hu or Tau hu by the Chinese, which is for them a food more widely used than any other and which, though bland by itself, when served with seasonings and condiments, is a pleasant and healthy dish.

Chapter 4. Le Soya in China (p. 446). The generic name of the soybean is Yeou-Teou. Yellow soybeans are huang-tou.

He-tou is black soybeans. Certain varieties are selected for each of the various food uses; not just any varieties are used. Soybeans are used to make fermented spirits and artificial wines called Teou-che.

Soy oil (p. 448). This oil is very widely used. It is of the first grade among the 15 or 20 oils possessed by the Chinese. Europeans find that it has a disagreeable aftertaste of raw beans. Except for this, it is of excellent quality. It was written in the introduction that M. Fremy analyzed the seeds / grains of Soya and that they contained 18% oil. Three samples analyzed by the German chemist Senff contained an average of 18.71% lipids. The analysis of Mr. Pellet of 3 samples of yellow Soya from China, Hungary, and Etampes, that we furnished him, gave about the same result.

Tofu (*Le fromage de Soya*, p. 449): Only the Tartars, scattered throughout the Empire, have continued to use milk. The Chinese do not use it. For them the soya takes its place. From the soybean they extract and filter a milk, a true milk (*lait*) usable like the milk of the cow, goat, or ewe (female sheep).

We are reporting in the chapter entitled Soya in France what type of tests we have done personally and those which have been done by the Society of Horticulture of Marseille. We have but to mention here the immense consumption of soymilk (*lait de Soya*) in China, as such or in form of cheese [tofu]. The Introduction contains reports on tofu by Baron Montgaudry and M. Champion, so there is no need for us to say any more about tofu here. Continued. Address: France.

32. Roman, E. 1881. Correspondance: Sur le Soja [Correspondence: On the soybean]. *Nature* (*La*) (*Paris*) 10(425):115. July 25. Letter. [Fre]

• ***Summary:*** "The soybean (Le Soja or Soya), of which you have spoken in previous issues of *La Nature*, is a very interesting plant and destined to play a major role in our agriculture, but it is not new, and its introduction [to Europe?] should not be attributed to Italy [but rather to France]. The [Natural History] Museum was already in possession of its seeds in 1779, but at that time it was nothing but a curiosity. It has been cultivated there up to 1880 inclusive.

"It is now grown not only in Italy but also in Austria-Hungary, where its cultivation seems to have undergone a major development, and in France at various points, especially at Etampes and at Montpellier. Likewise, I had some planted at Orange [capital of Vaucluse in southeast France] this year.

"This plant is probably destined to play as important a role in the future as the potato. Its qualities, which have already been confirmed in France by many experimenters, leave no room for doubt. *La Revue Horticole* has already published several articles on soya; and Mr. Paillieux has written a brochure on this subject (published by la *Maison rustique*).

"Although it seems incredible, soya a hardy plant in France, especially from the latitude of Paris southward, grows in any soil, even the driest, and can provide us with the following: 1. An excellent forage, that is good for fattening cattle. 2. Seeds similar in shape to small haricot beans, but containing 37% protein, 20% fat, and only 3% starch.

"None of our French legumes has an equal chemical composition. The nutritional composition of soya is much better than that of haricots and lentils. It comes close, in that respect, to that of cheeses and could possibly replace the famous dry pepper sausage (*saucisson aux pois*).

"Cooked with rain water and certain precaution, those beans can make a nice dish similar to haricots.

"From it, the Chinese make milk (*du lait*), various cheeses (*divers fromages*), oil, a condiment (*Indian Soy* [sauce]), etc., etc.

"In France, people have envisioned roasting the seeds to make imitation coffee.

"I immediately tried it to check the idea and, although I am very choosy when it comes to coffee, I recognized that the flavor and properties of this decoction of soya were quite similar to those of an average quality coffee. It goes without saying that a cup of soy coffee, well prepared, is immensely preferable to what we are served under the name of mocha in 75% of publish establishments.

"Mixed with milk, the decoction of soya is, in my opinion, better than the coffee with the best aroma. For some time now, we have been drinking this soy coffee with milk every morning. The awareness of these properties of soya would be very useful to the poorer classes, for it actually costs 1.20 French francs per kg at Vilmorin, and this price will certainly drop by more than half when soya comes to be extensively cultivated.

"You can see from the above that soya is one of the most valuable plants and that its cultivation merits encouragement in France. It is doubtful that, to start with, we will develop all of the applications mentioned above. But we could–and this is the advice given by those who introduced it–cultivate it first for use as forage. Animals are not sensitive to routine; they accept with pleasure anything savory that one offers them, and have already adopted the soybean. Once the plant is extensively cultivated and well known, we will gradually come to take advantage of all of its qualities."

Note: This is the earliest French-language document seen (Aug. 2013) that uses the word *lait* to refer to soymilk. Address: Ingenieur en chef à Périgueux.

33. Napier, Mrs. Alexander. ed. 1882. The noble boke off cookry ffor a prynce houssolde or eny other estately housshold: reprinted verbatim from a rare ms. in the Holkham collection. London: Elliot Stock. xiii + 136 p. For almond milk see p. 27, 29, 25, 42-43, 47, 75-76, 86-87, 109. 23 cm.

• ***Summary:*** Contains a brief glossary of "obsolete words" at the end. Discusses almond milk and gives recipes for preparing it. This recipe was found in a rare manuscript (written ca. 1467) in the Holkham collection in England.

Page 27: "To mak comyne [cummin]: To mak comyne set almond mylk on the fyer then tak amydon and stepe it and drawe it and put ther to pouder of comyne and boile it and stirr it well put ther to sugur or hony and colour it with saffron and salt it and let it be rynyinge, and ye will have it standing tak raw yolks of eggs well betene and put it in the pot at the setting downe then leshe it in dyshes and cast on a drige mad with hard yolks of eggs sugur mynced ginger clowes maces and serue it."

Page 29: "Charlet forced:... then tak the mylk of almondes or cow creme and sett it on the fyere put ther to sugur and colour it depe with saffrone then leshe out the crud and couche it in dishes and pour out the ceripe [syrup] and cast on sugur and canelle [a kind of spice] and serve it."

Page 35: "To mak bland sorre: To mak bland sorre tak the mylk of almondes blanched mad with capon brothe then tak the braun of a capon and bet it in a mortair and mele the fishe and the mylk to gedur [together] in the mortair with the pestelle and thik it with flour of rise and boile it put ther to sugur or hony and mak it stondinge then lesk it in dyshes and diaper it with turnsole and serue it."

Pages 42-43: "Creme of Almonds: To mak creme of almonds tak blanched almondes and grind them up and temper them up akurd thik mylk with faire water drawe it into the pot and sett it on the fyere and stirre it welle when it begynnethe to rise and ye have to myche put ther to a dishefulle of venygar. if ther be alitille putt ther in the lesse hille the pot and let it stand awhile then tak a clene cloth and hold it abrod betweene iiij men strait cast the creme there in and rube it undirnethe the clothe with a ladille toward and froward with the egge of the ladille to draw out the watter then gadur it to gedur unto the myddle of the clothe then bind the corners to gedur and hong it upon a pyne and let the water run out then put it in a bolle and temper it up withe wyne and bruse it with a saucer as soft as ye wille and serue it."

Also: "To make hagges of Almayne" (p. 43-44). "To make hattes in lent" (p. 47-48). "Soupes in dose" ("grinde blanched almondes," p. 75-76).

"To mak hoot milk of almondes" (hot milk, p. 76. "To mak hot mylk of almonds tak blanched almonds and grind them and draw them with faire water and sugur or Hony clarified then salt it and boile it and serue it furthe hoot and toisted [toasted] bred ther in"). "Cold mylk of almondes" (p. 76. "To mak cold mylk of almondes put fair water in a pot with sugur or hony clarified so that it be douce [sweet] then salt it and set it on the fyere and when it is at boilling scom it and let it boile awhile then tak it from the fyere and let it kele then blanche youre almondes and grind them and temper them with the same water in to a good thik mylk and put it to wyne that it may haue a good flavour ther of and serue it then cut bred and toist it and baist it and toist it again that it be hard and serue them in one disshe and the mylk in an other disshe").

"To mak furmente with porpas in" (p. 86-87). "Cawdell ferry" (p. 109). Address: England.

34. *Wanganui Chronicle* (*Manawatu-Wanganui, New Zealand*). 1883. Local and general: A new bean. Oct. 30. p. 2.

• ***Summary:*** "Mr. James Laird has introduced into this district [Wanagui / Whanagui, on the southwest coast of the North Island of New Zealand] a very prolific and nutritious bean called the Soja. This cereal, which is an important addition for vegetable garden and farm purposes, was (so far as Europe is concerned) originally developed in Hungary [through the work of Friedrich Haberlandt in Vienna, Austria-Hungary], whence it extended to general consumption in many parts of Italy and France, in which countries it is supposed that the Soja will probably play as important a part in the future as the potato. The seeds take the form of small kidney beans, but their nutritive properties are far greater than the beans and lentils usually employed for food. Besides the ordinary soup and other dinner table purposes, the beans are in France roasted like coffee, and the Soja, mixed with milk, becomes a fragrant and appetising decoction [soymilk?].

Although the Soja has scarcely ever been heard of in New Zealand, it has for centuries fed the millions of Eastern Asia, and has become the favorite food of Southern Europe [sic]. In this colony [New Zealand] the plant grows like a shrub, and reaches a height of three feet, the pods never dropping their beans on the ground. No other known leguminous plant bears beans of such tasteful, healthy and nutritious qualities, or contributes such a proportion of straw adapted for fattening food for cattle.

"Analysis discovers in the Soja bean 34½ per cent. of albuminous matter and 18½ per cent. of fat. Horse beans show only 25 per cent. of the one and 1½ per cent. of the other, and maize only 10½ and 4½ per cent. respectively.

"As an alternative crop, Soja beans will prove a blessing and a restorative to the soil anywhere. We apprehend that when the merits of this bean become known in the Wanganui district, Mr. James Laird will have many demands for seed."

Note 1. Edited portions of two articles, previously published in other New Zealand newspapers in 1882 (Jan. 21 and April 18) can be found in the text above, together with some new and important material.

Note 2. This is the earliest document seen (March 2010) concerning the cultivation of soybeans in New Zealand or in Oceania. This document contains the earliest date seen for the cultivation of soybeans in New Zealand (Oct. 1883), and the earliest clear date seen for the cultivation of soybeans in Oceania (Oct. 1883). The source of these soybeans was Mr.

James Laird.

But who was Mr. Laird? How did he learn about soybeans? And where and from whom did he did he get his soybeans?

35. *Cosmos: Revue des Sciences et de leurs Applications.* 1885. Noms lait de soja [Names of soymilk]. Page 408. [Fre] • ***Summary:*** In this article the first section, titled *Lait factice,* states that this is a fake / pseudo milk that can be used like cow's milk (*un lait factice utilisable comme celui de la vache,...*).

The beans, by far the richest in legumin among the many plants in the leguminous (legume) family, hold in reality a solid milk. Based on that fact, they take the beans and soak them in water, then crush them, then pass them through a sieve after having diluted them in water to make a fake or pseudo milk that can be used like the milks of the cow, the goat or the sheep. They mostly use it in that stage, or they prepare, through coagulation of this vegetable casein, a cheese similar to our quark, that they call in China Teou-fou and in Japan To-fu, and that they consume in great quantity, be it fresh or dried, raw or cooked.

This cheese, when it is well done, is rather pleasant to the taste and it makes for a very delicate dish when it is fried in grease as it is done with potatoes. Similarly, by grinding the beans with an equal amount of wheat, barley or rye, and letting them ferment for a certain period of time, after having diluted them with water, they prepare a condiment sauce [soy sauce].

This condiment sauce is very much appreciated with roasted meats or fish; added to beef or beef bouillon, it gives them.... (the rest of the phrase is missing).

Besides this culinary use, soja is also used in these countries as a forage plant.

Note 1. This is the earliest French-language document seen (Aug. 2013) that contains the term *lait factice,* used to refer to soymilk.

Note 2. Hervé Berbille (of France), who discovered this article, writes: If *factice* and *artificiel* are both translated in English as "artificial", in French, "factice" and "artificiel" are not exact synonyms. *Factice* rather evokes a "fake" cow's milk, whereas "artificiel" evokes "not natural" (as opposed to cow's milk arbitrarily chosen as a reference). However, in practice, these two names refer both to soymilk.

This article is also important because soymilk is described as a fully fledged food, not only as a precursor of tofu.

Finally, the following article contains the key elements of the *Cosmos* article: Hervier, P. 1910. "Le pois oléagineux de la Chine: Soja hispida." *Jardin* (*Le*). 24:233-36. Aug. 5. See p. 235, left column, 70% of the way down.

36. Gordon Cumming, C.F. (Constance Frederica). 1886. Wanderings in China. 2 vols. New edition. Edinburgh and London: William Blackwood and Sons. Illust. Index. 21 cm. • ***Summary:*** The author is a Protestant Christian; she praises Christian mission work in China and sees all Chinese (except Christian converts) as heathens and idolaters. She traveled in Hong-Kong and China in late 1878 and 1879. Each entry is dated, like a journal.

Volume I: In describing a Chinese feast on the island of Nantai, she notes that beef is prohibited by Confucianism on utilitarian grounds; however sea-weed and "almonds with bean curd" are among the many delicacies served. All manner of delicate little dishes "were scattered about the table for the guests to play with between courses, and each was provided with a tiny silver plate for mustard, soy [sauce], or any other condiment" (p. 220-23). A footnote on delicacies of old states that in the late 1500s at Launceston, England, porpoise was served with furmenty [frumenty; a dish of wheat boiled in milk and usually sweetened and spiced], almond-milk, sugar, and saffron (p. 222).

She describes a vegetarian meal at Kushan Monastery, noting that butter is considered as unfit for food, and milk is fit only when curdled and sweetened (p. 260).

Volume II: In a delicious vegetarian dinner at the Tien-Dong Buddhist Monastery, "pea-nuts" were served on the first tray. "Of course the whole was entirely vegetable [vegetarian], though some portions of corn-husk and other things tasted so very much like meat and preserved fish that we found it difficult to persuade ourselves that such was not the case" (p. 39). From vendors with portable street ovens in Peking: "Bean pudding in a crust of mashed potatoes, fried in oil, seemed to be in great demand..." (p. 281).

"But the favorite food here [Peking] is a cake made of bean curd. Common small beans are ground between two granite millstones like a hand quern. As the upper stone is turned, water is poured on, and a creamy white fluid oozes out, which flows into a tub, and is boiled with salt. The froth is skimmed off, and the curd is tied up in a cloth, put under pressure, and so formed into square cakes [tofu], which really taste rather like our own curds. They are generally, however, fried in oil, or else eaten with soy, which is a sauce obtained from the same bean when fermented." (p. 282).

"Every now and again among the curious vehicles dragged noisily along the street, came a gigantic wheelbarrow, laden with wicker oil jars. It seems that the manufacture of oil from the yellow and white pulse bean is one of the great industries of Northern China, and thousands of junks are annually employed in transporting the oil and bean-cake to the Southern Provinces. The beans are first crushed in oilmills, whose revolving stone wheels are turned by bullocks. Some mills are so large as to employ about sixty bullocks. The beans are then steamed, and when very hot are (by a somewhat elaborate process) subjected to great pressure whereby the oil is expressed. It is filtered through a cloth, and is then generally poured into large jar-shaped baskets, each made to contain a hundred pounds of oil. They

are lined with tough paper, which is glued to the wicker-work by a strong varnish, and is quite oil-proof. The narrow mouth of the jar is then covered with the same varnish paper, and no further packing is required even for a sea voyage. The oil, which is clear and pale, is used both for lamps and for cooking purposes.

"The bean-cake which remains after the oil has been expressed, is used as manure for the land, but is never given to cattle, who, however, are largely fed on the bean itself. As the aforesaid very popular pulse curd and soy sauce are both prepared from the same bean, it must be allowed that it holds an important place among the vegetable products of the land" (p. 283).

Miss Constance Frederica Gordon Cumming, a woman, lived 1837-1924. A portrait photo of the author appears as the frontispiece of each volume. Address: Author and world traveler.

37. Lecerf, Ch. 1888. Sur la valeur alimentaire du Soya hispida [On the nutritional value of the soybean]. *Bulletin de la Societe de Medecine Pratique de Paris* p. 442-49. Meeting of April 26. Presided over by M. Laburthe. [Fre]

• ***Summary:*** Because of the difficulty many people have in tolerating gluten bread, we are anxious to find another food free from sugar and amylaceous materials for diabetics. I thought it would be interesting to do some trials on the use of the seeds of a bean used often in China, Japan, and Malaysia.

I had the occasion to study this bean under the direction of my master, Mr. Muntz, when I was at his laboratory at the Agronomic Institute (*l'Institut agronomique*). I wish to speak of soybeans (*Soya*).

In 1855, Mr. de Montigny, struck by the considerable nutritional value of soybeans, imported some to France, and submitted them to the Society of Acclimatization (*la Société d'acclimatation*), hoping that our farmers would make the best of this legume that is the foundation of the food of the poor classes of China and Japan. In these countries, the soybean equals the potato in our countryside, in consumption. We shall see, in a bit, that the bean of this legume (sub-order *papillonacée* [sic, papilionaceæ]) is richer by far in nutritious elements than the tuber of Parmentier [the potato].

Since this attempt [by Mr. Montigny in 1855], many agronomical trials have been conducted, at different places in our territory [France and its colonies], and they have proven that the acclimatization of this plant, in France, is possible. They have also permitted us to hope that the climate of our regions is analogous to that of the Chinese and Japanese provinces where the soybean (*le Soya*) is cultivated on a large scale. Unfortunately, these trials had the goal of feeding animals rather than the introduction of this bean into the human diet.

However, eight years ago, Count Attems, who was busy with the cultivation of soybeans in Austria, wrote: "We fool ourselves when we think that soybeans are only an advantageous pasturage, or when we believe that they constitute a delicate dish only for the table of the rich. Soybeans have also been discovered for the large class of less idle consumers, for the country folk and the workers; and although it is a plant of ancient Asia, future generations will make a great case for them and without a doubt will call them "Haberlandt's bean" (*Haricot de Haberlandt*) in recognition."

Professor Haberlandt, who tested the cultivation of soybeans following the Exposition of 1873, published his results in 1878 and became the popularizer of their cultivation and use in Austria. Here is this author's [Haberlandt's] opinion on the nutritive value of this bean:

"I think that soybeans are a food too concentrated to be prepared alone and that, consequently, it is better to mix them with other foods, especially those containing starch... They can furnish armies with provisions of little volume, and enter with good right, as the best equivalent, in pea sausages."

In France, although many notes relative to the cultivation and use of soybeans have been addressed to the Society of Acclimatization, I believe that the first, if not the only monograph that was made of it, is that of Mr. Paillieux. This work was published in 1881; I have borrowed from him numerous times. As for me, it was in 1883 at the Agronomical Institute that I came to know soybeans, following the analyses and experience of Mr. Muntz, and of my dear friend, the late Levallois, from whom the Academy of Sciences received last April 3rd a posthumous communication on the composition of the beans that he harvested at the agronomic station in Nice, of which he was the director.

The name *Dolichos soya* was given by Linnaeus to this Chinese bean that Moench later named *Soya hispida.*

In Japan, they call it *Daïzu Mame,* that is, food seed *par excellence.* In China, it is known under the name *Yéou-téou;* its cultivation there is less important than in Japan, although it enters largely into the food of the working class and is used, as in Japan, for the commercial / industrial preparation of a variety foods.

The soybean is also cultivated and consumed in India, the Himalayas, Ceylon, Tonkin, Cochin China, and the Dutch possessions in Malaysia. In these different lands, it is eaten in its natural state (*en nature*), and used to make many food products, on the one hand the daily food of the poor, on the other condiments sought after by the rich.

Because of the high content of fatty materials in soybeans (17-18%), its flour emulsifies with water, giving with oil a certain quantity of *légumine* [a protein found in soybeans]. The mixture, passed through a cloth, yields, as a filtered liquid, a true milk (*vrai lait*), used like that of cows, goats, or sheep. This is the milk (*le lait*) of the Chinese.

This milk is used to prepare a cheese (named *Téou-fou*

in China, *Tou-fou* in Japan), that resembles a white cheese known, in France, under the name of *fromage à la pie* (quark). The lightly heated milk is coagulated when it is warm with the help of a few spoonfuls of liquid nigari / pure sea water (*d'eaux mères de sel marin*). The curds (*caillé*) thus obtained are allowed to drain, then submitted to the action of flowing water. Note 1. The drained curds are first pressed to make tofu, then cut into cakes, which a placed into a container of cold, circulating water.

According to Mr. Champion, in China a piece of tofu (*fromage de pois*) as big as a fist sells for a cent (*un centime*). For many people of the working class, it constitutes the morning meal, either in a liquid state [as soymilk], or coagulated and fresh [as curds], or in a dried state [probably as pressed or firm tofu, or possibly as yuba] and fried in oil extracted from soybeans.

According to the analyses of Mr. Fremy, the soybean contains 18% of this oil, which is in the first rank among the 15-20 types of oils that the Chinese possess. It is of excellent quality and for Europeans, has the sole drawback of retaining the aftertaste of the raw bean.

In Canton [China], soybeans figure in the composition of a solid ferment, *Kiu-tsée*, that the Chinese use to make an artificial wine and their brandy (*eau-de-vie*).

Note 2. This is the earliest document seen (Oct. 2012) that contains the term *Kiu-tsée* (written with an acute accent), which it uses to refer to a solid Cantonese wine ferment.

Continued.

38. Petit, Léon. 1888. L'huile de soya. Son emploi en médecine comme purgatif à petite dose [Soy oil. Its use in medicine in small doses as a purgative]. *Bulletin de la Societe de Medecine Pratique de Paris.* p. 449-52. Meeting of April 26. Presided over by M. Laburthe. [Fre]

• ***Summary:*** Kaempfer first introduced soybean seeds into Europe from Japan, where they are used to make *miso* and *shoyu* (a black and limpid liquid). These two are indispensable condiments in the Japanese diet. They also make a vegetable cheese, tofu, which is usually eaten fresh, and of which the people are very fond.

In Cochin China, soya occupies a major place in the culinary art. The Chinese do not consume milk; instead, they crush the soybean and obtain from it a liquid, rich in casein and oils, which they use like we use the milk from cows' goats, or sheep. From it, they also make white cheeses, red cheeses [fermented tofu], and a sauce, *Tsiang-Yéou* (*jiangyou* or soy sauce), which are greatly appreciated. For my part, I have had the occasion to taste this condiment several times and I admit that I do not share, in this regard, the enthusiasm of the Chinese. Much more, *soya* enters in the preparation of a ferment used for making spirits and wines.

Nothing could be easier than obtaining soybeans; in France, they germinate as easily as haricots. They contain 30-35% protein and make excellent forage.

The soybean has been tested as a forage plant, either alone or mixed with hay, oats, barley, sugar beets, etc. Mr. Paillieux, a distinguished agriculturalist, even conducted various trials in using the soybean for human food.

He cooked the seeds, like one cooks haricot beans, after they had been soaked in distilled water. He also roasted soybean seeds to make a sort of coffee. He successfully reproduced the various Japanese and Chinese food preparations. He even tried to make a flour by grinding the beans, but this flour degenerated [rancidified] because of the large quantity of oil and fat that it contains.

It is possible that if this oil were extracted, the soybean oilcake (*le tourteau de Soya*) could be ground / reduced into flour which would contain more than 40% nitrogenous materials [protein] and would have no bad [after]taste. But unfortunately, this flour would have a rather high net cost, because of the manipulations that its production would necessitate, unless a use for soybean oil, which is the object of an enormous traffic in China, is found. This very limpid oil, which has a beautiful yellow color like olive oil, leaves a little acrid taste in the mouth which is not disagreeable. It possesses very obvious drastic qualities. I had a liter at my disposition, and I observed that with a minimum dose of 10 gm, you obtain a very energetic purging [like diarrhea], without any type of abdominal pain / colic (*colique*). I hope, before long, to receive a certain quantity of soybean oil that I shall place at the disposition of those of our colleagues who would like to test it as a purgative.

Note: The writer is the only person ever to ascribe a "purging" or "purgative" property to soy oil.

There follows a question and answer session. Mr. Terrier asks: Can Mr. Lecerf provide us with some information about the use of this oil in China and Japan? Mr. Petit responds: I believe that the Chinese and Japanese use this oil only for therapeutic purposes. Soy sauce (*La liqueur de Soya*) is widely employed in England as a condiment. Mr. Lecerf adds: I know nothing about how the Chinese and Japanese use soy oil as a medical substance; but, as I said, this oil is of the highest rank among the oils consumed throughout China. I would say to Mr. Petit that the *India Soy,* which the English consume, is a product which contains only a small proportion of soybeans; it is made with considerable quantities of barley and rice [sic], and it comes from China. However *Shoyu,* which I present to you, is originally from Edo [Tokyo, Japan]. Like that from Batavia [Jakarta] (Ket-Jap [ketjap, kecap]), it is made with from equal parts wheat and soybeans (*Soya*).

Mr. Gillet de Grandmont asks: Very precise and extensive information on the cultivation of soybeans can be found in the *Annals* [*Bulletin*] *of the Society for Acclimatization.* This bean, which I have tried to use for food, does not soften easily upon cooking; it always retains a very disagreeable, acrid taste. I could hardly stand it, except consumed in the form of a salad after cooking.

Mr. Lecerf replies: In the fresh state [as green vegetable soybeans], soybeans are not hard and their taste is even agreeable. In the dry state, it is easy to render them less tough, by adding a small quantity of sodium bicarbonate [baking soda] to their cooking water, and by taking care to soak them in water 24 hours in advance. Address: M.D., 2 Rue Casmir-Delavigne, Paris.

39. Egasse, M. 1888. Le soja et ses applications économiques et thérapeutiques: Matière médicale et therapeutique [Soja and its economic and therapeutic applications: Medical and therapeutic subject-matter]. *Bulletin General de Therapeutique Medicale, Chirurgicale, Obstetricale et Pharmaceutique* 115:433-48. Nov. 30. [28 ref. Fre]
• ***Summary:*** This is a review of the literature, especially the use of soy in diabetic diets. The author was one of the first Westerners to suggest the therapeutic use of soybeans in diabetic diets. Illustrations show: (1) A soy bean plant (from Vilmorin 1883, p. 434). (2) Two views of a soy bean and a cross section of soy bean seed (both from Blondel, p. 435).

Discusses (with 11 tables) the work with soybeans of Haberlandt in Austria-Hungary, Steuff [Steuf] in Germany, Schroeder (a chemist) in Napagedl [in Mähren / Moravia, a region in today's central Czech Republic], Capan [sic, Caplan] in Vienna, Pellet in France, P. Muntz, A. Levallois, Stingl and Morawski, E. Kaempfer, Eug. Simon, Champion, L'hôte and Champion, Mr. Lecerf, Mr. Dujardin-Beaumetz and Mr. Bourdin at Reims (soy bread), and Mr. Lailleux in Algeria.

Blondel (1888) reports the absence of starch in all parts of the soybean seed (p. 435).

"Soybeans are used above all to prepare foods: in Japan, miso and shoyu (*le sooju*), in China an imitation of milk (*une imitation du lait* [soymilk]) and a cheese (*un fromage* [tofu]) greatly appreciated by the common people" (p. 441).

"Throughout China, soybeans (*les graines du soja*) are also used to prepare a milklike / lacteal emulsion (*une émulsion leiteuse*) which replaces milk and which is obtained by crushing the seeds, soaking them in water, and simply passing the liquid through a fine sieve. The [soy] milk, this liquor (*liqueur*), only looks like [dairy] milk, but since [dairy] milk is extremely rare, this liquor supplements the milk [i.e., soymilk supplements dairy milk] from the alimentary point of view" (p. 443). Note: This is the earliest French-language document seen (Aug. 2013) that uses the term *une imitation du lait* or *une émulsion leiteuse* to refer to soymilk.

"The applications of soybean seeds for the feeding of diabetics is not numerous. Yet we know, via an oral communication from Mr. Lailleux, former intern at the hospital in Algiers, that a certain number of diabetic Arabs under treatment at the hospital of Dey, in Algiers, have seen, under the influence of a dietary regimen based on soybean pap, that not only did the content of sugar in their urine diminish by a considerable proportion, but also the condition of their sores was improved, a condition which like all of its type had resisted other treatments employed. If this fact can be verified again, either with soy pap or soy bread, the therapy would have found in soybeans an aid of great utility in the ordinary treatment of diabetes mellitus, which is so difficult for most patients to stand, especially because they must abstain from starches for which they generally show such a strong appetite" (p. 447). Address: France.

Two fifteenth-century cookery-books. Harleian MS.279 (ab. 1430) & Harl. MS.4016 (ab. 1450) with extracts from Ashmole MS.1439, Laud MS.553 & Douce MS.55, edited by Thomas Austin. [4 ref]
• ***Summary:*** On the tile page below the title we read: "Published for The Early English Text Society by the Oxford University Press." Contents: Forewords. Collation with Ashmole MS., and errata. Harleian MS. 279 (about 1430 A.D.). Harleian MS. 4016 (ab. 1450 A.D.). Ashmole MS. 1439 (Sauces). Laud MS. 553 (Bodleian Library). Recipes from Douce MS. 55 (ab. 1450 A.D.) Glossary and Index.

Almond milk is mentioned many times throughout this book, however the words "Almond" and "milk" are spelled in many different ways. The word "almonds" is also spelled "almand" (p. 34, 112 {2 times}, 113 {2 times}, 114 {3 times}),

"almande" (p. 114),

"almaund" (p. 119, 124),

"almaunde" (p. 1, 11 {3 times, all almaunde mylke}, 14 {2 times}, 16 {2 times, 1 almaunde mylke}, 17 {2 times, 1 almaunde mylke}, 14 {2 times, all almaunde mylke}, 19 {2 times, all almaunde mylke}, 21 {2 times, all almaunde mylke}, 22 {almaunde mylke}, 23 {almaunde mylke}, 24 {2 times, all almaunde mylke}, 28 {almaunde mylke}, 29 {2 times, all almaunde mylke}, 30 {3 times, all almaunde mylke}, 31 {2 times, all almaunde mylke}, 33 {almaunde mylke}, 34 {almaunde mylke}, 35 {almaunde mylke}, 38 {2 times, all almaunde mylke}, 43, 46 {almaunde mylke}, 47, 49, 55 {2 times}, 59, 119 {3 times, incl. almaunde mylke}),

"almaundis" (p. 56, 119),

"almayn" (p. 123),

"almayne" (p. 2, 3, 111, 114 {"peys de almayne" = pease and almond milk}, 120, 123, 132, 140 {2 times}),

"almaynne" (p. 2, 19 {2 times}, 44, 120 {2 times}, 123 {2 times}, 132),

"almaundys" (p. 1, 6, 7 {3 times}, 9 13 {2 times}, 15, 16 {3 times}, 18 {3 times}, 19 {4 times}, 20 {2 times}, 21, 22, 23, 24, 25 {2 times}, 26 {2 times}, 27 {2 times}, 28 {3

times}, 29, 30 {2 times}, 31 {2 times}, 32, 33 {2 times}, 34 {2 times}, 36 {3 times}, 37, 38 {3 times}, 41 {2 times}, 42 {2 times}, 43, 46, 48 {3 times}, 49 {2 times}, 55, 58, 60, 62, 119, 124, 126, 127, 148),

"allemaundys" (p. 10),

"almondes" (p. 66 {5 times}, 68, 71 {2 times}, 74, 80, 84 {4 times}, 85 {3 times}, 87, 88, 71 {2 times}, 90 {2 times}, 94 {2 times}, 95 96 {5 times}, 97 100, 105 119 {3 times}, 120 {2 times}, 121, 130, 132),

"almond mylke" (p. 71, 90, 98). "bruet of almaynne" (p. 2, 19 {2 times}, 120. 123),

"creme of almaundys" (p. 7, 60),

"creme of almaundes" (p. 119),

"crem of almonde mylk" (p. 119),

"fride creme of almaundys" (p. 7), "froyde almoundys" (p. 7, 119),

"froydelet dalmandes" (p. 91),

"froyte de almondes" (p. 91, Lent; froyte = froid in French = cold), fried creme de almondes (p. 66, 91),

"milk of almondes" (p. 120),

"mylke of almaunde" (p. 17),

"mylke of almaundys" (p. 6, 13, 15, p. 19 {2 times}, 23, 26, 28, p. 31 {2 times}, 32, p. 33 {2 times}, p. 34 {2 times}, 38, p. 41 {2 times}, 46, 124, 148).

The Foreword begins: "The Ancient Cookeries edited in this volume have been copied from Harleian MSS. 279 and 4016, in the British Museum... This MS. [Manuscript] is divided into three Parts, the first, headed *Kalendare de Potages dyuers*,–containing 153 recipes: the second Part, *Kalendare de Leche Metys*, has 64 recipes, and the third Part, *Dyuerse bake metis*, 41 recipes. This MS., besides the Cookery, contains the Bills of Fare of several Banquets which are noticed more fully below. The date of this MS. is about 1430 or 1440, and has been given a little too early on pages 1 and 5. This has been collated with Ashmole MS. 1439, in the Bodleian, noted as A. in the text. For the second MS. it was originally intended to publish Douce MS. 55, in the Bodleian Library, but this was found imperfect, and was replaced by Harleian MS. 4016. They are similar books, and contain the same recipes in nearly the same words, the latter having a few that are not in the former, and *vice versa*. The Harleian Cookery has 182 Recipes, while the Douce Cookery has 184. The two have been collated, and are of about the same date, ca. 1450. Two Banquets are prefixed to this MS., which are also more fully noticed below. Several of the recipes of the Douce MS. are appended at page 115.

"Some recipes for sauces, taken from Ashmole MS. 1439, are given at page 108. This MS. is about the same date as Harleian MS. 279, and has the same Feasts added, though some of the leaves are missing. These recipes are followed by others taken from two odd leaves in Laud MS. 553, in the Bodleian Library; see page 112. The first English Cookery Book seems to be that of Neckam, in the twelfth century, but the *Forme of Cury* is the oldest practical work" [ca. 1390].

Address: England.

41. Dujardin-Beaumetz, Georges Octave. 1889. L'hygiène alimentaire: Aliments, alimentation, régime alimentaire dans les maladies. Deuxième édition revue, corrigée et augmentée [Food hygiene: Foods, feeding, special diets for illnesses. 2nd ed., revised, corrected, and expanded]. Paris: Octave Doin. viii + 239 p. Series: Conférences de Thérapeutique de l'Hopital Cochin, 1885-1886. Illust. [1 soy ref. Fre]

• ***Summary:*** Dr. Dujardin-Beaumetz, a world-famous physician, lived 1833-1895. He wrote the preface to the first edition on 15 Oct. 1886, and to the second edition in July 1888. This book contains papers presented by the author at 15 conferences. Soya is discussed extensively at the 5th (p. 71-90) and 11th (p. 175-80). Page 72 notes: The principal vegetable proteins (*albuminoïdes végétaux*) have been well studied by Ritthausen (see his book *Die Eiweisskoerper,* 1872, Bonn). They consist of vegetable albumin, vegetable casein, legumin, vegetable gelatin, gluten, and conglutin [*Ils se composent d'albumine végétale, de caséine végétale, de légumine, de gélatine végétale, de glutine et de conglutine.*] As for gluten, its composition is more complex, and Ritthausen affirms that it contains at least four albuminous substances, gluten-casein which is insoluble in alcohol, and three substances which are soluble in alcohol; gluten-fibrine, gliadin [a term first used in about 1828], and mucedin (*mucédine;* a nitrogenous substance, one of the constituents of gluten. Word first used in English in 1879). Note: This is the earliest French-language document seen (Nov. 2003) that contains the word *caséine* or that uses the terms *caséine végétale* or *albumine vegetale* to refer to "vegetable protein."

Page 88 notes: Dr. Bovet has shown that legumin, which is rich in protein and low in starch, can serve as a base for cakes and pâtés to be used in diabetic diets. But certainly the most interesting fact is that which was communicated by Lecerf to the Society for Practical Medicine (Société de médecine pratique; June 1888) concerning soy flour (*farine de soya*).

"Soya (*Le soya*) is a legume very similar to our haricot, which originated in China and Japan, and which is cultivated presently in Austria. From soya one can extract a fatty substance, which the Chinese use as milk and from which they even make a cheese [tofu]. As for the flour, it contains a considerable quantity of protein, more than even beef (36.63% vs. 22.74%), as one can see from the following table... But what is most interesting is its low content of starches and sugars. Lecerf proposed that this flour be used to make a bread for diabetics. Such a bread would contain 45% water, 20.1% protein, 9.35% oil, 2.794% starches and sugars, and 0.863% phosphoric acid. Thus, this bread, which has an agreeable flavor, can be substituted for gluten bread, which contains at least 16-17% starches and sugars.

The chapter on diabetic diets contains a long discussion of bread (p. 181): Bread is an indispensable food. The

introduction of gluten bread in the feeding of diabetics, which we owe to Bouchardat, is one of the most important points in the dietary treatment of this disease. But there are various types of gluten bread, each with a different content of starches and sugars; dry gluten bread, sold in slices, contains the least. This brand, made by Cormier, is widely praised by Bouchardat. Page 185 shows a table stating that fresh gluten bread contains 27.07% sugars and Lancry gluten bread contains 31.15%. Boussingault wrote an article titled *"Analyse comparative du biscuit de gluten et de quelques aliments"* [Comparative analysis of gluten biscuits and of some other foods]. (1876, *Annales de Chimie 5:114-26*).

Concerning soya bread (*pain de soja;* p. 187-88): Soya bread constitutes a major step forward in the feeding of diabetics. As noted above, Lecerf has given its composition; it contains less than 3% starches and sugars compared with at least 16% in gluten breads. It is also rich in protein. Therefore there is real interest in replacing gluten bread and potato bread by soya bread in diabetic diets. Address: Membre de l'Académie de médecine et du Conseil d'hygiène et de salubrité de la Seine médecin de l'hôpital Cochin.

42. Yeo, I. Burney. 1889. Food in health and disease. London, Paris, New York and Melbourne: Cassell & Company, Ltd. x + 583 p. See p. 432-33, 440. Illust. Index. 19 cm. Series: Clinical Manuals for Practitioners and Students of Medicine. Reissued in 1890 in Philadelphia by Lea Brothers & Co.

• ***Summary:*** In Part II, "Food in disease," Chapter 3 is titled "Food in diabetes." "Soya" is mentioned on pages 432-33. "Dujardin-Beaumetz also objects both to gluten bread and to almond cakes; the former he maintains is often found to contain a considerable percentage of starch."

"Quite recently Dujardin-Beaumetz has advocated (Footnote: 'L'Hygiène Alimentaire.' Second edition) the use of 'soya' bread for diabetics, of which he gives the following as the composition:–Soya Bread: Water 45.000. Proteids 20.168. Fats. 9.350. Starch and sugar 2.795. Phosphoric acid 0.863.

Note 3. This is the earliest English-language document seen (Dec. 2011) that contains the term "proteids" (or "proteid") in connection with soybeans.

"This bread, he states, keeps well, and has an agreeable taste, and contains much less sugar-forming material than gluten bread, the best kind of which, he asserts, contains at least 16 per cent. of starch and saccharine substances.

"Lecerf (Footnote: *Journal de Médicine Pratique,* 10 June 1888, p. 923) was one of the first to call attention to the value of the meal of the *Soya hispida* in dietetics. It has a leguminous fruit like the haricot, and is a native of China and Japan, but is now cultivated in Austria. The Chinese extract from soya a fatty substance which they use as milk [soymilk], and even make cheese [tofu] with it. The meal is very rich in nitrogenous substances, more so than animal flesh, and the amount of starchy and saccharine substance is very small."

The section on "Diabetic dietaries" contains "5.–Dujardin-Beaumetz's" (p. 440) which begins: "He adopts with little modification the dietary of Bouchardat. He strongly recommends... *the use of soya bread."*

The author (who lived 1835-1914) mentions gluten on pages 7, 10, 74, 76, 78-83, 184, 186, 193, 194, 428-33, 437, 439-40, 541, and 556.

He seems favor a non-vegetarian diet Chapter 4 (p. 73+), which is titled "Vegetable foods," begins: "We derive from the vegetable kingdom a great variety of foods, many of them of a highly nutritious character, and therefore of great importance to the human race... but as a rule, in vegetable foods the non-nitrogenous constituents are greatly in excess of the nitrogenous ones, and occur chiefly as carbo-hydrates; and, save in the case of certain fruits and seeds, they contain but little fat."

"There is legumin or vegetable casein, abundant in the seeds of the leguminosae, and resembling in all essential particulars the casein of milk" (p. 74). Chapter 12 (p. 341-54), which is titled "The relative advantages of animal and vegetable foods–Vegetarianism (Beneke's diet for carcinoma)," contains a fair and balanced review of the literature on vegetarian and non-vegetarian diets. He states (p. 344-45): "There are few persons in the present day who advocate the practice of limiting the human dietary to substances of exclusively *vegetable* origin. The majority of the so-called 'vegetarians' of modern times adopt no such exclusive diet, but take, together with the more highly nutritive forms of vegetable food, such typical animal foods as eggs, milk, cream, butter, and cheese. They object only to animal flesh. But those who take for their food the egg and the milk prepared by animals from the vegetable substances they feed on, and reject only animal flesh, have no claim to call themselves 'vegetarians.' They feed, as has just been said, on the most typical and concentrated of animal foods. They have a *sentimental* objection to killing animals for food, and they found upon it a scheme of diet which we believe to be utterly impracticable on an extensive scale, and irreconcilable with the existing state of civilised man, not so much on strictly physiological grounds as on general economical considerations. There can be no objection to individuals adopting any kind of diet which they may find answer their needs and minister to their comfort; it is only when they attempt to enforce what they practise on others that they must expect to encounter a rational opposition."

"But there exists also abundance of evidence that a purely vegetable diet is not the most appropriate for the production of either physical or intellectual effort.

"Jules Béclard has recorded in his well-known text-book on Physiology that 'the workmen employed at the forges of Tarn were for a long period fed with vegetable substances. It was then found that all the workmen lost, on an average,

fifteen days' work a year on account of exhaustion or illness. In 1883, Mons. Talabot, deputy of La Haute Vienne, took charge of the forges. Meat was then made an important part of the diet. The health of the men afterwards improved so greatly that they did not lose more, on an average, than three days' labour a year. Animal food produced a gain on each man of twelve days' work a year.'

"It has also been stated that the Italian labourers from Lombardy, with their largely vegetable dietary, performed much less work when engaged in piercing the St. Gothard Tunnel than their Swiss co-labourers with a more richly animalised scale of diet."

The author also mentions the words "vegetarian," "vegetarianism," or "vegetable diet / dietary, / foods / kingdom / origin / substances" on pages vii, x, 32, and 406-408. Address: M.D., F.R.C.P., Prof. of Clinical Therapeutics, King's College, London, and Physician to King's College Hospital [London, England].

43. *Good Health* (*Battle Creek, Michigan*). 1890. Vegetable milk. 25(5):153. May.
• ***Summary:*** An English periodical notes: There are several trees which produce milk, the best known being the *Palo de Vaco* or "cow-tree," of the Cordilleras of the coast of Caracas [Venezuela] in South America. "Humboldt says of this tree, 'Among the many curious phenomena that I beheld during my journey, there was hardly any that struck my imagination so forcibly as did the "cow-tree..." pierce the trunk and a sweet and nourishing milk flows. At sunrise this vegetable source is most abundant; then the blacks and native people hurry from all parts, provided with jugs to catch the milk, which turns thick and yellow on the surface.' M. Boussingault has analysed this vegetable milk, and declared before the Academy of France that it most certainly approaches in its composition to the milk of a cow..."

Note: This is the earliest English-language document seen (April 2010) that contains the term "Vegetable milk." However it does not refer to (or even mention) soymilk.

44. *Lancet.* 1890. Analytical Records: Bread and biscuits made from the soya bean (G. Van Abbott and Son, 6, Duke Street Mansions, Grosvenor Square, W. [London]). 136(3494):342-43. Aug. 16.
• ***Summary:*** "The use of 'soya' bread has recently been advocated for diabetics by no less eminent an authority than Dujardin-Beaumetz. Lecerf, according to Professor Yeo was one of the first to call attention to the value of the meal of *Soya hispida* in dietetics. It has a leguminous fruit like the haricot, and is a native of China and Japan, but is now cultivated in Austria. The Chinese extract from soya a fatty substance which they use as milk [soymilk], and even make cheese [tofu] with it. The meal is very rich in nitrogenous substance, more so than animal flesh, and the amount of starchy and saccharine substance is very small. Our examination of the bread before us confirms this. We find it to contain as much as 25.02 per cent. nitrogenous matter, and as little as 2.72 per cent. starch, and 4 per cent. of mineral matter. In texture it is just like ordinary wholemeal bread, and it possesses quite an agreeable taste. Messrs. Abbott have evidently made a very valuable addition to their list of foods which are intended for the use of the diabetic. The biscuits are not less satisfactory." Address: England.

45. Purdy, Charles W. 1890. Diabetes: its causes, symptoms, and treatment. Philadelphia and London: F.A. Davis. viii + 184 p. See p. 87. Index. Physicians' and students' ready reference series, No. 8. [2 soy ref]
• ***Summary:*** In Section VI, "Treatment of diabetes mellitus," the soya bean is mentioned (p. 87): *Soja*, or Japanese bean, owing to its high nutritive properties and its low percentage of starch, is likely to enter largely into the diabetic diet of the future. It has recently been much cultivated in some parts of Europe, especially in Hungary. Its composition is as follows: Nitrogen, 36.6 per cent.; fatty matter, 17 per cent.; starchy matter, 6.4 per cent.

"A sauce is made from *soja* which bears the name of *miso* and *soju* [shoyu]. A kind of cheese [tofu] is made from it, and very much prized in Japan as a table-luxury. (Footnote: See Egasse 1888, p. 433-38).

"In Europe the soja has already been utilized for food of men and animals, and recently the attempt has been made to make bread of it. This is very difficult because of the large proportion of oil which it contains. This oil is very purgative [sic], and hence it becomes necessary to rid the meal of it in order to render it fit for domestic usages. Lecerf in Paris and Bourdin in Rheims have succeeded in rendering the bread made from this meal very well supported by the stomach.

"This bean, which, as the analysis shows, is more nutritive than meat, serves for nourishment to a great country like Japan, under the forms of sauce, of cheese, of farina, and even of *real* artificial milk" (Footnote: Therapeutic Gazette, March 15, 1890, p. 150).

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "artificial milk" or "real artificial milk" to refer to soymilk.

Gluten is also mentioned several times (p. 84-85): "First in importance ranks the question of bread in the construction of any diabetic diet-list. The withdrawal of this article from the list is usually the most serious deprivation the patient has to encounter. In consequence of this fact, an almost endless number of breads have been placed upon the market, which are *claimed* to be free, or nearly free, from starch, and are hence named diabetic breads. Now, I do not hesitate to say that most breads which have been put upon the market with such claims are 'a snare and a delusion,' and have unquestionably shortened the lives of hundreds of diabetic patients. Most samples of so-called 'diabetic flour,' from which the starch is claimed to have been eliminated,

'or nearly so,' contain from 30 to 70 per cent. of that article... But Dr. Chas. Harrington, of Boston, has rendered us under perpetual obligations to him for fearlessly exposing the most of these deceptions, by publishing a careful analysis of most of them in detail. It may first be noted that his analysis of home-made bread gives the proportion of contained starch as 44.99 per cent. The Graham wafer, made of Graham flour, contains 58.45 per cent. of starch. The gluten flour, of Farwell & Rhines, of Watertown, N.Y., contains 67.17 per cent. of starch... The gluten flour of the New York Health Food Company contains 66.18 per cent. of starch. Bread made of this flour would contain 35 per cent. of starch... The Boston Health Food Company's diabetic flour, No. 1, sold as absolutely non-starchy, contains 62.94 per cent. of starch. Bread made of this flour would contain 30 per cent. of starch." Address: M.D., Queen's Univ. [Kingston, Ontario, Canada].

46. Coupin, Henri. 1892. La soya [The soybean]. *Nature* (*La*) (*Paris*) 20:203-04. Aug. 27. [Fre]

• ***Summary:*** An overview of the soybean (*La Soya*). It is not possible to encourage too much the acclimatization of exotic plants in France. One cannot doubt the worthiness such an interest when a plant, such as the soybean, has found, in its country of origin, such numerous applications.

This plant is used in China and Japan for human food and for animal feed, for making bread, cheese [tofu], for extracting an oil [soy oil], etc. Why would we not do the research necessary to raise such a precious plant in France? Many trials have already been conducted and have succeeded rather well; we will return to that later, but first we must see how the soybean behaves in Japan and China.

The soybean (*Glycine Soya*) belongs to the legume family. A botanical description is given.

In Japan, the soybean is one of the most widely used plants. It is known under the name of either *mame* or *daizu,* and it is widely used to make a sort of paste, named *miso* (*le Miso*). The process for making miso is described. [Note: However koji is not mentioned so it will not work]. It ferments for 1-2 months, and then is ready for food use. It is part of the breakfast of many Japanese.

The second product made from soybeans is a condiment, a liquid named *Shoyu.* It is a sort of dark brown syrup which serves as a sauce to season dishes, especially fish. The manufacture of shoyu is a very important industry in Japan. In the city of Nagasaki alone there are as many as ten factories, and each makes more than 1.2 million kilograms per year of shoyu. A description of how shoyu is made is given using equal quantities of boiled soybeans and roasted wheat, plus salt. 1.8 liters sells for 40-50 centimes.

The third product made from soybeans is a cheese called tofu (*le To-fu* or *fromage de Daizu*). The process for making tofu is described. It can be eaten fresh, but unfortunately it retains the taste of raw beans, which is not very agreeable.

In China the soybean is known as *Yeou-teou,* but ice it is not ordinarily cultivated on a large scale, as it is in Japan. According to Eugene Simon: Each person makes his or her own cheese [tofu]. Very also, often, each one makes his oil, if not at home, then at least at one of his parents' homes or in the neighborhood; it is distributed by the head of the family.

There is a variety of black soybean which constitutes the principle food of animals; horses and mules eat the seed in nature. People use mainly the white soybean (*la Soya blanche*)*:* from it they extract an oil [soy oil], which is the object of an enormous trade and which occupies the top rank among the oils used in China. As in Japan, the Chinese also make tofu. According to Paillieux and Bois, in the entire Chinese empire, only the Tartars use daily milk; the [Han] Chinese do not consume it at all. They use soymilk instead. The soybean is solid milk. Not all legumes contain legumine, as the soybean does. Describes how to make soymilk from soybeans.

Trials for the acclimatization of soybeans in Europe are rather numerous. In 1875, the first ones were conducted by F. Haberlandt and Blaskovics in Austria-Hungary. In France, Buffon received soybean seeds and cultivated them at the Museum [of Natural History]. One of the problems with the soybean is that its seed mature very late. However some varieties mature their seeds earlier than others.

An illustration [non-original] shows a soybean plant. At the bottom of the column on page 1, we read: See No. 425, of 25 July 1881, p. 115 [an article by E. Roman]. Address: Ingenieur en chef à Périgueux.

47. *Avenir de Diego-Suarez* (*Madagascar*). 1893. [Foods made from the soybean]. March 2. [11 ref. Fre]*

• ***Summary:*** Note 1. As of Oct. 2012 we have been unable, after great effort, to obtain a copy of this article; we do not even know the title. However a detailed summary (which we have; which see) appears in *Le Temps* (Paris) of 8 April 1893.

Note 2. Diégo-Suarez (renamed Antsiranana or Antsirane in 1975) is a harbor and town at the northern tip of Madagascar. In 1893 Madagascar was part of the French colonial empire. The place was named for Diego Soares, a Portuguese navigator (brother of the better-known Bartholomew Dias) who visited the bay in 1543.

The estimated population in 1990 was 54,400. A French naval base (maintained since 1901) was handed over to Madagascar in 1975.

48. *Temps* (*Le*) (*Paris*). 1893. On lisait dans *l'Avenir de Diego Suarez* du 2 mars cet avis: [One reads in *l'Avenir de Diego Suarez* of March 2 this notice:]. April 8. p. 2, cols. 2-3. No. 11641. [1 ref. Fre]

• ***Summary:*** The governor hurriedly lets the residents know that he has just received from Mr. de Mahy a box of soya bean seeds (*une boîte de graines du haricot* soya), with which is made a cheese [tofu] that keeps for a very long

time. It improves with age and that is a precious resource for settlers who live far from the urban centers.

This notice appears to have surprised a few of our colleagues. It did not contain, however, the revelation of an unknown food.

Cheese made from soya is called tofu (*to-fu*). Here is the recipe for tofu, which seems to us of interest to reproduce given the efforts being made to acclimatize this legume in Europe. You begin by softening the seeds of this bean in water, then you crush them in a mortar so as to make a milky paste. When this paste is pressed in a piece of linen it separates into two parts: one [okara] stays inside the linen and is used for animal feed. The other, a liquid which passes through the linen, is rich in emulsified fatty matter and in albuminoidal matter (albuminoids). This liquid is heated; coagulation is facilitated by adding nigari (eau mere / mother water, which flows out of sea salt piles). This curd separates and gives the cheese. It is eaten either raw, or cooked with fish, or most often pulverized. During the winter [after being frozen], it is dried. In this state, it keeps for a very long time.

Soya cheese (*Le fromage de soya*) is a very important food in China. Only the Tartars / Mongols have continued to use [cow's] milk. The Chinese do not consume any such milk. In its place they use soya. Its seed is a sort of solid milk. No other legume contains as much legumin (a substance chemically analogous to casein) as the soybean. None other is as rich in fatty acids. All you need to do is to crush the soya seed, dilute it with water, and filter through a sieve to obtain a product with milklike properties that can be used just as you would milk. Soya cheese looks just like quark cheese (*fromage à la pie*).

The soybean (*La soya*) which is cultivated in Japan, in China, in the Indies [Dutch East Indies, today's Indonesia], in Cochin-China [today's South Vietnam], in Tonkin [today's North Vietnam], etc. is used for more than just making tofu. It is used in these countries in a great variety of ways to make human foods and seasonings. Transformed by cooking in water into a gruel / pap (*bouillie*) which is mixed with salt and polished rice, one obtains miso, which is served at lunch [as the seasoning in miso soup] by many Japanese.

Mixed with barley and submitted to fermentation, after adding additional water and being pressed, one obtains a syrupy liquid, called shoyu, a unique sauce used to season almost all Japanese foods (*mets*), and which is employed in such large quantities that the factories of the city of Nagasaki make more than 1,200,000 kilograms of it each year. Finally, an oil is extracted from the soybean which is the object of an important trade and which serves for both human consumption and in industry.

49. *Natuur* (*De*). 1893. Soja [Soya]. 42(20):233-34. May 13. [1 ref. Dut]

• ***Summary:*** This Dutch-language periodical appears inside a German-language periodical titled *Die Natur* (Halle). The author of this article (whose initials "CKN" appear at the end) discusses: The soybean plant, named *Glycine Soya* or *Dolichos Soja* or (in Dutch) *de Sojaboon,* which is widely used for food in Japan (where it is called *Mame* or *Daizu*) and China. Food products made from the soybean in Japan: Miso, shoyu (soy sauce), To-fu [tofu] or *Kaas van Daizu;* a brief description is given of how each is made. Soybeans in China, where it is called "Yeou-teou," and where they make a cheese (*Soja kaas*), oil (*eigen olie*), and milk (*melk*) which resembles cow's milk.

Note. This is the earliest Dutch-language document seen (April 2013) that uses the term *To-fu* or the term *Kaas van Daizu* or the term *Soja kaas* to refer to tofu.

Black soybeans (*zwarte Soja*) are widely used. Proteins in the soybean, including legumine. In Europe, by 1881, the soybean was known in Italy, Austria, Hungary, and France (especially at Etampes and Montpelier); from the seeds, people learned to obtain oil, milk, cheese, an excellent cattle feed, and a vegetable for humans–similar to the French bean but much better (*en een groente voor den mensch, gelijkende op onze spersiebonen, maar veel beter*). Soybeans are used by doctors to treat people suffering from diabetes.

In France, the seeds are roasted like coffee beans; the result is a good-tasting coffee substitute (*dure koffie,... een even goed smakend surrogaat verkrijen*).

A large illustration (engraving) shows a soybean plant bearing many pods. In the lower left corner is one large pod. In the lower right is written "Al Clement," which appears to be the artist's name.

Note 1. This is the earliest Dutch-language document seen (Nov. 2012) that mentions soy coffee.

Note 2. This is the earliest Dutch-language document seen (June 2009) that mentions green vegetable soybeans, which it calls *"een groente voor den mensch,..."*

Note 3. This is the earliest Dutch-language document seen (Aug. 2013) that mentions soymilk, which it calls *melk.*

Note 4. This is the earliest Dutch-language document seen (Oct. 2003) that mentions oil from the soybean, which it calls *olie.*

50. *St. Louis Post-Dispatch* (*Missouri*). 1893. Use of the soya bean. Nov. 12. p. 20.

• ***Summary:*** "The use of the Soya bean in the dietary of diabetics has recently attracted much attention. Heretofore the bean has been used only for culinary purposes, the Japanese using a liquid called sooju [shoyu] or soja [soy sauce], a condiment which they prepare by fermenting the seeds of the Soya bean. The Japanese name of the plant is Daidsu [Daizu]. Linnaeus, the great botanist, called it *Dolichos Soja."*

The Japanese call the beans Mame, and make 'miso' or sooju from them. The preparations are used principally in cooking meat. In China an emulsion [soymilk] is made from the oil of the beans [sic, from the whole beans]. It forms a

white liquid and is drunk in the districts in which milk is too dear for the poor to buy it. The Chinese also make a kind of cheese [tofu] from the beans. Soy sauce is exported to and used in many European countries. The Dutch call it 'Zoya.' In the East Indies it is known as 'Ket Jay' [sic, 'Ket Jap'] (probably the source of 'catchup' or 'ketchup'). This liquid is obtained by fermentation of cakes of roasted barley and boiled soya bean. After [the first] fermentation salt is added. The whole is kept for two or three years and then the sauce is squeezed out of the mass.

"Bread and biscuit, made from the flour of the beans, have been highly recommended for diabetics on account of the low proportion of starch and the high proportion of fat and proteid. They are said to be pleasant to the taste. Dr. W. Hale White, writing from Guy's Hospital, London, where he has used the bread and biscuit for some time, says: 'They are to patients suffering from diabetes not only a good substitute for gluten bread, but they form a pleasant change from it, and many patients much prefer the taste of them to gluten bread.'"

51. Schlegel, Gustave; Cordier, Henri. 1894. The Chinese bean-curd and soy and the soya-bread of Mr. Lecerf. I. Tofu. *T'oung Pao* (*General Newspaper*) 5:135-46. March. [11 ref. Eng]

• ***Summary:*** "Of late these Chinese preparations have again attracted the notice of Europeans. The *Temps* in France published last November [sic, April 8, 1893] a note upon the subject after an article in the *Avenir de Diego-Suarez* of 2 March 1893, and Dr. Vorderman, of the civil medical service in Java and Madura... We will add to these notices what is written about the subject by the Chinese themselves.

"I. Tao-fu or Bean Curd. According to 'Collected Omissions of *Sieh-choh*' nothing had been ever heard of the confection of bean-curd before or after the period of the three dynasties of antiquity (B.C. 2205-250), and it was only mentioned for the first time in the work of *Liu-ngan* [*Liu An*] king of Hoai-nan [Huai Nan] of the Han (second century before our era) Cf. Mayers, Chinese Readers Manual, No. 412, Cap. 24."

"The *Tao-fu* or Bean-curd was also called 'Leguminous milk', and was prepared by boiling curds or milk from beans.

"It is further related that when *Shi-tsih* [pinyin: Shi Ji] was governor of *Ts'ing-yang* [pinyin: Qing Yang] (Latitude 30º45', Longitude 115º26') he, in order to purify himself and to rouse the population, did not permit himself the use of meat, but bought every day in the market several pieces of bean curd, so that the townpeople called these curds 'The little slaughtered sheep.'

"The bean of which this curd is prepared is known in science by the name of *Soja hispida*, and has been imported in the form of a meat-sauce from Japan to Europe under its japanese name of *Sho-yu*, the corrupted japanese pronunciation of the chinese *tsiang yu* or 'relish-oil' which this sauce bears in some parts of China, and which has been further corrupted by the Dutch into *Soja*, by which name (also written *soya* and *soy*) it became known all over Europe. We will return to this by and by.

"According to Dr. Vorderman (loc. cit. p. 354) the soy-beans are distinguished in light-colored (cream-color, straw-yellow, light ochre-yellow and amber-yellow), brown and black. The first two sorts are roundish, the last either roundish or oblong, as they come from the one or the other variety of the plant. Accordingly, the plant with roundish seeds is called *Soja hispida, tumida* and that with oblong seeds *Soja hispida, platycarpa,* amounting, with the differences in color, to four varieties: 1. Soja hispida, tumida Beta pallida; 2. Soja hispida, tumida Beta atrospuma [atrosperma]; 3. Soja hispida, tumida Beta castanea; 4. Soja hispida, platycarpa Beta melanosperma.

"No. 2 and 4 are black and serve especially for the fabrication of Soy or Ketchup, whilst No. 1 (pale-yellow) and No. 3 (brown) are used for other culinary purposes.

"Since the Vienna [Austria] exhibition of 1873, when several samples of Chinese, Japanese and Indian soybeans were exhibited, their great nutritive proprieties and richness of azote [nitrogen] and fat have been shown by chemical analysis, and the culture of this plant has been largely introduced into Europe, especially in Hungary."

Note 1. This is the earliest English-language document seen (July 2003) that contains the word "soybeans"–spelled as one word.

König in his work *Die menschlichen Nahrungs und Genussmittel,* 2nd Ed., Vol. II, p. 372, gives an analysis of the composition of 4 types of soybeans. "Dr. Vorderman says that he has not been able to detect amylum [starch] in the Soybeans of Java, China and Annam in applying the reaction of jodium [iodine] upon the section of the bean. The texture of the cotyledons consists principally of oblong, radiating parenchyme-cells, about five times longer than broad.

Note 2. This is the earliest English-language document seen (Oct. 2004) that uses the word "cotyledons" in connection with soybeans.

"II. *Tao-kan* or Preserved Bean Curd. The Chinese make of the Soy-beans two preparations, one called in Java *Tao-hu* and the other *Tao-toa.* They both consist of leguminous cheese, obtained from the light-brown beans, principally those obtained from Annam. But at present many Chinese in Batavia prefer the so much cheaper *kadele putih* grown in the *Preanger* and the *Ommelanden* (circumjacent territory of Batavia).

"These lightcolored beans are macerated during five hours in rainwater, when they swell up to about twice or thrice their original size. After having been cleansed from accidental dirt or admixtures, they are ground in a stone handmill, very much resembling that in which Europeans ground colors. One Chinese turns the mill, whilst the other throws the macerated beans, still in their husk, with a little

water into the mill, so that the stuff runs as a white, thin mass, by a small gutter, into a tub prepared for its reception. This mass is then heated upon the fire in a large iron open cauldron, until it reaches the boiling-point. The froth is skimmed, and the fluid strained, after boiling, through a cotton cloth, in which a white, doughy residu [sic, residue = okara] remains, having a peculiar oily smell, and which serves as food for ducks and fowl.

"The filtrated fluid, which has a milkwhite color, is mixed, whilst it is being cooled, with a certain proportion of common Madura-salt or with a little calcined gypsum.

Note 3. This is the earliest English-language document seen (Aug. 2013) that refers to soymilk, which it calls the "milk from beans" and "The filtrated fluid, which has a milkwhite color..."

"This gypsum is imported from China in the form of large lumps of radiated gypsum. As it is specially used for preparing the leguminous cheese of the soybeans, it is called by traders in Batavia by the Malay-Chinese hybrid word *Batu-tao* i.e. 'bean-stone.'\ "The salt (or, as in China, the chloride of magnesium) and gypsum change the juice, by precipitation of the legumine [legumin], into a white, gelatineous [gelatinous] mass, which, when sufficiently cooled, obtains a certain consistency, allowing it to be cut into flat square pieces. This can, however, not be done for after two hours after the precipitation. These squares are then laid upon plantain-leaves protected by a white cotton cloth against dust, and hawked about in the streets.

"They have an unpleasant raw bean-flavor, but when mixed with other victuals, this taste is lost. It is used as well in the preparation of Chinese victuals, as in that of the so-called Indian rice-dish.

"In order to preserve the *tao-fu* for continuous use, it is made to *tao-koa* (or dried beans) by the following method.

"The *tao-fu,* cut into flat squares, is plunged into a decoctum of *Curcuma longa,* which colours it intense yellow. These yellow cakes are then wrapped up in white square pieces of cotton, laid between boards and exposed to a certain pressure. Generally they are at the same time stamped with Chinese characters.

"By this pressure a good deal of water is lost, but the cakes can be preserved much longer.

"Dr. Vorderman says that both *tao-fu* and *tao-koa* can be successfully used in the nourishment of feeble children, who refuse to take eggs. *Tao-koa* is also imported from China, but these cakes are much larger than those prepared in Java, and are always stamped with Chinese characters."

Note 4. This is the earliest document seen (Aug. 2002) that mentions Liu An of Huai Nan in connection with tofu.

Note 5. This is the earliest English-language document seen (April 2013) that uses the word "Tao-fu" (or "Tao fu"), or the word "Tao-hu" (or "Tao hu"), or the word "Tao-kan" (or Tao kan") to refer to Chinese-style tofu.

Note 6. This is the earliest English-language document seen (Sept. 2004) that uses the term "pale-yellow" or the term "straw-yellow" to describe the color of soybean seeds.

Note 7. An article in this same issue, titled "The Chinese in Boston" [Massachusetts], notes that presently "1,000 Chinese live in Boston, of which 700 work in the 180 laundries, and about 300 are merchants and traffickers, all dwelling on Harrison Ave. Here one also finds 63 gambling dens (or houses of ill repute) and several others where opium is smoked–visited in part by the most vile class of Americans."

Note 8. We wonder if there wasn't at least one tofu shop in Boston at this time. Address: 1. Professeur de Chinois à l'Universite de Leide [Leiden]; 2. Professeur à l'Ecole spéciale des Langues orientales vivantes et à l'Ecole libre des Sciences politiques à Paris.

52. Martin, Ernest. 1895. Le Tao-fu (soya), son origine, ses propriétés, son acclimatation [Tofu (soya): Its origin, properties, and acclimatization]. *Revue Scientifique* (*Revue Rose*) 3(5):144-46. Feb. 2. Series 4. [Fre]

• ***Summary:*** A French-language review of the literature on tofu, including a brief discussion of soy sauce and soybeans. The Soya hispida (Family: Papilionacées; Glycine Phaseolus) is an oilseed (*graine oléagineuse*) that originated in China. According to the research of Prof. Schlegel at the University of Leiden, it was first mentioned in the work of Liu-An, king of Huai-nan, of the Han dynasty, in the 2nd century before the Christian era. From this period, the seed was boiled and a milk-like liquid [soymilk] was extracted which had the reputation of possessing beneficial properties.

When the soybean (*le soya*) was imported to Europe, it was in the form of a sauce made in Japan and sold by the Dutch who were the first [sic] European navigators to arrive in Japan. Note: Portuguese navigators arrived in and traded with Japan before the Dutch.

Its name was *sho-yu,* which is nothing but the corruption of the Chinese characters *tsiang-yu,* which signifies savory oil [sic]. From sho-yu, the Dutch made the word "soya" or "soy" the name by which the bean is known in Europe.

Discusses: The shape and color of soybeans. The Exposition of Vienna [Austria] in 1873. König's discovery that soybeans contain 31-33% protein. The research of Vorderman and Pellet. Tao-Kan, Tao-Hu (tofu in Java), and Tao-Koa. Tofu exported from Annam. How Chinese in Batavia make soymilk and tofu (curded with gypsum); use of the pasty residue (*résidu pâteux*) [okara] for feeding to penned poultry, such as chickens and ducks. Further processing of tofu to extend its shelf life.

Note: This is the earliest French-language document seen (June 2013) that uses the term *résidu pâteux* to refer to okara. Preparation of soy sauce. Many uses of tofu in Chinese therapy. Shi-tsih as the founder of the vegetarian diet. Writings of Montigny, the French consul general. Soy bread in diabetic diets. Mr. Desvilles. Soybean trials and

acclimatization in France. Composition of soybeans grown in France.

"From the viewpoint of practical utility, we conclude that the acclimatization of species of the vegetable and animal kingdoms, which was formerly the goal of multiple costly tests, has now lost much of its importance. The ease of communications and the rapidity with which exotic shipments can be made often provide the same results.

"However we must continue to be attentive to failures of acclimatization, for they have much to teach us. One of the most interesting problems of science is that of mutations. The work of the mutationists (*tératologistes*), and especially of Dareste, on the production of artificial anomalies, has led to new proof that the variability of animal organization is much greater than one would be tempted to believe–and this variability extends also to plants... Such research can help elucidate the problem of the origin of races, which has heretofore remained in the deepest obscurity despite the work of savants such as Is. Geoffroy Saint-Hillaire, Darwin, and Quatrefages.

"Thus there is nothing surprising in the transformations manifested in living things which, transplanted from afar, find themselves placed in telluric [terrestrial] and climatological conditions completely different from those of their original habitat. Examples of this transformation multiple with each new day;" they include the opium poppy, rhubarb, some legumes, numerous varieties of bamboo. "What is the reason for these laws of transformation and degeneration that extend over each of the large kingdoms of nature? The problem is posed but has not been seriously addressed.

"As for the soybean (*graine de soya*), we have shown that it undergoes this transformation in a very sensitive manner: in it, the protein molecule progressively gives way to the starch (*amylacée*) molecule. At the heart of the plant organism, a special synthesis is accomplished: its chemical composition is modified in proportions such that it becomes inappropriate for the goal targeted by its cultivation in Europe."

53. Kellogg, John Harvey. 1895. Milk as a food unsuited for the diet of adults: Editorial. *Modern Medicine and Bacteriological Review* (*Battle Creek, Michigan*) 4(5):121-22. May.

• ***Summary:*** "The popular idea that milk is one of the most wholesome and nutritious articles of food for use at all periods of life, is by many facts shown to be an error. Cow's milk is admirably adapted for digestion in the stomach of a calf."

"Kumyzoon is a scientific preparation of milk in which the lactose is replaced by lactic acid... Kumyzoon is manufactured by the Sanitarium Health Food Co., Battle Creek, Michigan, and 28 College Place, Chicago, Illinois. This company is manufacturing kumyzoon according to the formula furnished by the writer, and has it made under the writer's care at the Battle Creek Sanitarium."

Note: This is the earliest document seen (July 2013) that discusses problems with cow's milk as a food for adult humans. Address: M.D., Battle Creek, Michigan.

54. Inouye, M. 1895. The preparation and chemical composition of tofu. *Bulletin of the College of Agriculture, Tokyo Imperial University* 2(4):209-15. Aug. [6 ref. Eng]

• ***Summary:*** One of the best early articles on tofu in Japan. Inouye tried to make a product resembling Swiss cheese with tofu, with moderate success.

"The efforts to prepare an easily digestible food from soya beans led to the preparation of *miso* and *natto*, two kinds of vegetable cheese, which were investigated some time ago in the laboratory of this college. (Footnote: On the preparation of *miso*, by O. Kellner, this Bulletin, Vol. 1, No. 6. On *natto*, by Yabe; Bulletin Vol. 2, No. 2).

"But the most interesting preparation is *tofu*, which consists principally of the protein-matter of the soya bean and which, according to the investigation of Prof. Osawa in Tôkyô, is as easily digestible as beef. This preparation is freshly made every day and sold in the form of tablets [cakes] about 10 c.m. broad, 2 c.m. thick, and 25 c.m. long [4 by 10 by 0.8 inches thick], is of snow-white appearance and of the consistency and taste of freshly precipitated casein of milk, but as there is no trace of bacterial action connected with its preparation, the name vegetable cheese is certainly not justified." A table (p. 211) shows the composition of tofu a determined by *Kellner.*

"*Tofu* is also sold in another form called *kori-dofu* [dried-frozen tofu]. It is prepared by exposing the fresh *tofu* tablets to the action of frost, under which they shrink considerably, lose water, and become more compact. While fresh *tofu* contains, on an average, 89.02% of water, *kori-dofu* contains only 15.32% in the air dry condition. The analysis of *kori-dofu* gave me the following results: Water 15.32%. Albuminoids 41.42%. Fat and lecithin 23.65%. Non-nitrogenous extract 15.05%. Cellulose 1.48%. Ash 3.08%."

Note 1. This is the earliest English-language document seen (April 2013) that uses the term *kori-dofu* to refer to dried-frozen tofu.

The author then describes the tofu manufacturing process, noting that it "is manufactured only on a small scale, by people who sell it in their own shops." "The beans are first soaked for about twelve hours in water and then crushed between two mill-stones until a uniform pulpy mass is obtained. This is then boiled with about three times its quantity of water for about one hour, whereupon it is filtered through cloth. This liquid is white and opaque, exactly like cow's milk; while the smell and taste remind one of fresh malt." "I also analyzed the fresh milky liquid with the following results" for "Soya bean milk" and

cow's milk, respectively (p. 212): Water 92.53% / 86.06%. Albuminoids 3.02% / 4.00%. Fat 2.13% / 3.05% Fibre 0.03% /–. Ash 0.41% / 0.70%. Non-nitrogenous extract, including carbohydrates 1.88% /–. Milk sugar–/ 5.00%.

"The fat contained in this liquid as well as in the *tofu*-tablets was found to consist partly of lecithin. *Tofu* dried at 100º yielded 26.65% fat and 4.83 gr. of this fat yielded, after igniting with carbonate of soda and nitrate of potash in the usual way, 0.280 grm. of magnesium pyrophosphate, which, when multiplied by the lecithin-factor, 7.2703, corresponds to 2.035 grm. lecithin, amounting to 11.2% of dried *tofu,* leaving for the genuine fat 15.4% (Footnote: A portion of this lecithin was probably present in the soya bean as lecithalbumin; comp. Leo Liebermann, J.B. f. Thierchemie, 1893, p. 32, and E. Schulze, *Chemiker Zeitung*, 1894, No. 43); more of the latter, therefore, is left in the refuse than of the former."

Note 2. This is the earliest English-language document seen (March 2001) that contains the word "lecithin" or "lecithalbumin" in connection with soy–in this case tofu.

"In the manufacture of *tofu*-tablets from the freshly prepared milky liquid, about 2% of concentrated brine [natural nigari] as it is obtained as mother liquor from the preparation of sea salt, is added with constant stirring, whereupon a flocculent precipitate is soon formed which is separated by means of a cloth filter, slowly pressed, and then cut into tabular shape. I have tried to arrive at a satisfactory explanation of the nature of *tofu,* and have found that the salt-brine does not act by its chloride of sodium, but by the calcium and magnesium salts which are in it; for we can at once obtain precipitate from the milky liquid if we add a little calcium nitrate or magnesium sulphate, while we can not obtain any separation or precipitation by adding even considerable quantities of sodium chloride or sodium sulphate."

"I have analysed a sample of the salt brine used for *tofu* making and found it to contain, besides chloride of sodium, 27.9% of chloride of magnesium and 7.0% of chloride of calcium."

Footnote 4 (p. 213): "In order to see whether a product similar to Swiss Cheese could be obtained from the crude soya casein or *tofu,* I infected 50 grm. of fresh *tofu* with a small dose of pulverised Swiss cheese, and added ten per cent of common salt to the mixture, pressed it in cloth, and allowed it to stand in a moist beaker glass for several months. The product resembled, only to a limited extent, the cheese from milk, but further experiments with the addition of small quantities of milk sugar are intended."

Note 3. This is the earliest English-language document seen (Aug. 2013) that contains the term "soya bean milk."

Note 4. This is the earliest English-language document seen (Aug. 2013) that contains the word "milky" in connection with soymilk, or that uses the term "milky liquid" to refer to soymilk. It is the second earliest English-language document seen (Aug. 2013) that mentions soymilk, and the earliest that mentions it in connection with Japan. However there is no suggestion that Japanese consume soymilk as a beverage.

Note 5. This is the earliest English-language document seen (March 2009) that uses the term "vegetable cheese" to refer to miso. Address: Nôgaku-shi [Prof. of Agriculture], Japan.

55. Kellogg, John Harvey. 1895. Re: Work with digestion, nuts, and peanut butter. Letter to Ellen G. White, "Norfolk Villa," Granville, N.S.W., Australia, Oct. 10. 6 p. Typed, with signature.

• ***Summary:*** The letter, addressed to "Dear Sister White," states: "I have just finished the MS. for a new edition of Digestion and Dyspepsia. It is really a new book, well illustrated, and I hope will prove helpful to the work. Mrs. Kellogg has also finished the MS. for a small book on Cookery, in which careful attention has been given to the many suggestions which you and others have made with reference to a work for Australia.

"I entirely agree with you in the suggestion that cream and milk should not be too freely used. I think they are even worse than the limited use of butter as a seasoning, as there are so many people who have dilated stomachs and cannot digest them. We make very little use of cream or milk in our family, and use no butter whatever for seasoning, but use nuts instead. I have recently succeeded in making some very excellent preparations from nuts which take the place of butter entirely and are sweeter, more palatable, and more digestible. I find this plan is working very successfully both with the patients and with the helpers at the Dormitory."

Note 1. The preceding paragraph states that Dr. Kellogg was developing various nut butters, but he does not say from what kinds of nuts. However, about 3 months later, on 4 Nov. 1895, he applied for a U.S. patent (No. 567,901) for a "nut-butter" made from peanuts or almonds. This is the earliest document seen (Jan. 2005) concerning the work of John Harvey Kellogg or Seventh-day Adventists with nut butters, and probably with peanut butter.

Note 2. The letter also discusses the Medical Missionary College and its Seventh-day Adventist students: "I cannot describe to you what an encouragement it is to me to see these 40 young men and women devoting their lives to the grand work which the Lord has placed in our hands. I have done my best to inspire them with confidence and courage and to lay before them the importance of thorough consecration to the work." Dr. Kellogg is anxiously awaiting Ellen White's revised manuscript for Christian Temperance.

Note 3. The original letter is in the Ellen G. White Papers, Incoming papers, Ellen G. White Estate, Inc., General Conference of Seventh-day Adventists, 12501 Old Columbia Pike, Silver Spring, Maryland 20904-6600. Address: M.D., Superintendent, Battle Creek Sanitarium,

Battle Creek, Michigan.

56. Prinsen Geerligs, H.C. 1895. Eenige Chineesche voedingsmiddelen uit Sojaboonen bereid [Some Chinese foods made from soybeans]. *Pharmaceutisch Weekblad voor Nederland* 32(33):1-2. Dec. 14. Summarized in Teysmannia (1897) 7:413-15. [5 ref. Dut; eng]

• ***Summary:*** Contents: Introduction. Tofu or bean cheese (*Tao-hoe of boonenkaas*). Chinese soja or Fao-ijoe (boonenolie; soybean oil). Japanese soya (soy sauce; In Japanese: Shoijoe; in Chinese: Sex-sze-ijve). Taucho or bean paste (*Fao toio of boonenbrei*).

In the section on tofu, soymilk is mentioned twice.

Note 1. This is the earliest Dutch-language document seen (April 2013) that uses the term *boonenkaas* (unhyphenated) to refer to tofu.

Note 2. This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *melkachtige, vettige vloeistof* ("milky, fatty liquid") or *gefiltreerde melkachtige vleistof* ("filtered milky liquid") to refer to soymilk.

Note 3. This is the earliest document seen (March 2009) that mentions Indonesian-style miso, which it calls "Fao toio." This would later be spelled tao-tjo, taotjo, tauco, or taucho.

At the end of the section on tofu, the author continues: Another widely used bean preparation is soy sauce (de Soja), of which two kinds exist: the Japanese and the Chinese Soja. The first-mentioned has already been repeatedly described, for example by König (1889, p. 241), further by J.J. Hoffman in his "Contributions to the Knowledge of the Language, Geography, and Ethnology of the Netherlands Indies" (*Bijdragen tot de Taal-, Land- en Volkenkunde van Nederl. Indië;* Vol. V, p. 192), and recently by G. Schlegel in T'oeng pao [T'oung Pao 1894] (Part 5, No. 2) and O. Kellner in *Chemiker Zeitung* (1895, p. 120). While I could not find anything in the literature about the preparation of Chinese soy sauce (*Soja*), I have copied the following from the manufacturers themselves.

Chinese Soja or Fao-ijoe (bean oil). For this, only black varieties of the *Soja hipida* [*sic, hispida*] *humida Beta atrosperma* or *Soja hipida platycarpa Beta melanosperma* have been used. Their seeds are cooked and the water poured off, after which the beans are left in the sun for half a day to dry. Now they are cooled on big trays of woven bamboo out of the sun, then covered with leaves of a *Hibiscus* variety. On the beans there will always appear a type of mold, the *Aspergillus Oryzae* to be precise, which, at least on Java, appears every time again on moist soybeans exposed to the open air, but strangely enough does not appear on other foods. The beans are allowed to stand until the mold sporulates, which can be seen by the green color of the mold threads (hyphae), then they are dried again for some days and then put in a strong salt solution that has been cooled. This mixture is put in the sun for 8 days and afterwards it is boiled. The salt solution is then poured off from the beans and saved. The beans are boiled again and the water is added to the first salt solution. This process is repeated as many times as it takes to extract the residue completely.

The decoction is strained through a fine sieve, boiled again, and the sugar from the areng palm, star anise (not the leaves), and some other herbs (which are available from Chinese druggists as "soya herbs") are added. Finally, this dark brown, pleasantly aromatic liquid is boiled down until salt crystals start to appear on the surface, indicating that the liquid is completely saturated with salt. After cooling, the soy sauce (*soja*) is ready to use. It yields a spice which is used together with all different kinds of foods as a pleasant condiment, and in the Chinese, Javanese, and even the European kitchen on Java it is an irreplaceable ingredient.

Soy sauce is sold in several quality grades, of which the best is a thick sauce with a special aroma. The lesser kinds are thinner and are made by diluting the thick soy sauce with salt water, while in the very low-grade kinds, instead of the pleasantly sweet-tasting palm sugar, the bitter, sour-smelling unassimilated molasses from sugar factories is used.

Note 4. This is the earliest document seen (May 2010) that describes the preparation of a sweet Indonesian-style soy sauce quite similar to *ketjap manis* (which seems to have been first created about 1960), yet the writer does not mention its name.

The Chinese soy sauce appears as a black colored, thick, clear liquid in which sometimes a viscous sediment can be found. When diluted with water it turns turbid or cloudy, but after adding salt this cloudiness disappears. Here is an analysis of one of the most common varieties: Specific gravity 1.254, saccharose and glucose 15.60%, nitrogen containing substances (*stikstofhoudende stof*) soluble in alcohol 4.87%, nitrogen containing substances not soluble in alcohol 2.62%, nitrogen-free substances soluble in alcohol 0.25%, nitrogen-free substances (*stikstofrije stof*) not soluble in alcohol 0.75%, salt 17.11%, other ash components 1.65%, water 57.12%. Total 100%.

The substances insoluble in nitrogen consist (except for peptone) mainly of legumin, which is soluble in strong salt solutions (compare Beilstein, *Handbuch Organische Chemie*, III, p. 1275) and will precipitate when diluted. This protein product (*eiwitstof*) has, by repeated precipitation with alcohol and renewed dilution in water and salt, been cleaned and could be recognized as a legumin. The elementary analyses gave these figures: Carbon 51.6, hydrogen 7.1, nitrogen 15.9.

Furthermore, the dilution in water was precipitated by ammonium sulfate, magnesium sulfate and sodium sulfate and not by a large quantity of sodium chloride.

The nitrogen containing substances soluble in alcohol were leucine, tyrosine and aspartic acid, all breakdown products of legumin, plus a little ammonia. Nitrogen-free extraction substances are almost not present and consist of a little pectin and the black coloring agent from the skin of the

soybeans, which gives the black color to the soya.

Just like Kellner (*Chemiker Zeitung* 1895, p. 121) remarks, the composition of the soya is very similar to the one of meat extract, by which the big importance of this condiment in countries, where mainly vegetable type food is consumed, can be readily explained. Very peculiar moreover is the way in which during the preparation of the soya the heavily digestible protein substances, which are locked into the thick skinned cells of the soya, have been converted into an easily digestible, very delicious food.

One lets the boiled beans mold by means of the *Aspergillus oryzae*, which above all has the quality of changing amylodextrine and starchy substances into sugars followed by carbonic acid and water breakdown. We can say that a microscopic investigation of a molded soybean shows that the mold threads (hyphae) penetrate the cell walls of the complete soybean and partly dissolve them so the contents will be more readily available. When the mold has used up all that food, as shown by its fructification, the beans are put into a strong solution of salt water so that the legumin will dissolve, producing a thick fluid liquid. At the same time, the broken down substances of the legumin will dissolve pepton [peptone], leucine, tyrosine and ammonia, next to the aromatic substance that will start to form in this stage. The continued manipulations, addition of sugar, herbs, etc., are of course of minor importance, but principally the clever way in which the mold is being used to dissolve the cell walls is highly interesting. This, like so many Chinese preparations, is completely empiric and no Chinese would have the slightest notion of what all this molding is about.

This article describes the first attempt to identify the tempeh mold. In the section on Indonesian miso (taucho), the author notes: In a similar way, in Java, other molds are used to make leguminous seeds into more digestible foods. Thus the presscake, which remains after making peanut oil and would be indigestible without further preparation, is subjected to the action of molds. In central and eastern Java *Chlamydomucor Oryzae* [now known as *Amylomyces rouxii*] is used, whereas in western Java an orange mold of the family Oospore (Neurospora) is used. In the former case, the food is called 'bongkrek,' and in the latter 'ontjom.' If soybeans are molded with *Chlamydomucor* the spice is called 'tempets' [sic, tempeh]. In the preparation, the seeds are boiled, spread, mixed with a little molded cake from a former batch, and left alone for a while until the mass is bound into a solid white cake.

All the aforementioned molds have the ability to break starch and pectin substances down into sugars, by which means the cell walls are opened and the seeds made more easy to digest.

In the case of the starch-containing peanut presscakes, the breakdown of starch into sugars, followed by the use of the resulting sugars, proceeds so rapidly that the cakes become warm and within 1 day about 5% of their weight will disappear.

Kagok Tegal 28.9.95.

Note 5. This is the earliest document seen written only in Dutch that mentions Indonesian miso, which it calls *Fao toio* or *boonenbrei*, and *tao tsioe.*

Note 6. This is the earliest document seen stating that Hibiscus leaves are used in Indonesia to make soyfoods–in this case soy sauce.

Note 7. This is the earliest document seen (April 2012) that mentions "bongkrek"–but the explanation is incorrect.

Note 7. This is the earliest document seen (Sept. 2011) that mentions "ontjom." Address: Java, Indonesia.

57. *Times* (*London*). 1896. Agriculture: Crops and live stock. Jan. 13. p. 8, col. 3. [1 ref]

• ***Summary:*** "A vegetable preparation possessing many of the dietetic properties of meat is produced in Japan under the name of 'tofu.' It consists principally of the protein matter of the soya bean, and is said to be as easily digestible as beef. It is freshly made every day, and is sold in thin tablets of snow-white colour, and of the consistency and taste of freshly-precipitated casein of milk. The name 'vegetable cheese,' proposed to be applied to it, is not justifiable, as there is no trace of bacterial action associated with its preparation. Another form, known as 'kori-dofu,' is prepared by exposing the fresh tofu tablets to the action of frost, with the result that they shrink considerably, lose water, and become more compact. Fresh tofu contains, on the average, 89 per cent of water, whilst kori-dofu contains only 15.3 per cent, in air-dry condition. Tofu is manufactured by the people who sell it in their shops. The beans are first soaked for 12 hours in water, and then crushed between two millstones to a uniform pulpy mass. This is boiled for an hour with three times its quantity of water, and is then filtered through cloth. The liquid passes through white and opaque, exactly like cow's milk, whilst the smell and taste is suggestive of fresh malt. Upon standing, very fine particles separate on the surface, and these under the microscope are easily recognizable as small globules of fat. After two or three days there is a strong development of lactic acid, under the influence of which the casein separates exactly as in the souring of milk. Mr. Inouye, of the College of Agriculture at the Imperial University, Tokio, states that in preparing tofu tablets from the fresh milky liquid about 2 per cent of concentrated brine is added with constant stirring; a flocculent precipitate soon forms and is separated by means of a cloth filter, slowly pressed, and cut into tabular shape. In this way about one-fourth of the total quantity of the proteid in soya beans is obtained in the tofu. The brine employed is made from sea water, and it is to the potassium and magnesium salts contained in this that the precipitation of the tofu appears to be due. Wherever rice forms the principal food of man, as in China and Japan, the addition of some other food rich in nitrogenous matters, or proteids, is necessary to make up for the deficiency of

proteids in rice. The people of the sea coast supply this want by the use of marine animals, whilst inland the seeds of various leguminous plants, and notably the soya bean, are employed, as beef and other meats have only recently come into use. Tofu, therefore, may be regarded as a kind of vegetable beef prepared artificially from a plant product, and, when consumed in conjunction with rice, filling the *róle* of a nitrogenous or proteid food in the presence of a larger quantity of a carbonaceous one."

Note: This is the earliest article seen (Dec. 2005) in the *Times* (London) that contains the term "soya bean."

58. Prinsen Geerligs, H.C. 1896. Einige chinesische Sojabohnenpraeparate [Some Chinese soybean preparations]. *Chemiker-Zeitung* 20(9):67-69. Jan. 29. (Exp. Station Record 8:72). [3 ref. Ger]

• ***Summary:*** This is a German translation of the author's 1895 Dutch article, but with two mistakes concerning tempeh corrected. He changed the name of the mold from *Chlamydomucor Oryzae* to *Rhizopus Oryzae* and he changed the name of the product from "tempets" to "tempeh." He added in conclusion that "it was finely sliced and enjoyed, mold and all." But he continued, apparently mistakenly, to refer to tempeh as a Chinese soyfood.

He also improved his description of Chinese-style soybean paste, which he now calls *Tao-tjiung* (*Bohnenbrei*) [*doujiang*], and says has much similarity with the miso of the Japanese (p. 68 R.7).

Note 1. These two articles by Prinsen Geerligs ushered in the era of scientific research on tempeh by European microbiologists and food scientists.

Note 2. This is the earliest document seen (Sept. 2011) that contains the word "tempeh"–spelled with an "h" on the end.

Note 3. It is also the earliest German-language document seen (Sept. 2011) that mentions tempeh, which it calls "tempeh."

Note 4. This is the earliest German-language document seen (Aug. 2013) that uses the term *milchweisse Flüssigkeit* ("milk-white liquid") to refer to soymilk. Address: Java, Indonesia.

59. Kellogg, John H. 1896. Nut butter and nut meal. *Good Health* (*Battle Creek, Michigan*) 31(2):56-57. Feb. [1 ref]

• ***Summary:*** This article by Dr. Kellogg was reprinted from *Modern Medicine.* The most valuable products developed from nuts are nut butter, nut meal, and bromose. Gives ten "special advantages of nut butter over ordinary butter, tallow, lard, cottonseed oil, cocoanut butter, olive oil, suet, cream, and other materials used for shortening foods..." "1. Nut butter is a purely vegetable product, and hence free from the elements of disease which are often found to an extent dangerous to life in animal fats." "Bromose is a combination of nuts with digested starch. It is the vegetable analogue of malted milk and constitutes a perfect food."

"Nut butter, nut meal, and bromose are manufactured and sold at reasonable rates by the Sanitas Food Company, Battle Creek, Michigan." Almonds are mentioned; peanuts are not.

Note 1. This is the earliest document seen (May 2004) that mentions Sanitas Food Company.

Note 2. This is the earliest English-language document seen (Jan. 2005) that contains the term "Nut butter" used without referring to a specific type of nut.

Note 3. This is the earliest English-language document seen (Aug. 2013), that mentions Bromose, a dry non-dairy product resembling malted milk, made from nuts.

Note 4. This is the earliest document seen (Feb. 2005), that mentions a dairy alternative made by Seventh-day Adventists. Address: M.D., editor.

60. **Product Name:** Bromose (Dry Milklike Product Made from Malted Nuts–No Soy).
Manufacturer's Name: Sanitas Nut Food Co. from 1899. Renamed Kellogg Food Company in mid-1906, then Battle Creek Food Co. in the spring of 1921.
Manufacturer's Address: Battle Creek, Michigan.
Date of Introduction: 1896. February.
Ingredients: Mainly peanuts.
New Product–Documentation: Kellogg, John H. 1896. "Nut butter and nut meal." *Good Health* (Battle Creek, Michigan) 31(2):56-57. Feb. "Bromose is a combination of nuts with digested starch. It is the vegetable analogue of malted milk and constitutes a perfect food."

Sanitas Food Co. 1896. "New nut products" (Ad). *Chicago Vegetarian* 1(3):8. Nov. Four products are advertised: 2. Bromose. "Makes fat and blood. This is a product made by malting nuts, and is especially adapted to persons who cannot digest starch."

Ellen Goodell Smith. 1896. *The Fat of the Land and How to Live on it.* Page 195 contains a full-page ad for products made and sold by the Sanitas Food Company (Battle Creek, Michigan) titled "Pure Products of Nuts." These include Bromose.

Schwarz, Richard W. 1970. *John Harvey Kellogg, M.D.* Nashville, Tennessee: Southern Publishing Assoc. "During the decade following the appearance of peanut butter, Dr. Kellogg developed several other food products with a nut base. In 1896 he patented a product labeled 'Bromose,' which he claimed to be a vegetable equivalent of malted milk" (p. 120-21).

61. Trimble, Henry. 1896. Recent literature on the soja bean. *American J. of Pharmacy* 68:309-13. June. [12 ref]

• ***Summary:*** One of the best early reviews of the literature, especially the Japanese and European literature, published in the United States. This paper introduced several new soyfoods (such as *natto* and *kori-dofu*) to the United States

Contents: Introduction. Nutritional composition of the soja bean based on analyses of 5 samples from China, Hungary, France, and Japan. Diastatic enzyme / ferment "present in the soja beans to a greater extent than in many other leguminous seeds (see Güssmann 1890). Composition of etiolated soja shoots [sprouts]. The oil [of the soja bean]. Starch content. Sugar content. Use of soybeans as food in Japan. Miso. Natto. Tofu. Kori-dofu. Introduction of the soja bean to the United States in about 1888. Ability to obtain nitrogen from the air.

Note. This is the earliest English-language document seen (Jan. 2013) that uses the term "etiolated soja shoots" to refer to soy sprouts.

"The immediate excuse for the appearance of this paper is the fact that a number of contributions have recently appeared on the soja bean, notably from the College of Agriculture, Imperial University of Japan."

"The oil may be extracted by pressure or by means of solvents [in the laboratory]; it is said to possess some laxative properties, is of a yellowish brown color, and has a slightly aromatic odor; it is intermediate between the drying and non-drying oils." The following constants, based on Stingl and Morawski (*Chemiker Zeitung,* 1886, p. 140) are given: "Specific gravity at 15ºC: 0.924. Point of solidification: 8-15ºC. Fusing point of the fatty acids: 27-29ºC. Point of solidification of fatty acids: 23-25ºC. Temperature rise: 59ºC. Iodine number: 121.3. Iodine number of the fatty acids: 122. Saponification number: 192.5. Note: Trimble actually got these constants from *J. of the Society of Chemical Industry,* 31 May 1893, p. 453-54, which summarised an Italian-language article by De Negris and Fabris (1891), whose values confirmed those obtained by Stingl and Morawski.

Trimble (p. 311-12) gives a good, detailed description of natto based entirely on Yabe (1894). Parts of his summary perceptive: "Yabe found in this substance four kinds of microbes present, and he believes the chemical decomposition of the proteids to be due to one or more of these microbes... A chemical investigation by the author just mentioned [Yabe] revealed tyrosine, peptone, guanine, leucin and xanthine. The total proteids amounted to considerably more in the *natto,* when allowance is made for moisture, than existed in the original bean, and the artificial product is also considered to be much more digestible."

Concerning tofu and soymilk: "A still more interesting preparation of the soja bean than either of the preceding [miso and natto] is *tofu.* This has been described and investigated by M. Inouye (*Bulletin Imp. College of Agriculture,* Vol. 2, No. 4 [1895]). The beans are first soaked for about twelve hours in water, and then crushed between two millstones until a uniform pulpy mass is obtained. This is then boiled with about three times its weight of water, and filtered through cloth. The liquid filtrate is white and opaque, very closely resembling cow's milk, while the odor and taste remind one of fresh malt. On standing, the liquid becomes sour from the formation of lactic acid, and a coagulation of the casein takes place. The freshly boiled and filtered liquid is coagulated either by the addition of a portion of the sour liquid which has been set aside from a previous lot, or it is treated with about 2 per cent of a concentrated brine, such as is obtained as mother liquor from the preparation of sea salt."

"Somewhere about the year 1888 the soja bean was introduced into the United States. It has been tried in a number of State Experiment Stations, and is gradually working into favor in the Southern States. In Kansas the plant has been found to withstand considerable drought... The plant is valuable for forage or soiling. The beans have been produced in South Carolina to the amount of 10 to 15 bushels per acre. On account of their richness in oil they have been used as a substitute for cotton-seed meal in feeding cattle, with very satisfactory results.

"The plant is believed to have, in common with most leguminosæ, the power of obtaining some of its nitrogen from the air, and hence, of acting as a soil renovator."

Note 1. This is the earliest document seen (Aug. 2013), published in the USA, that contains the word *tofu,* or *kori-dofu* [dried-frozen tofu], or that discusses soymilk.

Note 2. This is the earliest English-language document seen (March 2003), published in the USA, that uses the word "crushed" or one of its cognates (crushing, crushers, etc.) in connection with soybeans.

Note 3. This is the earliest U.S. document seen (Sept. 2002) that mentions the use of a solvent for extracting the oil from soybeans.

Note 4. This is the earliest English-language document seen (March 2008) that contains the term "iodine number" (regardless of hyphenation or capitalization).

Note 5. This is the earliest English-language document seen (March 2008) that contains the word "drying" in connection with soy oil and its iodine number, or that states that soy oil is intermediate between the drying and non-drying oils. Address: USA.

62. Newberry's. 1896. Just received: A large assortment of Health Foods from the Battle Creek Sanitarium (Ad). *Los Angeles Times.* July 21. p. 7.
• ***Summary:*** "Granose Flakes–25¢ package. Whole wheat biscuits–15¢ package. Granola–15¢ package. Aranola–15¢ package. Caromel coffee–15¢ package. And many others including Bromose." Address: 216 and 218 South Spring Street [Los Angeles, California].

63. Kellogg, John Harvey. 1896. Cow's milk a cause of disease: Editorial. *Modern Medicine and Bacteriological Review* (*Battle Creek, Michigan*) 5(9):220-23. Sept.
• ***Summary:*** Contents: Introduction. Milk a natural food for infants, but not for adults. Milk the cause of biliousness. Milk the cause of nervous headache, or migraine. Vegetable

substitutes for milk.

"Cow's milk differs very materially from mother's milk, containing less sugar, more fat, and four times as much casein [protein] as mother's milk. The casein in cow's milk also differs from that in mother's milk in that it forms large, firm, tough curds, whereas those formed in mother's milk are small, soft, and friable, crumbling easily into small particles under the action of the stomach.

"It will thus be seen that that popular notion that since milk is the natural food of infants, cow's milk must be the most wholesome and easily digested of all foods for adults, is without proper foundation. When pure cow's milk is fed to infants, the child not infrequently vomits fragments of decomposing curds, which, having remained many hours in the stomach, are still hard, tough, and leathery. Every nurse is also familiar with the fact that the bowel discharges of children fed upon cow's milk often contain large quantities of tough, undigested curds."

"The writer has become thoroughly convinced that there are few persons who do not suffer sooner or later from the long-continued use of cow's milk."

"Vegetable substitutes for milk.–Some years ago Sir B.W. Richardson, the eminent London physician, prophesied that the time would come when milk, as well as all other forms of animal food, would be derived directly from the vegetable kingdom... The milk of the cocoanut furnishes a satisfactory substitute for cow's milk to the teeming millions of many tropical countries..." Most nuts, when crushed and mixed with water, give a solution "closely resembling milk... By the addition of a proper amount of sugar, preferably levulose or maltose, a very perfect substitute for milk may be produced. Such a preparation may be made from almonds..."

"In the experiments which we have made with nut milk we find it has a delicate, delightful flavor, with a suggestion of its nutty origin, but resembles cow's milk very closely indeed... Added to cow's milk in proper proportion, lac vegetal, or nut cream, prevents the formation of hard curds in the stomach, as when the cow's milk is used alone. This renders it an exceedingly valuable food for infants–vastly superior to any infant's food which has been devised."

"Nuts are unquestionably the vegetable analogue of meat and other animal foods, not only containing all the food elements to be found in animal products, but in finer and more digestible form, more delicately flavored, and wholly free from deleterious elements which abound in meat..."

Note 1. This is the earliest English-language document seen (Feb. 2012) that uses the word "vegetal" to refer to a plant-based or pure vegetarian diet. *Merriam-Webster's Collegiate Dictionary* (1998) defines vegetal (derived from the Middle Latin *vegetare*, meaning to grow), a word first used in English in the 15th century, to mean: "1: vegetable. 2. Vegetative..."

Note 2. This is earliest English-language document seen (Aug. 2013) that contains the term "nut milk" (or "nut milks" or "nut-milk") or the term "nut cream" (or "nut creams" or "nut-cream") or the term "lac vegetal" (or "lac-vegetal"). Address: M.D., Battle Creek, Michigan.

64. Sanitas Food Co. 1896. New nut products (Ad). *Chicago Vegetarian* 1(3):8. Nov.

• ***Summary:*** Four products are advertised: 1. Nuttose. Has "the consistency of cheese, having somewhat the appearance and flavor of cold roast mutton." Prepare like meats. 2. Bromose. "Makes fat and blood. This is a product made by malting nuts, and is especially adapted to persons who cannot digest starch." 3. Nut Butter. "A substitute for ordinary butter, presenting fat in the form of a perfect emulsion; combined with water, forms a delicious cream. Used for shortening of all kinds. A pure product of nuts; can be eaten by those who cannot eat ordinary butter." [Note: This may well be peanut butter.] 4. Nut Cream. "A delicate, delicious nut preparation, which, properly diluted, furnishes a delicately-flavored cream or milk. It resembles milk in appearance." Note: It is probably made from peanuts and/or almonds.

"Send 25 cents in stamps for samples. Circulars free on application."

Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "Nut Cream." Address: 65 Washington St., Battle Creek, Michigan.

65. Newberry's. 1896. Just arrived: Another shipment of Health Foods in today from Battle Creek (Ad). *Los Angeles Times.* Dec. 3. p. 7.

• ***Summary:*** "Bromose, Nuttose, Almond Meal, Granose, Caramel Cereal, Granose Flakes and Avanola." Address: 216 and 218 South Spring Street [Los Angeles, California].

66. **Product Name:** [Dr. Lahmann's Vegetable Milk].
Manufacturer's Name: Lahmann, Dr. Heinrich.
Manufacturer's Address: Dresden, Germany.
Date of Introduction: 1896.
How Stored: Shelf stable.
New Product–Documentation: Ad in Ellen Goodell Smith. 1896. *The Fat of the Land and How to Live on It.* Page 196 contains an ad titled "Pure. Vegetable. Nutritive." by The Hygienic Supply Co. (F. Witte), 203-205 Park Ave., Baltimore, Maryland. They are "Importers of German health goods and books" including Dr. Lahmann's Vegetable Milk (for infants), Dr. Lahmann's Vegetable Extract, and Dr. Lahmann's Nutritive Cocoa.

Lahmann, H. 1901. *Natural Hygiene*. London: Swan Sonnenschein. Dr. Lahmann's Vegetable Milk is discussed in detail (p. 149-60). It is made by Hewel & Veithen in Cologne.

M. Fuerstenberg. 1917. Die Soja (The Soybean). p. 32. The most popular vegetable milk is Dr. Lahmann's Vegetable Milk (*Lahmannsche Vegetabile Milch*), an emulsion made

from almonds and nuts.

Note 1. According to *Vegetarisches Kochbuch mit Gesundheit Regeln,* by Carlotto Schultz (1886), Dr. H. Lahmann of Stuttgart is an authority on the feeding of infants and problems related to indigestion. Note 2. Strittmatter (1915, p. 56) says that H. Lahmann M.D. lives in Munich, Germany.

Note 3. Janet Barkas in *The Vegetable Passion* (1975, p. 100) states that Dr. Heinrich Lahmann was an early, influential vegetarian in Germany. "Lahmann traced many illnesses to an over-reliance on meat and unnatural medications." He was one of the first German physicians to use natural healing methods. He was the author of at least 3 major books, his sanitorium generated much enthusiasm, and, at the turn of the century, he founded a vegetarian society in Dresden.

67. Hoy, Albert Harris. 1896. Eating and drinking: The alkalinity of the blood, the test of food and drink in health and disease. Chicago, Illinois: A.C. McClurg and Co. 304 p. Index. 20 cm.

• ***Summary:*** Saliva contains ptyalin, which converts / digests the starch in food into maltose, a sugar. Saliva is a weakly alkaline fluid; acids inhibit its action. After mastication, food is swallowed and enters the stomach–which is normally free of acid for 30-45 minutes during the process of eating (p. 44-47).

Results of experiments published by Dr. J. von Feder show that the increasing alkalinity of the blood is nature's way of overcoming harmful bacteria. After the blood is infected, its alkalinity suddenly increases (p. 82).

Chapter 6 (p. 222-95) is titled "Food, its effects on the alkalinity of the blood." In discussing the subject of vegetarianism, the questions is always raised: "Is animal food, in some form, absolutely essential for all races of men? The answer must be equivocally, no." Vegetarians are divided into two classes, from hygienic [health] and from ethical considerations. Vegetarians of the first class partake of butter, milks, eggs, and cheese–food which can be procured without taking life. Ethical vegetarians eschew the use of animal fat, substituting in its place vegetable fat, as olive oil, cocoa butter, etc. (p. 234-35). The daily ethical vegetarian diet of a healthy woman from Oct. 27 to Nov. 23 is given; it includes Graham bread, nut butter, nuts, cocoanut butter, bananas, grapes, and gluten pancakes (p. 238-43). "That the proper alkalinity of her blood was maintained was shown by the amphoteric condition [capable of reacting chemically either as an acid or as a base] of her morning urine." Vegetarians have always claimed that meat-eating causes both intemperance [over-consumption of alcohol] and excess thirst (p. 244).

The longer meat has stood after an animal dies, the more acid is generated by uric acid. Cooked meat is "less stimulating than rare. Trainers of fighting dogs recognize this and put their brutes on a raw meat diet before contests" (p. 251).

"An artificial milk, made from sweet almonds, is highly recommended in many cases of febrile diseases or in cases of feeble digestion and assimilation, and often given better results than natural milk." Directions for making it at home are given (p. 262-63).

Soups made by pureeing peas, beans and lentils only are "rich in a substance known as legumin, which is simply a vegetable caseine. This is as nourishing as the caseine of milk..." (p. 271).

Gluten "satisfies, by itself, all that nature demands for prolonged and complete nutrition." "The writer recommends it very highly as a non-acid-making, non-fermenting food, and feels justified in asking physicians to give it a thorough trial" (p. 275, 277).

Note: This is the earliest document seen (Aug. 2004) that discusses, systematically and at length, alkalinity, alkaline vs. acid reaction, or the alkalinity of the blood in relation to human health. Note that the author is an M.D. Address: M.D., 103 State Street, Chicago, Illinois.

68. Kellogg, Ella Ervilla Eaton. 1896. Every-day dishes and every-day work. Battle Creek, Michigan: Modern Medicine Publishing Co. 184 p. Index. 24 cm.

• ***Summary:*** The wife of the famous Dr. John Harvey Kellogg discusses her system of meatless cookery–though the term "vegetarian" is not used. She lived 1852-1920. Contents: Eight pages of ads (for books, foods, and medical instruments/devices). Title page. Cereals (incl. Graham grits, Graham apple mush). Preface. Introduction. Cereals (incl. Graham grits, Graham meal). Macaroni. Fermented or yeast bread (incl. whole-wheat bread, Graham or wheat-meal bread). Unfermented or aerated bread (incl. Graham puffs, Granola gems). Fruit (cooking, canning). The leguminous seeds (incl. peas, beans, lima beans, lentils, cooked peanuts). Vegetables. Soups (incl. without milk, with milk and cream; Bran stock). Eggs (incl. cream). Desserts. Pastry. Cake. Toasts. The Battle Creek Sanitarium Health Food Company's products (discusses and contains recipes using Granola, Granose, Crystal Wheat, gluten {13 recipes}, nut butter and nut meal, Nuttose, zwieback, and caramel cereal, p. 139-52). Hints about every-day work. Every-day bills of fare.

The eight ads on unnumbered pages in the front of the book are for: (1) "Caramel-Cereal. A most delicious substitute for the Coffee Bean, and contains none of its harmful properties... Caramel-Cereal has been used for over twenty years at the Battle Creek Sanitarium, and the demand has increased daily... Try it, and you will always use it... Manufactured by Battle Creek Sanitarium Health Food Co." (2) Battle Creek (Mich.) Sanitarium Health Foods. "Eat Granola, Granose. Drink Caramel-Cereal." (3) Charcoal Tablets: Antiseptic... Absorbent. Sanitas Food Company, Battle Creek. (4) Almond Meal, from Sanitas Food Co. (5)

Lac Vegetal or Nut Cream: Prepared from the choicest nuts. A perfect substitute for cow's milk. Sanitas Food Co. (6) Bromose: Makes fat and blood. "Consists of cereals and nuts in which the starch is completely digested... Unequalled as a tissue builder... Gain in flesh." Sanitas Food Co. (7) The natural abdominal supporter. Modern Medicine Co., Battle Creek. (8) *The Stomach: Its Disorders and How to Cure Them,* by J.H. Kellogg, M.D. Modern Medicine Publishing Co.

A table (p. 7) shows the "nutritive value of some common food substances," including sweet almonds, peanuts, five legumes, milk, and six types of meat and poultry, and eggs. Values/columns are given for: Water, albuminous elements, starch, grape sugar, free fat, salts, cellulose, proportion of carbonaceous to nitrogenous material, total nutritive value.

The chapters on cereals and breads include Graham Grits, Wheat-Meal or Graham Mush, whole-wheat breads, Graham breads, Graham Puffs, etc.–but most breads are made with white flour and milk–and fermented. The chapter on leguminous seeds contains two recipes for blanched and boiled peanuts (p. 76); soy beans are not mentioned. Milk, cream, eggs, and sugar are used in moderation throughout the book. There is an entire chapter titled "Eggs." Desserts are generally sweetened with sugar. Up to 1 cup of sugar is used in some recipes (p. 117), but fruits are often used instead; milk or cream are also widely used in desserts. The chapter on "Pastries" (mostly pies) begins by discussing the dietetic evils of pastries; recipes calls for less fat than typical recipes.

The section on "Nut Butter and Nut Meal" (p. 147-49) notes that these two foods "have been prepared as substitutes for butter and cream," which cause many persons to "suffer from biliousness, nervous and sick-headache, and various forms of indigestion." Ten recipes are given. For example (p. 149): "Nut Butter Sandwiches.–Spread slices of thinly cut graham bread with nut butter, and then with chopped dates or figs..." Note 1. Although "peanut butter" is not mentioned, this is almost certainly a peanut butter sandwich. Yet this book contains no recipe for making peanut butter at home.

The section titled "Nuttose" (p. 149-50) states: "This is a pure product of nuts. It is intended as a substitute for meat, which it completely replaces dietetically, having nearly twice the nutritive value, while it furnishes the same elements and in a form much more digestible, and wholly free from the objectionable features of meat. Nuttose may be prepared and served in the same manner as the various forms of flesh food. It so perfectly resembles meat in appearance and flavor, as well as nutritive properties, that many persons find it difficult to distinguish the difference. 7 recipes are given.

The 1¼ page discussion of Zwieback (p. 151) states: "Any one who has ever made a visit to Carlsbad [Karlsbad or Karlovy Vary in today's Czech Republic] will remember the delicious zwieback which occupies so conspicuous a place in the bill of fare... At Carlsbad, zwieback is made by exposing the sour 'schwartz brodt' to moderate heat for several hours until the starch becomes to dextrin and dextrose. For years the Sanitarium Health Food Company has manufactured for the use of the numerous patrons of the Medical and Surgical Sanitarium, Battle Creek, Mich., a superior quality of zwieback, which is not only more palatable but much more wholesome than the original article of Carlsbad manufacture... With milk or cream it is a real delicacy, as toothsome as it is nourishing and easy of digestion. Zwieback is supplied in three grades as follows:–No. 1. Made of graham flour (Sanitarium brand), containing fifteen per cent. of gluten... For recipes, see pages 145 to 138."

Note 2. This is the earliest document seen (July 2004) that contains the word "zwieback" (pronounced SWEE-bak in English). The word is also spelled like this in German, but with a capital "Z" and pronounced TSVEE-bak. The earliest occurrence of the word seen by *Merriam-Webster's Collegiate Dictionary* is 14 March 1894, *New York Weekly Tribune* (p. 5, col. 4). "These Zweiback will keep for a long time if put in a dry place." Note spelling and capitalization!

The eight ads on unnumbered pages in the back of the book are for: (1) Health Foods–Granola, a health food, an invalid food. From Battle Creek Sanitarium Health Food Co. Established 1876. "One pound more than equals three pounds of best beef." (2) Health Foods–Granose, Granola, Caramel-Cereal, Battle Creek Sanitarium Breakfast Food, Germless Oats, Germless Wheat Grits, Germless Corn Grits, Crystal Wheat, gluten preparations, diabetic foods. Send for a catalogue and price list to Battle Creek Sanitarium Health Food Co. (3) "Almond Butter–A substitute for ordinary butter. Presenting fat in the form of a perfect emulsion. Combined with water it forms a delicious cream. Used for shortening of all kinds. A pure product of nuts; can be eaten by those who cannot eat ordinary butter. Send five cents for sample. From: Sanitas Food Co., Battle Creek. (4) "Nuttose–Pure product of nuts. Perfect substitute for all flesh foods. Makes fat and blood. In their natural state nuts are difficult to digest, and cannot be eaten by many persons... Nuttose has the consistency of cheese, and much the consistency of cold roast mutton, and may be eaten cold, stewed, cooked with vegetables or other foods, made into gravies and other preparations in the same manner as meat..." "Send ten cents for a sample can... Ready to eat at once. Keeps indefinitely." From: Sanitas Food Co., Battle Creek.

(5) *Science in the Kitchen,* by Mrs. E.E. Kellogg. Published by Modern Medicine Publishing Co., 65 Washington St., Battle Creek, Michigan. (6) Universal Mercurial Dynamometer, developed by Dr. Kellogg for testing the strength of individual groups of muscles in the human body. From: Sanitary and Electrical Supply Co., Battle Creek. (7) *Home Hand-Book,* by Dr. J.H. Kellogg. Published by Modern Medicine Publishing Co. Over 1,700 pages and 500+ engravings. Describes the best means of

preserving and regaining health. (8) Perfection vaporizer, from Modern Medicine Co. Address: A.M., author of "Science in the Kitchen," etc., Battle Creek, Michigan.

69. Smith, Ellen Goodell. 1896. The fat of the land and how to live on it. Special chapters on nuts and vegetable oils, and how to use them in cooking; milk; bakeries; feeding infants and various other subjects relating to the problem. Amherst, Massachusetts: Press of Carpenter & Morehouse. 251 + [12] p. Portrait. Illust. Index. 20 cm. At top of title page: "A practical cook and text book for general use."
• ***Summary:*** A remarkable and wholistic vegetarian (actually vegan) cookbook by a medical doctor (M.D.). A photo (frontispiece), facing the title page, shows a portrait of Dr. Ellen Smith. Dedication: "To the millions of thinkers who think in new directions, and to other millions who do not stop to think whether they should 'live to eat' or eat to live' this book is dedicated." Facing the table of contents are three quotations from Buddhist and Christian scriptures on the importance of not killing.

The Preface begins: "This book *is* because of the agitation and discussion upon the various phases of the food question. The title indicates its character to be vegetarian; this word however is a misnomer, but as none better has yet been coined, we will simply state that we are vegetarians because we think nature designed us to subsist on the 'fat of the land,' and not on the flesh and blood of beasts, or of any living, sentient creature."

"To be a health and dietetic reformer in the early days of this movement meant much sacrifice and often personal abuse" (p. 10).

"With no desire to set aside the work of the scientists, we accord 'honor to whom honor is due,' and may success attend their gigantic efforts, that seem to be heroically directed toward healing, protecting, and preparing the animal world and their products for human consumption" (p. 11).

This chapter, after listing many of America's major problems, concludes: "From a vegetarian standpoint, these unhealthful conditions of mind and body are largely propagated, nourished and developed and developed from the never ending supply of slaughtered flesh and its stimulating–not nourishing–accompaniments. The moral and physical health of millions is thus undermined, and from such material is created generation after generation of imperfect human beings;..." (p. 11).

Chapter 5, titled "Milk, cream, butter, etc." begins: "Milk, cream, butter, salt and sugar are admissible in hygienic and vegetarian dietary, but in most of the recipes here given are not included... [but] in all cases salt can be added if desired, or milk substituted for water."

Chapter 6, titled "Vegetable oils," notes: "Those at present extensively used for culinary purposes are obtained from the olive, cocoanut and cotton seed." It is almost impossible to obtain olive oil unadulterated. "The *American Analyst* tells us that 'Two-thirds of the olive oil sold in the markets of the world is born in the cotton fields of the southern states" (p. 57). "At Manheim, Germany, cocoanuts have for many years been made into butter for general culinary use... [It] keeps indefinitely and even when exposed to the air *will not become rancid* like animal fat. This butter is also manufactured in England... It is now manufactured in America by the Pure Food Co., Chicago, Illinois" (p. 58). Chapter 6 concludes prophetically: "One need not be a vegetarian or even a hygienist to use these vegetable oils, for these are thousands of families using them, who also use animal food, finding economy in health and purse by so doing." Note 1. This is the earliest document seen (March 2005) that contains the term "Pure Food," probably in connection with the growing "pure food movement" in the USA

Chapter 10, titled "Nuts, their culture and use in cooking," (p. 141-56) discusses almonds (now largely grown in California), walnuts, pecans, Brazil nuts, and peanuts. Peanut oil is largely exported to foreign countries and doubtless returns, with olive oil, under the name of "Pure Olive Oil." "It is said that America uses 4,000,000 bushels of peanuts yearly at a cost to the consumers of $10,000,000. Very rarely do we find these nuts on the table as an article of food, but they are consumed between meals by everybody, from the shoeless and hatless street waif to the gray-haired millionaire." "Unbelievers tell us that a vegetable diet lacks proteids or tissue building elements, and hence that vegetarians are not properly nourished. Science has demonstrated that proteids are abundant in the grains," nuts, and other foods (p. 148-49). The section titled "Nuts as food" (p. 149-53) begins: "Nuts are not only superior to flesh as an article of diet, but may be used in many forms of cookery, either whole, chopped, grated, crushed or ground into a paste or meal." "The pine nut, sold under the name of pegnolia [pignolia], is an excellent nut for cooking." Two sub-sections are titled "Nut substitute for milk" (using cocoanuts, pecans, peanuts, Brazil nuts, etc.) and "Nut butter" (one of the latest novelties). There are recipes for sandwiches with "almond nut butter," and "Peanut sandwiches" spread with a "form of nut butter which flavors so strongly of peanuts that it will make an excellent substitute for dairy butter to spread the bread and hold the crushed nuts in place." Note 2. This book contains no recipe for making peanut butter at home.

Chapter 11, "Salads," contains a long section titled "Japan Soja" (p. 164) which clearly refers to Japanese soy sauce: "A jar of the extract of Japan soja was received too late for careful testing or experiment. But coming from a German vegetarian laboratory [Dr. Lahmann's] and said to be free from injurious substances, it may prove to be a useful addition to the table. Following is a description of the Soy-bean from which it is made.

'Japan Soja, a substitute for flesh meat extracts such as Bovinine, etc. etc. The soy-bean or pea is a small erect

herb, ("Glycine soja," or "soja hispida") of the bean family, "Papilionacees" of India and China, cultivated for its seeds; composed of 38% proteids, 17 to 20% fat, 5% cellulose [fiber] and 4% ashes. The hygienist loses nothing by declining flesh meat extracts of any sort, but substantially gains by adopting Japan Soja, a safe and far more palatable flavoring for various dishes. It may not only be so employed in the preparation of dishes, prior to serving, but subsequently and similarly to Worcestershire sauce, etc.'

The odor and flavor of this preparation is very delicate and may readily supply a need in the dietary of those who are making a change from an animal to a vegetable diet."

The next (and last) paragraph of Chapter 11 (p. 165) notes that commercial samples of "Bromose and nut butter... manufactured in vegetarian laboratories and guaranteed free from animal fat" were "received at 'the eleventh hour,' too late for critical experiment... Crushed nuts, nut butter and nut meal of home make were used in all preceding recipes containing nuts."

Chapter 12, titled "Condiments and seasonings" (p. 167-71) argues against the use of salt, spices (including pepper, mustard, ginger, etc.), and commercial condiments. "Salt destroys natural flavor and gives its own flavor to all food... Salt also induces unnatural thirst,..." Instead, why not grow and use "sweet herbs" and "aromatic seeds." "Why may not sweet marjoram, sweet basil, rosemary and lavender, lemon verbena, rose and geranium leaves lend their exquisite flavors to our food? Thyme, parsley, sage and mints of various kinds..." Note 3. This general attitude may explain why Japanese soy sauce, a commercial condiment, was not considered a condiment and included in this chapter.

A "Directory" (p. 246) lists 13 sources of "pure food products" including: "Health foods: Dr. J.H. Kellogg, Battle Creek, Michigan. Nut preparations: Sanitas Food Co., Battle Creek, Michigan... Vegetable milk, etc.: Hygienic Supply Co., 203-05 Park avenue, Baltimore, Maryland... Readshaw's Forest Mills Graham Flour (Original) and cereals, Dansville, New York."

A full-page ad (p. 255) describes products made and sold by the Sanitas Food Company (Battle Creek, Michigan) titled "Pure Products of Nuts." These include Bromose, Nuttose, Nut-Butter [probably peanut butter], and Nut-Meal.

A full-page ad (p. 258) is titled "Pure. Vegetable. Nutritive," by The Hygienic Supply Co. (F. Witte), 203-205 Park Ave., Baltimore, Maryland. They are "Importers of German health goods and books" including Dr. Lahmann's Japan Soja, which "Is a pure vegetable extract, which is far superior to Meat Extract. It can be used for making soups, or may be added to other foods in order to make them more appetizing. Price per jar, $1.00." (Note 4. According to *Vegetarisches Kochbuch mit Gesundheit Regeln,* by Carlotto Schultz {1886}, Dr. H. Lahmann of Stuttgart is an authority on the feeding of infants and problems related to indigestion.) Other products imported from Germany by this company include Dr. Lahmann's Vegetable Milk (for infants), Dr. Lahmann's Vegetable Extract, and Dr. Lahmann's Nutritive Cocoa.

Note 5. This is the second earliest English-language document seen (Aug. 2013) that contains the term "Vegetable Milk." This non-soy product is an emulsion made from almonds and nuts.

Page 259 contains an ad for *Health-Culture: A Journal of Practical Hygiene* by The Health-Culture Co., 341 Fifth Ave., New York.

Page 260 contains an ad for *Food, Home and Garden,* a periodical edited by Rev. Henry S. Clubb of the Vegetarian Society of America, 310 Chestnut St., Philadelphia, Pennsylvania.

Note 6. Notice that this book contains no chapter on main dishes or entrees; unleavened Graham bread (made with "entire wheat flour") was considered the best main dish. Very few the many recipes call for the use of dairy products, eggs, animal fats, or honey, and in each case they are optional.

Chapter 13, "Pudding, pastries and cakes," convincingly questions the need for this entire category of foods, but those who *must* have such sweets are encouraged (p. 176-77) to use water instead of milk, vegetable fats instead of animal fats and dairy products, reduce the number of eggs and the amount of sugar used by one-half or more, and gradually eliminate spices and salt.

Chapter 14, "Milk and the cow" makes a strong case for not using these animal products.

A woman cited several times (p. 68, 177) as an authority on foods is Mrs. Emma P. Ewing. Address: M.D., Pansy Park, Dwight, Massachusetts.

70. Kellogg, John Harvey. 1896? Cow's milk a cause of disease (Brochure). Battle Creek, Michigan. 18 p. Undated. 15 cm.

• ***Summary:*** Contents: Introduction. General suspicion of cow's milk. Milk a natural food for infants, but not for adults. Why milk disagrees with adults. Milk the cause of biliousness. Milk the cause of nervous headache, or migraine. A vegetable substitute for milk (Lac Vegetal, or Nut Cream, sterilized in half pound tin cans). Nuts and fruits remain man's natural diet. The advantages of Nut Cream (10 advantages). Directions for use.

Infants who cannot digest cow's milk should "add one part of Nut Cream to six parts of thin gruel made of the Sanitarium Infant Food, or Sanitarium Gluten Meal. Every one who has seen Nut Cream and tasted it, is astonished that so close an imitation of milk could be produced from nuts. It constitutes one of the most useful and interesting products of the many experiments which have been conducted by the Sanitas Food Co. Taken together with Nuttose, nut cheese, and nut butter, Nut Cream completes the list of substitutes for most common animal food substances; namely, meat and

milk and their products."

Note: This brochure was probably published shortly after an article by the same title appeared in *Modern Medicine and Bacteriological Review* (Battle Creek, Michigan) (Sept. 1896, p. 220-23)–because it is longer and more detailed. Address: M.D., Battle Creek, Michigan.

71. Newberry's. 1897. Health, 'Lead in quality and quantity.' We are headquarters for Battle Creek Sanitarium Health Foods. The following is a partial list (Ad). *Los Angeles Times.* March 7. p. 27.

• ***Summary:*** "Granose Flakes–20¢ a package. Arenola–15¢ a package. Granola–15¢ a package. Bromose–50¢ a package. Nuttose–25¢ a can. Zwieback–15¢ a package. Glutin [Gluten] Biscuits–40¢ a package. Glutin Wafers–25¢ a package. Caramel Cereal, a substitute for coffee–15¢ a pound. Whole Wheat Wafers–15¢ a package.

"Just in a large shipment of shredded whole wheat biscuits, from Worcester, Massachusetts, 15¢ a package." Address: 216 and 218 South Spring Street [Los Angeles, California].

72. Kellogg, John H. 1897. Vegetable substitute for milk. *Good Health* (*Battle Creek, Michigan*) 32(4):245. April.

• ***Summary:*** The cocoanut furnishes a satisfactory substitute for cow's milk to millions of people in tropical countries. For the past 20 years, Dr. Kellogg has been searching for a suitable substitute for milk to meet the dietetic requirements of invalids. About 18 months ago he "succeeded in producing a very palatable substitute for milk, which was termed 'Lac Vegetal.'... It can not be offered with confidence as a thoroughly satisfactory substitute for animal milk. Lac vegetal, or nut cream, is made from the choicest nuts, and is thoroughly sterilized. Its composition is such that it constitutes a perfect and symmetrical food." It is made from almonds.

"Lac vegetal, when diluted, has precisely the appearance of cow's milk; and if allowed to stand, a cream will rise upon it.

"In experiments made with nut milk it has been found to have a delicate, delightful flavor, with a suggestion of its nutty origin, but resembles cow's milk very closely indeed. It agrees with the most delicate stomach, and can be taken with perfect impunity by persons who cannot take cow's milk or cream even in the smallest quantities without suffering more or less severely in consequence. Added to cow's milk in proper proportion, lac vegetal, or nut cream, prevents the formation of hard curds in the stomach, as when the cow's milk is used alone. This renders it an exceedingly valuable food for infants,–vastly superior to any infant's food which has been devised." Address: M.D., Battle Creek, Michigan.

73. Langworthy, C.F. 1897. Soy beans as food for man. *Farmers' Bulletin* (*USDA*) No. 58. p. 20-23. July 7. Revised (very slightly) in 1899. [1 ref]

• ***Summary:*** Describes and gives the nutritional composition of various Japanese soyfoods, including natto, miso (white, red, or Swiss), tofu, frozen tofu, yuba, shoyu. Many of his descriptions of soyfoods are based on Trimble (1896).

"Tofu, or bean cheese, is prepared as follows: The beans are soaked in water for about twelve hours, and crushed between millstones until of a uniform consistency. The ground material is then boiled with about three times its bulk of water for about an hour, and filtered through cloth. The filtrate is white and opaque, having somewhat the appearance of milk. It has, however, the taste and smell of malt. This milky liquid, to some extent, resembles cow's milk in composition, as is shown by the following table:" The table, titled "Comparison of the composition of soy-bean milk and cows' milk," shows that the two liquids (soy / cow) have the following composition: Water 92.53% / 86.08%, albuminoids 3.02% / 4.00%, fat 2.13% / 3.05%, etc.

"The protein in soy-bean milk is precipitated by adding the mother liquor obtained in the manufacture of salt from sea water, which contains considerable magnesium chloride. The precipitate is filtered off and formed into cakes with the hands. It is eaten in the fresh state or frozen. In the latter case it loses part of its water."

"Though these soy-bean products are prepared chiefly in Japan and other eastern countries, their manufacture has been attempted to some extent in Switzerland and elsewhere..."

"Bean sausages in considerable variety are prepared in Germany, and formed part of the ration of the German soldier in the Franco-Prussian war. So far as can be learned, these are always made from ordinary varieties of beans and not from soy beans...

"Under the name of coffee beans, soy beans are eaten to some extent in Switzerland as a vegetable, and dried and roasted are also used as a coffee substitute. Their use for this latter purpose is not unknown in America. The attempt has recently been made by certain dealers to place the soy bean on the market as a new substitute for coffee and to sell it under other names at an exorbitant price.

"Bulletin No. 98 of the North Carolina Experiment Station recommends soy beans as a palatable vegetable when prepared as follows: Soak the beans until the skins come off and stir in water until the skins rise to the surface and then remove them. Boil the beans with bacon until soft, season with pepper, salt, and butter, and serve hot. If the beans are green the preliminary soaking may be omitted. No other references to the use of soy beans for human food in the United States have been found."

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy-bean milk." It is also the earliest U.S. government document or USDA document seen (Aug. 2013) that uses the term "soy-bean milk" (or any other term containing the word "milk") to refer to soymilk.

Note 2. This is the earliest document seen (Jan. 2005) concerning the work of the USDA with nutrition (or home economics) and soybeans. Address: Office of Experiment Stations, USDA, Washington, DC.

74. *Kokomo Daily Tribune* (*Indiana*). 1897. The latest in butter: Kokomo has a new industry making butter from peanuts. The dairy cow faces a new enemy in the butter markets of the world–a good substitute. Nov. 16. p. 4, col. 3.
• ***Summary:*** "Butter made out of peanuts is a new thing in dairying. Kokomo has a factory that makes butter from peanuts–the real, prime, good old yellow cow butter, to all appearances."

"The manufacturers of this new commodity are Lane Bros., the well known manufacturers of Lane Bros. Cereal Coffee. Their factory on McCann St. has enlarged its borders and is now making peanut butter. Peanut cream is also being made to put in the Cereal Coffee. This is no joke. Lane Bros. are actually making cream and butter at their factory and are making it from peanuts–just common, ordinary 'goobers' grown in Georgia. Of course, only the best quality of nuts are used in the erection of the new fangled butter and the highest grade of 'goobers' only enter into the article.

"The nut being ground as fine as the finest flour and the oil in it makes a sightly, palatable and wholesome article of diet. It is said to be an admirable substitute for real butter and some like it better. It can be colored to suit the eye and resembles the genuine stuff. "Peanut cream is made from peanut butter–the butter being thinned to the required consistency. Both articles are in good and growing demand for table use and if the consumption continues to increase at the present rate the old barn yard cow will have a formidable competitor in the butter markets of the world.

"The little peanut may in time relegate the old brindle cow to the rear just as the horse is being displaced by the electric car and the horseless carriage."

Note 1. This is the 2nd earliest English-language document seen (May 2005) that contains the term "peanut butter."

Note 2. This is the 2nd earliest document seen (May 2005) worldwide that describes commercial production of peanut butter or peanut cream. This and later documents indicate that Lane Brothers began commercial production of peanut butter in late 1897, definitely by Nov. 16.

Note 3. This is the earliest English-language document seen (Aug. 2013) that contains the term "Peanut cream" which is used to refer to thick peanut milk.

Talk with Bonnie Van Kley, Curator of Archives, Howard County Historical Society, Kokomo, Indiana. 2004. Jan. 13. Bonnie found this important article by consulting a librarian (in the Kokomo Public Library, local history services room), who had an old, obscure index that contained a card citing this article.

75. Kellogg, John Harvey. 1897. Nuts for diabetics: Editorial. *Modern Medicine and Bacteriological Review* (*Battle Creek, Michigan*) 6(11):274-77. Nov.
• ***Summary:*** "In view of the high nutrient value of nuts, it is astonishing that they have heretofore been so little employed as a source of food by civilized nations." The ancient Arcadians in Italy used chestnuts. The Indians of California used pine-nuts. The cocoanut furnishes food for vast multitudes of people in the Pacific islands and tropical countries. The hickory-nut, the walnut, and the butternut are also valuable foods. In "their natural condition [raw] they are somewhat difficult of digestion, and so have been altogether excluded from diet lists... Even peanuts, which are perhaps the most refractory to digestion of all nuts, may be so prepared as to be acceptable to the most delicate and sensitive stomach.

The especial characteristics of nuts, from a dietetic standpoint, are the almost entire absence of starch and allied substances, and an abundance of proteids and fats... This fact is well shown by the accompanying table." It gives values for the walnut, hazelnut, sweet almonds, peanuts, and cocoanut." Most contain a much larger proportion of proteids than beefsteak.

"Some extensive experiments have recently been made in Germany for the purpose of determining the food value of the peanut. The material used is what is known as the 'oil-cake,' a residue of the oil industry. Some thousands of tons are annually imported to Germany for the purpose of making salad oil, a large portion of which is sold in this country as olive-oil." More than 25 factories in Germany are engaged in this process.

"Within the last few years the writer has made many experiments with nut products of various sorts in diabetes and other disorders, and has found the following preparations extremely valuable:-

"1. Nuttose.–This is a thoroughly cooked and sterilized product of nuts, chiefly peanuts. Nuttose is made into the form of a cheesey mass which readily dissolves in the digestive fluids, the nuts having been first completely disintegrated and then thoroughly cooked" [steamed or blanched].

"2. Nut meals of various sorts.–These are chiefly almond meal and nut meal, the latter consisting of an admixture of nuts." They can be added to cakes, soups, etc. or used for shortening pie crusts.

"3. A sterilized nut butter.–This preparation consists of a combination of nuts which have been first thoroughly blanched, then completely disintegrated by conversion into a paste, and finally cooked at a temperature which secures complete sterilization. This product is an excellent substitute for butter and shortening of all kinds. When mixed with water it makes a very delicious nut cream or milk, and is very readily assimilable.

"Fürbringer's examination of the fecal matters of

persons fed upon nuts shows that roasted peanuts in their ordinary form are practically indigestible, coarse particles being found in about the same condition as when swallowed. When reduced to a paste, roasted peanuts are much more digestible, but, for perfect digestibility, the nut needs to be subjected to long cooking at a lower temperature than that employed for roasting.

"Luedtke has shown that the proteids of the peanut are much more easily digestible than those of beans, peas, lentils, etc..." Address: M.D., Battle Creek, Michigan.

76. Trimble, Henry. 1897. The soy bean. *American J. of Pharmacy* 69:584-93. Nov. [11 ref]
• ***Summary:*** Much of this material is derived from Williams and Langworthy (1897). Illustrations (p. 585, from Williams, p. 5) show: (a) flowering branch of a soy bean plant (reduced 2/3), (b) one of the flowers (enlarged), (c) pods of a soy bean plant (reduced 2/3).

One table (p. 588) shows the chemical composition of various kinds of forage made from the soy bean (fresh or air-dry substance, or water-free substance): Fodder (early bloom to early seed), soy-bean hay, straw, straw (hulls and vines after threshing), soy-bean seed, soy-bean meal (18.9% / 21.0% fat), soy-bean ensilage, corn and soy-bean ensilage, millet and soy bean ensilage.

Another table (p. 591) shows the composition of the following "Soy-bean food products": Fresh tofu, frozen tofu, natto, yuba, white miso, red miso, Swiss miso, and two types of shoyu. For each is given the percentage of water, protein, fat, nitrogen-free extract, fiber, and ash [minerals].

Note: This is the earliest English-language document seen (Sept. 2011) that contains the term "soy-bean food" or "soy-bean food products." It is also the earliest document seen (Sept. 2011) concerning the etymology of the word "soyfoods." Address: USA.

77. Angell, Stephen H. 1897. Soya as food and fodder. *Consular Reports* [*USA*] 55(207):551-52. Dec. [2 ref. Eng]
• ***Summary:*** A remarkable article about all aspects of soybeans and soyfoods. It begins: "The following is a translation from an article by M. Henri Fortune, the well-known French agriculturist. 'There exists a plant extensively cultivated throughout China, Japan, Cochin China, and Tonquin, of which the culture on clay and flinty clay lands would be an excellent experiment for agriculturists and persons interested in the progress of agriculture. This plant acclimatizes perfectly in Belgium.

"'It is employed in the above countries as a food and for divers other purposes. Transformed by cooking into a pulp, which is mixed with salt and rice, we obtain the 'miso,' which constitutes the regulation breakfast of the Japanese. I have eaten this preparation in Yedo [Edo, Tokyo] in 1892, and I found it excellent in taste and very nourishing.

"'Mixed with barley, fermented with water and pressed, this product yields a sirup known as the "soya," which is, so to speak, the unique sauce for all and every Japanese dish, and is employed in such large quantities that the works in the town of Nagasaki have a yearly production of 2,000 tons. The soya also yields a very superior quality of oil, which advantageously replaces olive oil.'"

"'The bread made from the flour of the soya is as good as cake without sugar, and is very appetizing, and is not to be compared with gluten bread, which constipates.'" Fortune believes that 'soya bread is twice as nourishing as wheaten bread, five times as poor in starch, and ten times as rich in fatty materials, and, once its qualities are fully known, the soya may be pronounced the bread of the future.' He recommends the use of soya in bread and biscuits for diabetic diets.

"'In China, the soya replaces milk, which the Chinese do not drink at all. To make this milk, the grain must be crushed, put in a sieve, water slowly poured over it, and a product obtained having all the qualities of milk.

"'The cheese made from soya is delicious. The grain is softened in water and pounded in a mortar. The pulp compressed in a cloth gives two parts; that which is hard is used to feed poultry, etc., and the other, which passes through the cloth, is albumen, and is put on the fire, the curds separated with the aid of rennet, and, when coagulated, a little salt is added.'"

Of green vegetable soybeans he writes: "'We have a project in hand to call together the principal Paris restaurant keepers this winter, to allow them to partake of this new vegetable, which will advertise it throughout the world under the patronage of such substantial connoisseurs.

"'In a few years hence, one will buy soya at the grocers, as to-day one buys beans. It is an excellent substitute for hay, and keeps horses in good condition, and cows, when fed on it, will yield at least 20 per cent more milk daily than when fed on ordinary hay.

"'The soya produces per hectare (2.471 acres) from 2,500 to 3,000 kilograms (5,512 to 6,614 pounds) of seed, especially if phosphate fertilizers are sufficiently employed.'"

Note: This is the earliest document seen (Feb. 2001) concerning soybeans in Belgium, or the cultivation of soybeans in Belgium. This document contains the earliest date seen for soybeans in Belgium, or the cultivation of soybeans in Belgium (Dec. 1897). The source of these soybeans is unknown. Address: Commercial Agent, Roubaix, France July 13, 1897.

78. Sanitas Nut Food Co., Ltd. 1897. Eat Bromose, Maltol, Malted Nuts (Ad). *Gospel of Health* (*Battle Creek, Michigan; Seventh-day Adventist*) 1(11):2. Dec.
• ***Summary:*** A ½-page ad. "Are you thin? Would you like to get fat? 'Laugh and grow fat' is an old adage which may have in it a grain of truth, but thousands of scrawny

individuals will testify that something more than laughter is necessary to produce plump, rosy cheeks and a rotund figure. Fat- and blood-making foods are necessary. We have three new foods, all produced from nuts, which make fat faster than any other food remedies known. Send for brochure 'How to Get Fat,' for circulars; and if you wish a sample of foods, enclose ten cents." Address: Battle Creek. Michigan.

79. Kellogg, Ella Ervilla (Eaton) (Mrs.). 1897. Every-day dishes and every-day work. Battle Creek, Michigan: Modern Medicine Publishing Co. 184 p. Index. 22 cm. [2 ref]
• ***Summary:*** The text of this book is identical to that of the 1896 edition, and on the same pages. However the order and location of the ads are different.

The eight ads on unnumbered pages in the front of the book are for: (1) *Science in the Kitchen,* by Mrs. E.E. Kellogg. Published by Modern Medicine Publishing Co., 65 Washington St., Battle Creek, Michigan. (2) Universal Mercurial Dynamometer, developed by Dr. Kellogg for testing the strength of individual groups of muscles in the human body. From: Sanitary and Electrical Supply Co., Battle Creek. (3) *Home Hand-Book,* by Dr. J.H. Kellogg. Published by Modern Medicine Publishing Co. Over 1,700 pages and 500+ engravings. Describes the best means of preserving and regaining health. (4) Perfection vaporizer, from Modern Medicine Co. (5) Health Foods–Granola–a health food, an invalid food. From Battle Creek Sanitarium Health Food Co. (6) Health Foods–Granose, Granola, Caramel-Cereal, Battle Creek Sanitarium Breakfast Food, Germless Oats, Germless Wheat Grits, Germless Corn Grits, Crystal Wheat, gluten preparations, diabetic foods. Send for a catalogue and price list to Battle Creek Sanitarium Health Food Co. (7) "Almond Butter–A substitute for ordinary butter. Presenting fat in the form of a perfect emulsion. Combined with water it forms a delicious cream. Used for shortening of all kinds. A pure product of nuts; can be eaten by those who cannot eat ordinary butter. Send five cents for sample. From: Sanitas Food Co., Battle Creek. (8) "Nuttose–Pure product of nuts. Perfect substitute for all flesh foods. Makes fat and blood. In their natural state nuts are difficult to digest, and cannot be eaten by many persons... Nuttose has the consistency of cheese, and much the consistency of cold roast mutton, and may be eaten cold, stewed, cooked with vegetables or other foods, made into gravies and other preparations in the same manner as meat..." "Send ten cents for a sample can... Ready to eat at once. Keeps indefinitely." From: Sanitas Food Co., Battle Creek.

The last 8 unnumbered pages of the book contain more ads. Foods from Sanitas Food Co. in Battle Creek include: Almond Meal, Lac Vegetal or Nut Cream ("Prepared from the choicest nuts. A perfect substitute for cow's milk. Added to cow's milk, it increases its digestibility. Especially valuable for invalids and infants"), and Bromose ("Consists of nuts and cereals, in which the starch is perfectly digested... It is the most easily digested and most fattening of all foods.").

Other terms *not* seen in this book: Bran, roughage, dietary fiber, or fiber (but cellulose is mentioned in a table on p. 7).

A slightly enlarged edition (186 p.) of this book was published in 1898, and another in 1900 (copyright 1896). Address: Battle Creek, Michigan.

80. Newberry's. 1898. 'Lead in quality and quantity.' Battle Creek Health Foods are the best pure foods in the world (Ad). *Los Angeles Times.* Feb. 2. p. 7.
• ***Summary:*** "Granose Flakes–1-lb package 20¢. Granose Biscuits–1-lb package 20¢. Avanola–2 packages 15¢. Wheat Gluten–15¢ a package. Wheat Granola–2 packages 25¢. Zwieback–2 packages 25¢. Ralston Breakfast Food–2 packages 25¢. Selected Bran–4-lb package 10¢. Malted Nuts–1-lb package 65¢. Maltol–1-lb package 55¢. Bromose–1-lb package 50¢. Gluten Farina–3 packages 25¢. Caramel Cereal a fragrant and palatable drink, as a substitute for coffee–2 packages 25¢.

"The Hotel Green of Pasadena and San Gabriel Pulmonary Sanatarium are supplying their patrons with the famous Glen Rock Water." Note: An early record of selling bottled water. Address: 216 and 218 South Spring Street [Los Angeles, California]. Phone: Main 26.

81. Sanitas Nut Food Co., Ltd. 1898. Twentieth century foods (Ad). *Gospel of Health* (*Battle Creek, Michigan; Seventh-day Adventist*) 2(5):106. May.
• ***Summary:*** A ½-page ad. The company makes the following foods: Ambrosia. Bromose. Nuttose. Nut Butter. Malted Nuts. Maltol. Address: A 25, Battle Creek. Michigan.

82. *Good Health* (*Battle Creek, Michigan*). 1898. The medical opinion of the Battle Creek Sanitarium Health Food Company's products. 33(6):391. June.
• ***Summary:*** The London *Lancet* is one of the leading medical publications of the world. It is recognized as an eminent authority in all parts of the civilized globe. A recent issue contains the following reference to the foods manufactured by the Battle Creek Sanitarium Health Food Company and the Sanitas Nut Food Company: -

"'There are some novel and interesting dietetic preparations in the list of this company. They consist chiefly of food prepared from cereals and from nuts.

"'Granose Flakes,' for example consists of light brown flakes resembling potato chips, which on analysis present the composition of wheaten flour of superior quality–that is, flour in which all the essential food constituents are retained. The nitrogen amounted to 2.14 per cent., which is equivalent to a total of 13.37 per cent. albuminoids. The moisture amounted to 12.02 per cent., and the mineral matter to 2.09 per cent. The microscope showed the presence of starch

granules highly distorted by cooking, probably by steam. The preparation is undoubtedly nutritious, not merely on account of its composition, but also because the constituents are prepared for the digestive process.

"'Nuttose' is an oily compound prepared from nuts. The fat is in a finely divided state, amounting to an emulsified condition, while the carbohydrates and nitrogenous matter are previously treated so as to render them easy of digestion.'"

Bromose and Caramel Cereal (an alternative to coffee) are also discussed.

83. Dujardin-Beaumetz, Prof. 1898. The soya bean: A vegetarian treasure. *Vegetarian* (*The*) (*London*). July 23. p. 468.

• ***Summary:*** From *Health News:* The Soja, or Soya bean, is the Japanese bean (*Glycine soja*), cultivated in certain countries of Europe, and more particularly in Hungary, since 1875. This bean, which contains extremely little starch, and has been employed in the dietetic treatment of diabetes by Lecerf, contains a very large amount of albuminoid matter (flesh formers); and, on referring to the different analyses published by Steuff [Steuf], Capan, Pellet, and Muntz, we find the following percentage of alimentary principles contained in the bean:–Albuminoid matter, 36.67 per cent.; fatty matter, 17.60 per cent. If this analysis is compared with that of meat, the Japanese bean has a decided advantage over beef.

"From an alimentary point of view, the soya bean serves several uses. A sauce is made from it, which bears the name of *stiso* [*miso?*] and *soju* [shoyu], but the most curious and interesting point in the application of soja to dietetics, is a kind of cheese made from it–it is the *pea or bean cheese* [tofu], very much prized in Japan.

"In Europe, the soya bean has been utilized as the food of men and animals, and in the last few years the attempt has been made to make bread of it, which is a matter of considerable difficulty, by reason of the large proportion of oil which this bean contains. This oil, as Leon Petit has shown, is very purgative, and might replace castor oil in medical practice. Hence it becomes a necessary to rid the meal of this oil, in order to render it fit for domestic use. Lecerf, in Paris, and Bourdin, in Rheims, have succeeded in rendering the bread made from this meal very well borne by the stomach.

"Here, then we have a bean which is more nutritive than meat, and which serves for nourishment to a great country like Japan, under the different forms of sauce, of cheese, of farina, and even of an artificial milk. The advantage which the Vegetarian dietary may derive from such a food is evident." Address: Physician to the Cochin Hospital, Paris.

84. Kellogg, John Harvey. 1898. Re: Medical missionary work, use of the tongue in diagnosis, and work with nuts. Letter to Ellen G. White, "Sunnyside," Cooranbong, N.S.W., Australia, July 29. 5 p. Typed, with signature.

• ***Summary:*** The letter, written on ornate Battle Creek Sanitarium letterhead (illustrations show two views of the "San") and addressed to "Dear Sister White," begins with a discussion of Dr. Kellogg's views of the importance of medical missionary work by the General Conference and its president Eld. [Elder] Irwin who is "a thorough-going health reformer. At the college View Conference last year he showed me his tongue. It was thickly coated, about the worst looking tongue I ever saw. He complained of constant pressure and headache, and was laboring under great difficulties. I called his attention to the fact that he was using milk and cream. I advised that he discontinue them and take a diet of fruits, grains, and nuts as a source of fat and albumen, and take once in a while a meal of fruit only. He adopted this plan with most excellent results.

"We have continued our experiments with nuts until now we are able to dispense with butter, milk, and cream altogether. In our Health Food department, we no longer use any animal fat of any kind but shorten our crackers, rolls, etc. with nuts and with such excellent success every one pronounces them more palatable and excellent in every way. I feel more thankful than I can say that we are at last delivered from the Beast entirely in diet at any rate."

Note 1. The preceding paragraph suggests that Dr. Kellogg was developing peanut butter, peanut milk, and peanut cream. If so, this is the earliest 2nd document seen (Aug. 2013) that refers to peanut milk.

Note 2. The letterhead states that the medical staff at the Sanitarium and hospital includes: J.H. Kellogg, M.D.; Kate Lindsay, M.D.; Lou C. Cleveland, M.D.; David Paulson, M.D.; Ruth O. Bryant, M.D.; D.H. Kress, M.D.; G.H. Heald, M.D.; Lauretta Kress, M.D. Abbie M. Winegar, M.D.; Howard F. Rand, M.D.; C.E. Stewart, M.D.

Note 3. The original letter is in the Ellen G. White Papers, Incoming papers, Ellen G. White Estate, Inc., General Conference of Seventh-day Adventists, 12501 Old Columbia Pike, Silver Spring, Maryland 20904-6600. Address: M.D., Superintendent, Battle Creek Sanitarium, Battle Creek, Michigan. Phone: Nos. 135, 45, 188.

85. *Kokomo Dispatch* (*Indiana*). 1898. Bucking the cow: Butter from peanuts and how it is manufactured. A Kokomo product growing in demand–locks horns with the farm cow in many markets. Nov. 12. p. 2, col. 3.

• ***Summary:*** "Out on Courtland avenue, near the Palmer school-house, stands a curious little factory. It is a modest frame edifice of one story, architecturally speaking, but it has another story but little known even in the immediate neighborhood of its location. This factory is engaged in the manufacture of butter from peanuts, a rather queer procedure one might say, but nevertheless a real, genuine occupation, started up in opposition to the saffron Jersey "sookey"

[sookie, used as a call to cows] of the farm barn. The little peanut butter factory stands just across the street from a large dairy barn, which location gives evidence that the 'goober' is bearding the lion in its den [boldly confronting, opposing, and defying a powerful opponent].

"The butter made from peanuts is hairless. Like Samson shorn of his locks, the peanut butter does not attain the prodigious strength that the product of the cow is capable of, especially of the kind that frequents cheap boarding houses and depot restaurants of neighboring towns.

"The proprietor of this new industry is George B. Lane (formerly Lane Brothers), and he is doing a thriving business. The process of manufacture is simple, but interesting. Nearly a year ago Mr. Lane began in a small way to convert peanuts into butter, using Georgia and Virginia nuts, but he soon discovered that the American grown 'goobers' did not fit the bill. He now uses the Spanish nuts grown at the Philippines, Cuba, and Porto Rico.

"At the present cost of the tropical bean the butter is made and sold at fifteen cents per pound, and if these islands become American possessions the butter will be less expensive.

"Mr. Lane makes no secret of his process, and anybody who has the machinery and understands the business can make the butter. The hulled peanuts are carefully hand-picked to remove all the imperfect grains, after which the nuts are put into a baker's rotary oven and roasted to a rich brown color. After roasting the nuts are again gone over by hand to rid them of scorched and faulty ones. They are then put into a hopper and ground to the finest of flower. The product comes from the mill looking very much like putty, the natural oil of the nut giving it that consistency. This completes that manufacture, nothing being added, not even salt. It goes into the mill a peanut and comes out butter. It never goes rancid, keeps in any climate and does not stale with age.

"The butter is put up [packed] in one, two, five, ten, twenty-five and 100-pound cans and sealed. It is used for every purpose cow butter is used and is said to be an excellent substitute for the output of the cow. Rich 'Jersey' cream is also made by reducing the butter with pure water. Sky-blue milk, if wanted, will appear through the liberal application of water in the reducing process.

"The peanut butter is in great demand at health resorts and sanitariums throughout the country. It also finds favor with camping parties. Mr. Lane recently filled large orders for the annual camp meeting of the Indiana Baptists at Logansport and Rushville, and had the Spanish war lasted a little longer the butter probably would have been in use in feeding the United States soldiers–a ration the boys would have appreciated, as no butter of any kind was issued to them. The new butter is very pleasant to the taste, and physicians say it is more healthful than that produced by the cow.

"Mr. Lane also manufactures Lane Bros.' cereal, graham crackers and other health foods, having quite a large trade in Indiana and adjoining states."

Note: Mr. Lane roasts his peanuts, whereas his mentor, Dr. Kellogg, at Battle Creek, Michigan, did not.

86. Trabut, Louis. 1898. Le soja [The soybean]. *Algerie, Service Botanique, Informations Agricoles. Bulletin* No. 16. 7 p. [7 ref. Fre]

• ***Summary:*** The author, who demonstrates a good knowledge of American and European publications on the soybean, has cultivated soybean varieties at Alger (Algiers) and Rouïba since 1896. The soybean resists dryness well. "Soya (*le Soja*) has remained a curiosity and is not well known among agriculturists. This is explained by the large diversity of soybean races having very different needs, and also by their very varied aptitudes and uses. This is not astonishing, for soya is cultivated in the country of its origin in both temperate and tropical zones, and is used for the feeding of animals, which eat it in the form of grain, hay, and green forage. It plays a major role in the human diet, providing abundant nutrition in the form of sauce, vegetable milk (*lait végétal*) or cheese [tofu], oil, flour, and bread. Soya completes rice, which is lacking in nitrogen. It is very widely used, furnishing, at a low price, a food which replaces meat or fish." Note 1. This is the earliest French-language document seen (Aug. 2013) that uses the term *lait végétal* to refer to soymilk.

"We have made the mistake of presenting soya as a rival to the haricot bean: the comparison turned out to be advantageous for the latter legume (haricot) and soya was rejected.

"In Algeria we think that, for the moment, soya must be looked at primarily as a forage plant. Very remarkable for its richness in nitrogenous materials and fat, it can be very useful in the feeding of animals, for fattening and for the production of dairy milk. Its role in the human diet is less evident, however the indigenous people might find a precious resource in this legume. The soya would perfectly complement 'bechna' [probably a local grain] and barley, which are used to make a flat cake which, is too low in nitrogenous materials."

"At this station the maximum yield has been obtained from a large yellow soybean obtained directly from China. On an area of 10 ares (1,000 square meters or 0.1 hectare) the yield has been 30 tonnes/ha of green forage giving about 70 quintals (7,000 kg) of dry forage." Note 2. This is the earliest document seen (Jan. 2001) that uses the word "quintals" (or quintal") in connection with soybeans. Note: 1 quintal = 100 kg.

"The yield of the seed had been high enough that cultivation of soybeans can be considered profitable. The early varieties have given the following yields in kg/hectare at the Rouïba Station in 1896/1897: Chocolate dwarf 1370

(not watered)/1735 (watered). Compact green 2980/1735. Yellow early 2500/1785. The spring of 1896 was very rainy, while the spring of 1897 was very dry and it was necessary to water the crop.

On page 7 is a brief description of miso, shoyu, and tofu (made by coagulation of soymilk).

Concerning nodulation: Until this year, the numerous varieties of soya which I have cultivated at the station did not show any trace of nodulation on the roots; it is therefore evident that in our soils the special microbe which determines these nodules or tumors is not present. In Jan. 1897 I contacted Prof. Kirchner (at the School of Agriculture at Hohenheim), who is especially interested in the rhizobium of soya, and I asked him to send me several nodules in order to allow me to introduce to the soya crops here the microbe which assimilates atmospheric nitrogen.

All the pots that were inoculated produced soybeans whose roots were covered with nodules the size of peas. It was not formerly possible to appreciate the influence of the nodules on the development of the plant. Field trials concerning this point will be made during 1898.

An illustration (non-original, p. 2) shows a soybean plant (from an original in Carrière 1880). Address: Algeria.

87. White, Ellen G. 1899. Re: Work with health foods, including peanuts. Attitude toward nuts (1868-1876). Letter to John Harvey Kellogg, M.D., Superintendent, Battle Creek Sanitarium, Battle Creek, Michigan, April 17. 1 p. Typed, without signature.

• ***Summary:*** "As yet we have received only two hundred fifty pounds from the Echo office. Special direction was given in regard to the manufacturing of health foods, but lately we have not had money to invest in peanuts for our own family. We eat no meat or butter, and use very little milk in cooking. There is no fresh fruit in this season. We have a good yield of tomatoes, but our family think much of the nuts prepared in a variety of ways. For many months my food has been uncooked tomatoes and bread."

Note 1. This is the earliest use of the word "peanuts" see in the collected papers of Ellen G. White, co-founder of the Seventh-day Adventist church. The full text of all her letters and diary entries has been computerized and this fact is the result of a search conducted by the Ellen G. White Estate. This letter is cited as follows: Lt 73, 1899. The original letter is in the Ellen G. White Papers, Ellen G. White Estate, Inc., General Conference of Seventh-day Adventists, 12501 Old Columbia Pike, Silver Spring, Maryland 20904-6600.

Note 2. Ellen White's attitude toward nuts seems to have changed over the years. She first uses the word "nuts" in a letter to James Edson White [her eldest child/son; Willie was her youngest son] dated 27 Feb. 1868. "I have frequently asked myself what you could have done with so much money. Edson, I am answered in a dream, you are not a health reformer in principle. You do not live up to the light God has given and while you neglect one ray of light that the Lord has graciously permitted to shine upon your pathway, you will be in darkness. When you boarded yourself, did you not spend money for nuts, candies, and hurtful things and eat these between meals and at any time? I concluded that your frequent headaches were caused by the indulgence of your appetite. You gratified the taste to the injury of the stomach..." (Letter 5)

Again in July 1874, in an undated letter to Brother and Sister Abbey, she states: "You have fostered a perverted appetite by indulgence. You have allowed her to eat between meals, to fill her pockets with nuts and crackers, and to have the third meal, eating sometimes late at night. How can you expect her to have a healthy relish for coarse and healthful food? I understand her father has bought Lillie white baker's bread to tempt her delicate appetite, and at night she has eaten this baker's bread and butter in the cellar with Nellie Matthews. Is this in accordance with the principles of a health institute?" (Letter 65).

Again on 12 June 1876, in a manuscript, Ellen White states: "We were pained to hear the mothers' fretful chiding, as they sought to hold in check the outbursts of temper exhibited by the children. But these mothers did not control themselves; how then could they expect their children, with their perverted habits, to have tranquil tempers. Both parents and children ate at irregular intervals all through the day, after eating heartily three times a day. The boy on the cars who sold cakes, candies, nuts, and fruit was freely patronized by the indulgent parents." Address: "Sunnyside," Cooranbong, New South Wales, Australia.

88. Sanitas Nut Food Co., Ltd. 1899. The Dujardin-Beaumetz antiseptic dietary (Ad). *Modern Medicine* (*Battle Creek, Michigan*) 8(6):Ad at rear of issue. June.

• ***Summary:*** A full-page ad on page 8 of the "Advertisements" section at rear of issue. "It is universally recognized by European physicians as essential to the successful treatment of Disorders of the Stomach and Liver. This dietary excludes flesh, fish, and shell-fish of all kinds. The chief difficulty in enforcing the non-flesh regimen is the lack of a suitable variety of foods rich in proteids in the ordinary bill of fare.

"The Sanitas Nut Food Co. has discovered how to make all sorts of delicious meat dishes from nuts, by newly discovered processes, which have proved so successful that thousands of invalids are already daily regaling themselves with the most delicate and tasty meat 'stews,' 'roasts,' 'potted meats,' meat 'soups,' 'broths,' and other savory and blood-enriching viands, without the slightest fear of 'hepatic congestion,' 'uric acid diathesis,' or any thing of the sort.

"'Vegetable Meat–in the form of 'Protose,' 'Nuttose,' 'Bromose,' 'Nutta,' And their congeners, is as much more toothsome than 'bloody beefsteaks,' as Bartlett pears are superior to crabapples. Address for circulars and further

information,-

"Sanitas Nut Food Co., Ltd., Battle Creek, Michigan." Address: Battle Creek, Michigan.

89. Blasdale, Walter C. 1899. A description of some Chinese vegetable food materials and their nutritive and economic value. *USDA Office of Experiment Stations, Bulletin* No. 68. 112 p. See p. 32-36. [19 ref]

• ***Summary:*** "According to Prinsen-Geerligs [*Chemiker-Zeitung*, 20 (1896) 67-69], 'tao hu,' or bean cheese, is prepared from the seeds of the white variety of soy bean. These are allowed to soak for three hours in water, are then reduced to a thick paste, and the mass cooked. The cooked mass is strained through a coarse cloth. The filtrate consists of a milky-white liquid containing protein and fat. As soon as this becomes cool some material is added (for instance, crude salt containing magnesium chlorid [chloride]), which precipitates the proteid material, the fat being inclosed in the coagulated mass. The coagulated material is pressed and kneaded into small cakes. The cakes may be dipped for a few moments into a saline solution of curcuma. Variations in the process give rise to a number of varieties of bean cheese. This is essentially the method used by the Chinese of San Francisco in the preparation of the bean cheese used by them. It is sold either in the form of a freshly precipitated curd or in the form of small square cakes obtained by compressing the former material. It is usually cooked in peanut oil before being eaten and, in the author's opinion, is a palatable food. A partial analysis of one of the cakes gave 81.35 per cent, fat 5.19 per cent, and ash 0.80 per cent.

"The filtrate from the cooked soy beans resembles milk, and, on heating, a skin [yuba], not unlike that formed on milk, rises to the surface of it."

A large number of varieties of the soy bean are in cultivation in China and Japan, but only two were found in the Chinese markets in San Francisco, a yellow and a black variety. Aside from a difference in color, the two forms apparently do not differ materially from each other. The yellow variety is known as 'wong tau,' and is designated by the characters 'yellow' + 'bean' (2 Cc = 2 Chinese characters are given) while the black is known as 'hak tau,' and is designated by the characters 'black' + 'bean' (2 Cc).

"Both varieties obtained from the Chinese market in San Francisco grew readily in Berkeley, attaining a height of about 3 feet, and in spite of a very dry season produced an abundant crop of seeds... The composition of the seeds of the two varieties is shown in Table 10 (p. 33), the average composition of American-grown soy beans being quoted also for purposes of comparison." This table gives values for water, protein, albuminoids, amids [sic] (by difference), fat, starch, cane sugar, reducing sugars, crude fiber, ash, and undetermined.

On a dry-weight basis, the original black soy beans contained, on average, 0.35% more protein (39.62% vs. 39.27%) and 0.72% less fat (18.77% vs. 19.49%) than the yellow soy beans. The soy beans grown in Berkeley (average of 8 analyses) contained 38.1% protein and 19.00% fat. On a dry-weight basis, the black soybeans were found to contain 15.8% more starch than the yellow soybeans (7.41% vs. 6.40%).

Photos show: (1) The upper portion of a plant of the black soy bean (p. 33).

(2) "Mature plant of yellow soy bean" (showing only the pods and stems, no leaves, p. 35). Address: Instructor in Chemistry, Univ. of California.

90. *Natal Agricultural Journal.* 1899. Pea-nut butter. 2(14):437. Sept. 29. [1 ref]

• ***Summary:*** "A new factory has just been put into operation in Kokomo, Indiana, for the manufacture of butter from peanuts, says *St. Louis Globe Democrat.* For a year or more Lan Brothers, of that city, have been working on a process of making butter from the peanut to compete with the product from the farm cow, and have succeeded in producing the desired article. At the present price of the nuts the butter can be sold at 15 cents per pound. The process of manufacture is no secret. The nuts, after the hulls are removed, are carefully handpicked, and faulty kernels removed. They are then roasted in a large rotary oven. Again they are gone over by hand, for the removal of scorched grains. The nuts are then put through a mill and ground as fine as the finest flour, the natural oils in the grains giving it the appearance and consistency of putty as it leaves the mill, except that it is more of an orange colour. By the addition of filtered water, to reduce it to a more pliable state, the butter is complete, no other ingredient, not even salt, being used. It never grows rancid and keeps in any climate. It is put up in 1 lb., 2 lb., 5 lb., 10 lb., 25 lb., and 100 lb. tin cans and sealed. The new butter is already in great demand at sanatoriums and health resorts. It is used for all purposes ordinary butter is used, including in shortening and frying. Physicians pronounce it more healthful than cow butter, and it is much less expensive. By the addition of water a delicious cream is made, and, if desired, in the same way be reduced to the consistency of milk. The new butter factory is located but a few rods from a large dairy barn, and is run in opposition to it."

91. *Union Conference Record* (*Australia*). 1899. The health food factory. 2(10):8. Dec. 1.

• ***Summary:*** "After a long but most determined and persevering effort the Sanitarium Health Food Factory is well fitted up, and able to turn out many of our health foods rapidly. This has required much longer time than was expected by anyone, but the work has been well done..." "They are now manufacturing granose biscuits, granose flakes, bromose, nuttose, antiseptic tablets [charcoal tablets], granola, caramel cereal, nut butter, wheatmeal biscuits,

gluten biscuits, gluten meal, and still other foods are in the experimental stage. White and brown bread, for the school and the immediate neighbourhood, are also made at the factory. We are thankful to see this enterprise at last on its feet, and we believe it will be appreciated in proportion to the effort it has cost."

Note 1. This is the earliest document seen (Feb. 2010) concerning the Sanitarium Health Food Factory (or Company) in Australia, or stating explicitly that foods with names such as "granose biscuits, granose flakes," etc. are being made in Australia. Formerly foods with these names were made only in Battle Creek, Michigan, then some were imported to Australia.

Note 2. Ellen G. White, co-founder of the Seventh-day Adventist Church, apparently never used the word "gluten" in her own writings. However the above passage appears in her biography, *Biography of Ellen G. White,* 6 vols., by White, Arthur L. 1981-86. He cites it to show what products are being made by the Sanitarium Health Food Factory in Australia. Ellen White was almost certainly aware of all these products (including gluten) since she was in Australia during the 1890s; she arrived in Dec. 1891 and stayed until about 1900.

Note 3. As of May 1997, this Seventh-day Adventist church paper is still published under the title *Record.*

92. **Product Name:** Malted Nuts (Non-dairy Product Made from Malted Cereals and Nuts and Resembling Malted Milk).
Manufacturer's Name: Sanitas Nut Food Co. from 1899. Renamed Kellogg Food Company in mid-1906, then Battle Creek Food Co. in the spring of 1921.
Manufacturer's Address: Battle Creek, Michigan.
Date of Introduction: 1899.
Nutrition: Water 2.6%, protein 23.7%, fat 27.6%, carbohydrate (malt sugar and dextrin) 43.9%, and ash 2.2%. Calories per ounce: 140.
New Product–Documentation: Mrs. Anna L. Colcord. 1899. "A friend in the kitchen: Or, what to cook and how to cook it. Containing about 400 choice recipes carefully tested." The next to last page of the book (unnumbered) lists foods available from the St. Helena Sanitarium Health Food Company [California], including "Malted Nuts."

Sanitas Nut Food Co., Ltd. 1900. *Good Health* (Battle Creek, Michigan). 35(7):July. Ad section in back of issue. Unpaginated. "20th century foods" (Ad). Products include "Malted Nuts."

John Harvey Kellogg. 1921. The New Dietetics–What to Eat and How... Battle Creek, Michigan: Battle Creek Modern Medicine Publishing Co. p. 359. "Nearly thirty years (1892-93) the writer, in seeking to supply the needs of invalids unable to eat cow's milk, conceived the idea of combining malt-digested cereals with nuts to prepare a substitute. The result reached after many experimental efforts was the product known as 'Malted Nuts,' which much resembles malted milk in appearance, while having a delicate and very agreeable nutty flavor. This product has been produced in considerable quantities and has come to be somewhat widely used." 'Malted Nuts' is an excellent source of food iron and it increases the milk secretion in nursing mothers.

In: Richard W. Schwarz. 1970. John Harvey Kellogg, M.D. Nashville, Tennessee: Southern Publishing Assoc. 256 p. See p. 121. "In 1896 he [Dr. Kellogg] patented a product labeled 'Bromose,' which he claimed to be a vegetable equivalent of malted milk... At about the same time, John Harvey originated a similar product which he named Malted Nuts. Derived principally from peanuts and almonds, one could mix Malted Nuts with water to form a vegetable milk which Kellogg maintained looked 'exactly like milk, and tastes so nearly like it that it is a very satisfactory substitute.' He designed the latter product primarily for infants who could not tolerate cow's milk..."

93. Colcord, Anna L. (Mrs.). 1899. A friend in the kitchen: Or, what to cook and how to cook it. Containing about 400 choice recipes carefully tested. Oakland, California, San Francisco, New York, Kansas City: Pacific Press Publishing Company. 126 + v p. Illust. 19 cm.
• ***Summary:*** A Seventh-day Adventist vegetarian cookbook. The subtitle continues: Plain directions for healthful cookery; How to can fruit; A week's menu; Proper food combinations; Rules for dyspeptics; Food for infants; Simple dishes for the sick; Wholesome drinks; Useful tables on nutritive values of foods, time required to digest foods, weights and measures for the kitchen, etc.

Pages 105-09 discuss "Specially Prepared Health Foods" which may be obtained from the St. Helena Sanitarium Health Food Company (St. Helena, California), of the Battle Creek Sanitarium Health Food Company (Battle Creek, Michigan). They include Granola (thoroughly cooked and partially digested; may be eaten with milk, cream, or fruit juice), Granose (light, crisp flakes; serve like Granola), Nut Butter (a substitute for butter and cream), Protose ("This is also a nut product and is intended as a substitute for meat..."), and Caramel Cereal (a "harmless and nutritious substitute for tea and coffee, both of which are now generally recognized by the best physicians as harmful beverages, and the cause of many nervous disorders. It is made wholly from grain products...").

Page 120 gives a week's menu and page 121 discusses the Sabbath and Sabbath dinners ("The Sabbath is the day of rest In order that it may be devoted by all to religious exercises, holy meditation, and spiritual delight, it should be as free as possible from the ordinary duties and cares of life... With proper planning, very little, if any, cooking need ever be done on the Sabbath...").

A full-page ad on the next to last page of the book (unnumbered) lists foods available from the St. Helena

Sanitarium Health Food Company (which has a San Francisco branch at 1422 Market St.): Granose ("The Queen of cereal foods"), Granola, Granose biscuit, Caramel cereal, Whole wheat sticks, Graham sticks, Pure gluten biscuit, Whole wheat zwieback, Whole wheat wafers, Nut butter, Nucose, Nutlet, Bromose, Malted nuts, Protose, Maltol, Ambrosia, Almond butter, Manno, Fruit coco. "Unfermented breads aid digestion: Most of our crackers and sticks are unfermented."

Note: This is the earliest document seen that mentions Protose (which was Dr. John H. Kellogg's first meat alternative product), or that mentions "Malted Nuts" (a nondairy product made principally from peanuts and almonds; when mixed with water it resembled malted milk).

94. Lambert, Almeda. 1899. Guide for nut cookery: Together with a brief history of nuts and their food values. Battle Creek, Michigan: J. Lambert & Co. 452 p. Illust. Index. 22 cm.

• ***Summary:*** Published in 1899, this book was copyrighted in 1898 by Mrs. Almeda Lambert (of Battle Creek, Michigan), who was almost certainly a Seventh-day Adventist. She quotes from Genesis 1:29 and on pages 60-65 she quotes extensively from the writings of Ellen G. White, the founder of the Seventh-day Adventist religion; she likewise advocates a vegetarian diet–indeed a pure vegetarian diet, free from milk and dairy products.

In the Introduction (p. 6) she states: "In the last few years there has been a great awakening in regard to healthful living and great strides have been made in the methods of emulsifying nuts into a paste or butter,–a convenient form for cooking purposes and much easier to digest. But the majority of those who have adopted nut butter, use it instead of the dairy product only to spread on bread. It is the object of the author to place before the public a book treating upon the use of nuts as shortening, seasoning, etc., to be used in every way in which milk, cream, butter, or lard can be used, and fully to take their place."

Chapter 1, "Nuts and Their History" (p. 7-58) includes many species of nuts arranged alphabetically including almonds, beechnut, chufa (earth almond), cocoanut, groundnut (*Apios tuberosa,* common in low, wet grounds), hickory-nut, litchi (leechee nut), peanut, pecans, sapucia-nut, souari-nut, pine-nut, walnut, and water chestnut.

The section on the peanut (*Arachis hypogæa,* p. 37-42) states that it is also "known in different localities as the earthnut, ground-pea, goober, pindar, jar-nut, and Manila nut. Strictly speaking it is not a nut at all, and should be more properly called the ground-pea." About 3½ pages of extracts are given from *Farmers' Bulletin* No. 25 titled "Peanuts: Culture and Uses," by Robert B. Handy (1895). Mrs. Lambert then comments: "Thus we see that over thirty years ago, peanuts were not only used as titbits [sic, tidbits] between meals, but also for culinary purposes. But since the invention of machinery for family use, for grinding the nuts into a butter, their use has spread over a greater territory. This is partly due to the fact that the expense is thus lessened, and not only this, but because the nut as it comes from the mill is in a much healthier condition to eat, being easier of digestion than the oil or the raw residue that remains after the oil is taken out. The nut butter can be easily mixed with water, forming an emulsion, and by thinning it sufficiently, it makes an excellent substitute for cream and milk. It can also be made into various nut foods."

A table compiled by Prof. König (p. 41) shows that peanut meal has the largest number of nutritive units per pound of twelve principal foods listed, and the cost of 1,000 nutritive units in the form of peanut meal is the lowest. For this reason the German army now uses peanuts, peanut flour and peanut meal extensively in its diet (p. 6).

In the chapter titled "Nuts: Their properties and food values" she states (p. 68-69): "The purest and most easily digested of all meats is the meat of nuts. In nutritive value they far exceed all flesh meats." "Nuts are more digestible if they are first emulsified, as very few can masticate them fine enough to be acted upon by the digestive juices. The question of emulsifying nuts has been practically settled in the last few years by the invention of machinery for that purpose, both for family and factory use. It is sincerely hoped and believed that the time is not far distant when nuts will fully take the place of animal flesh, fats, and products."

The chapter titled "Nut butter" (p. 70-75) describes how to make the following at home: "Peanut butter, raw peanut butter, almond butter, Brazil-nut butter, peanut cream, peanut milk, raw peanut milk and cream, almond milk, hickory milk, pine-nut milk, chufas milk, and cocoanut milk."

Note 1. This is the earliest document seen (Aug. 2013) that mentions coconut milk, which it calls "cocoanut milk."

Concerning homemade "Peanut butter" (p. 70-71): The introduction states: "The Spanish peanut makes the best peanut butter. The first essential thing is to have a nut-grinding mill" [such as the one made by Joseph Lambert & Co.]. The recipe itself states: "The first step is to roast the peanuts to a nice brown, being careful not to over-brown or scorch them, as too much cooking spoils the flavor. They can be roasted in an ordinary oven, but can be better done in a peanut roaster made especially for this purpose. As soon as they are roasted and cool, the skins or bran should be removed by rubbing them in the hands, or what is better, a coarse bag; or take a square piece of cloth and fold the edges together, forming a bag of it. The chaff can then be removed by the use of an ordinary fan, or by pouring from one dish to another where the wind is blowing. The process of removing the skins is called blanching. Next look them over carefully, remove all defective nuts and foreign substances, and they are ready for grinding. If a fine, oily butter is desired, adjust the mill quite closely, and place in the oven to warm. Feed the mill slowly, turn rapidly, and always use freshly roasted

nuts; after they have stood a day or two they will not grind well nor make oily butter. If the butter is kept in a cool place in a covered dish, and no moisture allowed to come in contact with it, it will keep several weeks; and if put in sealed jars or cans, will keep indefinitely."

Note 3. This is the earliest document seen (Dec. 2007) that contains a recipe for homemade peanut butter.

When making peanut cream and milk, roast the peanuts less than when making peanut butter. "They should have a light straw color."

Note 4. This is the earliest document seen (Oct. 2004) that mentions Joseph Lambert in connection with peanut butter. Unfortunately it provides little information on the history of peanut butter or the history of his work with it.

Note 4. This is the earliest document seen (Sept. 2000) that mentions almond butter (resembling the modern product) or gives a recipe: "Almond butter is more difficult to make than peanut butter because the skins can not be so easily moved. Roasting does not loosen the skins of the almond as it does of the peanut. They have to be soaked in boiling water from two to five minutes; then the skins become loose and can be pinched off by pressing on the nut with the thumb and finger; the skin will crack and the kernel pop out. But by this process the nuts have soaked up some water and become tough. They must then be dried in the oven until quite crisp, but the oven must not be hot, or they will brown. Then run them through a loosely adjusted mill or a sausage grinder, and place on a cloth stretched over the stove until perfectly dry; then grind them in the nut-butter mill, quite tightly adjusted. This makes excellent butter if the almonds are first-class, and sweet."

Note 5. This is the earliest U.S. document seen (Sept. 2000) that mentions "Almond milk" which is prepared as follows: "Dissolve 1 tablespoonful of almond butter in 1 pint of warm water, adding a little at a time.

Note 6. This is the earliest English-language document seen (Aug. 2013) that contains the term "peanut milk." Continued. Address: Battle Creek, Michigan.

95. Lambert, Almeda. 1899. Guide for nut cookery: Together with a brief history of nuts and their food values (Continued–Document part II). Battle Creek, Michigan: J. Lambert & Co. 452 p. Illust. 22 cm.

• ***Summary:*** Continued from p. 76. Other chapters include–Nut meal (p. 76-78): To make peanut meal, heat the nuts sufficiently to remove the skins, but do not brown them. Blanch (remove skins), then boil in water until very tender. Drain until perfectly dry, then grind in a mill that is loosely adjusted. If desired, rub through a flour sieve. A very rich meal can also be made by grinding raw peanuts. Meals can also be made from almonds, pine-nuts, etc.

Sausages (p. 79-81): For peanut sausages mix 1 tablespoon peanut butter, 2 tablespoons water, 3 tablespoons gluten or dry bread-crumbs, a little salt, sage, and parsley. Form into small cakes and bake on an oiled tin. Serve topped with Peanut Gravy No. 1.

Nut oil (p. 82-83): Boil ground cocoanuts or peanuts with water in a kettle for 1 hour. Set in a cool place and the oil will rise to the top. Nutmeatose, Nutora, etc. (p. 84-90): These foods are best cooked under high-pressure steam to make them quite solid. For Nutora of peanuts: Mix 2 cups raw nut butter or nut meal with 1 cup water and salt to taste. Beat with an egg beater for 5 minutes or more, then put into cans and cook (in a steam cooker) for 3 or 4 hours. For "Nut cheese," see p. 90.

Note 7. This is the earliest document seen (Aug. 2002) in the Western world concerning a meatless sausage.

Nutmeato (p. 91-127): This chapter contains many nut-based recipes for meat alternatives. The main ingredient is usually nut butter, but "nutmeatose" gluten, zwieola or toasted bread crumbs, and legumes are also used, along with corn starch and a little salt. The mixture is usually sealed in a can and steamed for 3-5 hours. Recipes include: Mock Nutmeato roast, Nutmeato steak, Nutgrano No. 1-10 (No. 1 and No. 8 use 1 cup raw peanut butter), Nutmeatose No. 1-7 (p. 97-98; No. 1 uses 2 cups peanut butter), Frutose, Frutosia, Butter for table (butter whipped with an equal quantity of water), Roast goose (with full-page photo, based on zwieola {see p. 399} and eggs), Turkey legs, Chicken legs, Roast turkey (with photo, based on zwieola, gluten, pecan meal, almond meal, peanut butter), Nut lobster, Baked trout (with photo), Mock fish stuffed and baked, Sauce for baked fish (with photo), Mock turkey, Mock fish-balls, Vegetable nut roast, Mock salmon, Mock chicken croquettes, Mock fried oysters, Mock oyster patties, Mock chip beef. Includes many photos of the finished dishes.

Unleavened breads (p. 156-67): These are "made light without the use of yeast, baking-powder, or soda. Since they are the most healthful of all breads, it would be of benefit to mankind if they were in more general use." For best results "run the dough through the nut-butter mill twice or more, instead of kneading by hand as directed in the recipes." Recipes include: Graham gems, Raw peanut-butter gems, No. 1 gluten (made from best grade white flour which is rich in wheat gluten–such as Pillsbury's Best). Yeast breads (p. 168-82) incl. Graham bread.

Legumes (p. 246-52) incl. Nut meatose beans, Vegetable turkey, boiled peanuts. Gravies for vegetables and toasts (p. 311-17) incl. Mock milk gravy (from peanut butter), raw peanut milk gravy. Pies (p. 320-32) incl. Peanut meal pie crust, Chufa cream pie crust.

Puddings (p. 333-43): "Puddings made with dairy milk and sugar combined are apt to ferment in weak stomachs. They are much better prepared without dairy milk." Incl. Custard No. 1 (from raw peanut milk). Sauces for puddings (p. 344-49) incl. Almond cream sauce. Cakes (p. 354-75): "Cakes and pies are filled with animal fats, irritating spices, and are raised with baking-powder or soda, are certainly very

unwholesome; to use them in our bill of fare could work nothing but injury to all who partake.

"Animals are becoming so diseased that it is no longer safe to use their flesh as food, and even if they were not diseased, free fats are hard of digestion." (p. 354).

"Spices and condiments, which usually enter into cake making, are equally injurious. The effect that they have upon the stomach can be illustrated by putting them upon a raw surface or in the eye; inflammation immediately takes place. They irritate the nerves, cause irritability and peevishness, and create a craving for something more highly spiced, which often leads to grosser forms of intemperance."

Drinks (p. 381-83) incl. Peanut and cereal coffee (with wheat bran, corn-meal, and malt), Peanut coffee No. 1-2 (roast peanuts until dark brown), Chufa coffee. Food for the sick (p. 400-01) incl. Almond milk, Graham gruel, Plain gluten gruel, Nut gruel (with almonds and peanuts), Egg nog (made from cocoanut cream, eggs, and sugar).

Note: This is the earliest document seen (Dec. 2012) that mentions or contains a recipe for a nondairy egg nog.

Creams, ices, etc. (p. 411-14) incl. Ice-cream No. 1-3 (made from almond or peanut cream, sugar, and eggs), Ice-cream made of peanut milk, Almond ice cream, Sherbets (from frozen fruit juices). To blanch nuts (p. 415-16); blanch peanuts dry and almonds by pouring boiling water over them. To salt nuts (p. 417-18). Confectionery (p. 419-24) incl. Peanut candy (with 1 lb each sugar and peanuts). Menus (p. 425-33) incl. Thanksgiving dinner: This "has been a great puzzler to the vegetarian housewife... I propose that we do have a turkey for Thanksgiving, not the corpse of a bird whose life was sacrificed to satisfy our perverted appetites, but something which... is only one made of nuts and grains... "With painstaking we shall have a better dinner than our sisters who have their platters ladened with the remains of a barn-yard fowl, and with cakes and pies filled with animal fats and spices. Besides this, we shall have a clearer mind, as well as a clear conscience; while those who eat meat are taking poisons into the system which benumb the brain, cloud the conscience, and render man unfit to meet the vesper hour and hold communion with his God."

Thanksgiving dinner menu (8-course meal), Christmas dinner. Composition of foods (p. 434-39) incl. Dietetic tables by Atwater and Woods of USDA. See p. 439 for composition of nuts.

On the last page is a full-page ad for nut grinders, blanchers, and peanut roasters made by Joseph Lambert & Co., Battle Creek, Michigan.

Note 8. This is the earliest U.S. document seen (March 1999) that mentions almond milk.

Note 9. This is the earliest document seen (Oct. 2001) that mentions a non-dairy non-soy ice cream; it is based on almonds or peanuts.

Note 10. This is the earliest document seen (June 2007) that gives a recipe for a meatless turkey and the 2nd earliest that mentions meatless turkey. However soy is not mentioned.

Note 11. This is the earliest document seen (Dec. 2003) that mentions or gives a recipe for a meat alternative resembling beef: Mock Nutmeato roast, and Nutmeato steak. These were made with nuts rather than soy. Address: Battle Creek, Michigan.

96. Langworthy, C.F. 1899. Appendix: Soy beans as food for man. *Farmers' Bulletin* (*USDA*) No. 58 (Revised ed.). p. 20-23. [1 ref]

• ***Summary:*** This part of Bulletin 58 is identical to the original July 1897 edition. Address: Ph.D., Office of Experiment Stations, USDA, Washington, DC.

97. *Los Angeles Times.* 1900. Care of the body: Valuable suggestions for acquiring and preserving health. Jan. 7. p. IM27.

• ***Summary:*** The section titled "A vegetarian restaurant" states: "Los Angeles has now a first-class vegetarian restaurant and it appears to be well patronized. The restaurant, which also keeps health foods for sale, is connected with a well-known hygienic institution [Battle Creek Sanitarium] in Michigan, which manufactures these foods on a large scale, and has branch sanitariums all over the world. For those who are not acquainted with the wide range of dishes at the command of the modern vegetarian in the United States, the following dinner bill of fare of the restaurant above referred to, on a recent Sunday, will be of interest:

"Bayo beans and tapioca soup, celery, cabbage salad, onions, nut and vegetable roast, egg macaroni, boiled potatoes with gluten sauce, lima beans and nut stew, carrots, vegetable stew, ambrosia, bromose tablets, shaved nuttose, sliced nucose, protose.

"Boiled eggs, plain omelet, scrambled, poached, poached on toast, and poached on granose.

"Rice with raisins, granose, granola, gluten mush with milk, nut cream or dairy cream.

"Steamed figs, pear sauce, baked apples with cream, sliced bananas with cream, stewed prunes, apple sauce, apples, oranges, and bananas. Apple charlotte, cream rice pudding.

"Cereal coffee, hot malted nuts, cold milk, hot milk, unfermented wine, glass one-half cream and one-half milk, lemonade, hot or cold orangeade, distilled water.

"Whole-wheat bread, graham bread, zweiback [zwieback], graham sticks, whole-wheat sticks, mixed wafers, oatmeal wafers, graham wafers, granose biscuit, gluten wafers, and whole-wheat wafers."

Note: This is the earliest document seen (March 2007) worldwide that mentions a health foods restaurant.

98. Clark, Annie M.L. 1900. The Alcotts in Harvard

[Massachusetts]. *New England Magazine* 22(2):173-80. April. New Series.
• ***Summary:*** The detailed story of Amos Bronson Alcott and his family at Fruitlands. Early in June, 1843, a small colony of 16 men and women gathered near the quiet town of Harvard, Massachusetts. Amos Bronson Alcott was born on 29 Nov. 1799 in Wolcott, Connecticut. He married Abba May on 23 May 1830 in Connecticut. While a teacher at the famous Temple, Mr. Alcott developed the idea that "the simplest food was alone conducive to lofty thinking and living." Traveling to England, he found there congenial spirits, and in October 1842 he came home, accompanied by three of these new friends, Charles Lane, his son William Lane, and Henry C. Wright. Together they went by wagon to a place they called Fruitlands near Harvard–a field of about 100 acres on a hillside. They immediately began the work of forming "a family in harmony with the primitive instincts of man." Mrs. Alcott and Anna Page were the only women. "No animal food was to be eaten, nor were butter, cheese, eggs or milk allowed–nothing that in the taking would cause pain or seem like robbing any animal; besides, animal food... would corrupt the body and through that the soul. Tea, coffee, molasses and rice were forbidden for two reasons"–they were foreign luxuries and the product of slave labor. "Water alone was for drink, fruit in plenty, and some vegetables were allowed"–but only vegetables that grow in the air, not those that grow downward like potatoes. Salt was also forbidden. The impractical but idealistic group returned to Concord at the end of the summer, 1844, after about 15 months of their experiment.

Five photos show: (1) Old house at Fruitlands. (2) The Brick Ends. (3) Orchard at Fruitlands. (4) The road to Prospect Hill. (5) The Nashua Valley from Prospect Hill–Fruitlands at Right.

99. *Vegetarian Messenger* (*Manchester, England*). 1900. Price list of the Vegetarian Society's food stores, 19, Oxford St., Manchester, S.E. April. Unnumbered page at rear of issue.
• ***Summary:*** The five categories of food sold are: (1) Foods [cereal grain, whole, crushed, meal, and flakes] (First item is whole wheat meal, freshly ground from best English red wheat). (2) Beans, peas, lentils (incl. soya beans and lists the price as "4*d.* a lb" plus carriage; also 4 types of haricot beans {2.5 to 4*d.*} and 4 types of lentils {2.5 to 3*d.* a lb.}).

(3) Prepared foods (incl. Dr. Nicholl's Food of Health, Dr. Allinson's Food of Health, Fromm's Extract, Fromm's Soup, Nuttosia, Nut Butter {almond, hazel}, Nuttose, Protose, Sterilized Nut Butter, Granose Flakes, Granose biscuits, Avenola, Crystal Wheat, Nutta, Bromose, Falona). (4) Biscuits (incl. Graham crackers, Wholewheat wafers, Wheat and nut rolls, Zwieback–white or Graham). (5) Plasmon (powder, chocolate, or biscuits).

Note: This is the earliest English-language document seen (June 2009) published in England that contains the word "Granose" (a flaked cereal food).

100. Stewart, Charles E. 1900. Chronic constipation, a symptom resulting from a disordered state of the sympathetic nervous system. Its causes and cure. *J. of the American Medical Association* 34:1306-10. May 26.
• ***Summary:*** "Nuts, in order to be of service, should go through a special process of preparation. At the present time such specially prepared nut foods as protose, nuttolene, malted nuts, granuts, bromose, and a number of others can be found on the market. A careful analysis of these nut foods has been made in our laboratory, and they have been found to be sterile and wholesome, and to contain nitrogenous and fatty material to meet the demands of the human economy. A diet consisting of granose, browned rice, protose, steamed figs, prune marmalade, and ripe fresh fruits..., almond butter, and cream [almond cream], is so palatable, nourishing, and easy of digestion that the most fastidious epicure could find no fault with it" (p. 1309). Address: M.D., Battle Creek, Michigan.

101. Langworthy, C.F. 1900. Vegetable cheese. *Sanitary Home* (*Fargo, North Dakota*) 2(3):55-57. May.
• ***Summary:*** "It is commonly believed that the Japanese, Chinese, and other oriental peoples live almost exclusively on rice, eating little or no meat... In the course of centuries the Japanese and Chinese have evolved the art of preparing substances resembling dairy products from vegetable sources. It is well known that beans, peas, and other legumes contain large amounts of protein... The soy bean, which is perhaps the principal legume grown in Japan and China, is less suited for food in its natural state."

"Though the soy bean is not relished when cooked in the ordinary way, the Chinese and Japanese prepare very satisfactory foods from it in ways which are unknown to western cooks. Bean cheese or bean curd, called by the Japanese tofu and by the Chinese tao hu, is one of the most important of these products and is prepared as follows: The soy beans are soaked in water for about 12 hours and crushed between mill stones until of a uniform consistency. The ground material is then boiled with about three times its bulk of water for an hour or more and filtered through cloth. The filtrate is white in appearance and has somewhat the appearance of milk. It has the taste and smell of malt. Analysis shows that it resembles cow's milk in composition. When heated a film forms on the surface which in appearance suggests cream. This is dried and eaten under the name of yuba. As soon as the soy bean milk becomes cool, some material is added; for instance, crude sea salt, containing magnesium chlorid [chloride], which precipitates the proteid material, the fat being inclosed in the coagulated mass. The coagulated material is pressed and kneaded into small cakes or cheeses. These are sometimes dipped in saline

solutions of curcuma to color them. The bean cheese cakes are sometimes eaten fresh or may be cooked in different ways. Often when practicable they are frozen. This removes a considerable part of the water present. As shown by analysis, the fresh bean cheese contains about 5 per cent of protein and 3 of fat. Ordinary cheese made of milk contains about 28 per cent protein and 36 per cent fat.

"Miso resembles tofu to some extent. It is prepared from cooked soy beans, which are rubbed to a thick paste and fermented with rice wine ferment. Shoyu is a thick sauce prepared from a mixture of cooked pulverized soy beans, roasted and pulverized wheat, wheat flour, salt, and water. The mass is fermented with rice wine ferment in casks for from one to five years being frequently stirred. The resulting product is a moderately thick, brown liquid, in odor and taste, not unlike a good quality of meat extract, though perhaps a trifle more pungent. Throughout the East it is eaten in large quantities with rice and other foods and is an important source of protein. Under the name of soy sauce, it has been known to Europeans in India for many years, and is not unknown in the United States. Most of the soy bean products are fermented; that is, they are prepared with the aid of micro-organisms. The micro-organisms break down the cell walls and similar materials and thus the cell contents are rendered more accessible to the digestive juices at the same time peculiar and pleasant flavors are developed. The manufacture of these products is of very ancient origin and affords an interesting, practical illustration of the use of bacteria for economic purposes.

"The Chinese residents of San Francisco and other cities consume large quantities of these soy bean products and it is stated on good authority that soy bean cheese is manufactured in this country, though doubtless it is seldom, if ever, eaten by any except the Chinese."

Note 1. This periodical was later named *North Dakota Farmer.*

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "bean cheese cakes" to refer to tofu.

Note 3. This is the earliest document seen (June 2011) concerning soybeans in connection with (but not yet in) North Dakota.

Note 4. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy bean milk."

Note 5. Dr. E.F. Ladd was a nationally-known pioneer in food safety and sanitation in the United States. He published this periodical, *Sanitary Home,* in Fargo and distributed it free of charge like an extension publication before the extension service was created; North Dakota State Univ. paid the printing and mailing expenses. Interested in home safety, he rewrote technical publications in a language homemakers could understand. He did much work with North Dakota food purity and chemical purity laws. Address: PhD, Office of Experiment Stations, Dep. of Agriculture, Washington [DC, USA].

102. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1900. Sanitarium health foods (Ad). July 6. p. 3.
• ***Summary:*** "Supply on hand: Caramel Cereal [a coffee substitute]. Granola (packets and bags). Granose Biscuits. Nut Butter. Nuttose. Bromose. Gluten. Charcoal Tablets.

Note 1. No company name [Sanitarium Health Food Company] or address is given.

Note 2. This is the earliest document seen (Nov. 2009) concerning "Sanitarium health foods" in New Zealand.

103. Sanitas Nut Food Co., Ltd. 1900. 20th century foods (Ad). *Good Health* (*Battle Creek, Michigan*) 35(7):July. Ad section in back of issue. Unpaginated.
• ***Summary:*** "We manufacture the most unique, delicate, and toothsome line of foods on the market. While these foods are so prepared as to be perfectly adapted to the stomach of the feeblest invalid, or the youngest child, they are at the same time of the greatest value in forming the healthy tissue of the vigorous man or woman. They are prepared with the greatest care from the choicest edible nuts. Perfect substitutes for meat, butter, and milk. Possessing none of their objections." Products include: "Malt Honey, Bromose, Protose, Nut Butter, Malted Nuts, Maltöl. Ask your grocer for samples, and if you fail to get them, write us, giving his name, and you will hear of something to your advantage."

Note: According to Stoltz (1992) Sanitas Nut Food Co. was legally founded in 1899. Address: Battle Creek, Michigan.

104. Abel, Mary Hinman. 1900. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 32 p. See p. 9-11. Illust. Revised Nov. 1904. Corrected March 1906. [1 ref]
• ***Summary:*** A section titled "Soy Bean (*Glycine hispida*)" (p. 9-11) briefly describes the soybean plant and the rich nutritional composition of its seeds. The first paragraph is quoted from USDA Farmers' Bulletin 58.

Starting with paragraph 2: "This leguminous plant, probably native in China, is the most important legume of China and Japan... In the Orient this bean and the various food products made from it are so largely consumed that it is perhaps the most important food plant next to rice. The soy bean is eaten to a small extent boiled like other beans, but in China and Japan it is elaborated into a variety of products, all of which have a high percentage of protein, and when eaten in connection with the staple food, rice, which is so deficient in that constituent [protein], helps to make a well-balanced dietary. Some one of these products is eaten at perhaps every meal and by rich and poor alike, especially in the interior of these countries, where sea food is not obtainable.

"One of the most important of these preparations is shoyu, and it is the only one that has been introduced to any

extent into other countries, where it is known as soy sauce...

"There are also several varieties of bean cheese or similar products made from this legume which are very important foods. These are natto, miso, and tofu. Natto is made from soy beans that have been boiled for several hours until very soft, small portions of the still hot mass being then wrapped securely in bundles of straw and placed in a heated, tightly closed cellar for twenty-four hours. Bacteria, probably from the air or the straw, work in the mass, producing an agreeable change in its taste.

"For tofu, the soy bean, after soaking and crushing, is boiled in considerable water and filtered through cloth. To the resulting milky fluid 2 per cent of concentrated sea brine is added, which, probably by virtue of the calcium and magnesium salts present, precipitates the plant casein, which is then pressed into little snow-white tablets. It is made fresh every day. Tofu is sometimes cooked in peanut oil before it is eaten. In natto and miso the action of minute organisms plays an important part. In tofu there is no such action. The composition of a number of these products is as follows:"

A table (p. 11) shows the nutritional composition of food products made from soy beans, including fresh tofu, natto, white miso, red miso, Swiss miso, and shoyu (2 samples).

An illustration (non-original line drawing, p. 10) shows a soy bean plant with a cluster of 7 pods to its upper left (slightly changed from an original in Carrière 1880, p. 154).

This bulletin also discusses (with an illustration of each): The bean–Broad or Windsor bean (*Vicia faba*). Kidney bean (*Phaseolus vulgaris*). Lima bean (*Phaseolus lunatus*). Scarlet runner (*Phaseolus multiflorus*). Frijole (*Phaseolus spp.*). Cowpea (*Vigna catjang*). Lablab bean (*Dolichos lablab*) and other common varieties. Locust bean (*Ceratonia siliqua*).

The pea–Field pea (*Pisum arvense*). Garden pea (*Pisum sativum*). Chick-pea or gram (*Cicer arietinum*).

The lentil (*Lens esculenta*). The peanut (*Arachis hypogæa*).

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the term "milky fluid" to refer to soymilk.

Note 2. Mary Hinman Able was not an employee of the USDA or of the federal government. She was a pioneer in the fields of nutrition, nutrition education, home economics, and popularizing science for the general public. Between 1904 and 1913 she wrote several farmers bulletins for the USDA. From 1909 to 1915 she was editor of the *Journal of Home Economics*.

105. *Kneipp Water Cure Monthly* (*The*) (*New York City*). 1900. Nut foods. 1(8):141-42. Aug.
• ***Summary:*** "By those who desire to leave off animal foods, such as eggs, milk and flesh meats, there has been a long-felt want for some food which will supply an abundance of nitrogenous matter in easily digestible form." Gives eight advantages of nut foods. "8. They are more digestible than raw nuts.

"The first of these foods put on the market was nut butter, and it has had such a remarkable success that it is now manufactured all over the country, in a small way, by families and by small manufacturers. It is proving a boon to many people, but on account of the temperature at which it is produced, a change takes place in the oil, rendering the fat more or less indigestible to certain individuals; so in a certain proportion of cases it is found to disagree. Notwithstanding this, it is probably used, on account of its cheapness, to a greater extent than any of the other nut foods.

"Nut Marmalate and nutlet are foods put up in sealed cans, and have a growing popularity. These foods are excellent sliced, or can be made up into stews."

"There is another series of foods, in which nuts are combined with predigested starch in the form of malt sugar. These foods, bromose, malted nuts, etc., are very delicate and toothsome,..."

106. Kellogg, Ella Ervilla (Eaton) (Mrs.). 1900. Every-day dishes and every-day work. Battle Creek, Michigan: Modern Medicine Publishing Co. 206 p. Index. 21 cm. [1 ref]
• ***Summary:*** The wife of the famous Dr. John Harvey Kellogg discusses her system of meatless cookery. She lived 1852-1920. This book was copyrighted 1896.

Contents: Preface. Cereals. Macaroni. Fermented or yeast bread. Unfermented or aerated bread. Fruit. The leguminous seeds (soy is not mentioned). Vegetables. Soups (without milk, with milk), Eggs. Desserts. Pastry ("Dietetic evils of pastry–General suggestions for making pies"). Cake. Toasts (incl. Zwieback). The Battle Creek Sanitarium Food Company's Products (recipes using them; including Granola, Granose, Crystal Wheat, Gluten, Zwieback, Caramel-Cereal).

Sanitas Nut Food Company's Products (recipes using them; including Nut Butter, Nuttolene, Nut Meal {"Many persons suffer from biliousness, nervousness, sick-headache, and various forms of indigestion, from the use of butter, milk, and cream, without being aware that these substances are harmful to them. Persons suffering from dilatation of the stomach, a condition which is exceedingly common, must avoid milk and butter in all forms. Nut butter, nut meal, and nuttolene have been prepared as substitutes for butter and cream. In nut butter, the fat is in a state of perfect emulsion, so that it mixes well with water. Thus it does not interfere with digestion}," Protose, Granose, Almond Meal). Hints about every-day work (Economizing time, system in work, daily program of kitchen work, economizing money, economy of material, uses of stale bread, left-overs, waste of fuel, general suggestions for economical housework, order of clearing the table, washing the dishes, dish-cloth and towels, cleaning silver, care of table linen, disposal of garbage).

Peanut butter is called for as an ingredient in recipes on pages 166 and 170 ("An icing for the peanut cake may be

made in the same way by using the peanut butter").

Almond butter is called for as an ingredient in recipes on pages 140 (one well-rounded tablespoonful in an icing for Almond pound cake), 155 (twice), 156 (twice), 166 (twice), 170, and 172 (twice).

The term "nut butter" appears on 32 pages; see p. 201 in Index.

The word "Vegetarian" appears in this book only once, in the titled of a recipe, "Vegetarian Boiled Dinner" (p. 164).

Bran (including wheat bran) is mentioned on pages 98 and 99 (3 times each in the section on soups), 100, 144, 169, and 197.

Near the end of this book are full-page ads for: Bromose (p. 207), Malted Nuts ("presented in the form of a fine granular powder," p. 208), Protose–vegetable meat ("This truly wonderful food product is, without question, the most remarkable discovery in dietetics which has been made within the last half century... Protose is a Perfect Substitute for flesh food... Send 10 cents for a sample can," p. 209), Battle Creek Sanitarium Health Foods (Granose, Granola, Caramel-Cereal, Battle Creek Sanitarium Breakfast Food, Germless Oats, Germless Corn Grits, Crystal Wheat {sterilized, ready cooked}, Gluten Preparations, Diabetic Foods, A large variety of crackers and biscuit and other wholesome preparations. Superior canned goods. Warranted pure. Send for catalog and price list, p. 210).

Antiseptic charcoal tablets–antiseptic, absorbent. "Charcoal Tablets are not a panacea, but they have proved to be the moat valuable remedy we possess for morbid conditions arising from fermentation or decomposition of food in the stomach and intestines. They consist of a special form of vegetable charcoal, much superior to willow, freshly prepared, to which is added sulphur, one of our most valuable intestinal antiseptics, and diastase, a starch-digesting ferment. This will at once be recognized as a happy combination for combating the action of microbes in the alimentary canal," (p. 211). *The Stomach: Its Disorders and How to Cure Them,* by J.H. Kellogg, M.D. (p. 212). *The Home Hand-Book,* by J.H. Kellogg (p. 213). *Science in the Kitchen,* by Mrs. E.E. Kellogg, A.M. (p. 214). Address: A.M., Battle Creek, Michigan; Author of *Science in the Kitchen,* etc.

107. *Los Angeles Times.* 1901. Queer spirits of vegetarian sect: They live in round rooms and on cocoanut milk–Vagaries of Placentia's unique and unhappy colony. June 2. p. C3.

108. Sanitas Nut Food Co., Ltd. 1901. Cow's milk kills babies: Malted nuts cures babies (Ad). *Good Health* (*Battle Creek, Michigan*) 36(7):Unpaginated. July.
• ***Summary:*** "By the thousand every year. The manure germ is always present in milk, and is now known to be the cause of *Cholera Infantum,* and other gastro-intestinal disturbances which are the bane of infant life, especially during the warm months. Cow's milk forms tough and indigestible curds. Cow's milk develops ptomaines which cause rickets. Cow's milk causes coated tongue and biliousness [peevish and ill-natured in disposition]. Cow's milk constipates.

"Cow's milk may be improved by mixing with malted cereals (malted milk or cream), and in various other ways, but it is cow's milk still, and often causes rank poison to the babe, and is not much less unwholesome for adults, often gastric catarrh, biliousness, periodical headache, and obstinate constipation.

"Malted nuts cures babies and adults of the mischiefs which milk creates, and is the one perfect substitute for mother's milk, a delicious and wholesome substitute for cow's milk." An oval photo on this full-page ad shows a baby. Address: Battle Creek, Michigan.

109. *Good Health* (*British*) (*England; Seventh-day Adventist*). 1901. A Christmas dinner. 1(2):25-26. Dec.
• ***Summary:*** Gives a menu with recipes. The main dish is: "Protose roast.–Use one-half pound of protose as it comes from the tin. Press into the sides of this one large onion which has been sliced thin, and sprinkled with salt. Place in a baking dish, and surround with a nut cream made by dissolving one-fourth cup of peanut butter in one and one-half pints of water, and salt to taste. As it bakes in a hot oven, baste often with the dressing until the protose and onion become a rich brown. The time usually required for baking is from one and one-half to two hours."

110. Bie, H.C.H. de. 1901. De landbouw der inlandsche bevolking op Java [The agriculture of the indigenous people in Java]. *Mededeelingen uit 's Lands Plantentuin* (*Buitenzorg*) No. 45. 143 p. See p. 97, 99, 138-43. [Dut]
• ***Summary:*** The soybean is discussed in the chapter titled "Cultivation of crops other than paddy rice: Cultivation of secondary crops (*Palawidja*)." Soya bean is one of the secondary foods served with rice, but it is mostly used to make soy sauce and tempeh (*tempe*). One variety of soybean, which originally came from Japan, is widely grown as a second crop on the wet rice fields (*sawahs*), and it is easy to cultivate at altitudes of 1,200 to 1,500 feet above sea level. It is called *katjang kedele* in Central and East Java, but *katjang djepoen* in Sunda or West Java (*de Soendalanden;* [the area around Bandung only]). A description of the plant and the method of cultivation in Java is then given. It is planted much more on wet rice fields than on dry (non-irrigated) fields (*tegalans*) near the rice fields used for vegetables and secondary crops. Usually the soybean seeds are planted right after the paddy stumps have been cut away, but sometimes they are planted just before or during the paddy harvest, and pressed into the earth under the feet of the paddy cutters. They are rarely weeded, excepted when the crop is suffocated by tall weeds. At harvest, the plants are pulled

completely out of the ground and bound into bunches. At night they are stored under a specially-constructed roofed shelter in the field, and during the day they are sun-dried on bamboo structures or on the ground. This takes at most 3-4 days, if the plants are really ripe and the weather is good, after which the bunches are put on bamboo mats in heaps and threshed. To protect the seeds from damage, one preferably uses piece of banana tree branches which still have fibrous veins. The fibrous plant stems and branches are removed together with the soybean pods and burned on the sawah fields. Poor people first sort out the pieces good enough for fuel and take these home. Immature green leaves are fed to animals. Sometimes soybeans are planted on the dikes of the paddy fields at the same time as or a few days later than the paddy rice. The fresh seeds from this harvest are then planted in the sawah fields after the paddy is harvested. Soybeans planted in this way are called *katjang apitan.*

There are two varieties of soya: one has an ivory yellow seed coat and the other is black. The latter is used almost exclusively to make soy sauce; the former to make pastry and condiments for rice or as a vegetable (*sayur; sajoer*). Soya is cooked with salt in the green pod and eaten as a snack.

The indigenous people do not occupy themselves with the production of soya (soy sauce) or *ketjap* or other products made from soybeans such as *taoetjo* [*tao tjo, tauco, taucho* = Indonesian style miso], *taoehoe* [*tao hoe, tahu* = tofu], *taoekwa* [*tao koan, taokoan or takoa* = fermented tofu], and *taoetji* [*tao dji, tausi* = fermented black soybeans]. The work is too involved and takes too long before the product is ready to be sold. Most people are too inexperienced and there is not enough of a market for the product.

The only food that most people make out of soybeans is tempeh (*témpé*), which plays the same role in Central and East Java as does ontjom in Sunda or West Java, and is prepared similarly. The tempeh-making process is described. It takes place indoors, out of the light. Tempeh is sometimes cut into smaller pieces. It is usually eaten pan-fried after being soaked in a solution of tamarind and salt. It is also cooked with vegetables.

Most soybean seeds are sold to the Chinese, who export them or process them to make soy sauce and other products. To make soy sauce, the seeds are roasted to aid in removing the hulls. Some people pound the seeds instead. They are cleaned, boiled in water, drained, spread on flat bamboo trays (*tampah* or *njiroe*) and dried daily for a week in the wind. They are washed again then soaked for 30-40 days in salt water which has been boiled then cooled. This mash is mixed thoroughly and strained through a cloth. To the black liquid is added a boiled and cooled mixture of cane sugar and water, then the mixture is boiled until its volume is reduced by 20%. If the solid residue removed by filtering still tastes salty, it is put into water, kneaded and strained again. A sugar solution is added and all is boiled down as before to make second-grade ketjap.

To make *taoetjo* (*tauco, taucho* or Indonesian-style miso), the soybeans are soaked in fresh water, the hulls are removed, the seeds boiled and spread on bamboo trays to cool. Rice or glutinous rice flour is roasted until golden brown, then mixed with the seeds and set aside for 2-3 days to ferment between hibiscus (*waroe*) leaves on flat trays. When the mass has molded, it is sun dried for a few days until very hard. Note: This is the soybean koji used making taucho.

Remove the leaves and put this mass of soybean koji into salt water. On the third or fourth day, add some yeast (*gist*) and some cane sugar syrup. Continue the soaking and fermentation in salt water for 2-3 weeks. Place it [in crocks] daily outside in the dew, taking care that no rain gets on it.

To stimulate the fermentation, take steamed rice or glutinous rice that is only half cooked. Add *ragi* starter and allow it to ferment for 2-3 days until a sweet, alcoholic flavor develops. This kind of fermented rice is called *peujeum* in West Java, or *tapé* in Central or East Java. Now add this fermented rice to the soybeans in salt water to enhance both the fermentation and the product.

After 3-4 weeks the soybeans should be very soft like porridge; then the taucho is ready to be used. It is eaten raw with cooked or raw vegetables, or mixed with meat or rice dishes; other condiments are also made from it.

Another product that the Chinese make out of soybeans is tofu (*tahoe* or *tauwhoe*). Soaked soybeans are ground and the puree is mixed with fresh water. Then a milky liquid (*melkachtige vloeistof*) is filtered off and coagulated. The Chinese use a coagulant called *tjiogo* (gypsum or calcium sulfate), which is specially imported from China and is not always available, even to the Chinese apothecary. It is first burned, then cooled before being added to the milky liquid. The white mass which is precipitated is called tofu. A similar product can be made from mung beans. Address: Batavia (Jakarta), Java.

111. Lahmann, Heinrich. 1901. [Natural hygiene: or, Healthy blood, the essential condition of good health and how to attain it. A treatise for physicians and their patients on the predisposition to and prevention of disease. Translated by H. Buettner]. London: Swan Sonnenschein & Co. vi + 218 p. Illust. No index. 22 cm. Printed in Holland. [10* ref. Ger]
• ***Summary:*** This is a translation of the 8th edition of *Die diätetische Blutenmischung* (*Dysaemie*) *als Grundursache der Krankheiten,...* first published in German in 1892. Hygiene ought to be taught in plain language so that children can understand it. The author has four children (see photo facing title page), ages 6 years to 8 months, who have been raised on his system. “The most important factor... as regards the maintenance of health is food” (p. 11). The fundamental cause of disease is not external agents such as micro-organisms but is always an internal and constitutional

predisposition; the external causes are secondary causes (p. 12). Dietetic dysæmia is an abnormal composition of the blood and the principal origin of all predisposition to disease. The blood is formed from what we eat and drink (p. 15). The key to a good diet is its inorganic or mineral substances. The "total amount of food salts contained in the ordinary food of European nations is not only altogether too small, but the relative proportion of the food salts to each other also varies widely from that of the normal food-mixture" (p. 27). An unbalanced vegetarian diet can also lead to dysæmia (p. 28). Dietetic dysæmia arises from three main causes: Wrong selection (or preparation) of food, the abuse of common salt (NaCl), and excessive consumption of water. Uric-acid diathesis is a comprehensive name for gout (p. 59, 61). Carnivores and men consuming vegetable food form only small quantities of uric acid, whereas men living on flesh food form very large quantities. "Consequently man cannot be classed as a carnivore and cannot eat flesh unpunished" (p. 64). As "man is subject to sweating, it is evident that he was not intended to live on flesh, but on vegetables or rather on fruits, for he was never meant to live on cereals, as we have seen above" (p. 65). People should eat so as to maintain an alkaline condition of the blood (p. 121). They should avoid stimulants (*Genussmittel*) such as tea, coffee, alcohol, tobacco, etc.–which cause dysæmia.

In 1883 Dr. Lahmann hit upon the idea of adding the milk of nuts and almonds, instead of plain water, to cow's milk. Then he added food-salts extracted from leafy vegetables (p. 149). His invention, named "vegetable milk," was made by Hewel & Veithen in Cologne, and concentrate into a thick jelly. The product forms finer curds in the stomach of infants.

"The question of food reform has only lately been practically taken in hand, and this we owe to the *vegetarians.* They were the first to earnestly consider the food question, and they were right in the beginning with that most important question: Ought man to belong to the carnivorous class, to the herbivorous (frugivorous), or to the omnivorous? One through instinct, another by philosophy, a third from moral reasons, arrived at the conclusion that flesh-eating was not proper for man, and all united in opposing it. But after all there was comparatively little gained by this; for almost all of them held fast to the albumen theory... This is the reason why the vegetarian regime has failed in so many cases... We can certainly live without meat, and indeed it is more natural for us to do so; but there is a correct and an incorrect way of using even vegetarian food." The best diet is based on green vegetables and juicy fruits, with cereals, pulses and nuts as secondary foods (p. 195-96). The author lived 1860-1905. Address: M.D., Sanatorium, near Dresden, Germany.

112. *Vegetarian Messenger* (*Manchester, England*). 1902. Price list. Jan. p. 12.
• ***Summary:*** Lists prices for foods; beans, peas, lentils; prepared foods; biscuits; Plasmon; tea and coffee substitutes; nuts; jams; bottled fruit; oils; butter and lard substitutes [margarines and shortenings]; soaps; and cookery appliances, etc.

All are available for purchase from the Vegetarian Society's Food Stores at 19 Oxford St., Manchester, England.

The foods in the category "Prepared foods" are of special interest, since most are meat alternatives and would soon be called "health foods." Those known to be made (or imported) by the International Health Association Ltd. (renamed Granose Foods Ltd. in 1926). are followed by an asterisk: Dr. Nichol's Food of Health, Dr. Allinson's Food (packed it tins), Fromm's Extract (jar), Maggi's Soups (packet), Granose Flakes* (packet), Granose Biscuits* (packet), Avenola (packet), Bromose* (tin), Falona (tin), Meatose*, Nutmeatse* (tin), Vejola (tin), Nutvejo (tin), Malted Nut Caramels (tin), Nut Butter* (tin), Carnos, Golden Grain Meal (packet).

Cookery appliances include several Nut Mills, and "The Pitman Spoon."

Note: There are apparently no foods made by Pitman sold at this vegetarian store.

113. Kneipp Health Store. 1902. Mother's milk (Ad). *Naturopath and Herald of Health* (*The*) (*New York City*) 3(3):Unnumbered page at front. March.
• ***Summary:*** "... is undoubtedly the best food for infants. When this, however, is not procurable the best substitute for it only should be used... Dr. Lahmann's Vegetable Milk (*Pflanzen-Milch*). Dr. Lahmann's Health Cocoa (*Närsalz-Cacao*). Dr. Lahmann's Hafer Cacao (made with oats). Dr. Lahmann's (sweetened) Chocolate. Dr. Lahmann's Nutritive Extract (*Närsalz-Extract*). Dr. Lahmann's Närsalz Hafer Biscuits." Address: 111 E. 59th St., New York City.

114. R.S.T. 1902. The solving of the meat problem: What has been accomplished at the Battle Creek Sanitarium during the past thirty-seven years. *Chicago Daily Tribune.* June 5. p. 7.
• ***Summary:*** "Just now, when the price of meat is so high as to make it an expensive luxury even to the well-to-do classes, it strikes me that it is a good time generally for people to learn the fact that meats are not the best foods obtainable to contribute to either health or strength."

"I was surprised to learn that the patients treated at this great institution were not only not given drugs for the cure of their ailments but were fed on a 'meatless' or vegetarian diet. At first I said these people are 'cranks,'... Gradually I sampled the 'vegetarian' dishes, and found them so temptingly prepared and served, that I soon learned to prefer them to the flesh foods. I was surprised at the great and pleasing variety of substitutes for meats in the line of cereal and nut preparations."

Dr. Kellogg, whom the writer has known intimately for about 6 years, "has been a vegetarian for 35 years or

more [i.e., since at least 1867]. He is the hardest and most persistent worker that I know of." He works at least 14 hours a day. "He is a human dynamo of wonderful energy. Recently, when he was engaged almost night and day planning and working for the rebuilding of the Sanitarium [destroyed by fire on 18 Feb. 1902], I asked him how he could endure so much work. He answered in his uniformly courteous and cheerful way: 'O, that is simple; I live right.'"

He has developed scientifically prepared foods from cereals and nuts for his thousands of patients. In "this line he is certainly the most prolific as well as the most successful inventor in the world."

These food products were primarily "for use in the Battle Creek Sanitarium, but as the thousands of patients who have been cured or benefited, learned the better way of living, they demanded that these foods be supplied to them at their homes, and as a result the Battle Creek Sanitarium Food Company and the Sanitas Nut Food Company came into existence, the former about 3 years ago [i.e., about 1899], and the latter about 7 years ago [i.e., about 1895].

"Dr. Kellogg is not the only living example of the superiority of a vegetarian over a meat diet. There are, I should judge, no less than 2,000 people in Battle Creek who do not eat meat, and who claim as a consequence that they enjoy better health on account of their method of living, and they certainly look healthier than the average persons who are meat eaters."

The Sanitarium "corps, numbering about 800, are all vegetarians, and the amount of work that they do, always with cheerfulness, amply demonstrates the fact that the 'Battle Creek Idea' is correct."

It is important to know that neither "the Battle Creek Sanitarium nor the Battle Creek Sanitarium Health Food Company is conducted for the purpose of making money." They are "wholly philanthropic in nature."

There follows a long column giving menus on specific days, starting with breakfast, 4 June 1902. Items preceded by an asterisk (*) are made by one of the two food companies. These include: Almond Cream, Bromose, Caramel Cereal, Cocoanut Crisps, Crystal Wheat, Gluten Biscuit No. 1, Gluten Wafers, Graham Crackers, Granola, Granut, Granose Biscuits, Granose Flakes, Malted Honey, Malted Nuts, Nuttolene. Protose, and Zwieback. Categories: Dextrinized grains. Unfermented breads. Eggs and milk are served, but no meat, fish, or poultry–except at the "sinners" table. Two photos show the Sanitarium, old and new.

115. Bilson (T.J.) & Co. 1902. T.J. Bilson & Co. (Ad). *Good Health* (*London*) 1(4):125. Sept.
• ***Summary:*** A ¼-page ad. "Supplies of the best dried fruits and nuts of all kinds.

"Also a full stock of the foods of the International Health Association [IHA], such as Bromose, Protose, Granose, Toasted Wheat Flakes, etc.

"Special offer made with respect to Welch's Grape Juice, a most delicious food-drink, and real tonic.

"Send stamp for full price list, in which you are sure to be interested."

Note 1. This small ad (3 inches high by 2.5 inches wide) is the earliest document seen (July 2009) (one of two ads on the same page) that mentions the "International Health Association," a Seventh-day Adventist organization, which was renamed Granose Foods in 1926. The IHA was an early (perhaps the earliest) manufacturer of health foods in England and the UK.

Note 2. This is the earliest document seen (July 2009) giving the name of a retail store that carries products manufactured by the International Health Association. Note that this retail store is located in London.

This same ad appeared in the Dec. 1902 (p, 228) and Jan. 1903 (p. 260) issues of this magazine. Address: 86 Gray's Inn Road, London, W.C. [England].

116. Meyer, Frank Nicholas. 1902. Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Industry, USDA. 2444 [i.e. 2577] leaves. Unpublished typescript.
• ***Summary:*** Only two copies of these rare, magnificent unpublished documents exist. One is Rolls 28-30, Vols. 105-109, Project Studies, Division of Plant Exploration and Introduction, Record Group 54: Records of the Bureau of Plant Industry, The National Archives. The second is at the University of California at Davis. Most are carbon copies of typewritten letters. Includes some illustrations (pencil sketches) by Meyer.

The first letter in this collection, dated 7th Oct. 1902, is from Meyer in Santa Ana, California, to Mr. Adrian J. Pieters (a fellow Dutchman) at USDA in Washington, DC. Meyer arrived in California on 18 Sept. 1902 and started immediately to work for USDA at the plant introduction garden in Santa Ana; he stayed 7 months. In April 1904 Meyer is in Guadalajara, Mexico. In March 1905, Meyer receives an offer from David Fairchild and Pieters to work for USDA as an agricultural explorer in northern China. In August 1905, he is in Nagasaki, Japan. In Sept., he is in Shanghai, China. In Oct. 1905, he writes a long letter to Fairchild. Meyer made four very fruitful expeditions to Asia, eastern Europe, and the Middle East. His first expedition was to China, Manchuria, and Siberia, 1905-08. His second was to Europe, Russia, Caucasus, Transcaucasia, Turkestan, and Siberia, 1909-12. His third was Russia, Siberia, Manchuria, China, and Japan, 1912-15. And his fourth and final expedition was to Japan and China, 1916-18.

On 23 Dec. 1917, war engulfed Frank Meyer at Ichang (I-ch'ang or Yichang) on the Yangtze River. He was trapped there until 2 May 1918 when he managed to break through lines of soldiers. The last letter in this collection, dated 18 May 1918, is from Meyer to Fairchild written from Hankow, China. He died about 1-2 June 1918, having drowned in the

Yangtze River below Anking, and above Wuhu, China.

Meyer did not report any soybeans in Russia or Turkestan.

Note 1. This is the earliest document seen (July 1998) concerning Frank N. Meyer.

Note 2. Ichang, which opened as a treaty port in 1876, was a city of 40,000 people by 1920. It is situated at the head of steam navigation on the Yangtze, at the throat of the main outlet from Szechuan, and at the point where the mountains of Szechuan and western Hupeh meet the central plain of Hupeh.

Note 3. Soyfoods Center owns all pages that mention soy, plus: (1) The full U.C. Davis cataloging record for the archival collection, which is in Special Collections SB108 A7M49 1902 v1-4. (2) A letter from Melissa Tyler of U.C. Davis, dated 22 Sept. 2003, discussing the collection and its lack of front matter. (3) Appendix A: Bureau of Plant Industry, by Knowles Ryerson about a dispute he had with Secretary of Agriculture Henry Wallace involving Nicholas Roerich, Dr. H.G. MacMillan, and James F. Stephens over a plant exploration expedition to Manchuria and the Gobi Desert. In 1934 Ryerson was appointed Chief of the USDA's Bureau of Plant Industry; this dispute led to his removal that same year; he was replaced by Frederick D. Richey. Address: USDA Bureau of Plant Industry.

117. *Good Health* (*London*). 1902. The International Health Association of Legge Street, Birmingham,... 1(5):156. Oct.
• ***Summary:*** "... have added two new foods to their list of products during the last few months; namely Toasted Wheat Flakes, and, very recently, Malted Nuts. These foods are not eminently wholesome and nourishing but also very palatable. Toasted Wheat Flakes bids fair to out-rival the famous Granose Flakes, from which it differs in affording more resistance to the teeth, and in its rich, sweet taste. The Association richly deserves the increased patronage which it is enjoying."

Note: Toasted Wheat Flakes was on the market by Oct. 1901, and widely publicized by 1902. Granose Flakes was on the market by 1898. Both products were first launched in the USA by Seventh-day Adventists in Battle Creek, Michigan.

118. Miles, Eustace Hamilton. 1902. Avenues to health. London: Swan Sonnenschein & Co, Ltd.; New York, NY: E.P. Dutton and Co. 438 p. Illust. Index.
• ***Summary:*** In Chapter 15, "Diet and feeding," Miles gives a full-page list of protein foods that he believes are nourishing and free from harmful elements. "I certainly find them pleasant to the taste." These include:

"Foods of the International Health Food Association (70-74 Legge Street, Birmingham; Battle Creek, Michigan, U.S.A.). Besides Protose, Nuttose, and Malted Nuts or Bromose (over 20 per cent. of vegetable Proteid), Granose is a excellent Grain product."

"Pitman's Vigar Oil (for Salads, etc.)."

"These and other food products can be ordered through the Pitman Stores, Corporation Street, Birmingham."

Note 1. The "International Health Food Association" was probably correctly named the "International Health Association"; in 1926 it became Granose Foods. It may have been the earliest known company in England that used the term "Health Food" or "Health Food Co." in its company name.

Note 2. On the last (unnumbered) page of the book is a long list of "Works [mostly books] by Eustice Miles, M.A." A summary of the prizes he won in racquets, tennis, and squash, etc. appears at the top of the list. He was a fine, well known athlete. Eustace Miles lived 1868-1948, and was at his peak of athletic performance in about 1897-1902. Address: Author, England.

119. Rorer, Sarah Tyson. 1902. Mrs. Rorer's new cook book: A manual of housekeeping. Philadelphia, Pennsylvania: Arnold and Company. 730 p. Illust. Index. 21 cm.
• ***Summary:*** The soy bean is mentioned in two special sections: Botanical classification of our common vegetables (p. 281): "Leguminosae: Pulse family. Soy bean, peanut, kidney bean, string bean, lima bean, black bean, pea, chick pea, lentil, St. John's bread."

Soy bean (*Glycine hispida*, Maxim.) (p. 334-35): "Soy beans are grown principally in China where they form an important article of food; in fact, they are the richest of all in food constituents. It is also grown to a considerable extent in India [sic], where it is mixed with rice. This bean ranks high in fat and albuminoids and is their only muscle-making food. It has more than meat value. By the Chinese it is made into cheese [tofu], pastes [jiang], and sauces [Soy]. Soy sauce is used by them on all meat and fish dishes. For the English and Americans it forms the foundation for such sauces as club-house and Worcestershire."

Note 1. This is the earliest document seen (Feb. 2012) stating clearly that soy sauce is used as an ingredient in making Worcestershire sauce.

"Soy is an agreeable seasoning to creamed meat dishes and a very pleasant addition to French salad dressing. It can be purchased in jugs at any Chinese shop, or at the American wholesale druggists by measure." A table (based on Church) gives the composition of the soy bean: Albuminoids, etc. 35.3%. Fat 18.9. Starch and dextrin 12.5. Sugar 12.0. Cellulose 4.2. Water 12.5. Mineral matter 4.6.

"Soy" [sauce] is used as an ingredient in 12 recipes: Japanese fish sauce (p. 228). Japanese eggs (p. 253). Sautéd [sic Sautéed] celery ("When ready to serve sprinkle over two tablespoonfuls of soy or mushroom catsup, and send at once to the table," p. 389-90). Ginger chutney (p. 435). Japanese dressing (p. 442). Celery salad ("This is greatly improved by adding a few drops of Worcestershire sauce, soy or mushroom catsup," p. 451). Bobotee salad (p. 457).

Philadelphia cream salad (p. 459-60). Shad roe salad ("one tablespoonful of Worcestershire sauce or soy," p. 469). Salad seasoning ("Agreeable seasonings to be kept on hand for salad making: Garlic, mushroom catsup, tomato catsup, Worcestershire sauce, soy, tobasco oil [sic, Tabasco], tarragon vinegar, mint sauce, capers and celery seed," p. 472). "A group of Hawaiian recipes"–To cook beef ("bake until brown. Then pour over it a half pint of sweet cream, to which you have added a tablespoonful of soy. Cook slowly for one hour, basting frequently with the cream," p. 691-92). Cream lettuce sauce to serve with fish ("a half saltspoonful of pepper and a teaspoonful of soy," p. 695).

Worcestershire sauce is used as an ingredient in at least 25 recipes. The first four are: Ox tail soup (p. 62). Cream of cheese soup (p. 74). Mock turtle soup (p. 80). Baked carp (p. 104).

Peanut butter is used as an ingredient in 5 recipes: Cream of peanut soup (p. 75). Lentil pie (p. 337-38). Peanut wafers (p. 535). Nut and fruit crackers (with almond butter or peanut butter, p. 537-38). Marguerites (p. 556).

The earliest recipe seen for homemade peanut butter states (p. 535): "Peanut Butter: Roast the nuts, shell and blow off the brown skins. When making it in large quantities, it will pay to have a bellows for this purpose, or put the peanuts on a coarse towel, cover them with another towel, rub them gently, then blow off the skins. If you use salt dust them lightly with it and grind at once. Pack the butter into glass jars or tumblers, cover them and keep in a cool place. This may be used plain or diluted with water."

Two recipes use almond butter as an ingredient: Almond wafers (p. 525). Nut and fruit crackers (p. 537-38). A recipe for homemade almond butter is given (p. 525).

The word "vegetarian" is mentioned in connection with 7 sections of recipes: Meats (p. 135-36). Vegetables (p. 277-78). Salsify (p. 317-18). Tomatoes and okra with curry (p. 417-18). Nuts (p. 522-23). Nut croquettes (p. 538). Sample menus–Vegetarian (p. 666). The author speaks very favorably of a balanced vegetarian diet. Scientists in general agree, she says, that animal proteids are easier to digest than vegetable proteids. "I must contend, however, that a well selected vegetable diet will give health, bodily vigor and mental strength to those who live rationally." In other countries and cultures, vegetarians are quite equal in strength to those of the same economic class who live largely on meat or on a mixed diet of proper proportions–and are most likely freer from disease. The out-door laborer would probably do better on a vegetarian diet whereas the sluggish digestive apparatus of an indoor is probably better suited to beef (p. 135-36).

"The American people, as a class, in their rushing and bustling life, prefer to take their nitrogen from animal products, which are more easily digested and assimilated than vegetables." "The Japanese, who do in their country the work performed by horses here, are practically vegetarians." The "vegetarian requires but two meals per day," yet they are more nourishing than three meals of meat. They take less time to eat, cost less, and offer more variety. "The amount of cellulose or waste in vegetable foods keeps up the peristaltic motion of the intestines and lower bowels; hence, vegetable eaters are rarely troubled with constipation and torpid livers." America has "grown into a meat-eating nation" in large part because the scullery maids who preside over the kitchen are largely uneducated, do not understand nutrition, and have never learned the subtleties of preparing vegetables (p. 277-78).

"To the vegetarian, they [nuts] are indispensable; they furnish his meat, milk and butter. They are palatable, nutritious, and, if well prepared, easy of digestion. Being of vegetable origin, they are free from the danger of disease germs. Their food value is generally overlooked by Americans as they are generally served as dessert"–on top of a heavy meal. "From the general awakening in regard to healthful diet, societies have sprung up all over the world, recommending the use of vegetable foods, especially fruits and nuts. We have well established, both in New York and London, large vegetarian societies, many with separate branches of 'fruit and nut eaters.' Personally I have tried the experiment, and find it most satisfactory" (p. 522).

The Preface notes that this "new book on Domestic Science... represents on paper The School at its highest period of development..." "A great change in the methods of living has taken place in America during the last few years." Not long ago, schools of cookery taught "fancy cookery"–"to succeed with these elaborate, dyspeptic-producing concoctions as the highest ambition. All this has now changed: the teacher or cook book (an ever present teacher) that does not teach health, body building, and economy in time and money, is short lived. There are still a few women who do elaborate cooking to please the palate and appetite,... They are still at the palate stage of existence. Strive to reach a higher plane of thought–eat to live. Why should any woman be asked to stand for hours over a hot fire mixing compounds to make people ill? Is this cookery? Is the headache that follows a food debauchery more pleasant or pardonable or less injurious than that which follows drink? Results of intemperance are identical. Simple living and high thinking have the approval of learned men and women,..."

Sarah Tyson Heston Rorer (1849-1937) "is one of the great ladies of American culinary history. She was a nationally recognized cookery expert, founded and ran a cooking school in Philadelphia for 18 years, authored over 75 books and pamphlets, edited her own magazine *Table Talk*,... and was domestic editor of the *Ladies Home Journal* for 14 years." With over 1,500 recipes, tips and advice, and more than 125 recipes, this "is one of America's great cookbooks. The *Ladies Home Journal* reprinted it in 1970. It offers an excellent view of American cookery at the turn of the 19th to 20th centuries" (MSU introduction).

Note 2. This is the earliest document seen (Jan. 2001) which states that "body building" is widely considered part of a healthy way of life. Address: Philadelphia.

120. *Good Health* (*London*). 1903. Malted Nuts, the new food which the International Health Association is putting on the market,... 1(9):285. Feb.
• ***Summary:*** "... affords the best hot, nourishing drink that we know of. A cup of hot malted nuts may be prepared in a moment, and is in such form that it is ready for immediate assimilation into the system. It is not only far superior to tea, coffee, or cocoa, but contains a great deal more nourishment than bovril or any other meat extract, as well as being free from the harmful extractives contained in these animal foods."

121. International Health Association. 1903. Health foods (Ad). *Good Health* (*London*) 1(10):319. March.
• ***Summary:*** A full-page 2-column ad with a large bold title. The introduction, spanning both columns, states: "The foods included in the following list are called 'Health Foods' because they are entirely free from all that is injurious, and contain just the elements required to build up the human system, both in health and disease. They are made from the purest materials, combined in the proper chemical proportions, and so perfectly cooked as to be easily digested by all."

Under the fairly large words "Price list" (also spanning both columns), the name of each of 14 foods appears underlined in large bold letters, followed by a detailed description and the price in regular size type. The foods are:

Granose Flakes (crisp flakes in packets containing about 13 ounces, 7½*d.*) Granose Biscuits ("The same as Granose Flakes but pressed into biscuit form." Sold in boxes). Toasted Wheat Flakes ("Sweetened with Malt Honey (Nature's Health Sweet)," Makes a "delicious breakfast dish." Serve warm or cold)."

Avenola (A combination of grains. "Makes porridge in one minute." Also tasty puddings. Packed in an air-tight canister). Nut Rolls (Made from "whole meal and finely ground nut meats, shortened with sweet nut oil. Very suitable for those who have to put their dinners in their pockets"). Gluten Meal (Made from wheat gluten for "diabetics and people who cannot digest starch").

Nut Butter ("Made from cooked nuts only. Can be used for shortening, flavouring soups, or for table purposes. When diluted with hot water it forms a delicate cream. In 1 lb tin"). Caramel Cereal ("A healthful and fragrant substitute for tea and coffee, prepared from cereals... One pound makes nearly 100 cups. Packed in air-tight canister. 8*d.*). Protose ("Vegetable Meat... It provides the same elements of nutrition that are found in the best meat, without any impurities. Liked by almost everyone from the first... In ½ lb. tin" 8*d.*). Bromose ("A combination of malted cereals and pre-digested nuts"). Fruit Bromose ("The same food as Bromose, combined with figs"). Wheatmeal biscuits. Oatmeal biscuits. Fruit wafers ("Made from the best flour and dried fruits, shortened with nut fats").

Across the bottom: "A package of assorted samples of the above foods will be sent, post paid, one receipt of One Shilling. Can also be obtained from your *Good Health* agent. Recipes furnished."

Note: This is the earliest ad seen (June 2009) for the various foods made or sold by the International Health Association of Birmingham. A few of these foods may be made in Battle Creek, Michigan, and imported into the UK. Address: Birmingham [England].

122. International Health Association. 1903. Radical temperance. Health foods (Ad). *Good Health* (*London*) 1(11):348. April.
• ***Summary:*** A 1-column half-page ad. The health foods advertised are: Caramel cereal (A "health beverage" for use in place of nerve stimulants like tea and coffee). Malted nuts (Use in place of stimulating Beef Tea and Meat Extracts). Protose (Use in place of animalising flesh foods). Address: Birmingham [England].

123. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*). 1903. Zappo: Tônyû oyobi jinzônyû [Miscellaneous news: Soymilk and other man-made or artificial milks]. No. 256. p. 616, 635. June. [Jap]
• ***Summary:*** Note: This is the earliest Japanese-language document seen (July 2012) that mentions soymilk in the title, or that uses the term *tônyû* (literally "bean milk") to refer to soymilk.

It is also the earliest document seen (Aug. 2013) in any language that mentions *tônyû* or *tonyu*. As of Aug. 2013 *tônyû* is the modern Japanese word for soymilk.

124. *Vegetarian Messenger* (*Manchester, England*). 1903. The Vegetarian Society's food depot. Sept. p. 211-12.
• ***Summary:*** "A new price list of specialties supplied at the V.S. Food Stores has been prepared, and can be had on application, from 19 Oxford Road, Manchester. It contains a list of Health and Food-Reform publications as well, and the prices quoted will be found to compare favourably with those charged at other depots.

"It may be convenient to group the specialities [sic] under different heads so that readers may the more readily understand their nature.

"Substitutes for fleshmeat fittingly comes first. Under this head we have Protose, Meatose, Nuttolene, Almond Nut Meat, Vejola, Savoury, and Banana Nut Meats. These range from 5d. to ¼ per tin, and it is claimed for them that they look like meat, taste like meat, are less expensive than meat, and can be served in all the many ways that meat can be; and I can affirm that they are much more healthful.

"Amongst nut butters (which even these warmer months are having a very ready sale) are. Pea-Nut, Almond, Almond Cream, and Coconut Butters, and there are in addition, two varieties of 'Nut' Butters, each having a distinctive flavour of its own."

"The grain preparations include wholewheat meal, whole wheatmeal bread, and cracked wheat (all of which are fresh daily), whole red and pearled wheat."

"Among biscuits may be mentioned the V.S. health biscuit (a most relishable and healthful wholemeal biscuit) at 4½d. per lb."

"With the introduction of Plasmon Powder, Milk Proteid Foods became a household word–and necessity. Besides this brand the Depôt stocks others of a similar character, viz.: Casumen, Lacumen, and Milcose, the latter being a preparation produced specially for the Vegetarian Society's Stores."

125. *Good Health* (*Battle Creek, Michigan*). 1904. Chart of food elements. 39(1):Insert after p. 48. Jan.
• ***Summary:*** This table lists 64 foods, both processed and unprocessed, with a standard serving size for each (both volume and weight), and the amount of proteid, fat, and carbohydrate per serving, plus the number of "food units" [apparently similar to calories] per ounce. Processed foods include: Granola, Granose, Graham crackers, Whole wheat wafers, Graham bread, Whole wheat bread, Gluten mush, Wheatose, Malted nuts, Bromose, Nuttolene, Protose, Stewed Nuttolene (½ water), and Kumyss. For example, Protose: 0.5 pint (4.2 oz) contains 21.3 [units not given] protein, 10.2 fat, 2.8 carbohydrates, and 60 food units per oz. Butter has the highest number of food units per oz (217.6), followed by shelled almonds (189.6). Lettuce is lowest (5.2).

126. International Health Association, Ltd. 1904. Our health foods reach to the ends of the earth: Have they reached you? (Ad). *Good Health* (*Britain*) (*Seventh-day Adventist*) 2(8):255. Jan.
• ***Summary:*** A full-page ad. This company sells (and perhaps makes) the following foods. A description and price of each is given. Granose flakes. Toasted wheat flakes. Avenola. Nut rolls. Whole wheatmeal biscuits. Oatmeal biscuits. Fruit wafers. Peanut butter. Pure almond butter. Caramel Cereal [a coffee substitute]. Protose. Nuttolene. Bromose. Malted nuts–in fine powder form.

"Send us One Shilling for a package of samples and cookery book, or ask your Good Health agent for these foods."

Note: Most or all of these products were first developed by Dr. John Harvey Kellogg at Battle Creek, Michigan, and sold by Sanitas Nut Food Co. Address: Birmingham [England].

127. Just, Adolf. 1904. Return to nature! The true natural method of healing and living and the true salvation of the soul. 2nd English edition. Paradise regained. Authorized translation from the 4th German edition by Benedict Lust. New York, NY: Published by the translator's Naturopathic Publishing Co. xv + 303 p. Illust. No index. 22 cm. Reprinted in 1970 by Health Research, Mokelumne Hills, California. [Eng]
• ***Summary:*** Contents: Dedication. Translator's preface to the English edition. Preface to the first edition. Preface to the fourth edition. The voices of nature. The Jungborn, its purposes. The natural bath. Rubbing and stroking of the body. Light and air. Light-and-air huts and cottages (injurious gaslight). Our clothing. Earth power. The fear of catching cold. Earth bandages and earth compresses. How shall we bury our dead? (not in coffins). Nutrition according to nature. Jesus and nutrition according to nature. Meat and alcohol. Fire. When ought we to eat? The natural food, care, and education of children. Cases and cures. Sea and mineral baths. When ought we to submit to a natural cure? My relation to the old method of natural healing. Everyone his own doctor. Agriculture, fruit culture, veterinary science and vivisection. Mental and physical work, fruit culture, and sport. The family, the home, and the country. Ideals and poetry. Conclusion: The soul's life. Supplement: The arrangements, aims, and purposes of the Jungborn. The contents and the significance of the following volumes (Vols. I and II) of my work.

Adolf Just, born in 1859, believed that everyone should return to nature, should be his own doctor, and should make use of the four great therapeutic means that nature offers–diet, mud, light and air baths, and the cold rub-down. Men must listen to the voice of nature to learn what is right. Primitive people are seen as "children of nature" whereas civilized mankind has gone astray–despite their higher intelligence and science, which is "the cunning serpent in paradise." For health, one must turn toward nature and away from science.

The section titled "Natural food" (p. 132-56) advocates a vegetarian diet, with native raw fruits and nuts as the main foods. Drink mainly water, but sparingly; unnatural thirst is caused by meat, salt, and spices. Meat-eating should be avoided. "Salted and smoked meats are the most injurious. Pork and various kinds of sausages are the worst of all... Instead of potatoes and leguminous seeds, we ought to choose green vegetables and salads." Avoid sugar, tobacco, alcohol, and other stimulants, especially coffee. "Instead of real coffee, cereal coffee (malt coffee) could be used." Also avoid salt and spices. Raw, uncooked milk or curds (although most stable cows are sick), plus bread and butter, can be helpful in making the transition. "This new departure in a meatless diet, in which fruit occupies the chief place, might be called the *new vegetarianism.*" The old vegetarian diet used bread, green vegetables, leguminous seeds, and some fruit as the main foods. It is "well known that the orang-

outang whose intestines and organs of digestion are so like man's... lives entirely on raw fruit and nevertheless possesses such enormous strength that he is the giant of the tropic forest" (p. 145). During sickness one should fast.

Sports (such as gymnastics, bicycling, etc.) are contrary to Nature; do productive physical work instead (p. 261-63).

Note: The first German edition of this book was published in 1896, the third edition in 1898, and the fourth edition in 1900. Address: Author: Jungborn, Stapelburg (between Isenburg and Hartzburg) in the Harz [Germany]; Translator: Naturopathic Physician, American "Jungborn," Butler, New Jersey, USA.

128. Abel, Mary Hinman. 1904. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 39 p. See p. 11-13, 18-20. Revised. Illust. [1 ref]*

• ***Summary:*** A revised edition, 3 pages longer than the 1900 original. The information about soy is unchanged, however it is on different pages (see above). The section titled "Nutritive value of the legumes" (p. 18-20) includes a table titled "Composition of fresh and dried legumes compared with that of other foods." Under "Dried legumes," the composition of "Soy beans" (dry, containing 10.8% water) is given.

129. Fulton, Edwin Giles. 1904. Vegetarian cook book: Substitutes for flesh foods. Oakland, California: Pacific Press Publishing Company. 266 p. Index. 19 cm.

• ***Summary:*** The introduction, titled "Why I was impressed to write a cook book," states: "The number of physicians and dentists increases each year at an alarming rate, but the aches and ills of the suffering people do not lessen. Thousands of people find themselves in a deplorable condition, with stomachs almost worn out, having depended largely upon predigested foods and a long list of so-called 'dyspepsia cures.'

"The amount of patent medicines, 'sure cures,' consumed by the people in the United States is enormous, and is increasing every year...

"Disease among cattle, poultry, and fish has increased so alarmingly in the last few years that we should no longer depend on the animal kingdom for food." "In our efforts to teach how to live without the use of flesh foods, we find we have only begun to discover the inexhaustible resources of the great vegetable kingdom in the boundless wealth of varied hygienic foods."

The chapter on "Entrees" (p. 67-114) contains only vegetarian recipes with names like Mock white fish, Fillets of vegetarian salmon, Mock turkey with dressing, Roast duck (vegetarian style), Vegetarian roast, Vegetarian hamburger steak (p. 113-14), or vegetarian sausage. Several commercial products are called for in many recipes: Protose, Nuttolene, and Nut Food–all made by the Sanitas Nut Food Co. of Battle Creek, Michigan.

The chapter on "Cereals" contains a recipe for Gluten-Granola mush (p. 184). The chapter titled "Toasts" states (p. 187): "Zwieback should be used as the foundation of all toasts, although ordinary toasted bread can be used." Adjust the fire so as not to burn or singe the bread.

The chapter titled "Nut butter" (p. 239-45) states that "Nut butter can be easily made in the home... Peanuts and almonds are the nuts most suitable for making nut butter... The best variety peanuts for making nut butter is the Spanish shelled." Three home-scale processes are given. The first is:

"Process no. 1: Put a layer of peanuts about one-half inch deep in a dripping-pan and place on perforated shelf in a moderate oven. Allow them to bake slowly for about one hour. Cook them until they are a light brown or straw color. Shake the pan or stir the peanuts every few minutes. When the kernels begin to crack and pop they brown very quickly, and should be watched closely.

"A splendid way to cook them is to fill a tight-covered dish about two-thirds full, place in the oven, and shake occasionally. When cooked this way, they are not liable to burn, and they retain their flavor better. When they have cooked sufficiently, spread out at once. When they have become quite cool, blanch as follows: This can be done by rubbing them in the hands, or what is better, a coarse bag, or take a piece of cloth and fold the ends together, forming a bag. Another good device is a screen made of coarse wire. Rub them until the skins are loose. The chaff can be removed by using a fan or by pouring them from one dish to another where the wind is blowing. Look them over carefully, removing defective nuts and foreign substances.

"The next step is to grind them. The most practical family mill we know of for grinding nuts, etc., is the Quaker City Mill (see cut [illustration] and description of same in this book).

"Always grind freshly cooked nuts, as they do not make good butter when left a day or two after being cooked." Note: No salt is used in this recipe. And, it is clearly based on the recipe in Lambert (1899, p. 70-71, which see). Moreover, the term "peanut butter" does not appear in this book.

These recipes are followed by recipes for: Salted nut butter ("Prepare nuts as described in process No. 1. Sprinkle salt on the kernels when grinding. It is much more preferable to grind the salt in with the nuts than to mix it in the butter"). Almond butter ("more difficult to make than peanut butter, on account of the difficulty in removing the skins"). Brazil nut butter. Peanut meal. Nut butter for the table. Peanut cream ("Emulsify with water until it is the consistency of milk").

Concerning "Nut butter for the table" (p. 245): "Put one-half the amount of butter required for the meal [p. 244] into a bowl and dilute with an equal quantity of water, adding a little of the water at a time, beating it thoroughly with a fork until it [sic, the mixture] is smooth and light. Enough water should be used to make it the proper consistency to spread

nicely. An egg beater or a wire potato masher is an excellent utensil for mixing. A little salt can be added if desired. Nut butter when mixed with water does not keep but a few hours."

Page 249 lists 25 U.S. and 2 overseas "Vegetarian Restaurants and Cafes" worldwide, each with a street address. USA: Vegetarian Restaurant, Los Angeles, California. Vegetarian Restaurant, Oakland, California. Vegetarian Cafe, San Francisco, California. Vegetarian Cafe, Colorado Springs, Colorado. Vegetarian Cafe, Denver, Colorado. Hygienic Dining Rooms, Washington, DC. Hygeia Dining Rooms, Chicago, Illinois. Vegetarian Restaurant, Des Moines, Iowa. The Hygeia, Battle Creek, Michigan. Vegetarian Restaurant, Detroit, Michigan. North Michigan Tract Society, Petoskey, Michigan. Pure Food Cafe, Kansas City, Missouri. Vegetarian Restaurant, Lincoln, Nebraska. Vegetarian Restaurant, Jamestown, New York. Health Restaurant, New York City, New York. The Laurel, New York City, New York. Hygienic Cafe, Philadelphia, Pennsylvania. Vegetarian Restaurant (Corner Church & Vine St.), Nashville, Tennessee. The Pure Food Cafe, Salt Lake City, Utah. Good Health Restaurant, Seattle, Washington. Vegetarian Restaurant, Spokane, Washington. Restaurant, Fairmont, West Virginia. Hygienic Cafe, Madison, Wisconsin. Hygienic Cafe, Milwaukee, Wisconsin. Hygienic Restaurant, Sheridan, Wyoming.

Foreign: Vegetarian Restaurant, Sydney, NSW, Australia. Vegetarian Restaurant, Copenhagen, Denmark.

Pages 250-52 contain a "Directory of Sanitariums," 56 in all, worldwide. They are located in the USA (35), Australia (2; Wahroonga and Cooranbong, NSW), Canada (4; Vancouver and Victoria, British Columbia; Knowlton, Quebec; and St. Johns, Newfoundland), Denmark (2; Skodsborg and Frederikshavn), England (2; Caterham, Surrey, and Leicester), Germany (Friedensau, Bez. Magdeburg), India (Calcutta), Ireland (Belfast), Japan (Kobe), Mexico (Guadalajara), New Zealand (Christchurch), Norway (Christiania), Samoa (Apia, [Western Samoa]), South Africa (Cape Colony), Sweden (Orebro), and Switzerland (Basle).

Page 252 gives a "Directory of Sanitarium Food factories: Battle Creek Sanitarium Food Company, Battle Creek, Michigan Sanitarium Food Company, Sanitarium, California. Portland Sanitarium Food Company, West Ave., Mt. Tabor, Oregon. Colorado Sanitarium Food Company, Boulder, Colorado. Union College Bakery, College View, Nebraska. Sanitarium Food Company, 228 Clarence St., Sydney, NSW, Australia.

Commercial food products made by these food companies and used in the recipes include: Gluten, Granose Flakes, Nuttolene, and Protose.

In the back are ads (on unnumbered pages) for: (1) Quaker City Peanut Butter Mill, made by A.W. Straub Co. at 3 locations: 3737-41 Filbert St., Philadelphia, Pennsylvania; Canal and Randolph Streets, Chicago, Illinois; Vegetarian Cafe, 775 Market St., San Francisco, California. (2) Sanitarium Food Company, Sanitarium [St. Helena?], California. Branch stores: San Francisco, Oakland, San Jose, and Fresno, California; and Salt Lake City, and Provo, Utah. They make bottled grape juice and apple cider. (3) Sanitas Nut Food Co., Ltd., Battle Creek, Michigan (makers of Protose and Nuttolene. "Nut foods were developed by the Sanitas Nut Food Co., Ltd., Battle Creek, Mich. Their manufacture is protected by patents... Sanitas Protose and Nuttolene are the only successful and scientific meat substitutes on the market. Sanitas Foods are sold by reliable dealers in all parts of the country... The Sanitarium Food Co., St. Helena and San Francisco, Cal., carry a full line of our products.")

Note: This is the earliest English-language document seen (Nov. 2003) that contains the term "meat substitutes" (or "meat substitute").

A slightly revised edition was published later in 1904, containing 268 pages. A second edition was published in 1910.

130. Kellogg, Ella Ervilla Eaton. comp. 1904. Healthful cookery: A collection of choice recipes for preparing foods, with special reference to health. Battle Creek, Michigan: Modern Medicine Publishing Co. 299 p. Index. 19 cm.
• ***Summary:*** Contents: Methods in hygienic cookery: Healthful cookery. Measuring and combining ingredients. Breads. Unfermented, or aerated bread. Sandwiches. Toasts. Vegetable substitutes for flesh foods. Eggs. Porridges and breakfast dishes. Vegetables. Gravies and relishes. Salads. Soup. Soups with nut soup stock. Gruels and liquid foods. Desserts. The invalid's meals. Seasonable bills of fare. Note: Soy is not mentioned.

"Peanut butter" is called for in various recipes: Nut cheese (p. 163), Nut cream (p. 164), Nut salad dressing (p. 171), and Vegetable soup (p. 181-82).

"Almond butter" is called for in: Fruit pin wheels (p. 49), Almond cream (p. 164), Nut cream (p. 164), Peach salad (p. 169), Sweet salad dressing (p. 172), Sour salad dressing (p. 172-73), Cream of almond soup (p. 179), Almond puree (p. 197), Hot nut milk (p. 197), Granola pie crust (p. 210), Almond pound cake (p. 231, incl. almond butter in the icing), Almond filling (for desserts, p. 233), Chocolate mold no. 1 (p. 239), Cocoanut almond cream sauce (p. 245), Almond whipped cream (p. 246).

"Nut butter" is called for in: Granuto cakes (p. 44), Nut butter puffs (p. 45), Nut gluten rolls (p. 47), and other recipes on pages 55, 57, 58, 71, 78, 82, 86, 87, 88, 104-06, 126, 136, 157, 159-62, 169, 173, 177-79, 233, 245, 301. For "Nut butters" see Sandwiches (p. 53; "The butter, whether dairy or some one of the various nut butters, should be creamed and spread smoothly on the bread...").

"Nut cream is called for in: Granuto cakes (p. 44; "Serve

at once with dairy or Nut Cream, dairy or Nut Butter,..."), Nut gluten rolls (p. 47), Pease gravy toast (p. 65), Nut Lisbon steak, no. 2 (p. 75), and other recipes on pages 86, 99, 104-05, 121-23, 129, 132, 136-37, 141, 146, 151, 153, 155, 159-60, 164, 176, 192, 205, 217, 245, 253, and 283.

Gluten is mentioned throughout the book, as are gluten bread, gluten flour, 40% gluten flour, ½ cup gluten (p. 84), 20% gluten (p. 99, in Protose and gluten patties), gluten meal, and gluten gruel.

This is a vegetarian cookbook. In the chapter on flesh-food substitutes (p. 67+), "vegetarian" is mentioned in several recipe names: Vegetarian roast (p. 106). Vegetarian roast No. 2 (p. 107). Also: Vegetarian boiled dinner (p. 134). Major branded ingredients in this chapter are: Protose ("vegetable meat"), Nuttolene, Granola, and Nut Butter. On page 84 is a recipe for "Vegetable turkey."

On the last 2 pages of the book is an ad: "This volume contains some six hundred recipes." "For the preparation of Sanitarium foods. These foods are manufactured by the Battle Creek Sanitarium Co., Ltd., and the Sanitas Nut Food Co., Ltd., the two original health food manufacturers of Battle Creek. Our products are of world-wide reputation, some of them having been in use more than a quarter of a century [i.e., since about 1879]. The company makes more than 49 food products. "Many good grocers carry only a few of them; some, a large line; more, none at all... Thousands upon thousands of grocers have never heard of our products."

"To all express offices in the following States we prepay the express on orders of $5.00 or more." On orders of $15.00 or more they also offer a 10% discount. The names of 23 states near Michigan are listed. Then the name, weight, packaging type, and price of every product is given.

The author is the wife of the famous Dr. John Harvey Kellogg. She lived 1852-1920. A slightly enlarged edition (313 p.) was published in 1908. Address: A.M., Battle Creek, Michigan.

131. Kellogg, Ella Ervilla Eaton. 1904. Science in the kitchen: A scientific treatise on food substances and their dietetic properties, together with a practical explanation of the principles of healthful cookery; a thousand choice, palatable, and wholesome recipes. Revised and enlarged edition. Battle Creek, Michigan: Modern Medicine Publishing Co. 508 p. [39] leaves of plates. Illust. Index. 24 cm.

• ***Summary:*** In this new edition, the wife of the famous Dr. John Harvey Kellogg discusses the principles and methods of the dietary system employed at the Battle Creek Sanitarium. Although this is a vegetarian cookbook (which includes the use of eggs and milk), that fact is not discussed anywhere in the book.

The "Preface to the fourth edition" (p. 4) begins "Cookery is a progressive science. Within the past few years several new and very valuable food products have been developed in the food laboratories of the Battle Creek Sanitarium and put upon the market, making necessary the evolution of many new recipes for their preparation for the table."

The long chapter on "Meats" (p. 389-417) in the 1892 ed. has been replaced by an even longer chapter on "Nuts and nut foods" (p. 389-425). After that we find all new chapters: "Food for the sick" (p. 426-52), "The daily menu (p. 453-63), and "Appendix" (p. 464+) with many pages of nutritional analyses, copied from the "Battle Creek Sanitarium Diet List," showing the "Food value of the large variety of foodstuffs when prepared for the table."

In the new "Introduction," the section on dairy products has been rewritten to deemphasize their use.

The long chapter on "Legumes" again notes that the Chinese "manufacture cheese [clearly tofu] from peas and beans" (p. 217-18).

The chapter on "Milk, cream, and butter" states (p. 369): "Various nuts, as almonds, filberts, and cocoanuts furnish products which make excellent substitutes for milk, and which can be utilized in cooking in early all recipes where milk is needed. These milk substitutes approach very closely the same composition as cow's milk, thus affording equal nourishment, while they have the advantage of being perfectly clean and free from germs. Recipes for their preparation are given elsewhere."

The chapter on "Nuts and nut foods" begins with a description of the major nuts. The long section on "The peanut or groundnut" notes: "In this country they are more commonly roasted, but in this form are almost indigestible, for the peanut is really not a nut at all, but a legume, and requires thorough cooking... to render it digestible. Peanuts are, however, a very wholesome and nutritious food when properly cooked" (p. 393). Recipes include: To blanch almonds. To blanch peanuts. Cocoanut cream. Nut pulp (from well blanched and baked peanuts). Peanut butter (Blanch, then cook in a double boiler for 8-10 hours before grinding). The section titled "Nut preparations" states: "Within the last few years, various processes have been discovered whereby nuts of different kinds are converted into most valuable and palatable foods. Chief among these nut products may be named protose, or vegetable meat, almond and peanut butters, nuttolene, nuttose, nut meals, and nut soup stock" (p. 398). Then come subsections on: "Protose and nuttolene recipes" (p. 399-411, incl. 2 recipes for Vegetarian roast, Vegetarian chili sauce, Protose steak, Nut steak in gravy, Mock hamburger steak, Nuttolene cutlets, Nut fillets, Protose patties, and Rice and lentil croquettes). "Nut products with vegetables" (p. 411-16). Nut cream and butter (p. 416+, incl. Nut butter, Nut milk). Sandwiches (p. 214+, incl. with almond nutter or nut butter).

The Appendix showing nutritional value of foods (p. 464-84) includes all the new nut products. At the very

end is a half-page table titled: "The following table shows clearly the inferior value of flesh foods." The nutritional composition of 23 such foods (red meat, poultry, fish, and shellfish) is given. The book contains 31 excellent illustrations and 39 unnumbered pages of glossy black and white photos, each page printed on only one side.

Note 1. This is the earliest document seen (Jan. 2007) that mentions a kind of meatless burger or patty, which it calls "Mock hamburger steak" and "Protose patties."

Also discusses: "The superiority of bread made from the entire wheat or unbolted meal" also called "whole-wheat bread" (p. 112, 143). Many gluten recipes throughout. Diabetic biscuit (p. 452, made of Graham or entire-wheat flour). The following words do *not* appear in the Index: Animal, beef, bulk, fiber, fish, flesh, roughage.

Note 2. The 1904 date appears only on page 4 in the section titled "Preface to the fourth edition." No mention of a 4th ed. appears on the title page. The copyright page gives only the 1892 date. Address: Battle Creek, Michigan.

132. Thurston, Herbert. 1904. Lent and Holy Week: Chapters on Catholic observance and ritual. London: Longmans, Green. See p. 46. *

• ***Summary:*** "... is undoubtedly the best food for infants. When this, however, is not procurable the best substitute for it only should be used... Dr. Lahmann's Vegetable Milk (*Pflanzen-Milch*). Dr. Lahmann's Nutritive Salt Health Cocoa (*Närsalz-Cacao*). Dr. Lahmann's (sweetened) Chocolate. Dr. Lahmann's Nutritive Extract (*Närsalz-Extract*). Dr. Lahmann's Oatmeal and Närsalz Biscuits. Dr. Lahmann's Japan Soya Sause [sic, Sauce] $1.00.

"Descriptive pamphlet on receipt of 2 Cents stamp. For sale by all naturopathic sanitaria and N.D's."

Note: This is the earliest document seen (Aug. 2007) in this periodical that mentions soy. Address: Sole importer and agent for the U.S., 124 E. 59th St., New York City.

134. Li, Yu-ying. 1905. Le lait végétal fabriqué en Chine [The vegetable milk made in China]. In: 2nd Congrès International de Laiterie: Compte-Rendu des Séances (2nd International Dairy Congress: Proceedings): Paris: Comité Français–Fédération International de Laiterie. 548 p. See p. 387-89. Held 16-19 Oct. 1905 at Paris, France. [Fre]

• ***Summary:*** The president of this international milk congress introduces Li Yu-ying as attaché at the Chinese Legation, and official delegate to the congress. Li begins by expressing his happiness at being able to speak to the congress and getting to know the many scholars and very competent people from many countries.

"In China, not much animal milk is consumed. It is replaced by another product: *vegetable milk* (*le lait végétal*). This latter product could not be used here and, therefore, is of little interest to you. I will speak to you about it only as a curiosity, first to explain the special method employed in my country for the production of vegetable milk and vegetable cheese, and finally to increase interest in these products because of their hygiene and economy.

"Everyone knows that animal milk is an excellent substance with numerous advantages. One may ask, therefore, why so little of it is consumed by the people of China. The reason is because it is relatively expensive and because cows cannot be raised in all parts of China. Dairying is practiced only in the north and the west of China. In the other provinces dairying is difficult because of the climate and the nature of the soil; so vegetable milk is consumed there.

"The latter is made with the seeds of *Soja hispida* or 'oil peas of China.' This is an annual legume which has been imported to England, Spain, Belgium, and France. Presently it is widely cultivated in America as forage.

"Mr. Lechartier, director of the agronomic station at Rennes, has experimented with this plant in France; he obtained yields of up to 25,000 to 30,000 kg of green forage per hectare. This plant is therefore already known here."

"As forage, the soja hispida is as rich in protein as clover (*trèfle*), horse beans or dried kidney beans (*les féveroles*), etc.; but it is richer in fats than the other legumes. The seeds are richer in nitrogenous materials [protein] than other plants of the same family. Analyses show that they contain 30% protein, oil, and little starch.

"The seeds of this plant can also be used to make a cheese (tofou [tofu]) which is a major source nourishment for the peoples of China and Japan. It is consumed, in effect, every day and at every meal, as a main dish.

"The production of these two products [milk and cheese] is very simple. First the seeds are cooked, then they are pressed strongly to obtain a sort of puree, which is coagulated by a mineral salt that plays the role of rennet. The fresh cheese, which is made daily, must be sold and consumed the same day. It can be used in recipes like vegetables or meats. However it can also be preserved, either hot, or by putting it in a salt solution: in this way one obtains various cheeses which are used as desserts, as following:

"(1). Salted and smoked cheese (*Le fromage salé et fumé*), which in both flavor and form bears some resemblance to gruyere cheese. It can be stored for a rather long time; (2) Salted cheese (*Le fromage salé*), white in color, whose taste somewhat resembles that of goat cheese; (3) Fermented cheese (*Le fromage fermenté*). Its color is white, yellow, or gray, and it flavor is very strong, like that of Roquefort.

"The processes which give rise to Chinese milk and cheese also give residues [okara] which are not lost. They are employed either as fertilizer, or as feed for farm animals.

Thus nothing is wasted from soybeans. Moreover, the factories where this plant is processed are very numerous, and the products made by them are the most moderately priced. A square or cake of vegetable cheese (*carré de fromage végétal*) (11 by 10 by 2½ cm), consumed daily by one person, costs about one centime, or about one-fiftieth the price of an animal cheese of average price.

"It is of interest, finally, to compare the products of the animal dairy with those of the vegetable dairy, not only in terms of their similarity in appearance, but also in terms of their chemical composition. It is well known that animal milk contains a large proportion of casein; the same is true of vegetable milk, which contains legumine that has the same chemical formula as casein.

"Furthermore, during processing, the peas (*le pois*, i.e. soybeans) undergo a complete chemical and mechanical transformation which concentrates the nutritive parts and eliminates the others; it is this which explains the richness of the vegetable milk and cheese in nutritive principles.

"After all these considerations, you can realize the interest present in this industry in China.

"It can also be interesting in places where raising livestock is impossible. It is evident that this would be more difficult than in the countries which produce animal milk in large quantities. I am well aware that animal milk has a real superiority over vegetable milk, but doesn't it also have its disadvantages: Fraud, on the one hand, and its contagious diseases on the other? Moreover, milk merchants have various categories of milk at different prices; it is clear that the most expensive is the best, and vice versa. But the consumer knows full well that some milk is not of good quality, yet he is obliged to take it in order to earn money. Thus it is the fate of the poor to be condemned to drink milk of inferior quality, and often fraudulent. However, vegetable milk does not support fraud and cannot transmit contagious diseases. It is the same for everyone; the poor consume the same product as the rich.

"Let the culture of soybeans expand therefore in Europe. One might try to make vegetable milk which will be destined, not for those who have the means to buy good milk, but rather for those who can only afford low-price milk; thus, fraud becomes useless, and this will a benefit for public hygiene and for the purse of poor people."

Note 1. This is the earliest document seen (May 2011) concerning Li Yu-ying. It is also the earliest publication seen by him on the subject of soya.

Note 2. These proceedings contain a list of attendees and of excursions. Address: Attaché at the Chinese Legation, and official delegate.

135. Fernie, William Thomas. 1905. Meals medicinal: With "herbal simples," (of edible parts). Curative foods from the cook; in place of drugs from the chemist. Bristol, England: John Wright & Co.; London: Simkin, Marshall, Hamilton, Kent & Co., Ltd. xxii + 781 p. See p. 84. Illust. Index. 22 cm.

• ***Summary:*** In this collection of unusual facts about the healing power of foods, the various foods are listed alphabetically. The section titled "Bean" states (p. 84): "The Soy Bean (*Glycina soja*) [sic, *Glycine soja*] is of three varieties, black, green, and white. These Beans are boiled, then mixed with barley, or wheat, until, through fermentation, they become covered with fungi; then brine is added, and further fermentation goes on for a couple of years. The sauce thus concocted is afterward boiled afresh, and put, when cool, into bottles, or casks. From a nutritive point of view it is superior to any other sauce in our markets." Soy is made throughout Japan, and most Japanese partake of it with every meal. "In China, Soy Cheese [tofu] is extensively eaten, whilst various sauces, and pastes [jiang] are prepared from the Beans... An old fable said that Soy was made from certain beetles, and Londoners have improved this to 'black beetles.'" Note: This is also the earliest English-language document seen (April 2013) that clearly uses the term "Soy Cheese" (or "soy cheese") to refer to tofu.

The author then quotes a four-line poem by Edward Lear from his *Book of Nonsense* (1862) which begins: "There was an old person of Troy / Whose drink was warm brandy and soy,..."

Also discusses: Seaweeds (p. 495-96, 627-33; Incl. Irish moss or carrageen, dulse, laver, sloke, samphire, sea holly, bladderwrack, and *Laminaria digitata* or sea-tang, sea spinach, agar-agar or Japanese isinglass). The Pea-nut (Arachis hypogæa, p. 504-05; Incl. pea-nut candy and nut cream). Vegetarianism (p. 711-17). The book contains no recipes. Address: M.D [England].

136. Abel, Mary Hinman. 1906. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 38 p. March 25. See p. 11-13, 18-20. Corrected. [1 ref]

• ***Summary:*** A corrected edition, one page shorter than the 1904 revised edition. On the cover, below the title is written "(Corrected March 25, 1906)," yet at the bottom of the same page the publication date is given as 1904.

The section about soy (p. 11-13) is titled "Soy bean (*Glycine hispida*) and its preparations," but the information in that section appears to be the same as in the original 1900 edition, as is the illustration of the soy bean plant (p. 12) and the table on page 19.

137. Atwater, W.O.; Bryant, A.P. 1906. The chemical composition of American food materials. *USDA Office of Experiment Stations, Bulletin* No. 28 (Revised ed.). 87 p. Corrected April 14.

• ***Summary:*** Note: The first edition of this classic was published in 1896. The composition of wheat gluten is given in a table on page 57, and gluten bread and Graham bread on page 60.

Under nuts (p. 74-75) is given the composition of almonds (edible portion and as purchased), cocoanuts, cocoanut milk, peanuts, and peanut butter.

Note: Soy is not mentioned. Is there no section titled "Beans" or "Oilseeds" in the index and no mention of oilseeds or soybeans. Beans mentioned in the long table titled "Vegetable food" (p. 56-75) under "Vegetables, fresh" (p. 65-69) include: Butter beans, dried beans, beans (frijoles), lima beans (dried and fresh), mesquite beans, string beans (cooked and fresh). Beans mentioned in the long table titled "Vegetable food" (p. 56-75) under "Vegetables, Canned" (p. 69-70) include: Baked beans, string beans, little green beans, wax beans, haricot verts, haricot flageolets, haricot panaches, lima beans, and red kidney beans. Address: 1. PhD; 2. M.S.

138. Katayama, T. 1906. On the preparation of a vegetable cheese from the protein of the soy bean. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(1):117-19. April. German summary in Chemisches Central-Blatt 1906(2):540. [4 ref. Eng]

• ***Summary:*** Describes experiments to make a cheese similar to Swiss cheese. The soybean contains (according to Osborne and Campbell 1898) as its "chief proteid constituent glycinin, a globulin similar in properties to legumin, but of somewhat different composition, containing nearly twice as much sulphur..." and having the following composition: Carbon, 52.12; hydrogen, 6.93; nitrogen, 17.53; sulphur, 0.79; and oxygen, 22.63 per cent.

This protein can be extracted from [soaked, ground] soybeans by boiling. "The liquid thus obtained resembles cow's milk in appearance," and when treated with calcium and magnesium salts, yields a precipitate which is sold in Japan under the name of Tôfu. The author has attempted the preparation of a cheese from tofu. 450 gm of pressed tofu were mixed with 60 gm of common salt, 50 gm of finely-ground Swiss cheese, and the mixture was wrapped in a linen cloth saturated with brine, and left for five months in a room with an average temperature of 15º C. At the end of this time the mass was of a grey color, and quite compact; it was free from the numerous pores produced by evolution of gas in Swiss cheese. The cheese had an agreeable taste different from that of Swiss cheese, and when extracted with water, yielded a solution in which the presence of albumoses and peptones was detected. Further experiments with mixtures containing larger quantities of milk-sugar, but no casein, gave similar results. Address: Japan.

139. Katayama, T. 1906. A condensed vegetable milk. *Bulletin of the College of Agriculture, Tokyo Imperial University* 7(1):113-15. April. German summary in Chemisches Central-Blatt 1906(2):540. [1 ref. Eng]

• ***Summary:*** A liquid closely resembling cow's milk is obtained by soaking soy-beans in water, crushing them, and boiling with water. "The composition of this milk prepared in Japan for the purpose of obtaining Tôfu by the precipitation with calcium or magnesium salts, is in average as follows:" A table titled "Soy-bean milk" shows: Water 92.53%. Protein 3.02%. Fat 2.13%. Fibre 0.03%. Non-nitrogenous extract, including carbohydrates (galactan), 1.88%. Ash 0.41%.

"There can be no doubt that this vegetable milk is of a certain value as an easily digestible food, although in regard to the nourishment of children it cannot replace cow's milk or mother's milk, even if the necessary amount of milk sugar be added.

"The idea suggested itself to prepare from that vegetable milk, the soy milk, by addition of sugar and evaporation a durable preparation resembling condensed cow's milk."

"In 4 litres of soy-milk were dissolved 4 g. dipotassium phosphate [to prevent separation of protein] and 600 g. cane sugar and the solution concentrated *in vacuo* to a very thick liquid. This no doubt can replace the much more expensive condensed cow's milk for certain purposes of the cuisine as e.g. for sweetening coffee and tea, and for the preparation of chocolate.

"It has an agreeable taste like cow's milk, but a very feeble odor recalling crude beans and a slightly yellowish color. If this preparation should be manufactured on a large scale, it must be, of course, always sold under its proper name, and adulteration of condensed cow's milk with condensed soy milk, must be strictly prohibited." Chemical investigations "must determine whether such an adulteration can be easily discovered. My experiments in this direction answer this question in the affirmative."

Such adulteration could be detected by addition of sodium carbonate, when a yellow coloration would indicate the presence of the soy milk. Also, if a portion of the suspected milk were mixed with twice its bulk of water, treated with a few drops of dilute sulphuric acid, and one-tenth of the whole distilled off, the distillate would possess the characteristic odor of the raw beans, if soy-milk were present. Adulteration might also be detected by separating the casein from the suspected sample with rennet, and adding calcium nitrate to the filtrate; the formation of a precipitate would indicate the presence of the globulin of soy-milk, the so-called glycinin.

Note 1. This is the earliest English-language document seen (Aug. 2013) that contains the term "soy milk" or the term "soy-milk."

Note 2. This is the earliest English-language document seen (Aug. 2013) that uses the term "vegetable milk" to refer clearly to soy milk.

Note 3. This is the earliest English-language document seen (Dec. 2010) that uses the term "condensed vegetable milk" to refer to condensed soymilk. It is also the earliest document seen (Dec. 2010) that mentions or discusses condensed or concentrated soymilk. Address: Japan.

140. Loew, O. 1906. Ueber einige sonderbare japanische

Nahrungsmittel [On some special Japanese foods]. *Mitteilungen der Deutschen Gesellschaft fuer Natur- und Voelkerkunde Ostasiens* 11(1):109-11. [Ger]
• ***Summary:*** Prof. O. Loew includes a discussion of tofu, soymilk, yuba, and shoyu (*shôyû-sauce*). On the coasts of Japan there were fresh seafish, and in the inland regions some salted fish were used. People have learned how to prepare wheat gluten (*Jap: fu; German: Weizenkleber*) in various dried forms, which are very porous and easily digested. The protein of the soybean, under the name of tofu (*Tôfu*), comes in the form of soft white cakes and is prepared daily. It is sold from door to door by salespeople.

The cooking of the softened soybeans, before the precipitation of the tofu, has a very milklike consistency. Without doubt, it is similar in nutritional value to milk but it can be recommended only for adults, and not for sensitive infants. "When this soybean milk (*Soyabohnenmilch*) mixed with some gelatine [sic] is simmered down, and while in a concentrated condition the mixture is poured into flat, level containers, there results from the drying of the gelatinous mass thin skins, which are sold under the name of yuba."

Note 1. This is the earliest German-language document seen (Aug. 2013) that uses the term *Soyabohnenmilch* ("soybean milk") to refer to soymilk.

Note 2. The date on the title page is given as 1907-09. The place of publication has now changed to Tokyo. Address: Prof. of Agricultural Chemistry, Imperial University, Tokyo, Japan.

141. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1907. Our mail bag: Japanese vegetable milk. March 16. p. 7.
• ***Summary:*** A condensed vegetable milk has been prepared by Professor Katayama of the Imperial Agricultural College, Tokio, but it is not yet a commercial article.

"It is prepared from soy beans, and the liquid is said to be very similar in appearance to cows milk, having a yellowish color and an agreeable taste which would be quite like the product but for a slight odor of beans."

142. *Bulletin of the Imperial Institute* (*London*). 1907. Utilisation of the soy bean. 5(1):86-87. [2 ref]
• ***Summary:*** "The plant yielding the "soy bean" (*Glycine soja*) has of late received much attention at the hands of agriculturists in tropical countries on account of its value as a green manure. The bean itself has long been employed in the East as a vegetable and food-stuff, and has been imported in large quantities into European countries, principally for use as a feeding-stuff for animals. It is also an important ingredient in Indian soy, which forms the basis of chutney. More recently the introduction of the extraction of cheaper methods for the extraction of fixed oils by the use of solvents has made it possible to utilise such materials as the soy bean, which contains only 10 per cent. of fixed oil, as a source of oil, and considerable quantities are now used in the United Kingdom in this way." Note: This is the earliest English-language document seen (March 2003) that uses the term "solvents" (or "solvent") in connection with the crushing of soybeans to give oil and meal.

Also discusses briefly the preparation of soymilk and tofu in Japan.

143. Marre, Francis. 1907. Le lait végétal en Chine [Vegetable milk in China]. *Nature* (*La*) (*Paris*) 35(1776 Supplement):13. June 8. [Fre]
• ***Summary:*** The use of milk as food in China is very limited. The immense empire, which is governed by the Son of Heaven, is not suited for raising livestock, except in its northern and western regions, which occupy only a small part of its total area. Moreover, the climate and nature of the soil do not permit the culture of forage crops. These purely geographical reasons are enough to explain why vegetable milk is consumed abundantly in the majority of Chinese provinces.

This milk, whose name seems strange and a bit paradoxical, is made from the seeds of *Soja hispida*, also called the oil pea of China (*haricot oléagineux de Chine*), an annual plant of the legume family. To obtain it, the seeds are first [ground with water], boiled and then pressed, making a sort of puree which, when dissolved in water, makes a very nourishing vegetable milk. When treated with a mineral salt, which acts much like rennet in milk, it coagulates and may be made into a kind of cheese (*to-fou*) [tofu] which plays an important part in nourishing the Chinese and Japanese people. It is one of their basic daily foods and can be made into a great variety of culinary preparations. It is generally consumed fresh, the day it is made. But it may be cooked, and preserved by salting or smoking. In commerce, three principal varieties of vegetable cheese (*fromage végétal*) [tofu] are found. One, which is fermented [fermented tofu], is white, yellow or gray, and has a piquant flavor like that of Roquefort. The second is white and salty, resembling goat cheese / goat's milk cheese. The third is smoked and quite like Gruyere (*gruyère*).

In the process of making vegetable milk and tofu, they recover with care the various by-products [okara, whey] and use them with ingenuity to nourish their animals and as fertilizer for their fields; in this way nothing is lost. Even the stems of the plant and the pods that envelop the seeds are used as forage. Thanks to the fact that every part of the plant can be used, and thanks also to the low cost of manpower in China, soy cheese (*fromage de soja*) can be sold for such a low price that enough to serve a man for a day (110 square cm of surface by 2.5 cm thick) costs less than a centime [one-fifth of a U.S. cent], or 50 to 60 times less than an equal quantity of animal cheese.

As for the food value of soymilk, it is approximately equal to that of cow's milk; it contains significant quantities of legumine, whose chemical composition is very close to

that of casein.

Mr. Li Yu-Ying, an attaché at the Chinese legation in Paris, made soymilk (*lait de soja*) the subject of an important presentation at the last dairy congress, and forecast the introduction of soya (*soja*) into French culture.

Note 1. This is the earliest French-language document seen (April 2013) that uses the term *to-fou* to refer to tofu.

\ Note 2. This is the earliest French-language document seen (Aug. 2013) that uses the term *lait de soja* to refer to soymilk. As of Oct. 2003 *lait de soja* is the modern French word for soymilk. Address: Chimiste-Expert près de la cour d'Appel de Paris et les Tribunaux de la Seine.

144. *Literary Digest.* 1907. Vegetable milk and cheese. Aug. 3. p. 65. Science and invention section. *
• ***Summary:*** This is an English-language translation of the following French-language article: Marre, Francis. 1907. *Le lait végétal en Chine* [Vegetable milk in China]. *Nature* (*La*) (Paris) 35(1776 Supplement):13. June 8.

145. Carles, P. 1907. Le lait végétal [Vegetable milk]. *Repertoire de Pharmacie* 19(11):487-88. Nov. 10. Series 3, 63rd year. [2 ref. Fre]
• ***Summary:*** Discusses the characteristics and value of vegetable milk made from soybeans. Note that this article was published in a pharmaceutical journal.

146. International Health Association, Ltd. (The). 1907. Monotony in diet tends to mal-nutrition (Ad). *Good Health* (*London*) 5(19):607. Dec.
• ***Summary:*** "A variety of sustaining breakfast foods eaten on alternate mornings is, for most people, better than the same kind morning after morning." Each of IHA's breakfast foods is perfectly cooked and ready to serve in two minutes.

They are: Granose Flakes and Granose Biscuits. Toasted Wheat Flakes. Avenola. Gluten Meal (I.H.A. brand).

"Can be obtained from all Health Food Stores, or direct from the makers. In districts throughout the United Kingdom where we have no agents we will send, carriage paid, a packet of each of the above five foods, also a tin of our delicious Malted Nuts, and a ½ lb. tin of Protose (Nut Meat), together with "One Hundred Hygienic Recipes," for 5/-.

Note: The first page of the December issue states: "Our seventh Christmas... Our edition this month is 80,000 copies. Six years ago it was 15,000." Address: Stanborough Park, Watford, Herts. [Hertfordshire, England].

147. Jaffa, M.E. 1907. Nuts and their uses as food. *Yearbook of the U.S. Department of Agriculture* p. 295-312. For the year 1906.
• ***Summary:*** The introduction (p. 296) notes: "The increased demand for nuts is due in the main to two causes, namely, a better appreciation of their appetizing qualities and the numerous ways in which they form a palatable addition to the diet of the average family, and, secondly, to their use by the vegetarians and persons of similar belief–a group small in proportion to the total population, but still fairly large numerically–who use nuts, and more particularly the peanut, as a substitute for meat and other nitrogenous and fatty foods.

"Many special nut foods, such as malted nuts, meat substitutes, etc., have been devised and extensively advertised by the manufacturers for general use in the diet and for the special needs of vegetarians and fruitarians. It is said that some of these American nut products contain soy beans, but apparently the peanut plays a very important part in their composition. In either case, since the peanut, like the soy bean, is a legume, these preparations might more properly be compared with the bean cheese and other soy-bean products so much used in China, Japan, and other eastern countries than with such nuts as the walnut, almond, or cocoanut."

In the section titled "Description of nuts," page 297 states: "The chufa, nut grass, or earth almond is a small tuberous root of a sedgelike plant and perhaps should be classed with the vegetables rather than with nuts. It is not common, though sometimes eaten."

In the section titled "Composition of nuts" a table (p. 299) gives the following analyses of peanut butter and round steak: *Peanut butter.*–Water 2.1%, protein 29.3%, fat 46.5%, carbohydrates 17.1%, ash 5%, fuel value 2,825 calories per pound. *Round steak.*–Water 65.5%, protein 19.8%, fat 13.6%, carbohydrates 0%, ash 1.1%, fuel value 950 calories per pound.

These figures show that peanut butter contains 1.5 times as much protein, more than 3 times as much fat, nearly 5 times as much ash, and 3 times as much fuel value as round steak. Analyses are also given for: Chufa (earth almond), cocoanut, ginkgo nut (seeds), lichi nut, pignolia, cocoanut candy, peanut candy, cocoanut milk, cocoanut–desiccated, cocoanut flour, peanut coffee made from the entire kernel.

Cocoanut milk contains: Water 92.7%, protein 0.4%, fat 1.5%, carbohydrates 4.6%, ash 0.8%, fuel value 3,125 calories per pound.

"Nut butters: Within the last few years so-called nut butters have been used in increasingly large amounts, and at least one variety, namely, peanut butter, is made and sold in ton lots." Nut butters are commonly marketed in jars. "The nut butters are recommended by vegetarians as a substitute for butter in culinary processes and for use at the table. With persons who are not vegetarians they are commonly used for making sandwiches and in other ways for their agreeable flavor and for the pleasing variety which they give to the diet. Nut butter may be easily made at home." "The nut butters just mentioned are entirely different from cocoanut butter and from cocoa butter, which are expressed and purified fats. These 'butters' are of considerable commercial importance and are used for culinary purposes, though

perhaps they are more commonly used in other ways."

A section titled "The pecuniary economy of nuts" (p. 309-10) states: "For the vegetarian or fruitarian, who looks to nuts as the chief source of protein in the diet, the peanut must be considered as much the most economical." A table shows the price in cents per pound of various foods, the cost of 1,000 calories of energy, and the number of pounds of protein that 10 cents will buy: Peanuts 7, 3.6., 0.31. Peanut butter 20, 7.1, 0.15. Peanut candy 25, 11.8, 0.04. Porterhouse steak 25, 22.5, 0.07. Whole milk 4, 12.0, 0.8. Cheddar cheese 16, 7.5, 0.17. Address: Asst. Prof. of Nutrition, Univ. of California [Berkeley].

148. *Otago Witness* (*New Zealand*). 1908. Science notes. Jan. 22. p. 84.

• ***Summary:*** In a recent number of a Japanese journal, a Mr. T. Katajama [Katayama] described a process for the manufacture of a vegetable milk, the properties of which would render it highly suitable for use in tropical countries. The, preparation is obtained from a well-known member of the leguminous family of plants–namely, the Soja bean–which is a very popular article of food among the Chinese. The beans are, first of all, softened by soaking, and are then pressed and boiled in water. The resultant liquid is exactly similar to cows' milk in appearance, but it is entirely different in its composition.

"This Soja bean-milk contains 92.5 per cent. water, 3.02 per cent. proteine, 2.13 per cent. fat, 0.03 per cent. fibre, 1.88 per cent. non-nitrogenous substances, and 0.41 per cent. ash. Katajama added some sugar and a little phosphate of potassium (in order to prevent the elimination of the albumen), and then boiled the mixture down till a substance like condensed milk as obtained; this 'condensed vegetable milk' is of a yellowish colour, and has a very pleasant taste, hardly to be distinguished from that of real cows' milk. However it still retains the aroma of the Soja bean. It is recommended as a cheap and good substitute for condensed cows' milk."

Note: Summaries of this article appeared several times in New Zealand newspaper articles until 1914.

149. *Advertiser* (*The*) (*Adelaide, South Australia*). 1908. Correspondence: A curious milk used in Japan is described in a Japanese periodical (Letter to the editor). June 9. p. 11.

• ***Summary:*** "It is made from the Soja bean. The liquid is exactly like cow's milk in appearance, and in taste can hardly be distinguished from it. To make it the beans are first soaked and then boiled in water. Some sugar and phosphate of potassium are added, and it is boiled down till it has the consistency of condensed milk."

150. Jaffa, M.E. 1908. Nuts and their uses as food. *Farmers' Bulletin* (*USDA*) No. 332. 28 p. Oct. 23. [9 footnotes]

• ***Summary:*** This article is based largely on the author's article by the same title published in 1907 in the *Yearbook of the U.S. Department of Agriculture* (p. 295-312. For the year 1906). In the Introduction (p. 8) we read: "Many special nut foods, such as malted nuts, meat substitutes, etc., have been devised and extensively advertised by the manufacturers for general use in the diet and for the special needs of vegetarians and fruitarians. It is said that some of these American nut products contain soy beans, but apparently the peanut plays a very important part in their composition. In either case, since the peanut, like the soy bean, is a legume, these preparations might more properly be compared with the bean cheese and other soy-bean products, so much used in China, Japan, and other eastern countries than with such nuts as the walnut, almond, or cocoanut."

The section titled "Description of nuts" states (p. 10): "The chufa, nut grass, or earth almond is a small tuberous root of a sedgelike plant and may, perhaps, be classed more properly with the vegetables than with the nuts. It is not common, though eaten to some extent." The Chinese olive (*Canarium* sp.) and closely related species of Canarium nuts (which are imported to some extent, but are by no means common) are also discussed.

The section titled "Nuts and nut products for diabetics" (p. 18) notes that "Nuts and nut products are often recommended as foods for diabetics and others from whose diet starch and sugar are excluded, or at least materially reduced."

The section titled "Nut butters and nut milk" (p. 18-20) states: "Within the last few years so-called nut butters have been used in increasingly large amounts, and at least one variety, namely, peanut butter, is made and sold in ton lots." "The nut butters are recommended by vegetarians as a substitute for butter in culinary processes and for use at the table. By persons who are not vegetarians they are commonly used for making sandwiches and in other ways for their agreeable flavor and for the pleasing variety which they give the diet." Peanut butter may be easily made at home; for best results use the roasted rather than the raw nuts. "The process of making nut butters has been frequently described in journals and cookery books." Describes how to make cocoanut milk and cream, which "are used to some extent by strict vegetarians who do not care to use cow's milk. A similar nut milk or emulsion of nut fat made from Java almonds (a species of Canarium) is used in Java, apparently with considerable success, as an infant food" (p. 20).

Note: Briggs and Calloway (1979, p. 16) state: "As far as we know, the first professor of human nutrition in the United States was Professor M. Jaffa, in 1908, at the University of California, Berkeley. In 1912 he became chairman of the Department of Nutrition at the Berkeley College of Agriculture. This may have been the first department of nutrition in America." Address: M.S., Prof. of Nutrition, Univ. of California [Berkeley].

151. Colcord, Anna L. (Mrs.). 1908. A friend in the kitchen: or What to cook and how to cook it. Containing 400 choice recipes carefully tested. 16th ed. Takoma Park Station, Washington, DC: Review and Herald Publishing Association. 112 p. Illust. Portrait. 20 cm.

• ***Summary:*** One chapter in this vegetarian cookbook, titled "Substitutes for meats," contains many Biblical quotations opposing meat eating. The recipes are based mostly on nuts, lentils and peas.

Another chapter, titled "Specially prepared health foods: Nuts, oils, etc.," gives recipes including: Peanut butter. Peanut cream. Peanut milk. Almond butter. Almond milk and cream. Cocoanut milk and cream. Home-made granola. Nutmeat. Protose steak. Protose cutlets. Nut gravy. Other chapters (p. 98-110) include "Simple dishes for the sick" (with recipes for Gluten gruel, Graham gruel, and Rice gruel), "Food for infants," "Remember the Sabbath Day to keep it holy," "Food combinations," "Time required to digest various foods" (Rice, apples, and granola take the least time, 1 hour; Roasted pork takes the longest, 5 hours and 15 minutes; animal foods generally take longer than foods of plant origin), "How to become a vegetarian," and "Vegetarianism in London."

A photo of the author, a Seventh-day Adventist, and her signature faces, the title page. Note: This is the second earliest U.S. document seen (March 1999) that mentions almond milk. Soy is not mentioned in this book. Address: USA.

152. Huang Shirong. 1908. Weituiju suibi [Random notes from the "plain flavor" studio]. China. Passage on soy reprinted in C.N. Li 1958 #349, p. 248-49. [Chi]

• ***Summary:*** Wade-Giles reference: *Wei T'ui Chü Sui Pi,* by Huang Shih-Jung. Qing dynasty. A revised edition of this book, edited by Huang's son, appeared in 1916 during the Republican period. This is a summary by Mr. Huang (in China) of a publication by Li Yu-ying–who was in France at the time.

The section titled "Soybeans efficacy and use" (*gongyong*) states: Mr. Li Yu-Ying recommends that China establish an association / society for soybeans and soybean technology for Chinese manufacturing. Li wrote two articles: One, to promote the establishment of a society for soybeans, and the second to promote manufacture of soybean products in China using modern technology. It is most important to invent new methods of production and manufacture, which would have a great effect on the industry. These two, which contained 5,000 words, were published in a Chinese newspaper [probably in China] the 2nd month on the 6th, 7th, 8th, 9th, 10th, 11th, and 12th days. Note 1. The name of the newspaper is not given. Mr. Huang summarizes the content as follows:

The nutrients of the soybean benefit health, economics, and commercial production; it is worthy of future development. Its wider propagation will improve the fertility of the soil because the roots contain nodules which fix nitrogen to enrich the soil. Soybeans are a rich source of dairy products (milk content) and oil, so they are very nutritious. They can be used to make good substitutes for meat. They are rich in phosphorus and potassium, so they are healthful and strengthen the brain. Since they are lacking in starch, they are good for diabetic diets. Because they are a rich source of dairy products (milk content) and oil, they would be a good material for industrial exploitation. And its very inexpensive; it sells for only about one-fifth as much as legumes from other countries. When you compare the milk / protein content with that of meat, milk, or eggs, or with other legumes and cereal grains, it is at least 2-10 times higher.

The soybean is rich in phosphorus, which is equal to the efficacy of Western medical phosphorus. Other products: Whole soybeans (*douren*). Soybean noodles (*doumian;* wheat pasta enriched with soy); it is a substitute for wheat gluten (*mianjin*). Soybean oil (*douyou*). Soybean cake–defatted (*doubing*). Okara or residue from making soymilk (*douzha;* [mostly fed to animals]).

Note 2. This is the earliest Chinese-language document seen (June 2013) that uses the term *douzha* to refer to okara.

Soymilk (*doujiang*). Spray-dried [or powdered] soymilk (*doujiangfen*). Canned soymilk (*guandoujiang*). Soured soymilk (*suandoujiang;* by lactic acid fermentation). Soybean extract (*doujing*). Tofu (*doufu*). Pressed tofu–sliced (*doufugan yupian*). Fermented tofu (*faxiao doufu*). Whey–from making tofu (*yujiang*). Soy sauce (*jiangyou*). Sweet wheat-flour jiang (*tiandoujiang*). Soy sprouts (*douyacai*). Soybean coffee (*douren jiafei*). (Translated by H.T. Huang, PhD, April 2003).

Note 3. This is the earliest document seen (Aug. 2013) worldwide that mentions powered soymilk.

153. Kato, Yogoro. 1908. Physico-chemical studies on tofu. *Memoirs of the College of Science and Engineering, Kyoto Imperial University* 1:325-31. (Chem. Abst. 3:2182). [2 ref. Eng]

• ***Summary:*** Tofu is a foodstuff made by grinding the soy bean with water, filtering to obtain a milky liquid, and coagulating the suspended matter by the addition of a bitter salt solution (bittern). This bitter salt solution is obtained as the residue in making common salt from sea-water by evaporation. The author concludes that the tofu solution contains a negative colloid and belongs to the class of solutions which might be called colloidal suspension. "It seems quite probable that the manufacture of tofu is based upon the coagulation of the colloid by electrolytes: consequently, several electrolytes containing cation [cations] of high valency, besides calcium and magnesium, may be employed for the coagulation."

Note: This is the earliest English-language document seen (Aug. 2010) that contains the term "physico-chemical"

or with the term "physico-chemical" in the title. Address: Chemical Lab., Higher Technological School of Tokyo.

154. Kellogg Food Co. 1908. Healthful living: An account of the Battle Creek Diet System. Battle Creek, Michigan. 72 p.
• ***Summary:*** The inside front cover, titled "A bit of history about the health food business in Battle Creek," states: "Thirty-five years ago Dr. J.H. Kellogg, the Superintendent of the Battle Creek Sanitarium, began the preparation of special food products, intended at that time for the use of the patients of the Sanitarium.

"The knowledge of their value grew. New foods were added from time to time as the idea developed. One of the first was a cereal coffee (1876). Later came the invention of Toasted Wheat Flakes (1895), and Toasted Corn Flakes (1901), then Toasted Rice Flakes and a long list of nut foods and other products.

"Dozens of food companies were organized in Battle Creek to manufacture toasted flakes, cereal coffees, and other foods. Millions were made and lost in exploiting the food ideas developed by Dr. Kellogg and the reputation acquired by Battle Creek as a headquarters for health foods and ideas.

"In order to protect the public against further imposition, a company has been organized and incorporated to manufacture and sell Dr. Kellogg's food products made after original and perfected formulæ, which will be known as The Kellogg Food Company, Battle Creek, Michigan."

The price list, near the back of this booklet, gives the prices for 126 foods–including various sizes. Among these are: Almond butter (1 lb can, $1.00), almond meal, Bran biscuit, Bromose, Diabetic gluten biscuits, Diabetic gluten meal, 40% gluten flour, Gluten meal, Granola, Meltose, Nut butter (1 lb can, $0.30), Nuttolene, Nuttose, olive oil, Peanut butter (large jar, $0.25; small jar, $0.10), Protose vegetable meat, Salted peanut butter (1 lb can, $0.25), Savora nut butter, Sterilized wheat bran, Taro gluten biscuit, Toasted corn flakes, Toasted rice flakes, Toasted rye flakes, Toasted wheat flakes, Vegetable gelatin, Wafer–whole wheat, Yogurt cheese, Zwieback.

On page 72 is a description of the company's "Peanut butter.–We were the originators of peanut butter, the use of which has become so widespread, and which is now manufactured by many concerns in different parts of the country. But we long ago abandoned the process of roasting the nuts, as we found this to produce harmful effects by setting free the oil and producing certain chemical changes in it. For years our peanut butter has been prepared by a wholly different process, by which the injurious effects referred to may be avoided. In this respect our Peanut Butter differs from all similar products. Prepared from choicest nuts. Put up in pound tins. Most excellent fat producer. Capital for use in sandwiches, for the preparation of salads and desserts. An excellent substitute for butter. Large glass jars, 25 cents; small glass jars, 10 cents.

"Salted Peanut Butter–Same as the preceding, but containing a certain proportion of salt. Pound tins, 25 cents.

"Nut butter–A combination of various nuts. An exceedingly palatable, toothsome vegetable fat which is readily accepted as a substitute for animal fats of all sorts. Pound, 30 cents."

Note 1. This is the earliest English-language document seen (Nov. 2003) that contains the term "vegetable meat" (or "vegetable meats"–with any combination of quotation marks).

Note 2. This is the earliest document seen (June 2002) showing interest by Seventh-day Adventists or Dr. John Harvey Kellogg in dietary fiber, or a high-fiber food product (Bran Biscuit, Sterilized Wheat Bran) sold by an Adventist food company. Dr. Kellogg was the founder and director of Battle Creek Foods. This is the earliest document seen (June 2002) that mentions bran in connection with Dr. John Harvey Kellogg. It is also the first commercial product seen with "Bran" in the product name. Address: Battle Creek, Michigan.

155. The babees' book: Medieval manners for the young. Done into modern English from Dr. Furnivall's texts, by Edith Rickert. 1908. London: Chatto and Windus. xxxv + 203 p. Illust. 16 cm.
• ***Summary:*** Contents: This book consists of an Introduction and 14 different books.

A recipe in this book states: "Take Almaunde Milke & yolkys of Eyroun."

In modern English, this reads: "Take almond milk and egg yolks." The first character of the word *yolkys* (pronounced YO-kus) is not actually a *y* but an ancient orthographic character called a "yogh," that looked liked somewhat like the number 3 and was sounded like a guttural *y. Eyroun* means "eggs" in a dialect of English.

This document was first cited by the Oxford English Dictionary under "almond milk." Note: "Nearly forty years ago, Dr. Furnivall (Frederick James Furnivall lived 1825-1910) collected for the Early English text society 'divers treatises touching the manners and meals of Englishmen in former days.' Some of these were published in 1868, under the title *The Babees' Book* (since listed as *Early English Meals and Manners*) and others ... in 1869, under the title *Queene Elizabethes Achademy.* The substance of Dr. Furnivall's collections in antiquated English are now presented in modern form." Address: England.

156. Friedenwald, Julius; Ruhräh, John. 1909. Diet in health and disease. 3rd ed. Thoroughly revised and enlarged. Philadelphia, Pennsylvania, and London: W.B. Saunders Co. 765 p. April. Illust. Index. 22 cm. [33* ref]
• ***Summary:*** The section titled "Legumes" (p. 108-10) discusses various kinds of beans and peas, the lentil and the peanut–but not the soy bean. However a large table (p. 109)

titled "Composition of fresh and dried legumes compared with that of other foods" (Based on Abel, Farmers' Bulletin No. 121 [1900, p. 17]) includes soy beans, cow peas, chick-peas, and peanuts.

The section on "Diseases in which diet is a primary factor" begins with a subsection on "diabetes mellitus" in which "various Substitutes for bread" are discussed. "Soya biscuits, or bread are made from the Soya bean, a Japanese product. Soya bread was suggested for diabetics by Dujardin-Beaumetz in 1890. Attfield gives the following composition of Soya flour: Protein 41.24%, fat 13.70%, carbohydrate 30.35%, phosphates 4.81%, other salts 0.52%, moisture 9.38%.

"Dujardin-Beaumetz gives the following as the composition of Soya bread: Water 45.000%, protein 20.168%, fats 9.350%, starch and sugar 2.794%, and phosphoric acid 0.863%." Aleuronat is a vegetable albumin flour made from wheat. "Peanut flour has also been used with success in making various dishes for the diabetic."

The section on "Vegetarian diet" (p. 44) states that there are various points of view about its healthfulness, but most have found that animal protein can be entirely replaced by vegetable protein without any appreciable change in the nitrogen balance. The amount of protein required seems to be related to the amount of muscular work performed.

During fasting (p. 44-45), according to Von Noorden, the amount of nitrogen excreted daily in the urine was as follows: For 5 days before fasting: 16.2 gm. During the first 5 days of the fast: 12.9 gm/day average. From the 21st to 25th day: 4.7 gm/day avg. From the 26th to 30th day: 5.3 gm. The experiment lasted 30 days and was conducted by Luciani on the professional faster Succi.

A table (p. 68) shows the "Comparative composition of various kinds of milk" of mammals. Only the milk of the mare contains less total protein (1.3%) than the milk of women (2.3%). Dog's milk contains the most protein (11.2%). "Milk ferments (p. 69): Milk contains various ferments [enzymes]... The principal ferments are proteolytic ferments, resembling trypsin, but less sensitive to acids; fat splitting ferments, lipase, amylase, amylase, peroxidase, and catalase. Chicory is the most common adulterant of ground coffee (p. 201).

In the section on "Vegetable foods," a subsection titled "Vegetarianism" (p. 113-14) begins: "It will not be out of place here to point out the disadvantages of an exclusive vegetable [vegan] diet." "Persons subsisting on a purely vegetable diet for any great length of time are apt to lose strength, as well as physical and mental vigor and endurance. Laborers are unable to perform the same amount of work they could on a diet containing animal food... A purely vegetable diet, if persisted in, is also said to lessen the powers of resisting disease" (2 references are given).

The section titled "Artificial food preparations" starts with a subsection on casein preparations, which include Nutrose, Eucasein, Sanos, and Plasmon. Artificial proteins prepared from vegetables include Roborat (made from rice, wheat, and maize), Legumin (from legumes), and Aleuronat.

In the section on "Recipes" under "Beverages" is a recipe for "Almond milk" (unsweetened). There are no soy recipes in this edition.

Julius Friedenwald lived 1866-1941. John Ruräh lived 1872-1925. Address: 1. M.D., Prof. of Gastro-Enterology; 2. Prof. of Diseases of Children. Both: College of Physicians and Surgeons, Baltimore, Maryland.

157. Nussbaum, -. 1909. Soja [Soya]. *Schweizerische Wochenschrift fuer Chemie und Pharmazie / Journal Suisse de Chemie et Pharmacie* (*Zurich*) 47(26):412. June 26. [Ger]*

158. Ruhräh, John. 1909. Soy beans in infant feeding; preliminary report. *J. of the American Medical Association* 53(2):140. July 10.
• ***Summary:*** This is a summary of the author's pioneering article that first appeared in *Archives of Pediatrics*, July 1909, p. 496-501. Address: M.D., Baltimore, Maryland.

159. Ruhräh, John. 1909. The soy bean in infant feeding; Preliminary report. *Archives of Pediatrics* 26:496-501. July.
• ***Summary:*** This pioneering paper was read before the Twenty-first Annual Meeting of the American Pediatric Society, Lenox, Massachusetts, May 28, 1909. "The soy bean (glycine hispida), sometimes incorrectly called the soja bean, is an annual leguminous plant which originally grew in a wild state from Cochin China to the south of Japan and Java."

There follows a brief but accurate history of the soy bean. "In 1875 Professor Haberlandt began a series of investigations with this plant in Austro-Hungary, and in his work published in 1878 he urges the importance of the soy bean as a food both for man and animals. After his death, which occurred in 1878, very little notice was taken of the soy bean in Hungary and the prophecy that he made for its future failed."

"As early as 1829 Thomas Nuttall wrote an article in the *New England Farmer* concerning the bean as a valuable crop for this country. The Perry expedition to Japan also brought back soy beans, but until the last fifteen or twenty years the plant was known only as a curiosity."

"The plant is grown in America, but is used chiefly for the purpose of a forage crop and comparatively little reference has been made to its use as food for man." The plants "bear a remarkable number of beans and the flowers are self-pollinated, making the yield independent of insects. The bean may be easily grown in Maryland. I am indebted to three friends for experimenting with this plant in their gardens and obtaining good crops..."

Note 1. This is the earliest document seen (May 2009)

that mentions soybean pollination–quite remarkable since it is by a pediatrician writing about a completely different subject. It is also the earliest document seen (May 2009) that uses the term "self-pollinated" (or self-pollinating, etc., with or without the hyphen) in connection with soybeans.

"At the present time there are seven varieties handled by seedsmen, and some twenty-two distinct varieties are known." The varieties Mammoth Yellow, Hollybrook, and Ito San have been used in infant feeding experiments. "The other varieties are the Guelph (green), the Samarow (green), the Ogemaw (brown), and the Buckshot (black). All of these latter may be grown in the north."

"I am indebted to Mr. Frank N. Meyer, agricultural explorer for the Department [U.S. Department of Agriculture], for information concerning the use of the beans in the East... The light-colored beans are eaten in soups and the pods are sometimes picked green, boiled, and served cold with a sprinkling of soy sauce. The green varieties are often pickled in brine and eaten moist or dried with meals as promoters of appetite; the same varieties are often slightly sprouted, scalded and served with meals in winter time as a green vegetable." Also discusses soybean oil, soy bean milk (which "has a composition nearly the same as that of cow's milk" as shown in a table), "natto, tofu, miso, yuba, shoyu,..." (p. 498).

"The soybeans are sometimes roasted and then used as a substitute for coffee" (p. 499)

"The fact that the soy beans contain little or no starch suggested to Dujardin-Beaumetz that they be used as a food for diabetics. The soy bean flour has been placed on the American market, but was withdrawn owing to the fact that according to the manufacturers it contained 8 per cent. carbohydrate. It contains much less carbohydrate, however, than any of the other diabetic foods."

"As regards the use of the beans in infant feeding it seemed to me that soy bean gruel or milk, either alone or with cow's milk, might be of value in feeding several classes of cases, viz., of marasmus and malnutrition, as a substitute for milk in diarrhea, and in intestinal and stomach disorders, and in diabetes mellitus."

Note 2. This is the earliest document seen (Aug. 2013) that suggests the use of a soybean preparation as a milk substitute for infants."

Note 3. This is the earliest document seen (Aug. 2003) concerning the actual feeding of soymilk to infants or children, or concerning a soy-based infant formula. The author was the world's first pediatrician to use soybeans in infant feeding, and did the first U.S. studies with soyfoods and human nutrition.

Note 4. This is the earliest English-language document seen (Aug. 2013) that uses the term "substitute for milk" to refer to soymilk.

Note 5. This is the earliest English-language document seen (Nov. 2002) that uses the word "malnutrition" in connection with soyfoods.

The writer had hoped to conduct experiments and make a more complete clinical report but several misfortunes attended his efforts to secure the beans. "My first crop was eaten by rats, my second moulded in the pods owing to some unusually damp weather, and insects ate about two-thirds of my last crop. Fortunately, the beans may now be obtained from Messrs. T.W. Wood & Son, Richmond, Virginia.

"So far the gruel has been prepared by soaking the beans over night, stirring to remove the envelope surrounding the bean. Three times the amount of water is added to the beans and they are boiled until a smooth gruel results. This is strained if necessary [to make real soymilk]. This has the odor and taste of malt, but with the addition of a little salt is well taken, especially after the first bottle or two. The gruel is retained unusually well and seems to be easily digested. The stools are not more frequent than with other foods. The stools are light brown in color like those from malted milk. This soy bean gruel has nearly the same food value as milk and for certain children may need further dilution. About the same size feedings should be used as if milk were being given. Five percent sugar may be added to increase the fuel value.

"I have not used the beans in a sufficiently large number of cases nor over sufficient periods of time to justify any further statements at this time, but I do feel that properly used they will be a most valuable addition to the dietary of the sick infant. Grinding them to a bean meal would simplify matters very much, and, if success attends their use, a soy bean meal could easily be prepared.

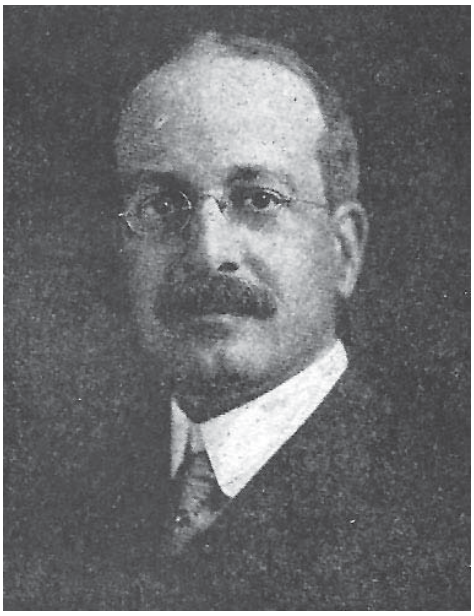
"I hope to be able to make a second report at the next meeting and have called your attention to the bean in hope that other members may try them and report at the same time."

Note 6. Pediatrician Herman F. Meyer (1960, p. x) published a long poem by Dr. John Ruhräh titled "A Simple Saga of Infant Feeding," which described the history and present status of infant feeding. Meyer described Ruhräh as a "philosopher, teacher, poet, pediatrist [pediatrician] and able historian."

Note 7. This is the earliest English-language document seen (Oct. 2001) that uses the term "soy bean flour."

The following photo (see next page) of Dr. John Ruhräh (1872-1935) was taken in about 1914. Born in Chillicothe, Ohio, he was a graduate of the College of Physicians and Surgeons (Baltimore, 1894), did post-graduate work at Johns Hopkins, the Pasteur Institute, Paris (1897), and in other European schools (1900-1901), and was quarantine physician of the port of Baltimore (1898-1900), where he became Professor of pediatrics in the University of Maryland Medical School and in the College of Physicians and Surgeons.

His autograph is shown below. Address: M.D., Baltimore, Maryland.



160. *Milling* (*Liverpool*). 1909. A new British industry. Soya beans. Their cultivation and manufacture. Their wonderful food value. Great possibilities. 33(9):290, 292. Aug. 28. Also printed in 1910 as *Soya Beans*, a 27-page booklet by Northern Publishing Co. in Liverpool., Liverpool. Extensively quoted by Sawer 1910 (p. 27) and 1911 (p. 212). [1 ref]

• ***Summary:*** "The firms which first entered the export trade in Soya beans in quantity were Messrs. Nathanson (Russia) and Messrs. Mitsui and Co. (Japan). Several English firms have also entered the trade, and among these must be mentioned Messrs. S. Macgregor and Co., and Messrs. Jardine, Mathieson [Matheson] and Co. We believe that Messrs. [John] Bibby, of Liverpool, were one of the first British importers of Soya beans, that firm having received a considerable quantity last year. It was not until last Spring, however, that consignments arrived in this country in large cargoes. Up the present time the imports in 1909 have been estimated at about 300,000 tons. This is a large total for the first year of general crushing, and shows that the trade is certainly to be largely increased, providing that Manchurian exporters can secure the beans, and of this there does not appear to be any doubt."

The yellow Sakura soybean variety shipped from Dalny appears to be the best quality and commands a price of about 2/6 per ton more than small yellow varieties such as the Harbin variety shipped from Vladivostok or the Hankow variety shipped from Shanghai. "The black Soya bean appears to be the richest in oil, while analysis proves it to contain a large percentage of albuminoids and phosphates.

"The analysis of the ordinary yellow Soya bean, made by Mr. Alfred Smetham, F.I.C., F.C.S., of Brunswick Street, Liverpool, shows an average of about the following constituents:–Water 12 per cent., oil 17 per cent., albuminoids (protein) 38 per cent., carbohydrates 22 per cent., fibre 5 per cent., ash 5 per cent., and sand 1 per cent...

"Mr. Smethan, in a pamphlet he has prepared for the *Annual Journal of the Royal Lancashire Agricultural Society* for 1909, gives a number of analyses of Soya beans, besides the products of oil and flour millers generally. Some of our readers will be interested to learn that the Chinese in Liverpool have regularly imported various kinds of Soya beans, which are sold in the Chinese shops for human food. We understand that the method of cooking them is very similar to the British plan of steeping and boiling dried peas. In China the beans, after having had the oil extracted from them, are used for feeding pigs and cattle, as well as for manuring the land. The beans have long been known in Japan, where they are made into a favourite condiment known by the name of Shoyu, the meal from the beans being mixed with meal from either wheat or barley."

The oil is of a superior kind and finds a ready sale at high prices for a great variety of purposes, including the manufacture of margarine and other edible goods, the manufacture of fine toilet soaps and paint oils. Note 1. This is the earliest document seen (Oct. 2007) concerning the use of soybean oil in margarine.

"We hear that the Japanese are extracting the caseine [casein] from Soya beans, using it as a substitute for milk. It is said that this vegetable milk is produced by extracting the juice. The preparation, according to the *Java Times*, is a very popular drink among the poorer classes of China and Japan. In making the milk the beans are first softened by being soaked and then boiled in water. The liquor is secured by straining and is similar to cow's milk in appearance, but has a different composition, which renders it highly suitable for use in tropical countries...

"The most interesting use to which the bean can be put, from a corn miller's point of view, is the production of flour for bread-making purposes. This has been done by a Hull firm who recommend that the Soya flour be mixed with wheat flour in the proportion of one of the former and four or five of the latter. We have obtained a sample of Soya flour and blended it with white flour. After baking a loaf it was seen that the top broke but the crumb was all that could be desired. The flavour of the loaf was superior to that of average brown bread. The Soya flour cannot be bleached; therefore, it would not be suitable for white bread making. We think that a proportion of Soya flour might be blended into the millers' brown meal with advantage, because of its great food value and its flavour. Further mention is made of Soya beans and flour in our editorial notes.

"Just as we go to press a gentleman called at this office and showed us a Soya bean pod which had been plucked

from plants raised in South-West Lancashire [England]. It was fully ripe and contained four beans... Soya beans, he informs us, have been grown before in this country as an experiment though without much success."

Note 2. This is the earliest document seen (Sept. 1999) that mentions Mitsui & Co. (a major Japanese trading company) in connection with soybeans.

Note 3. This is the earliest English-language document seen (Oct. 2001) that uses the term "soya flour" (one of two documents).

161. *New York Times.* 1909. The talk of the day [vegetable milk from the Soja bean]. Aug. 31. p. 6.
• ***Summary:*** "The Japanese have discovered a cheap substitute for the milch cow in the form of a tiny bean. The juice, which is extracted by a special process from the bean, is said to be an excellent vegetable milk, the properties of which render it highly suitable for use in tropical countries. The preparation, according to 'The Java Times,' is obtained from the Soja bean, a member of the leguminous family of plants, and a popular article of food among the poorer classes of Chinese and Japanese. In making the vegetable milk the beans are first of all softened by soaking and boiled in water. The resulting liquor is exactly similar to cow's milk in appearance, but is entirely different in composition."

162. *Manchester Guardian* (*England*). 1909. The Manchurian soya bean: New industries projected. Sept. 10. p. 10.
• ***Summary:*** "Considerable interest has been awakened in commercial quarters by the statements recently published as to the immense possibilities of the Manchurian Soya bean and there is a probability that at Liverpool, if not also on the banks of the Ship Canal, an important new industry will spring up."

Note: The Manchester Ship Canal, opened in May 1894, transformed Manchester from a landlocked city into a major sea port, known as the Port of Manchester.

"The value of the bean has already been recognised in various parts of the world, but it was only in the recent opening of the Manchurian Railway for other than military purposes that revealed the immense trade possibilities connected with it."

"The uses of the bean are manifold. It is said to be excellent in bread; it yields a rich oil, is a capital food for cattle and pigs; and in Japan even milk has been derived from it, and from that milk cheese of various sorts has been made. It forms such a rich food for pigs that it requires to be mixed with plainer fare before being offered to them. Its advantages in this direction were quickly grasped by the enterprising Danish pig-breeders; they bought heavily on the Hamburg market, and the subsequent decline in the imports of Canadian hog products into this country has been attributed, in part at any rate, to the advantages gained by the Danish breeders as a result of the extensive use of the bean.

"The first cargo of the beans to reach this country came in the Myrtledene to Bristol and was consigned to a well-known Liverpool firm of cattle food manufacturers. The bean is now used also for soap-making at Port Sunlight. The Myrtledene's cargo arrived in February last, and since then 200,000 tons have been imported.

"Although firms at Hull and Newcastle-on-Tyne are also moving, a serious attempt is to be made to centre the imports of the bean at Liverpool, with the intention not merely of increasing the shipping trade of the port, but also with a view to establishing a new local industry. The exportable surplus of this year's crop will, it is said, probably exceed a million tons, so that the magnitude and value of the trade is readily appreciated. Several of the most prominent commercial men of Liverpool are interested in the scheme, amongst them Sir Alfred Jones, who contemplates attempting its cultivation in West Africa. He is also interested in the question of its shipment from Vladivostok, and particularly in the erection of special mills at Liverpool to deal with the bean. Efforts are now being made to promote a company to take the matter up, and in a few weeks it will be seen whether these efforts have been successful.

"In the meantime the British Vice Consul at Vladivostok reports that the condition of the coming crop is very favourable,..."

163. Edie, E.S. 1909. Cultivation and uses of soya beans. *Liverpool University, Institute of Commercial Research in the Tropics, Bulletin* 1(1):1-7. Oct. 8. [1 ref]
• ***Summary:*** An excellent article. Contents: Introduction. Uses of the soya bean: Forage, hay, ensilage, soya oil, soya milk, a type of cheese made from soymilk [tofu], soya meal [flour]; use of soya bean oil for soap, illumination, paints and other industrial products, soya bean meal used as a fertilizer on Chinese sugar plantations, soya beans as a legume for enriching the soil with nitrogen, planting between rows of maize. Cultivation of soya beans. Varieties of soya beans.

"The Soya bean (*Glycine hispida*) is a native of South-eastern Asia, where it has been cultivated for centuries in China and Japan. It was introduced at a later period into India, and arrived in England towards the end of the eighteenth century. A considerable number of experiments were carried out with the plant were carried out in Austria about thirty years ago, but it is only quite recently that it has become an article of commercial importance in Europe."

After discussing uses as hay and silage: "It is in the bean itself, however, that the chief value of the Soya plant lies. As food for man and domestic animals it is used to a very large extent in the East. In some parts of China the bean forms one of the staple articles of food, and it is cooked much as beans and marrowfat peas are, and also in soups and other forms. The oil is used largely for making salads and sauces, and is also mixed with flour in the manufacture of cakes. Mr.

Turner tells me that the Chinese extract casein from the bean, and I have also seen this stated elsewhere.

"A liquid closely resembling cow's milk is prepared from Soya beans in Japan." The process is described. "This condensed product is of considerable value as a food, but it is unsuitable for the use of infants. This "Soya Milk" is also used in the preparation of a kind of cheese" [tofu]. Note: This is the earliest English-language document seen (Aug. 2013) that contains the term "Soya milk."

"Soya bean meal is now use in the manufacture of biscuits, and for mixing with flour for making brown bread in this country. In some parts of the Continent Soya meal is now being used in preference to rye meal for making bread."

"One of the most valuable products of the Soya plant is the oil. As mentioned before, it is used largely for eating purposes in the East, and Mr. Turner tells me that on the Continent a greater percentage of Soya oil than of Copra oil is allowed in the manufacture of margarine.

"Soya oil is largely used for soap making in the East, and I understand that it has recently been tried with very good results in this country also.

"As a considerable proportion of oil is left behind in the cake after expression of the oil, it may be more profitable to extract the oil by solvents such as naphtha and use it all for manufacturing purposes, as extraction by means of naphtha renders the oil unsuitable for edible purposes.

"In the East Soya bean oil is used as an illuminant and also in the manufacture of paints. The oil has a comparatively high iodine value, which is an index of the drying quality of an oil of that class." Note: This is the earliest English-language document seen (March 2008) which states that soy oil can be used in paints (or other coatings) in connection with its iodine number.

Cultivation: "Recently the question of raising this crop in various British colonies has been discussed. In most of the African colonies, including West Africa, the Soya bean would probably be successfully grown, and in rotation with, or along with maize and other crops, its cultivation would be a very profitable investment. I have seen samples of Soya beans at least three years old, which showed no signs of weevilling or deterioration in any way. Cargoes of the beans shipped from Vladivostock [Vladivostok] and Dalny to Hull and Liverpool are stated to have arrived in perfect condition."

Varieties: A table (p. 6) gives a nutritional analysis by S.H. Collins of "a sample of Chinese yellow Soya beans." Moisture: 10.23%. Oil 15.62%. Albuminoids 37.54%. Carbohydrates 27.27%. Woody fibre 5.02%. Ash 4.32%.

"I have analysed samples of five distinct varieties of Soya beans, some of which were obtained from the shop of a Chinaman who sells them to the Chinese in Liverpool for food. I do not, of course, know the age of the samples, nor their source..." After describing the shape and color (2 green, 2 brown, 1 black) of each, and noting that No. 4 came from Hong-Kong, he gives a nutritional analysis of each in tabular form, and the weight of 20 seeds of each in grams.

"In conclusion I have to thank Mr. A. Grenville Turner, Grain and Seed Broker, member of the Liverpool Corn Trade Association, for much valuable information regarding the Soya beans and for his kindness in obtaining samples for me. I am also largely indebted to an excellent article on Soya beans in the *Natal Agricultural Journal*, November, 1908.

"Since the above was written I have been enabled, through the kindness of Sir Alfred Jones, to analyse a sample of yellow Soya beans grown in West Africa from seed sent out by him early this summer." A table shows the analysis. Moisture: 10.52%. Oil 17.26%. Albuminoids 36.05%. Carbohydrates 26.16%. Woody fibre 5.39%. Ash 4.62%.

"The results show that in the first season at least the Soya bean underwent no deterioration in West Africa, and the plants also came rapidly to maturity."

Also published in 1909 as a 7-page booklet by C. Tinling & Co., Liverpool. Also published in 1911 Spanish by: Mexico. *Ministerio de Fomento, Colonización e Industria* under the title "Explotación de la soya," by E.S. Edic [sic, Edie]. The last line of the article seems to say that the author is at the central agricultural station (*Estación Agrícola Central*).–San Jacinto [probably in or near Mexico City], January 1911. Address: M.A., B.Sc, Liverpool Univ.

164. *Colonist* (*Nelson, New Zealand*). 1909. News of the day. Nov. 13. p. 2.

• ***Summary:*** "The Japanese have discovered a cheap and good substitute for the milch cow in the form of a tiny bean. The juice, which is extracted by a special process from the bean, is said to be an excellent vegetable milk, the properties of which render it highly suitable for use in tropical countries. The preparation, according to the "Java Times," is obtained from the soya bean, a member of the leguminous family of plants, and a very popular article of food among the poorer classes [sic] of Chinese and Japanese."

165. *London and China Telegraph* (*London*). 1909. The soya bean. 51(2,415):1086. Dec. 6. [1 ref]

• ***Summary:*** "An exhibition of Soya beans and by-products from North China, together with photographs of the Soya bean industry, was held recently at the boardroom of the Manchester Chamber of Commerce. Explanations and full particulars of the industry were given by Mr. Cavendish Evelyn Liardet, lately returned form China.

"At a recent meeting of the committee of the African Trade Section of the Incorporated Chamber of Commerce of Liverpool Mr. A. Grenville Turner delivered an interesting address on the cultivation and uses of the Soya Bean.

"In the course of his address Mr. Turner said that it was estimated that this year's crop of Soya beans is likely to exceed 1,000,000 tons. There were about 20 to 25 varieties of the beans, different in colours, size, and shape. The beans

contained about 18 per cent of oil, and it was stated that refined Soya oil fetches to-day a higher price even than refined cottonseed oil. The soya bean, which is an edible bean and can be used in the same manner as marrowfat peas, can be utilised for a number of purposes."

"In America an attempt has recently been made there by certain dealers to place the Soya beans on the market as a new substitute for coffee, and sell it under other names at fancy prices. A sample of coffee specially ground from the Soya bean, at the suggestion of Sir Alfred Jones, was submitted, and created much interest. Mr. Turner stated that according to a recent report issued by the Department of Agriculture of the U.S.A., as Soya beans contain no starch, they have been recommended for food for people suffering from diabetes. Soya bean cake is used as manure on the sugar plantations of Southern China, and on the rush beds, from which Chinese matting is made. Mr. Turner also stated that the Japanese extract casein from the bean from which they make a milk, which is condensed. Cheese is also made from this milk."

Also contains a long summary of information on the uses of soya bean oil and cake published recently: "Cultivation and utilisation of the soy bean." 1909. *Bulletin of the Imperial Institute* (London) 7(3):308-14.

166. Wildeman, É. de. 1909. Le soja [The soybean]. *Agronomie Tropicale; Organe Mensuel de la Societe d'Etudes d'Agriculture Tropicale* 1(12):195-200. Dec. 25; 2(1&2):5-8. Jan/Feb. 1910. [10 ref. Fre]

• ***Summary:*** An overview of the subject, including a brief history, based largely on a summary of about ten documents. It begins: "For some years now, attention has been drawn to the soybean (*Soja hispida* (Mönch) or *Glycine hispida* (Max.)), which comes from Manchuria; its products are now used in various ways in our daily lives."

"It is not a question of exhausting the question, but as the *Bulletin of the Imperial Institute* of London has already devoted several articles to this plant this year and that the first part of vol. I of the *Liverpool University, Institute of Commercial Research in the Tropics, Bulletin* [Edie, 8 Oct. 1909] is entirely devoted to it, it appeared useful to us to insist here on the soybean which would also have a certain importance for our colonies."

This legume originated in Southeast Asia, and has been cultivated for centuries in China and Japan. It is now abundant throughout Manchuria, where the seeds are widely appreciated for their nutritive value. It was later introduced into the Indies (*l'Inde*) and arrived in England at the end of the 18th century. About 30 years, it was the subject of numerous trials [by Haberlandt and co-workers] in Austria, but is only recently that it has become an article of commercial importance in Europe.

"The occupation of Northern Manchuria by Russian troops, during the Russo-Japanese War, gave rise to numerous demands for this bean, which stimulated the extension of [its] agriculture. After the departure of the troops, the local demand fell naturally, and it was necessary to find an outlet in foreign markets. From 1906 to 1908, a large part of the products of N. Manchuria were exported to Japan via Vladivostok, but in 1908 the economic crisis of Japan diverted a part of these products to Europe, which actually received large quantities of soybeans, especially in England. The first large shipment of soybeans contained 5,200 tonnes (metric tons) and arrived at Hull on 2 March 1909. The beans arrived at the destination in perfect condition despite the distance. They were classed in three categories: 1. Shipped from Dalny; 2. Shipped from Vladivostock; and 3. Shipped from Hankow. The value of those in category No. 1 is about £6 8*s.*/tonne [metric ton]; those in No. 2 and No. 3 is about £6 6*s.*/tonne, these prices being, naturally, subject to the fluctuations of the market. Most imported beans are monopolized by the manufacturers of oil who obtain 10-18% of the weight of the beans in oil. [The remaining] oilcake can be used in the feed of livestock."

There follows a long discussion of soybean cultivation and production, including soils, fertilizers, nitrogen fixation by root nodules, planting, intercropping, yields of forage and seed, use as silage, soil restoration, soybean varieties, tables showing the chemical composition of the plant and seeds showing their excellent nutritional value.

"Until recently, soybean cultivation has been confined to Asia and some states of the USA. Recently, the question of cultivating this plant in the various British colonies has been raised. In most of the colonies of West Africa, the soybean could probably be cultivated with success in rotation or mixed with maize or other crops, and give significant yields."

"In China, Japan, and Indo-China the seeds are used to prepare a sort of milky liquid (*liquide lactescent*) [soymilk] and a sort of cheese" [tofu]. A brief description of each process is given. The milk has considerable nutritional value "but is not suited for infants."

"The flour of soybeans (*La farine de fèves de soja*) is used to make biscuits, and, mixed with wheat flour, is used to make a brown bread; it is sometimes even preferred in this application to rye flour. Since it contains neither sugar nor starch, the soybean has been recommended as the basis of diabetic diets." Address: Prof., School of Horticulture, Vilvoorde, Belgium (Professeur au Cors colonial de l'École d'Horticulture de Vilvorde).

167. Imperial Hygienic Laboratories. 1909. Inshoku-butsu narabini shikô-hin bunseki-hyô [Analytical tables of food and luxury items]. *Eisei Shikenjo Hokoku* (*Bulletin of the Imperial Hygienic Sciences*) No. 10. p. 1-78. Miso, see p. 27-28. Shoyu, see p. 28-28. Soymilk, see p. 39-45. [Jap]

• ***Summary:*** Gives a detailed analysis of the nutritional

composition of these basic foods, including analyses of various well-known brands, which are clearly specified. The number of products analyzed are: Miso 30 products, shoyu 122, fermented black soybean Chiang (Shoyu shisho) 4, shoyu moromi 2, shoyu presscake (kasu) 1, Thick (noko) shoyu 11, shoyu second generation products and imitation products 16, soymilk (containing only soybeans) 6, other soymilk products 89. Address: Eisei Shikensho (National Institute of Hygienic Science), Tamagawayoga-machi, Setagaya-ku, Tokyo, Japan (in 1962).

168. Cornet, Paul. 1909. Le régime alimentataire des malades: Considérations pratiques sur les aliments et les boissons diététiques et sur l'hygiene de l'alimentation [The dietary regimen for the sick: Practical considerations on dietetic foods and drinks and on the hygiene of feeding]. Paris: G. Steinheil, Éditeur. 484 p. No index. 23 cm. [144* ref. Fre]

• ***Summary:*** In Part III, "Foods drawn from the vegetable kingdom," Chapter 20 titled "Starchy vegetables" discusses various fruits, grains, and legumes. The section on "Soya" (p. 269-70) gives the name of the soybean in Japan (*daizu*), Annam (*dau-nauh*), and China (*théou*), and notes that the seeds can be used to make shoyu, miso, and tofu–which are widely appreciated.

"Dietetic uses: Without having recourse to these exotic preparations, the nutritional value of soybeans is not used enough in our country. Soy bread is only used in anti-diabetic diets*, whereas one could prepare a pap and a drink (*boisson*, [soymilk]) no less precious, as well as extracts [soy sauce] which could be substituted for meat extracts." Footnote: *Soya is well suited for diabetics, for the seed contains only 3% starch plus 16% oil and 27% protein.

In Part V, "The regimens," Chapter 30 titled "General solid regimens" has two parts: The first, the "Vegetarian regimen" (p. 341-55) has the following contents: Indications for the vegetarian regimen. Application of the vegetarian cure: Absolute [vegan foods plus water], mitigated (lacto-ovo vegetarian), total vegetarian diet (*régime total*) throughout the seasons (incl. dry legumes such as soybeans, peanuts, etc.), culinary preparations. Vegetal calendar (*Calendrier végétal*)*:* soups, main dishes, and desserts for each month of the year. Address: Dr., Professeur at the municipal schools of the infirmaries of the Hospitals of Paris (aux Ecoles municipales d'Infirmières des Hôpitaux de Paris).

169. Edie, E.S. 1909. Cultivation and uses of soya beans. Liverpool: C. Tinling & Co. 7 p.

• ***Summary:*** See: Edie, E.S. 1909. "Cultivation and uses of soya beans." Liverpool University, Institute of Commercial Research in the Tropics, Bulletin 1(1):1-7. Oct. 8. Also published in Spanish in Mexico (1911). Address: M.A., B.Sc.

170. Kellogg, John Harvey. 1909. The Battle Creek Sanitarium diet list. Battle Creek, Michigan: Modern Medicine Publishing Co. Ltd. 71 p. 16 cm.

• ***Summary:*** A table on page 53 shows the "Number of food units or calories per ounce of various uncooked foodstuffs." Soja beans are said to contain the following: 38.4, fats 48.3, carbohydrates 33.5, total 120.2. Note: The units are not clear. The food with the highest total is almond meal (200.2). There are two types of Sanitas self-rising gluten flour. One with protein 20.0 and total 107.4, and another with protein 46.4, total 100.3.

One section titled "Disease-producing foods" (p. 58-59) discusses cane-sugar, fats (in excess), flesh foods, oysters and other shellfish, eggs, milk, condiments, tea, coffee, chocolate, cocoa, wine, beer, and all alcoholics [i.e. alcoholic beverages].

Note: This is the second earliest document seen (Nov. 2002) connected with Dr. John Harvey Kellogg that mentions soy beans [actually "Beans, Soja"]. Dr. Kellogg was born in 1852. Address: M.D., Superintendent, Battle Creek Sanitarium, Battle Creek, Michigan.

171. Rorer, Sarah Tyson (Heston). 1909. Mrs. Rorer's vegetable cookery and meat substitutes. Philadelphia, Pennsylvania: Arnold and Company. 328 p. + 8 p. of unnumbered ads at end. Index. 20 cm.

• ***Summary:*** An early, detailed and savoury vegetarian cookbook. The long chapter titled "In the place of meat" (p. 39-62) includes recipes for: Peanut butter and peanut meal (p. 41-42). Mock veal roast (with roasted peanuts), Mock meat hash, Mock tenderloin steak (with 1 quart nut meats {English walnuts, peanuts, pine nuts and almonds in equal quantities}), Mock turkey, Mock goose (with black walnuts), Mock duck, Mock fish, Planked mock fish, Mock ham (with English walnuts, black walnuts, pecans, and almonds), and nut cheese (p. 43-47). Also includes: Peanut sandwiches [actually Peanut butter sandwiches] (p. 194). Section titled "Nut milks and nut creams" with recipes for Cocoanut milk. Almond milk (p. 245). Section titled Menus (p. 249+). The author was born in 1849. Address: Philadelphia.

172. Hitier, H. 1910. Société Nationale d'Agriculture de France: Le soja [National Society of Agriculture of France: Soya]. *Journal d'Agriculture Pratique* 74(1):24-25. Jan. 6. [Fre]

• ***Summary:*** "Mr. Sagnier, on behalf of Mr. Liyuying [Li Yu-ying], delegate of the government of China in Europe, gave a very interesting presentation on the soybean (*le soja*), and its alimentary, therapeutic, agricultural, and industrial utilization. (This journal will soon publish an article on the soybean.)

After his presentation, Mr. Sagnier showed the members of the Society various products that can be extracted from soybeans: flour, bread for diabetics, cake, seasoning sauce, confections, raw milk, fresh cheeses, etc.

Mr. Schribaux recalled that the soybean, which is widely grown in East Asia, is also cultivated in Europe, but the varieties introduced up to this time have been very sensitive to the cold. In the USA the crop has expanded rapidly.

Mr. Lindet remarked that the soybean contains 16-17% oil, a rather low percentage. Mr. Ch. Girard has cultivated soya at Joinville as a forage plant, but the forage obtained is mediocre, in part because the plant is covered with hairs.

The prince of Arenberg noted that prior to 1908 not one kilogram of soybeans passed through the Suez Canal, yet in 1908 35 million kilograms passed through. This gives a good idea of the commercial development of this plant. Address: France.

173. *Advertiser* (*The*) (*Adelaide, South Australia*). 1910. Milk from the soya bean. Jan. 11. p. 7.
• ***Summary:*** "The Japanese make a milk, said to be very nourishing, from the soya bean. The process is as follows:- The beans are first of all softened by soaking, and are then pressed and boiled in water. The resultant liquid is exactly similar to cow's milk in appearance, but is entirely different in composition. The soya bean milk contains 2.5 per cent. of water, 3.02 per cent. albuminoid, 2.13 per cent. fat, 0.03 per cent. fibre, 1.18 per cent. non-nitrogenous substances, and 0.41 per cent. ash. Some sugar and a little phosphate of potassium are added in order to prevent the elimination of albumen, and then the moisture is boiled down till a substance like condensed milk is obtained. This condensed vegetable milk is of a yellowish color, and has a very pleasant taste hardly to be distinguished from real cow's milk."

174. *Bulletin de l'Association Amicale Franco-Chinoise.* 1910. Le soja [Soya]. 2(1):62-64. Jan. [Fre]
• ***Summary:*** This periodical was established to promote understanding and friendship among the people of France and China.

The name *Soja* or *Soya* comes from the name that the Japanese give to the sauce made from soybeans. In Chinese it is called *tsiang-yeou* (Cc = Chinese characters given [soy sauce]) and it is made from *houang-teou* (Cc [yellow soybeans]). This sauce, which is used in the well-known *Worcester sauce*, is widely used in China and Japan. Some Chinese residing in Paris [incl. Li Yu-ying] recently took the initiative to introduce into France this sauce, as well as several other products derived from these same 'yellow peas' (*pois jaunes*).

They have just built a factory near Paris in a town named Les Vallées (rue Denis-Papin), on the train line going to Saint-Germaine-en-Laye. There, perfected machines / equipment and the resources of western science allows them to obtain from the raw materials a much better yield than could be obtained using the rudimentary Chinese process. These things made it possible, at the same time, to develop many new soy products suited to European tastes.

A retail store named the Golden Jar in Paris (La Jarre d'Or, 4, rue du Renard) received the right to sell these products from *Caséo-Sojaïne.* And an exposition [of the soy products] was organized at the Grand Palace, at the time of the opening, last Nov. 20, of the Food Fair / Expo (*Salon de l'Alimentation*). There various products were offered.

A summary of the contents of an interesting brochure from that exposition is reprinted. Contents of the brochure: Introduction to the soybean. Products based on soymilk (*Le lait de soja, Le lait végétal*)*:* Liquid, powdered, or fermented soymilk, soy cheese (*Le fromage de soja, Le fromage végétal* [tofu]) (fresh, hard, and fermented). Soy sauce. Soy oil. Sweet soya preserves (*Confiture de Soja;* this soy cream {*crème de soja*} resembles chestnut cream {*crème de marron*}). Soybeans used as a vegetable (dehulled dry soybeans, and soy sprouts {*les germes de soja*}). Other soy products (including soy flour, bread for diabetics, whole-meal bread, and soybean cakes–used as feed for animals).

Note 1. It is unclear whether the Chinese-run factory, *Caséo-Sojaïne,* has started to make and sell commercial soy products, or whether they are just about to. They may have started on Nov. 20 of the previous year, however there is no description of soyfood products now being sold in Paris.

Note 2. This is the earliest document seen (April 2013) that contains the term *Caséo-Sojaïne,* which appears to be the name of a business, not of a product. This term would soon be used to also refer to "tofu." Li Yu-ying's name is not mentioned.

Note 3. This is the earliest document seen (Aug. 2013) that mentions soy cream (*crème de soja*).

Note 4. This is the earliest French-language document seen (Aug. 2013) that mentions powdered soymilk (*Le Lait de Soja, en poudre*).

Note 5. This is the earliest document seen (Sept. 2002) that mentions fermented soymilk (*Le Lait de Soja Fermenté*).

Note 6. This is the earliest French-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *les germes de soja.*

175. **Product Name:** [Soy Cream {Resembles Chestnut Cream} (Fresh, or Powdered)].
Foreign Name: Crème de Soja.
Manufacturer's Name: Usine de la Caseo-Sojaine.
Manufacturer's Address: Valles, Colombes (near Asnieres, Seine), northwest of Paris, France.
Date of Introduction: 1910. January.
New Product–Documentation: *Bulletin de l'Association Amicale Franco-Chinoise.* 1910 "*Le soja* [Soya"]. 2:62-64. Jan. See p. 64. A company named *Caséo-Sojaïne* has published a brochure showing products that it makes, including sweet soya preserves (*Confiture de Soja;* this soy cream {*crème de soja*} resembles chestnut cream {*crème de marron*}).

Beltzer, Francis J.-G. 1911. *"Études sur la caséine végétale du 'soja' et ses applications* [Studies on the vegetable casein of soybeans and its applications"]. *Revue Scientifique* 49(23):716-20. June 10. See p. 720. Conclusion: "A Chinese factory has already been established on the outskirts of Paris (at Vallées near Colombes) to make food products based on soya (*produits alimentaires à base de Soja*)." This factory now produces various food products, including sweet soya preserves (*confiture de Soja*).

Scientific American Supplement. 1911. "Extended utilization of soya bean products: Milk, cheese, and a variety of other products from a vegetable seed." Aug. 19. p. 115. "A Chinese factory has been established [by Li Yu-ying] not far from Paris for the purpose of manufacturing alimentary products from Soya, and it has already put on the market... preserves,..."

Li, Yu-ying; Grandvoinnet, L. 1912. *"Le soja* [The soybean"]. *Agriculture Pratique des Pays Chauds* (Bulletin du Jardin Colonial) 12(109):302-08. April. See p. 304. Under "Soy preserves (*Confiture de soja"*) we read that this product resembles *"Creme de Marron"* (sweetened chestnut paste/ butter). A table (p. 304) compares the composition of the soy and the chestnut cremes.

Note 1. This is the earliest known commercial soy cream product.

Note 2. *Creme de marron* is made by pureeing cooked chestnuts and sugar to make a very sweet spread for bread.

176. Sagnier, Henry. 1910. Le soja et ses produits [The soybean and its products]. *Journal d'Agriculture Pratique* 74(1):307-10. March 10. [4 ref. Fre]

• ***Summary:*** The soybean was a curiosity in Europe until 2-3 years ago, when large amounts started to be imported. The prince A. d'Arenberg, president of the Suez Canal Society, told the National Society of Agriculture, that prior to 1908 no soybeans had passed through the Suez Canal, yet in that year 35,000 tons passed through it. It seems that the new commerce has been stimulated by the expansion of the crop in Manchuria and Korea, under Japanese influence. Most of the imports have gone to England and northern Europe. In England, the oil is used to make soaps and the cakes are fed to livestock.

Recently it was announced that the Chinese government, preoccupied with the expansion of exports, would have manifested the intention to prohibit these exports in view of preventing a shortage of soybeans in the interior of the country.

"The Chinese are now greatly expanding their efforts to make known in Europe the advantages to be gained from soya and from the products that can be extracted from its seeds. I recently had the occasion to present to the National Agricultural Society of France a study written by Mr. Liyuying [Li Yu-ying], delegate of the government of China for several missions. It was titled *Le soja, utilisation alimentaire, thérapeutique, agricoles et industrielle*. This study was accompanied by samples of yellow and black soybean seeds, and by the principal products which can be extracted from this plant: flour, bread for diabetics, cake (*gâteau*), seasoning sauce (*sauce condimentaire*), confections (*confitures*), raw milk (*lait cru*), cooked and sweetened milk (*lait cuit et sucré*), cake for livestock feed, (*tourteau pour l'alimentation du bétail*), fresh cheese (*fromage frais* [tofu]), and smoked cheese (*fromage fumé* [smoked tofu]).

"These products originated from processing imported soybeans. They have been prepared at a test factory (a photo, p. 309, shows the interior) set up just outside of Paris, at Vallées, near Asnières. Li Yu-ying's study gives complete details on these products" which are made from imported soybeans. This factory, named *Caséo-Sojaine*, "has been established by the agents of a civil society constituted in China under the name of *Société biologique de l'Extrême-Orient* (Far Eastern Biological Society). Made up of physicians, scholars (men of letters), and businesspeople, this society would seem to have as its principal goal/object to make known and have used in Europe the pharmaceutical and agricultural products of the Far East [East Asia]."

Note: This is the earliest document seen (May 2011) that mentions the Far Eastern Biological Society (*Société biologique de l'Extrême-Orient*)

The author concludes by discussing soymilk (*lait de soja ou lait végétal*), soybean cakes (*les tourteaux d'huilerie*), and a brief history of the soybean in France.

Illustrations (p. 308) show: Mature soy bean plant with pods. Close-up of soy bean pods and seeds. Soy milk and soy flour viewed under a microscope (p. 309).

177. Le Goff, Jean. 1910. Sur l'emploi de la graine du "Soja Hispida" de Chine dans l'alimentation des diabétiques [On the use of soybeans in diabetic diets]. *Gazette des Hopitaux* 83(34):476-78. March 22. Also published as a brochure. [5 ref. Fre]

• ***Summary:*** The writer is interested in using diet to treat or manage diabetes. As early as Feb. 1908, she suggested the use of almond cake in diabetic diets. The almond is not the only oilseed that is available. Nuts, poppy seeds, roasted peanuts, etc. also taste good. "I am here today to call attention to a legume, *Soja Hispida* (Moench), popularly known as the oil-pea of China (*pois oléagineux de Chine*), which serves as the basis of the diet for the inhabitants of that vast country.

"Like wheat, it is an annual plant. It has been cultivated in China since antiquity, and is likewise found in Cochin China, Cambodia, the Indies, and Japan.

"Its cultivation not been tried much in France. The trial by Lechartier (1903), with the goal of using soya as a forage plant, has not yet been repeated.

"Desiring to increase the number of foods permitted for diabetics and, above all, providing them with a fresh

vegetable capable of replacing [dry] peas and haricot beans, I had the idea of trying to cultivate soybeans in France. The trials I made in 1909 were very encouraging.

"The soybean (*Le soja*) planted last May in the department of Loir-et-Cher [in north-central France] gave a magnificent stand of plants 100 to 110 cm in height, which bore fruit in September, even though that month was very rainy.

"Just like grapes, soybeans need plenty of heat to mature. The soybean harvest will be greatest in areas which are dry and warm. In short, the best regions for growing grapes would also seem to be preferable for soybean cultivation.

"It seems to me this demonstrates that the soybean can be cultivated in our country, like peas and haricot beans. It is the one new resource for diabetics who are living in the countryside where it is often difficult to obtain starch-free foods.

"Introduction of the soybean as a vegetable garden crop may be easier, since the trade has usually sold seed from the previous year's crop–or even older. Seeds that were not fresh contributed to the poor quality of foods made from them, and contributed to the discredit into when they fell."

"If soybeans are crushed in a mortar and mixed with water, you get a vegetable milk, resembling almond milk. With this milk, as with animal milk, one can make a cheese [tofu], the cost of which is practically insignificant. In China it is consumed in large quantities."

A table, by Mr. Balland, shows the chemical composition of soybeans from Cambodia and Tonkin.

"It is not only because of its low starch content or its richness in protein that one can recommend the soybean to diabetics; it is also because of the oils that it contains. From that point of view its action approaches that of almond cake.

There follows a long discussion of the action and importance of oils in diabetic diets.

Note: This is the earliest article seen (July 2001) by Dr. Le Goff on soy and diabetic diets. Address: M.D., Lauréat de la Faculté de médecine de Paris [France].

178. Demolon, A. 1910. A propos du 'Soja hispida' [About the soybean, Soja hispida]. *Journal d'Agriculture Pratique* 74(1):375-76. March 24. [Fre]

• ***Summary:*** "The article by Mr. H. Sagnier which appeared recently in this journal on the subject of *Soja hispida* (No. 10, 10 March 1910) stimulates us to publish some reflections on this timely question in which we took an interest while Li Yu-ying was working at our laboratory at the Chesnoy School of Practical Agriculture" [in France].

Demolon presents the soybean as a rather uninteresting plant, though one that could be of purely scientific interest. He makes 12 points–which Li later tries to refute in the Jan. 12, 1911 issue of this journal: 1. The carbohydrates in soybeans are represented by cellulose. 2. When one submits soy flour to an appropriate water treatment, the oil in the flour forms an emulsion and one obtains a whitish liquid. The name "vegetable milk" (*lait végétal*) which is applied to this substance has always seemed scientifically very inexact. 3. It is well known that vegetable albumins have a coefficient of assimilation very inferior to albumins of animal origin. The physical properties of so-called soy casein (*la soi-disant caséine du soja*) are not at all the same as those of milk casein, which has considerable importance from an alimentary/nutritional viewpoint.

Note: This is the earliest French-language document seen (Oct. 2008) that uses the term "soy casein" (or "soya casein") to refer to soybean protein.

4. What should we think of a milk in which lactose is totally absent and cannot be replaced except by indigestible cellulose. 5. Where are the lecithins and the soluble ferments, in short all those things which give milk the character of a biological liquid? 6. This vegetable milk has to its disadvantage a very characteristic taste, which reveals its origin. 7. Those of us who raise livestock are reassured by that fact that vegetable milk cannot compete in terms of results. 8. From the industrial viewpoint, and above all from that of an oil mill, we must note that the oil content of soybeans (16-18%) is inferior to that of most oleaginous plants (rapeseed or colza 35-40%, linseed 20-25%, and peanuts 45-46%). 9. Concerning the preparation of bread for diabetics, it is not clear what advantages soy bread has over gluten bread. The oil content and the strong flavor of soya cannot help but make the product inferior. 10. As Mr. Schribaux has noted, an agronomic trial conducted last year at the Chesnoy School of Agriculture gave an insignificant harvest. And even if varieties suited to these regions could be found, they would have to be superior to our good traditional legumes. 11. Nevertheless, the imported cake can find an advantageous place in livestock feeding. 12. It is however true that the soybean plant represents one of the curiosities of vegetable physiology and in this regard its study will be of great interest.

Note: This is the earliest French-language document seen (Nov. 2003) that uses the term *caséine du soja* to refer to "soy protein." Address: Director of the agronomic station of Aisne, France.

179. Blin, Henri. 1910. Le soja ou fève de Mandchourie. Production et utilisations [The soybean or bean of Manchuria. Production and utilization]. *Nature* (*La*) (*Paris*) 38(1, Supplement):141-42. April 2. [Fre]

• ***Summary:*** Since 1908 people in France have been very preoccupied with the large imports of soybean seeds which are grown in Manchuria and shipped from Dalny and Vladivostok. Soya beans are known in commerce as *Haricot de Chine* and *Pois oléagineux du Japon.* In England, soybeans have been used as a source of oil which is healthful, very nutritious, and of great value–especially for

use by soap manufacturers. In Germany, this bean is used for the preparation of an artificial distillery yeast; it contains an important amount of fermentable materials and of an enzyme (*ferment*) similar to the diastase of malt which transforms fermentable starches and sugars. The investigations of Dr. Calmette of the Pasteur Institute at Lille, have made it possible to extract from soybeans diastatic enzymes (*des diastases*) which have unique effects. [Note: Dr. Calmette was one of the inventors of the "amylo process," which began operation in France in 1891. He also first named *Aspergillus rouxii*.]

Recently Li Yu-ying, a delegate of the government of China in Europe, made a very interesting presentation to the French Society of Agriculture, concerning the food, therapeutic, agricultural, and industrial uses of the soybean: Flour, bread for diabetics, cakes, a seasoning sauce, confections, raw milk, fresh cheeses, etc.

Also discusses: Soybean cakes, cultivation of soybeans in Europe and the USA, soy coffee made by roasting soybeans in the south of France (*le Midi*), and the use of soya in diabetic diets. The author concludes by stating that the soybean has great potential in France, and varieties well adapted to this climate should be cultivated.

180. Brenier, Henri. 1910. La question du soja [The soya question]. *Bulletin Economique de l'Indochine* (*Hanoi*) 13(83):105-28. March/April. Series 2. [22 ref. Fre]

• ***Summary:*** This is an in-depth look at the relevance of the soybean to France, both now and in the future. It is prompted by the rapid growth of soybean imports to Europe from Manchuria. The author has a good knowledge of the literature on soybeans and a familiarity with the crop in the field in French Indochina and China.

Contents: 1. Soybean cultivation: Species and varieties, major soybean producing countries (China, Japan, Korea, Indochina), other countries (Java and the Dutch East Indies, France, USA. The Imperial Institute of London is conducting trials in the Cape of Good Hope and Natal [South Africa], in British West Africa, and in Gambia), methods of cultivation and yield. 2. Commerce: Exports of soybeans and soybean cake (beancake, *tourteaux de soja*) from China and especially Manchuria (Newchwang, Dairen/Dalny, Antung, Ta tung kow, Suifenho [Suifenhe] / Sui-fen-ho), importing countries in 1908 in descending order of amount imported (Russian ports on the Pacific [Vladivostok, for re-export to Europe], Great Britain, France, Holland, Italy, Belgium, Germany), prices. 3. Soybean utilization: Chemical composition, use as a forage plant and for improving the soil, use in human foods (tofu, shoyu, Worcestershire sauce, tuong [Annamite soy sauce], miso, natto, soymilk), the soybean as an oilseed (yield of oil from various oilseeds), soybean cakes. Conclusions.

Page 109 discusses soybeans in Indochina, according to information received from M. Crevost, Curator of the Agricultural and Commercial Museum of Hanoi, and from the article by Bui-quang-Chiêu (Dec. 1905). The names of the soybean are different in the various parts of Indochina. In Cochin China (especially in the provinces of Chaudoc and Baria), in Annam (sporadically), and in Tonkin it is called *dau-nanh* or *dau-tuong* (*Tuong* is a sauce made with soybeans, described later under "Uses"). In Cambodia (*Cambodge*) it is called *sandek sieng*. The variety most widely cultivated in Indochina seems to be one with a yellowish-white color, more oblong than round, a little flattened (*soja platycarpa* of Harz [1880, 1885] (?)), different therefore from the fine (*belle*) varieties of Manchuria and Japan that are well rounded and pure yellow.

A table (p. 112) shows soy bean grain exports (in 1,000 metric tons) from different Manchurian ports for the years 1905-1908. The author notes that Indochina could be exporting soybeans to France. One factor that stimulated the large exports of soybeans from Manchuria in 1908 (besides an excellent harvest in 1907) was a program to suppress the cultivation of opium by expansion of soybean acreage (p. 113). The author uses the scientific name *Phaseolus radiatus* to refer to the *petit haricot vert* (probably mung bean). He observed soybeans planted in mixed culture in Szechuan.

Page 116 notes that the rise of soybeans in Manchuria is due in part to the power of the Japanese commercial house Mitsui Bussan Kaisha and the large English oil mills, which joined to develop an industry that had not previously existed. At the end of 1906, Mitsui, which had a dominant commercial role in Southern Manchuria, sent one or two trial shipments of soybeans to England. Mitsui was followed mainly by the British trading houses (Samuel & Samuel, Jardine, Matheson), then by the Germans (Otto Reimers, Arnhold Karberg), and the Russians. Continued suppression of opium growing led to further expansion of soybean cultivation.

A table (p. 117) gives the price of soybeans (per picul of 300 catties = 180 kg), soybean cake (per 10 cakes of 53 catties each or 318 kg for the 10), and soybean oil (per picul of 100 catties = 60 kg) in New chwang [Newchwang] taels and in French francs in the average year from 1882-1891, and in the year 1897. Prices were up in 1897.

Page 124 states: "A factory was recently founded near Paris (at Saint Germain en Laye), with Chinese capital, for the preparation of a series of products derived from soya: milk, *"caséo-sojaïne,"* cheese [tofu], sauce, and sweet soya preserves (*confiture* (*?*) *de soja*)*."* A footnote states: "I owe this curious piece of information to the amicability of the secretary of *Ecole française d'Extrême-Orient,* Mr. Ch. Maybon, who pointed it out in the January 1910 issue of the *Bulletin de l'Association amicale franco-chinoise.*

A table (p. 125) shows that the soybean gives the lowest yield of oil of all major oilseeds: copra (from coconut) yields 67-70% oil, sesame seeds 50-56%, poppy seed (*pavot*) 43-50%, castor oil plant 42-50%, rapeseed (colza) 42-45%,

linseed 43%, peanuts 35-47%, cottonseed 21-26%, soybeans from Manchuria 16-18%.

Note: This is the earliest document seen (March 2000) that describes *caséo-sojaïne* as a product. Yet this may well be a mistake since its source of information is given as *Bulletin de l'Association Amicale Franco-Chinoise* (Jan. 1910)–which uses the term to refer to a business name. Address: Inspecteur-Conseil des Services Agricoles et Commerciaux de l'Indochine.

181. Ruhräh, John. 1910. The soy bean as an article of diet for infants. *J. of the American Medical Association* 54(21):1664-65. May 21.

• ***Summary:*** The author advocates the use of the soy bean as an article of diet in infant feeding and for diabetics because it is free from starch and has a high protein content (about 25%). It is also good in diabetic diets when the patient tires of eating meats.

"In the feeding of infants and of some young children one difficulty is to supply sufficient in a form in which it can be digested and assimilated. Mothers' milk is often not available, and the protein of cows' milk may not be suited, or cannot be adapted to the infant's digestion or, owing to certain diseases, may be contraindicated; and it is in these difficult and abnormal cases that the soy bean would seem to have place."

The author had a "gruel flour" made from dehulled soy beans by a company [probably run by Mr. Macey F. Deming of the Cereo Company, Tappan, New York–see last paragraph of article] which makes a specialty of producing such gruel flours. An analysis of this flour shows that it contained 44.64% protein, 19.43% fat, and no starch. Each ounce of this "soy-bean gruel flour" yields about 13 gm of protein and 120 calories. He mixed 1 to 6 tablespoons of the finely-ground flour with 1 quart of water (or water-milk mixture) and a little salt, boiled it for 15 minutes, and fed it with good results to infants with diarrhea, digestive disturbances, or diabetes.

He gives recipes for the preparation of gruels, broths, and muffins using this flour, and discusses the indications for its use in difficult infant feeding cases. He suggests that barley, oat, or wheat flour be added to the recipes to help them thicken and prevent settling. "Later, when the food is to be increased, condensed milk or cows' milk may be added to the soy-bean gruel to advantage."

He concludes: "I am indebted to Mr. M.F. Deming for assistance in getting a satisfactory soy flour made."

Note: This is the earliest English-language document seen (Oct. 2001) that uses the term "soy flour." Address: M.D., 839 North Eutaw St., Baltimore, Maryland.

182. Langworthy, C.F. 1910. Apendice. La soya como alimento para el hombre [Appendix: The soy bean as human food]. *Boletin de la Sociedad Agricola Mexicana* 34(20):389-92. May 25. [1 ref. Spa]

• ***Summary:*** This is a Spanish-language translation of USDA Farmers' Bulletin No. 58 (1897, Revised 1899). The soybean is referred to throughout as "La haba soya." It describes and gives the nutritional composition of various Japanese soyfoods, including natto, miso (3 types; *miso blanco, colorado, Suiza* [*Swiss*]), tofu (*Tofu o queso de haba; Tofu fresco*), soymilk (*leche de la haba soya*), frozen tofu (*Tofu helado*), yuba, soy sauce (*salsa de la haba soya*).

Note 1. This is the earliest Spanish-language document seen (Oct. 2012) that mentions yuba, which it calls *yuba.*

Under the name of coffee beans (*habas de café*), soybeans (*las habas soya*) are sometimes consumed in Switzerland as legumes (*como legumbres*); when they are dry and toasted, they are used as a substitute for coffee (*sustituir al café*). No mention is made of soybeans or soyfoods in Mexico.

Note 2. This is the earliest Spanish-language document seen (April 2013) that uses the term *Tofu* or the term *queso de haba* or the term *Tofu fresco* to refer to tofu

Note 3. This is the earliest Spanish-language document seen (Jan. 2012) that mentions natto, which it calls *natto.*

Note 4. This is the earliest Spanish-language document seen (March 2009) that mentions miso, which it calls *miso.*

Note 5. This is the earliest Spanish-language document seen (Nov. 2012) that mentions soy coffee or soy as a substitute for coffee, which it calls *sustituir al café.*

Note 6. This is the earliest Spanish-language document seen (Aug. 2013) that uses the term *leche de la haba soya* to refer to soymilk.

Note 7. This is the earliest Spanish-language document seen (April 2013) that mentions frozen tofu, which it calls "Tofu helado."

Note 8. This is the earliest Spanish-language document seen (April 2012) that mentions soy sauce, which it calls "salsa de la haba soya." Address: PhD, Office of Experiment Stations, USDA, USA.

183. Burtt-Davy, Joseph. 1910. The soy-bean (Glycine hispida). *Transvaal Agricultural Journal* 8(32):620-26. July.

• ***Summary:*** Contents: Introduction. Description. Climatic requirements. Varieties. Planting and cultivation. Harvesting the seed. Returns of seed. Use of the seed for stock feed. Use of the seed for human food. Commerce in the seed. Soy-bean oil. As green forage. For ensilage. For hay. As a rotation crop for green manuring. Some co-operative experiment reports (from South Africa).

"We have grown soy-beans successfully at Skinners Court and on the Springbok Flats since 1903. We have also tested them successfully in other parts of the country, but as there was no market for the beans, and farmers had not learned to use them for their own stock, they were not taken up as a regular crop. Another reason for this was that some varieties gave a uniformly poor germination, while on some

soils, or under some conditions, none of the varieties did well.

"We have continued our experiments and have now established a strain of seed which gives very satisfactory results. But owing to the variations in soil and the apparent necessity for inoculation (natural or artificial) in some cases, I cannot recommend farmers to plant largely until they have given the crop a trial on a small scale...

"A variety brought by me from the United States in 1903, known as the 'Southern,' has given the best results of any tried by us, both at Skinners Court and on the Springbok Flats. The seed harvested in 1904 we distributed extensively in different parts of the Transvaal, and have had favourable reports of it, both from the high veld and the bush-veld. The original stock was obtained through [seedsmen] J.M. Thorburn & Co., New York.

"Writing from London, Messrs. Mitchell, Cotts & Co. state that only two varieties have been imported into England in any quantity, viz., the north Manchurian or 'Harbin' quality, exported from Vladivostok, and the south Manchurian or 'Sakura' quality, shipped from Dalny, both of which are described as very similar in appearance and composition; the 'Sakura' realizes about 2*s.* 6*d.* per ton more than the others. These are the classes which are most acceptable to the English market. Seed has been received through the courtesy of Messrs. Mitchell, Cotts & Co., and will be tried the coming season."

"Of the varieties grown in Europe we have tried Vilmorin's 'Extra-Early,' 'Extra-Early Black,' and 'Yellow Etampes' at Skinners Court, but they did not thrive at all, even though grown alongside the 'Southern' which did excellently" (p. 621).

A list of the names of soybeans grown in Japan, grouped according to seed color, is given. Among the six white seeded beans (*Shiro Mame*), Teppo Mame or 'Gun Bean' is "the sort principally used to make the famous Soy Sauce." Maru Mame or 'Bullet Bean' is recommended as very valuable for horse food. The names of three black seeded soybeans (*Kuro Mame*) and three speckled seeded soybeans (*Fuiri Mame*) are also given. "These have not yet been tested by the Department, but seed is on order for trial next season. In the meantime I recommend farmers to restrict themselves mainly to the 'Southern' variety." Note 1. In calculating yields, 1 muid = 3.33 bushels.

"In China and Japan the soy-bean is an article of human diet. In Japan it constitutes a large proportion of the food of the people, a variety of dishes being prepared from it as well as foodstuffs similar to butter, oil, and cheese. A condiment famous among the Chinese under the name of 'soy', is made from this bean. The beans are of a pleasant taste when boiled, either in a green state or when ripe; in the latter state they need considerable soaking before use...

"The Japanese are reported to extract the casein from soy-beans, using it as a substitute for milk. This vegetable drink is said to be a very popular drink among the poorer classes of China and Japan. The beans are first softened by being soaked and then boiled in water.

"Experiments are being made in Europe in the use of soy-bean flour as an admixture with wheat flour for bread. A biscuit is made and sold in Paris, containing soy-bean flour, which has no starch, and is recommended for persons suffering from diabetes.

"Biscuits seem to be the most likely form in which this flour can be used, and two or three large English firms are now making them... A coffee substitute is made in America and on the Continent of Europe, out of soy-beans."

Note 2. This is the earliest English-language document seen (Oct. 2001) that uses the term "soy-bean flour." Address: F.L.S., etc., Governnment botanist and agrostologist.

184. Lemarié, Charles. 1910. Les sojas du Japon [The soybeans of Japan]. *Bulletin Economique de l'Indochine* (*Hanoi*) 13(85):493-98. July/Aug. [4 ref. Fre]

• ***Summary:*** "As a contribution to the study of the question of soybeans, so clearly revealed by the Inspector-Consul Mr. Brenier in a recent edition of this Bulletin, he judged it useful to ask me for the notes hereafter collected as much over the course of my lectures as upon the occasion of my voyage to Japan in 1903.

"I borrow much from Rein (*The industries of Japan*) and from Messrs. Paillieux and Bois (*Le Potager d'un Curieux* or *The Kitchen-garden of a Curious One*) who summarized all that we know about soybeans (*soja*) in Europe up until recently" (p. 493).

Describes and gives the names of more than twenty cultivated varieties, using the classification system of Rein and the Japanese based on seed coat color.

"I have already said that it [the soybean] needs heat and frequent watering. These considerations explain, in part, the failures encountered up to now in the attempts to introduce this crop into Europe. I fear the same obstacles for Mr. Li-yu-Ying, of Chinese nationality, formerly a student at the school of practical agriculture at Chesnoy, near Montargis (Loiret).

Note: Loiret is a department of France just south of Paris. Montargis is a commune in the Loiret department; the ancient town is located about 110 km (68 mi) south of Paris.

According to a lecture he gave last year to his former classmates, Li set himself the task of taking up these trials on the outskirts of Paris: or was it on the manure fields / sewage farms (*champs d'épandage*) of Gennevilliers or Achères.

"But even if the cultivation of soybeans in France is not profitable, nevertheless the popularization of the diverse products that come from them is no less useful; Indochina, if the need be, could provide for new industrial ventures. With Mr. Albert Demolon, a scientifically educated agriculturist (*ingénieur-agronome*), then professor at Chesnoy, and today

director of the Agricultural Station of Aisne [northeast of Paris] and of the Laboratory of Bacteriology at Laon, Mr. Li-yu-Ying again took up his previous studies related to these various products. In particular, he compared soymilk, which he calls *Caséosojaïne*, with animal milk, and he believed [it] possible, employing the highly developed procedures of handling and fermentation used [in France] with cow's milk, to obtain forms of tofu (*Téou-fou*) acceptable for our Western palates. That is to say: first, before any fermentation, a liquid [form of tofu] lends itself to the same uses as milk, especially useful for artificial feeding of livestock; then, after coagulation: 1. a hard cheese, corresponding to cheese of the firm sort (*fromage à pàte ferme*), cooked egg, or cooked meat in richness of protein; 2. a soft cheese, corresponding to fresh cheese (*fromage frais*) and able to be consumed as a legume; 3. a fermented cheese, after sterilization then inoculation with microorganisms of certain special cheeses, corresponding to these diverse fermented animal cheeses" (p. 497-98).

Also discusses: Azuki (p. 497). Address: Directeur des Services agricoles et commerciaux du Tonkin.

• ***Summary:*** Contents: Introduction. I. Botany and habitat: Introduction, varieties. II. Cultivation: Conditions of growth, methods of culture, soy bean mixtures. III. Harvesting: When to harvest, curing, frame for curing soy bean hay, harvesting for seed, yield of seed, yield of forage. IV. Chemistry of the soy bean: Introduction, digestibility, soy bean oil, soy bean bake. V. Value and uses of the soy bean: Introduction, the uses of the soy bean (uses of the oil {7 uses}, uses of the bean as a vegetable in Natal {like marrowfat peas or haricot beans}, in bread or biscuits in Paris [France] for diabetics, in France and Switzerland as a coffee substitute or adulterant, soy bean flour used for making bread and biscuits in England, soya meal for cattle feeding, oil-free residue made into cake for stock-breeding purposes, liquid closely resembling cow's milk made in Japan, vegetable cheese [tofu] made from the milk, a sauce called "Shoyu" made in Japan, soy-bean cake used as a fertilizer in Japan and China), as a soiling crop, as a silage crop, as a hay crop, as a pasture plant, as a soil renewer. VI. Value of the bean for feed: Introduction, soy beans for hogs, soy beans for dairy cows, other experiments with milch cows.

Illustrations (non-original line drawings) show: The soy bean plant with pods and roots (p. 280; from an original in Piper 1909). Flowering branch with close-ups on flower, leaves and pods (p. 285; from an original in Lamson-Scribner 1899). Frame for curing soy bean hay (p. 291; reproduced from Messrs. Lever Bros. pamphlet on Soy Bean Cultivation). Roots of soy bean plant with nodules (p. 301).

Note: This is the earliest document seen (May 2005) concerning Lever Brothers in connection with soybeans.

186. *Tropical Agriculturist, Supplement* (*Ceylon*). 1910. East Asiatic Co. and the soya bean industry. Soya cake factory erected at Copenhagen. 35(4):368. Oct. 15. Also titled Supplement to the Tropical Agriculturist and Magazine of the Ceylon Agricultural Society. [1 ref]

• ***Summary:*** A factory "has been erected there with capital provided by the East Asiatic Company at a cost of about 1,000,000 kr. (£55,500). It is estimated that as at present arranged 100 tons of soya beans can be pressed in 24 hours, and that, if necessary, the output could be increased. The factory appears to be well equipped and fitted with the latest improvements. The East Asiatic Company's own vessels are likely to largely contribute to the activity of the factory by bringing the beans from the East for pressing, though a quantity of soya beans has already been shipped from the United Kingdom [to Copenhagen]. It is anticipated that by establishing this, and in the course of time other oil cake factories, Denmark may be able to obtain a more effectual control over the price of butter than has been the case hitherto, and avoid the enormous fluctuations of price which of late have been so much in evidence."

"A French agency states that Mr. Li Yu Jin [sic, Li Yu-ying], who established the first soya bean industry in Paris, has returned from China after consulting Chinese capital of F. 1,500,000 for developing this enterprise in Europe. The soya will be worked at Paris, Brussels, London, and Berlin, and will be consumed in the form of milk, sauce, soup, vegetable, jam, cheese, flour, and bread.–*L. & C.* [*London and China*] *Express, Aug. 19."*

Note 1. It is not clear whether soybeans have arrived yet in Denmark for processing by this new oil mill. Note 2. This is the earliest English-language document seen (March 2000) with the term "Soya cake" in the title.

In 1890 Menudier used soy flour to treat diabetics. Address: Agricultural engineer (*Ingénieur agronome*).

188. Mene, Edouard. 1910. La Chine a l'Exposition de Bruxelles [China at the Brussels Exposition]. *Bulletin de l'Association Amicale Franco-Chinoise* 2(4):336-46. Oct. See p. 340-43, 346. [Fre]

• ***Summary:*** 1. The Chinese pavilion: In the beautiful and grandiose Universal Exposition of 1910, that a frightful fire partially destroyed, the Chinese section merits special mention. It is not an official exposition organized through the care of the Chinese administration. Rather, it is an exposition organized by five Chinese merchants The last one, Mr. Tsu represents both soya and the ideal kite (*soja et cerf-volant idéal*).

Note: The meaning of *cerf-volant idéal* is unclear. The Chinese have long been known for their beautiful and well-designed kites, some with long, flowing tails. However, if Mr. Tsu was exhibiting kites, he would have used the plural form of the noun. Is he saying that soy is like a high-flying kite?

These exhibitors have gathered a certain amount of indigenous and modern objects, commercial and artistic in a pavilion located in the section reserved to foreign countries (start of p. 339).

In the back of the room, to the right are displayed by Mr. Tsu, the different products extracted from one of most utilized plants in China: *Soja hispida*, Houang-teou, the soybean of the leguminous family.

One can observe plates filled with soybean seeds (*graines*), looking like little round (broad) beans (*fèves*), and some dehulled soya beans; jars filled with white soya cheese, looking like quark [tofu], cheese in round boxes, looking like Camembert [fermented tofu]; a jar with the skin of the soya cheese [yuba]; a vial with soya casein [soy protein].

A display case is filled with jars of different types of yellow, green, and black soybeans, of soya flour, of semolina, of a brownish soya coffee in bean and powder form, of bottles of soymilk, of soy oil, and of Soy [sauce], this condiment so utilized in Chinese cuisine. On a table are displayed soya pastries resembling in their shape, the Commercy madeleines [small sponge cakes shaped like sea shells], some noodles, macaroni and soya bread that is prescribed to diabetics as well as a gruel of soya flour. On the floor are placed several square soybean cakes (*tourteaux*), residue of the soya oil production, of a grey-yellow color, to be used as fertilizer. A brochure on soya-based food products, excerpted from the book *The Soybean* (*Le Soja*) by Mr. Li Yu-ying is being handed out through the care of the exhibitor, Mr. Tsu.

This brochure, titled: 'Soya based Food Products' (*Produits alimentaires à base de Soja*), Caseo-Sojaine, rue Denis-Papin, les Vallées (Seine), describes these products and their preparation: soya milk, liquid or in powder form, derived from the grinding of the beans, after immersion, in water, for several hours. The grain content consisting of legumin or vegetable casein, is placed under a grindstone: one derives an homogenous, nutritive and digestible milk product. Fermented and powdered milk is produced, soya casein, extracted from the soya milk, with uses in food and in industry; soya flour, obtained by the grinding of the dehulled beans, completely deprived of their seed coat to lessen the proportion of cellulose and increase its digestibility. It does not contain any starch; soya bread, well utilized to feed diabetics; by perfecting fermentation, one makes a rather light bread, one that reminds one of rye bread; pasta / noodles; cookies, pastries, white- and pink-tinted pasta prepared with soya flour, soy sauce (Soy) with a bouquet that reminds one of burned onion that is used to enhance fish and vegetables; soya jam (*confiture de Soja*), similar in appearance and taste to chestnut cream (à la crème de marrons), soya oil for food use; green vegetable soybeans (*légumes de Soja*), whose sprouts may be used as a salad. As for the soybean cakes (*tourteaux*), these are used for animal feed and fertilizer.

In China, the *Soja hispida* (the soybean), with hairy pods, with yellow, reddish, black, green, white, variegated beans, whose taste echoes the green bean, the lentil, the pea, and that has a high content of culinary oil, is grown, on a large scale, in Mongolia, in Manchuria, and in the provinces of Henan, Zhejiang, Jiangxi (*Ho-nan, Tchokiang, Chan-si et Chang-tong*). It is one of the most utilized plants from the culinary and industrial point of views.

Soy sauce, called Soy in English and in Chinese *Tsiang-yeou*, is a greatly-appreciated condiment that is prepared with yellow soybeans named *Houang-teou* and that one flavors with star anise, green anise, and grated orange rind. It is a blackish liquid, lightly syrup-like used to enhance the flavor of fish, meat, and vegetables. Another Chinese condiment [fermented black soybeans] is made with soybeans mixed with salt and ginger. In Canton, *Kiu-tsu* [*jiuzi*, Cantonese wine starter, a ferment] is made with soybeans, red rice, and leaves of *Glycosmis citrifolia*. As for soya cheese, it is made as follows (see footnote): Soak the soybeans in water for 24 hours to make them swell; drain off the water, grind while adding fresh water to form a slurry that is run through a filter. Stir it by hand, then pour it into a caldron, where it undergoes a slow cooking. Let it cool in a tub and remove and foam with a big spoon.

A thick film [yuba] is formed on the surface. It is lifted off with a round wooden stick shaped like a long chopstick (*baguette*) and it is allowed to dry on thin ropes. This skin is called skin of soya cheese [yuba]. To the remaining soymilk, add a little water mixed with calcium sulfate (*plâtre*) and several drops of nigari, which is magnesium chloride derived from the salt in salt beds.

Footnote at the end of page 342: See (1) *Bulletin of the Society for Acclimatation*, second series, volume 13, page 562, 1866, "On The production of tofu in China," by Paul Champion.

Stir in the liquid coagulant which will cause the casein in the soymilk to coagulate. Pour the warm mass into in a wooden frame or box lined internally with a fine cloth through which the liquid whey will seep. Atop the frame or box place a board loaded with weights to press the cheese which is of a grayish white color, looks like quark, and has a pea-pod taste (*à goût de pois*)*;* with the addition of salt, this cheese will keep; without this precaution, it spoils. It is used to feed the impoverished portion of the population: often, it is fried in soya oil. Soya cheese [tofu] is manufactured on a large scale near Peking and in most of the sea ports of Southern China. It is mostly the town of Ning-po that is the center of this production. Each year, thousands of junks (*jonques*) loaded exclusively with soya cheeses leave this town harbor to reach other Chinese harbors.

Besides cheese [tofu], the most important soya product is the oil that is extracted from its beans, mostly the yellow beans called *Houang-teou.* This yellow oil, which is siccative / drying, has a special smell and a pea-pod taste. At Kaifeng (K'ai-fong) in Henan (Ho-nan) province, at Tsi-nan in the Chan-tong, and at T'ai-yuan in the Chan-si, are located important soya oil manufacturing plants. But it is mostly Ningpo in the Tcho-kiang, that is the center for the production and the centralizing of soya oil. Much is also produced in Newchwang [Nieou-tchouang], and in Chefoo / Tantai (Tche-fou) in Shantung province. The soybean cakes (*tourteaux*), the by-products of soya oil processing, are a major export out of Newchwang and Chefoo; they are shipped to Swatow and Amoy to be used as fertilizer in sugar cane plantations.

These soybean cakes (*tourteaux*) are sought after as much as the beans themselves, and are to feed cattle, as are the pods, the stems and the foliage of the plant. The beans of *Hei-teou,* the black soya bean, mixed with cut up straw, are given as feed to horses and mules in Northern China and in Manchuria.

Note: This periodical was established to promote understanding and friendship among the people of France and China. Soja is mentioned on pages 341, 342, 343, and 346. Address: Dr.

189. *Times of India* (*The*) (*Bombay*). 1910. The soy bean. Nov. 1. p. 4.
• ***Summary:*** From Pioneer: "It will interest those who are now busily engaged in this country in the cultivation of soy beans, in the hope of intercepting some of the wealth that is freely flowing to Manchuria, where this class of cultivation has proved so important and so profitable, to know that, in addition to its many other claims to utility and popularity, a method has just been discovered of converting the soy bean into a kind of coffee, a kind of milk, and also a kind of cheese. Generally speaking imitation food stuffs are harmful, but the claim is made that these latest products of the now famous Manchurian bean are wholesome to a degree and are likely to find a ready sale amongst those classes of the community who cannot always afford a regular supply of pure coffee and milk and sustaining cheese. At all events there now seems to be a run on soy bean specialties."

"Experiments have shown that this bean can be cultivated in many places in India and required no very particular attention. Even when carelessly sown in an ordinary flower pot in a verandah in Calcutta it sprang up in a few days, strong and vigorous. The point to be borne in mind is this: The soy bean has been proved to be such an all-around useful commodity that the demand for it during the past year or so has become enormous in practically all parts of the world, and, as we have seen, new uses continue to be found for it. Secondly, the growth in this trade is such that it is evident that Manchuria will find it difficult to keep pace with it even if there were any desire on the part of those in a position to complete to allow her an undisputed monopoly of this profitable trade. And, finally, it must not be forgotten that the growing popularity of the soy bean is only acquired at the expense of other oil seeds which are chiefly grown in India, and it is not at all improbable that cultivators in this country will soon have to decide whether there are to be less oil seeds or more soy beans."

190. Kato, Yogoro. 1910. Yuba no seisei [On the chemistry of the formation of yuba]. *Tokyo Kagaku Kaishi* (*J. of the Tokyo Chemical Society*) 31(11):1139-55. Nov. [11 ref. Jap]
• ***Summary:*** Contents: The surface tension of soymilk (p. 1140). Relationship between the formation of yuba and the gas in contact with the surface of the soymilk (1142). Changes in the composition of the soymilk during yuba formation and relationship between concentration of the milk and the yuba (1148). Relationship between yuba formation and temperature (1149). Nature of the soymilk after removal of oil/fat (1150). Experiment on film formation using cow's milk (1151). Formation of films on a liquid consisting of dissolved starch (1153). Summary and conclusion (p. 1153).

Note: Throughout this article, the term for "soymilk" is written *tôeki,* or "bean liquid." Address: Rigakushi.

191. Li, Yu-ying. 1910. Vegetable milk and its derivatives. *British Patent* 30,275. 5 p. Date of application, 30 Dec. 1910. Accepted 29 Feb. 1912.
• ***Summary:*** Li gives his occupation as "Engineer." "This invention consists in the manufacture of a vegetable milk and its derivatives by means of soja grains (Chinese peas), the milk thus produced having the appearance, the colour

and the taste of ordinary milk, its chemical composition greatly resembling the same. It has moreover the same nutritive and alimentary properties." The grains are cleaned, decorticated, soaked and ground with water in a mill of the kind specified in British Patent Application 11,903 of 1911. The mechanized mill is composed of a fixed lower millstone above which the upper millstone is mounted on a vertical shaft.

"The clear milky liquid produced by grinding the grain previously mixed with water in combination with the supply of water in the millstone enters a channel then passes into a shoot (*t*) which conveys it to a tank (*u*) from which it is drawn off by a pump (*v*) which forces it under pressure into the filtering press (*x*). On leaving the filter, it falls, after passing through a sieve (*y*) into a vat (*z*). From this vat it is conveyed through a pipe (*a*) to the boiler or digester (*b*)." It is cooked with steam in a water-jacketed vessel, then pasteurized or sterilized. "It is then bottled and is ready for consumption. The soja milk may be utilised in the two following cases. 1st. As a substitute for ordinary milk. It may be consumed as sterilised at temperatures of 110º to 120ºC. 2nd. As a raw material for use in different manufactures (cheeses, casein, and the like). It must then be heated from 60º to about 120ºC.

"It may also be concentrated, dried, or fermented. "The milk obtained may be humanised or animalised," i.e., its composition may be brought to resemble that of human or animal milk. It is coagulated for making cheese by magnesium salts, organic salts, rennet, lactic ferments, or "sojaobacille," a ferment obtained by cultivation in a mixture of the above-described liquid and sodium chloride the fermented paste obtained by putting into salt water soy beans that have been cooked with water and allowed, alone or mixed with cereal flour, to stand in the air.

"For obtaining fermented cheese such as roquefort [Roquefort], parmezan [Parmesan], romatour [Rahmatour; Bavarian cream cheese], camambert [Camembert], and gruyere, suitable ferments are employed."

"For the fermented milk, the special ferment termed 'sojaobacille' is employed or other ferments used for obtaining fermented milks–kephir [kefir], yoghourt [yogurt], koumiss, and the like, and which are the saccharomyces cerevisæ, dispora caucasica, maya bulgare, and the like, and the said milk is modified by the addition of sugar levulose, and the like and particularly of lactose."

In making casein, the oil may be expressed from the beans before the preparation of the milk. The casein, obtained by coagulating the milk, may be used as food, paste, etc., or may be mixed with borax, oxide of zinc, magnesia, gelatin, etc., to obtain a hard industrial (non-food) substance termed "sojalithe" [resembling ivory, horn, or shell]. The filter press residues may be dried and ground to form a food for human beings, or may be used as food for cattle, or as manure. The liquid expressed in making cheese [soy whey] may also be used for feeding animals.

An illustration shows a longitudinal view of all the equipment used in the invention; each important part is marked with a letter.

Note 1. This is the earliest document seen (Sept. 2012) that mentions soy yogurt or fermented soy yogurt.

Note 2. This is the earliest document seen (Sept. 2012) that mentions kefir in connection with soymilk.

Note 3. This is the earliest document seen (June 2011) that mentions the word "sojalithe" (a hard plastic) or that discusses a specific non-food industrial use for soy protein; "sojalithe" is probably derived from "Galalith" (a registered trademark; see F.G.J. Beltzer, June 1911). Galalith, or Erinoid in the United Kingdom, a synthetic plastic material manufactured by the interaction of casein and formaldehyde, was introduced in 1900 at the Paris Universal Exhibition in France. In France, Galalith was distributed by the Compagnie Française de Galalithe located near Paris in Levallois-Perret. It was first used to make buttons, resulting in a revolution in the button industry. In 1913 some 30 million liters (8 million U.S. gallons) were used to make Galalith in Germany alone. Ever the entrepreneur, Li apparently saw "sojalithe" as a potential substitute for expensive ivory.

Note 4. This is the earliest English-language document seen (Oct. 2011) that uses the term "fermented cheese" to refer to a type of fermented tofu, or to a Western-style soy cheese (Roquefort, Parmesan, Camembert, or Gruyere types). It is interesting to note that all of these Western-style cheeses are traditional mold-ripened cheeses.

Note 5. This is the earliest document seen (Sept. 2012) that mentions a fermented Western-style soy cheese (see above).

Note 6. Levulose, now more commonly called fructose, is a sugar.

Note 7. This is the earliest English-language document seen (Aug. 2013) that contains the term "soja milk."

Note 8. This is the earliest document seen (Feb. 2011) that mentions the bottling of soymilk or the sale of soymilk in bottles. Address: Engineer, 46 rue Denis Papin, aux Valées [Vallées] (Seine), France.

192. Li, Yu-ying. 1910. Sauce consisting chiefly of soja grains. *British Patent* 30,351. 2 p. Date of application, 31 Dec. 1910. Accepted 29 Feb. 1912.

• ***Summary:*** Sauces. Cooked soy beans, to which flour may be added, are fermented with ferments such as "sojaobacille" (*vide* 30,275, 1910, *supra*), and the fermented mass is placed in saltwater. When matured, it is pounded to a paste or is diluted with saltwater and filtered. Alternatively, "soy milk," obtained as described in 30,275, 1910, is fermented with sojaobacille, sodium chloride being added, and filtered. Spices or sugar may be added, and the products may be concentrated or dried.

Note: This is the world's earliest patent seen for

soymilk.

193. *Revue Jaune* (*La*). 1910. La plante à Frégoli [The Frégoli plant]. 1:110-11. [Fre]

• ***Summary:*** We are talking about a Chinese plant, about Soya specifically. Just like the artist Frégoli, it takes on the most diverse and the most unexpected aspects.

If one should be a vegetarian, here is the menu that can be ordered in a chic restaurant at Pao-Ting-Fou or at Chang-Haï-Kouan:

Waiter, a soup dish please.

Would you care for a cream soup, an oxtail or for turtle soup?

Soya soup, please, garçon.

What would you like to drink, sir?

Soya milk please.

Would you care for a vegetable, sir.

Sure, a plate of soya if you please, waiter.

Do you care for English sauce, sir?

Not English sauce but soya sauce if you please, waiter.

Would you care for anything else, sir?

Cake, a good, solid soya cake if you please, waiter.

I see that you have a good appetite, sir. We still have custard. Would you care for some, sir?

For sure waiter. A custard made with this delicious soy flour.

Would you care for a few fried doughnuts, sir?

Yes, fried in soy oil, waiter. And served very warm if you please.

Would you enjoy a cheese platter, sir?

Soya cheese if you please, waiter.

Would you care for fresh, hard or smoked cheese, sir?

Well, today I shall have the fresh cheese.

Would you prefer French bread or sandwich bread, sir?

Soya bread, waiter. I never have any other bread.

Will you have dessert, sir?

Bring me your little soya fondants, those petite cakes that stay fresh for months and that just melt in your mouth. Ah!

Oh, I almost forgot the jam.

Yes, Soya jam if you please. Please bring that to me waiter and if you please, please refill my glass of soya milk.

Would you like some tea, sir?

Tea with soya cream if you please, waiter. Soya cream, soya cream, soya, soya...

Note 1. This is the earliest document seen (Aug. 2013) that mentions a soy custard.

Note 2. Why is the word *Frégoli* used to refer to the soybean? Hervé Berbille, who found and sent this document to us, says: "I found that Léopoldo Frégoli was at beginning of the 20th century a famous *transformiste*, a kind of artist whose performance consisted in changing appearance; likewise the soybean can be transformed into an infinite variety of foods." For more, see Wikipedia at Leopoldo Fregoli.

194. Caséo Sojaine booth at the Universal Exposition at Brussels in 1910 (Photograph). 1910.

• ***Summary:*** On a long table with the Caséo Sojaine in front of it is an elaborate, tall pile of soymilk bottles. A young Chinese man, wearing in a Western suit, is seated on a chair to the right, holding a book, with his legs high-crossed.

Across the top of the photo, in red letters, is written: A l'Exposition Universelle de Bruxelles 1918.

195. Fulton, Edwin Giles. 1910. Vegetarian cook-book: Substitutes for flesh foods. Mountain View, California, Kansas City, Missouri, and Portland, Oregon: Pacific Press Publishing Association. 419 p. Illust. Semi-index. 20 cm.
• ***Summary:*** This Seventh-day Adventist cookbook was first published in 1904 under the title *Substitutes for Flesh Foods.* In the long chapter on "Entrees" (p. 35-94), many recipes call for meat alternatives, such as Nuttolene, Protose, and "nut cero"–but with no recipe given for making the latter.

In the chapter on "Sandwiches," are two recipes (p. 301-02) which could be considered precursors of the veggie burger. The first, "Nut cero sandwiches," is a lettuce and sliced tomato sandwich, with nut cero serving in place of the burger.

On p. 260 are two recipes with "Granola" in the title. In Granola Porridge, the first ingredient is "Granola or fruit nuts, 1 cup." The meaning of "fruit nuts" is unclear. The second is Gluten-Granola Mush.

The sub-chapter titled "Nut butter" (p. 309-13) states: "Nut butter is easily made in the home... Peanuts and almonds are the nuts most suitable for making nut butter. The other varieties are difficult to blanch... The best variety of peanuts for making nut butter is the Spanish shelled... There are three ways of cooking them; namely baking or roasting, boiling, and steaming. The baking process is the easiest way, but care should be used not to scorch them..." Two processes / recipes for homemade peanut butter are given, followed by Almond butter, Peanut meal, Nut cream (alternative to dairy cream made by mixing 2 tablespoons peanut butter with 1 pint hot water and 1 teaspoon salt), Crystallized peanuts, Salted peanuts, and Blanched almonds.

The author was born in 1867; his portrait photo faces the title page, with the inscription "Yours for health," and his signature, A slightly revised edition with the same number of pages was published later in 1910.

196. Li, Yu-ying. 1910. Ta tou: Le soja [The soybean]. Paris: Société Biologique de l'Extrême Orient. 66 p. Illust. 28 cm. [Chi]
• ***Summary:*** This remarkable work, written entirely in Chinese, was the first of Li's major works on soybeans and soyfoods. Published in Paris, it was written in Chinese and meant to be read by young people in China interested in coming to Paris to study or in helping Li with research on Chinese soybean varieties. An expanded and revised version was published into French the next year (1911).

Contents: Soybeans: 1. Introduction. 2. Names and varieties (colors, sizes, and shapes) of soybeans. 3. Where soybeans are produced and their history. 4. The place of soybeans in the hierarchy of plants (taxonomy). 5. Nutritional composition of soybeans. 6. Characteristics of soybeans (physiological, morphological, etc.). 7. Food uses of soybeans (incl. tables comparing the price of tofu with various meats, and the various sicknesses associated with eating different types of meat). 8. Equipment used in making soyfood products (a photo shows the equipment in Li's modern soymilk and tofu plant near Paris; p. 37), and compares soymilk with cow's milk. A large soybean utilization diagram in Chinese (p. 44) shows all the products that can be made from soybeans using the wet process (from soymilk) or the dry process (from flour). Note: This is the earliest document seen (July 2002) that contains a diagram of this type.

9. Value of soybeans in agriculture (incl. fertilizer use). 10. Conclusion. Appendixes: (1) About the *Société biologique de l'Extréme Orient* (Far-East Biological Society). (2) Membership form for the Far-East Biological Society (Paris): Date, name, A.K.A., Address, Occupation or subject of study, Place of birth. Please enclose 2 yuan membership fee (p. A6). (3) Bibliography of publications on soybeans by the Society of the Far East (p. A7-8). (4) Special announcement concerning soybean research (p. A9).

Illustrations (line drawings) show: (1) Comparison of shapes and colors of 7 different colors of soybeans (p. 5). (2) Five views of soybean pods with beans, incl. outside of pod, inside of both halves when open, with beans in one half, the two cotyledons of a single soybean (p. 11). (3) Soybean plant with pods (p. 12). Photos show: (1) The cellular components and layers of soybeans and hyacinth beans (p. 22, 23). (2) The interior and equipment in Li's soymilk and tofu plant on the outskirts of Paris (p. 37). (3) Microscopic views of soymilk (*doujiang*) and a liquid resembling soymilk made from soy flour (p. 38).

Tables show: (1) Size range (length, width, and thickness; maximum, average, and minimum) of 7 colors of soybeans: yellow bean, green skin bean, green bean, dark bean {"black" or "crow" bean}, black bean, red bean, spotted bean (p. 4). (2) Composition of four parts of a soybean plant: Comparison, water, protein, oil, carbohydrates, ash (p. 18). (3) Comparison of oil and protein content of 5 colors of soybeans (red, black, green, white, yellow) from various countries and regions: China, Japan, Southeast Asia, Russia, Hungary, and France (p. 19). (4) Composition of soybeans, hyacinth beans, and wheat (p. 21). (6) Comparison of the price of tofu with that of various meats (p. 29). (7) Ash content of soybeans, hyacinth beans, duck, uncooked rice, cabbage, egg, beef, chicken, lamb, pork, carp, wheat flour (p. 31). (8) Carbohydrate content of uncooked rice, wheat flour, hyacinth bean, soybean (p. 32). (9) Weight of products containing 100 gm of protein: Soybeans, tofu (somewhat firm), hyacinth bean, uncooked rice, bread, cooked rice, vegetables (p. 32).

Publications listed in the Bibliography (p. A7-8): *Ta tou–The soybean* (this book; published 1909). *Bean curd–20 centuries of great craftsmanship around the world* (1908).

Soycrafting–China's manufacturing specialty (1908). *The Paris Bean Curd Company* (1908, illustrated). *An outline of the agricultural societies of France* (1908). Note: the above publications concern industrial matters.

A description of herbs (*Chinese medicinal plants etc.*) (1909). *TB* [*Tuberculosis*] *and its cure* (1909). Note: the above publications concern medicinal herb and health matters.

The benefits of soyfoods (1909). *Smoking and its relationship to health, economics and industry* (1909). Note: the above publications concern industrial and health matters.

Special announcement concerning soybean research (p. A9): "Gentlemen–Many of us in this society are researching the benefits of the soybean. It may be considered as China's greatest resource. We have already published a number of specialized reports. These have been made available to you. In view of the fact that there are so many varieties of soybean in China and that the regions of cultivation are so extensive, we must rely upon you, our colleagues, in all parts of the country to go into the field and collect data for us. Only then will we be able to complete our research into every variety of Chinese soybean. If we should receive your kind consent, we beg you to be so good as to send the soybean varieties to the Peking postal address of this Society (address is given). We are interested only in soybeans (see pages 1-6 of this book) and need one or two catties (0.5-1.0 kg) of each. Once our research into the benefits and properties of these beans is complete, we will submit a further report to this Society, in order to repay your goodwill. If you would please advise us of the cost of the beans and the postal charges, we will make the appropriate refunds. We will also send you a copy of this book as a modest token of our gratitude. Enclosed please find an explanatory document. Please take the trouble to complete this and send it together with the beans.

"The Paris/Far-East Biological Research Society"

On page A-10 is a form to be used when submitting the Chinese soybean varieties.

197. Wheldon, Rupert H. 1910. No animal food: And nutrition and diet with vegetable recipes. New York, NY; Passaic, New Jersey: Health Culture Co. 125 p. Plus 18 unnumbered pages of advertisements at end. Undated. No index. 19 cm.

• ***Summary:*** A comprehensive appeal to vegetarianism, advocating exclusion of all foods of animal origin [i.e., a vegan diet]. Contents: I. No animal food: 1. The urgency of the subject. 2. Physical considerations. 3. Ethical considerations. 4. The aesthetic point of view. 5. Economical considerations. 6. The exclusion of dairy produce. 7. Conclusion. II. Nutrition and diet: 1. Science of nutrition. 2. What to eat. 3. When to eat. 4. What to eat. Food table. Recipes (100 "strictly vegetarian" [vegan] recipes as they appear in the English edition).

The Preface states that "the following pages are in vindication of a dietary consisting wholly of the products of the vegetable kingdom, and which therefore excludes not only flesh, fish, and fowl, but milk and eggs and products manufactured therefrom." "This work is reprinted from the English edition with changes better adapting it to the American reader."

Pages 30-31: "As to the testimony of individuals it is interesting to note that some of the greatest philosophers, scientists, poets, moralists, and many men of note, in different walks of life, in past and modern times have, for various reasons, been vegetarians, among whom have been named the following:–Manu, Zoroaster, Pythagoras, Zeno, Buddha, Isaiah, Daniel, Empedocles, Socrates, Plato, Aristotle, Porphyry, John Wesley, Franklin, Goldsmith, Ray, Paley, Isaac Newton, Jean Paul Richter, Schopenhauer, Byron, Gleizes, Hartley, Rousseau, Iamblichus, Hypatia, Diogenes, Quintus Sextus, Ovid, Plutarch, Seneca, Apollonius, The Apostles (Matthew, James, James the Less, Peter), The Christian Fathers (Clement, Tertullian, Origen, Chrysostom, St. Francis d'Assisi), Cornaro, Leonardo da Vinci, Milton, Locke, Spinoza, Voltaire, Pope, Gassendi, Swedenborg, Thackeray, Linnaeus, Shelley, Lamartine, Michelet, William Lambe, Sir Isaac Pitman, Thoreau, Fitzgerald, Herbert Burrows, Garibaldi, Wagner, Edison, Tesla, Marconi, Tolstoy, George Frederick Watts, Maeterlinck, Vivekananda, General [Bramwell] Booth, Mrs. [Annie] Besant, Bernard Shaw, Rev. Prof. John E. B. Mayor, Hon. E. Lyttelton, Rev. R. J. Campbell, Lord Charles Beresford, Gen. Sir Ed. Bulwer, etc., etc., etc."

The chapter title "What to eat" states (p. 83): "The Mongol procures his supply of protein chiefly from the Soya bean from which he makes different preparations of bean cheese [tofu] and sauce." "Among the foods rich in protein are the legumes, the cereals, and nuts... Fat is chiefly found in nuts, olives, and certain pulses, particularly the pea-nut."

Several recipes (p. 116-17) call for: Nut-milk, Vegeton, Nutter or nut butter, Marmite, Carnos, Pitman's Vigar Gravy Essence. These can be ordered from stores in England (see p. 111). The last 16 pages contain advertisements for *Health-Culture* magazine (monthly), "health appliances" (such as Dr. Forest's massage rollers and colon syringes), and many books published by The Health Culture Co., Turner Building, 45 Escension St., Passaic, New Jersey.

198. Labbé, Henri. 1911. Le soja et ses usages [The soybean and its uses]. *Revue Scientifique* 49(1):171-76. Jan. 7. [6 ref. Fre]

• ***Summary:*** A summary of earlier publications (mostly in French) on soybeans and soyfoods. Discusses: Soy flour (*farine de soja*) for diabetics. Soy bread (*pain de soja*). Soy flour used to make various foods for diabetics as well as for vegetarians. Soymilk (*lait végétal à base de soja,* p. 174). Soy kefir and soy yogurt (Kephir, Yohourt). Soy sauce (*sauce de Soja, soyou, choyou*). Tofu (*Le fromage de Soja*

ou Tou-Fou), which was invented by the ancient Chinese philosopher Whai Nain Tzu. Fresh tofu and dry tofu [dried frozen tofu, containing 53.6% protein]. How shoyu is made.

Note: This is the earliest French-language document seen (April 2012) that uses the word *soyou* to refer to soy sauce.

The section on the nutritional value of soy and soy protein (p. 173) ends with this interesting thought: For a long time the Chinese and Japanese, who cared little about the future justification of their habits and customs, have adopted the consumption of soy on a large scale, without realizing that science would perhaps one day come to bestow / confer on them a certificate or testimonial of complete approbation.

The section on soymilk ends as follows: Soya milk, according to trustworthy Chinese persons, is not just a mere curiosity. It is used, in China, for breakfast, being mixed with cow's milk. It is also used for infant formula [literally "artificial breast feeding"] or therapeutically. For this latter purpose, it is the fermented foods, such as Kefir, Yogurt, etc. that appear to be of interest. (*"Le lait de Soja, au dire de Chinois dignes de foi ne serait pas une simple curiosité. On s'en sert, en Chine, pour le dèjeuner du matin, et en mélange avec le lait de vache. On l'utilise aussi pour l'allaitement artificiel, ou dans un but thérapeutique. Dans ce denier but, ce sont plutôt les laits de soja fermentés, genre Kephir, Yohourt, etc. qui paraissent intéressants"*).

The author notes (p. 175, footnote) that a Chinese proverb says: *Le To-Fou est la viande des os* ("Tofu is the meat of the bones"). Note: This makes no sense and appears (April 2013) to be a mistake. Tofu has long been known as "the meat without bones" (Horvath 1927, 1931, 1938, etc.) or "the meat without a bone" (Lager 1945, etc.).

The writer also notes that France is not taking any part in the development of an industry to produce soy oil (p. 176, footnote). Illustrations (p. 72) show: Soy bean plant, with roots and pods. Close-up of soy bean pod and seed. Address: Doctor of Sciences (*Docteur ès-sciences*), France.

199. Li, Yu-ying. 1911. A propos du Soja hispida [About Soja hispida, soybeans]. *Journal d'Agriculture Pratique* 75(1):48-50. Jan. 12. [4 ref. Fre]

• ***Summary:*** This is a the author's point-by-point reply to 12 points of a critical article in this journal on March 24 by M. Demolon, Li's former professor. Note: Li studied the soybean at Demolon's laboratory at the school of practical agriculture at Chesnoy. Li discusses: Carbohydrates and starch in soybeans, soy flour, the quality of vegetable proteins vs. animal proteins, the absence of lactose in soymilk, the lecithin in soybeans (*fèves de soja*), soymilk, soy bread for diabetics and their superiority to gluten breads.

"The soybean will grow in almost all climates, from Manchuria to the south of China. This year [1910], at the Exposition of Nanking, we found nearly 400 soybean varieties exhibited by different provinces. In Europe and America, successful trials have already been conducted. In France the Society for Acclimatization has already studied the soybean for many years. Mr. Paillieux has written a very well documented book on this subject which concludes in favor of the adoption of soybean cultivation in Europe. The fact that there was an isolated unsuccessful trial at the School of Agriculture at Chesnoy does not seem sufficient to demonstrate that soybean culture cannot succeed in France."

"Mr. Demolon represents the soybean to us as being of interest merely from the viewpoint of pure science." Li concludes by re-stating his belief (stated two years earlier in this journal, on 2 July 1908): "The question up to this point has nothing to do with industry and commerce; it is purely scientific, but pure science always precedes applications. And there is nothing to say that tofu or soy cheese (*le to-fou* {*fromage de soja*}) won't one day become a prized food for Europeans."

Note: This is the earliest document seen (Oct. 2004) that mentions the Exposition of Nanking, where 400 soybean varieties were exhibited by different provinces. Address: Paris.

200. Rousset, H. 1911. Chronique et correspondance: Chimie industrielle. Laits et beurres végétaux [Chronicle and correspondence: industrial chemistry. Vegetable milks and butters]. *Revue Generale des Sciences* (*Pures et Appliquees*) 22(1):182-83. Jan. 15. [2 ref. Fre]

• ***Summary:*** Vegetable butters are made from coconut oil. Soymilk is made from the soybean, a unique type of bean which is grown in China. Huge quantities have recently been exported. This paradoxical plant can be used in many different ways–as to make oil and soap, special breads for diabetics, forage and fodder for animals, and confections. The Japanese transform the soybean into a cheese [tofu], the Chinese make it into milk, and the English use it to make sauces [such as Worcestershire sauce].

According to Mr. Li Yu-Ying, who, as a former student at a French school of agronomy, is well qualified by his origins and knowledge to know the soybean, as well as the milk (*les émulsions*) prepared from seeds which have first been submitted to the beginning of germination. This milk is not different, at first glance, to animal milk. A table shows the composition of soymilk. A long discussion of soymilk and its uses follows.

201. *Lancet.* 1911. Notes from China (From our own correspondent): The soya bean. i(4560):202. Jan. 21. Summarized in *J. of the New Zealand Department of Agriculture*, 15 Feb. 1913, p. 149.

• ***Summary:*** "Within the past three years the outstanding merits of this pulse have come prominently to the front, and its export from Manchuria, where most of it is raised, has lately assumed very large dimensions. For the past 2000 years it has been used in North China for making bean

curd, a thick nutritious jelly eaten daily by all classes of the people. A widely used vegetable oil is also expressed from it, the refuse left over serving for cattle food and manure for sugar plantations."

"It is a cheap product, each bean when sown multiplying itself, on an average, 450 times. On account of the great nutritive value of the Soy Bean, it is well worth medical attention, more particularly for diabetic cases, because of its low proportion of starch. For making biscuits, soup powder, infant and other foods, it will be widely used in future when its dietetic value becomes better known." The composition is then given, and it is shown to be rich in albumin [protein, 40%], fats (20%), sugar 8-11%, and minerals 4-6%. "The most abundant salt is sodium phosphate. Advocates of the fleshless diet have to contend with large amounts of indigestible cellulose which occurs in vegetarianism. This cellulose is present in 4 to 11 per cent. of the soya bean, but is easily eliminated from the other products. Bean curd is entirely free from it" as is "a most excellent vegetable milk which resembles animal milk in that it coagulates." The author then gives some comparative nutritional figures, based on "the work of a French-trained Chinese chemist, Mr. Li Yu Ying."

202. *Matieres Grasses* (*Les*) (*Paris*). 1911. La fève de soja [The soybean]. 4(33):2094-95. Jan. 25. [Fre]
• ***Summary:*** A summary of recent world news related to soybeans. Two German researchers have applied for a patent on the manufacture of artificial rubber from soy oil. In China a sort of vegetable milk is made from soybeans according to a report by Li Yu-Ying made at the Dairy Congress held in Paris in 1908.

"In 1906 and 1907 the price of various oils grew rapidly. At the same time the consumption of vegetable oils grew rapidly. Therefore people in Europe began to ask if there was not a good way to use soy oil, which had been used for a long time in China and Japan for food and illumination. Then in 1908 imports of soybeans to Europe began. In 1909 at least 400,000 tons were imported to England... There is at least one factory in France which uses soy oil in the production of cakes (*tourteaux*).

"One can see that soybean commerce is very active; this 2-year infant would seem to have a bright future."

203. Shaw, Norman. 1911. The soya bean of Manchuria. *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p. Also published by P.S. King & Son, 2 Great Smith St., Westminster, London SW, England. [6 ref. Eng]
• ***Summary:*** Contents: Introductory. Varieties. The plant. Soil and climate. Cultivation. Soil infestation. Yield. Uses of the soya bean: In the Far East: Bean sauce or soy (called shoyu in Japan [whence the name "soya"] and *chiang-yu* in China), the Chinese paste *chiang* (incl. *ta chiang* {great, made with yellow soybeans} and *hsiao chiang* {small, made with soybeans and maize}), tofu (incl. firm tofu {*tou-fu kan-tzu*}, tofu curds {*tou-fu nao*, curded with calcium sulphate instead of brine}, curd skin or yuba {*tou-fu p'i*}, layers of tofu pressed in cloth [pressed tofu sheets] {*ch'ien-chang tou-fu*}, and "frozen curd" {*tung tou-fu*, tofu that is frozen then dried}), bean flour, bean refuse {okara}, bean oil for food or industrial uses. Beancake and its uses. Uses in the Western world (beancake in Europe, and bean oil in Europe). The bean oil and cake industry in Manchuria. Trade development (statistics on exports from Newchwang have been kept since 1864). Beginnings of the European trade. Bean oil and cake production in South Manchuria. Chief sources of supply. Map references. Supplementary note.

Appendixes: 1. Table showing values (in Haikwan taels) per picul of [soya] beans, beancake, and bean oil at Newchwang, 1864-1909. 2. Graph showing monthly values (in silver yen) at Dairen of beans, bean oil, and beancake, 1907-10. 3. Table showing estimated [soya] bean production of Manchuria in normal years, compiled by the South Manchuria Railway Co. in 1909. 4. Estimates of [soya] bean production of Manchuria for the last 5 years by province and territory, compiled by the South Manchuria Railway Company in 1909: Fengtien province 1,092,350 tons. Kirin province 626,500 tons. Heilungkiang province 280,250 tons. Grand total for all Manchuria: 1,999,100 tons. Estimated soya bean production in Manchuria has increased from 600,000 tons in 1906 to a peak of 1,500,000 tons in 1908, to 1,400,000 tons in 1910. Percentage contributed by various colors of soya bean in 1910: Yellow 80.1%, green 9.4%, white-eye 3.8%, black-eye 3.2%, and black 3.4%. 5. Table showing total export of [soya] beans and bean products from Manchuria, 1909. For export of soya beans: Dairen 51% of total, Suifenho [Suifenhe] 25%, Newchwang 23%. For export of bean cake: Newchwang 50%, Dairen 44%, Antung 2%. For export of oil: Newchwang 75%, Dairen 21%, Harbin 1%. The writer frequently refers to Sir Alexander Hosie's book on Manchuria (1901, 1904).

The introduction begins: "It is only in the last three years that soya beans have become important in intercontinental commerce, and their rapid emergence from obscurity has, indeed, been one of the most remarkable commercial events of recent times. The circumstance that 'the rise of a great export trade in beans is that fact that overshadows all others,... the soya bean thus taking at a bound a position equal to that of tea in the list of exports and, with the addition of beancake, even challenging the position of silk at the top of the list'"* (Footnote: * = "Statistical Secretary's Report on the Foreign Trade of China in 1909").

The "bean district *par excellence* is the upland country beyond Moukden [Mukden] where the hills... are overlaid with wind-deposited soil..."

"Cultivation: In Manchuria the beans are produced

almost entirely by hand methods. The plough, which is drawn by quaintly mixed teams of oxen, mules, and donkeys, has only one handle and a rough steel-tipped cutter. The seed is sown by hand, on top of the drills, in April, and is covered by hand. A heavy hoe is used for a good deal of the turning and breaking. When the plant appears the earth is heaped up round it, so that the roots may derive the maximum of nourishment from the soil."

"The harvest takes place in September, and the pods are usually harvested before they are quite ripe, as otherwise they are liable to burst on drying, a loss of seed being thus occasioned. The plants are pulled up by hand or cut with a straight-bladed sickle in Manchuria, and collected into small heaps in order to facilitate drying, and, when dry, the seed is separated by means of a cylindrical stone roller having longitudinal cuts on its surface, which is dragged over the plants by a mule as they lie on the threshing-floor. After this primitive threshing operation has been completed, the beans are winnowed in the usual Chinese method–that is, by throwing them against the wind. The only manure used is a compost of stable manure and earth, which is often taken from the miry pools formed in the roads–the despair of the carter but a boon to the farmer. In countries where chemical manures are used, it is only necessary to apply potash and phosphoric acid where they are lacking, for nitrogenous manure is unnecessary, owing to the property which the soya bean possesses, in common with other leguminous plants, of obtaining nitrogen from the air by means of colonies of bacteria."

Yield: In 1867 the Rev. A. Williamson, who travelled in the upper Sungari district at the time and who appears to have been a very close observer, estimated a maximum yield of 2,000 lb., or 15 piculs, to the acre.

The Chinese paste *chiang* is not the same as the Japanese paste miso. Chiang "is made by farmers and eaten with fish, meat, and vegetables, while the more expensive Chinese soy [sauce] is only made by wealthy families and restaurant keepers and is not consumed by the very poor. There are two kinds of *chiang: ta* (great) and *hsiao* (small)." Describes in detail how each is made. Great chiang is made from yellow soybeans, salt, and water. Small chiang contains a small amount of maize (p. 7).

Industrial uses of bean oil: (1) As an illuminant, where it has not been superseded by kerosene oil. One advantage is that "no lamp is needed to hold it, the wick being inserted into the basin or plate containing the oil." (2) As a lubricant, bean oil is used to a very considerable extent in north China and Manchuria "for greasing axles and parts of native machinery" (p. 8-9).

In China, bean oil "is used as a substitute for lard, in cooking. Although it is inferior to rapeseed and sesamum oils for this purpose, these oils cannot compete with it in point of price... In spite of its unpleasant characteristic odour and unpalatability, the poorer classes in China consume it in its crude state, but among the rich it is boiled and allowed to stand until it as become clarified" (p. 8). In Europe "Refined bean oil may be used as a salad dressing in place of other oils (but, owing to its unpleasant odour, is usually mixed with an oil of animal origin or with rapeseed oil), or in the manufacture of margarine, when a greater percentage of soya oil than of copra oil is allowed" (p. 10).

Traditional methods of pressing out the oil yield only about half of that present in the seed (9% of the weight of the beans); the rest is left in the cake, and this distracts very much from its fertilizing value. "By gasoline extraction the beans give up practically all their oil, which, as refined by this process, is a clear, pure liquid, hardly resembling the muddy, dark oil produced in the old way" (p. 14).

Photos on unnumbered pages show: (1) Seven varieties of soya beans: Large black, small black, large flat black, small flat black, two green, and two yellow. (2) Soybean root nodules. (3) A massive granite roller for crushing beans. (4) "Steaming vat with grating on which [soya] beans are placed in gunny bags during the steaming process." (5) Native bean press, showing cakes in receptacle and log wedges driven in to press out the oil. (6) Modern bean press [hand turned screw?] set up in bean mill. (7) Oil-motor and crusher. (8) Modern crushing machinery. (9) Piles of beans in sacks awaiting loading onto trains at Changchun. (10) Color fold-out map titled [soya] "Bean districts of Manchuria." A schematic diagram (in the form of a rhombus / diamond) shows the probable relationships of the different groups of soya beans based on their color. A beautiful map, approximately 17 by 22 inches, is attached between page 26 and page 27. "Wuchang" [not Wochan] is in the area labeled "Yellow Beans" in the map. Other labeled growing areas on the map include "Grasslands," "White eye," "Black beans" [soy], "Maize" and "Green beans." The major railways, rivers, roads, and towns / cities (with their Chinese characters) are shown. The major soybean markets (underlined) are Fenghwa / Maimaikai, Kungchuling, Changtufu, Tungkiangtze, Sinminfu, Tienchwangtai, Newchwang, Kaiyüan, Tiehling, Mafengkow, Moukden, Takushan, Antung, Harbin, and Shwangcheng.

Shaw finished writing this yellow book on 31 December 1910.

Note 1. This is the earliest document seen (July 2000) that mentions the South Manchuria Railway Company in connection with soybeans. This company was run by Japan. According to the *Encyclopedia Nipponica* (vol. 22, at "Minami"), the South Manchuria Railway Company (*Minami Manshu Tetsudo K.K.*) was established in 1905 based on the Portsmouth Treaty ending the Russo-Japanese War; Japan took over the rights to the railway from Russia. The company started to actually run the railway in 1907.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "frozen curd" to refer to dried-frozen tofu.

Note 3. This is one of the earliest English-language documents seen (Sept. 2006) that repeatedly uses the word "bean" (not preceded by the word "soya") to refer to the soya bean.

Note 4. This is the 2nd earliest English-language document seen (Oct. 2012) that uses the term "tou-fu p'i" (regardless of capitalization or hyphenation) to refer to yuba.

Note 5. This is the earliest English-language document seen (April 2012) that uses the term *chiang-yu* to refer to Chinese soy sauce. Address: 4th Asst., Custom House, Dairen.

204. Clerget, Pierre. 1911. La question du Soja [The question of the soy bean]. *Revue Generale des Sciences* (*Pures et Appliquees*) 22(3):100-01. Feb. 15. (Chem. Abst. 5:1637). [2 ref. Fre]

• ***Summary:*** Contains a brief description of the soybean and discusses its commercial importance, distribution, soil requirements, the value of the oil and its uses, and the composition and commercial value of the cake. During the past 2 years, the large amounts of soybeans exported from Manchuria to Europe have called attention to this plant. It is cultivated all over China, but especially in Manchuria (in the Liao Valley, where it is the second most important crop after sorghum), Japan, Korea, and Indo-China. In China it is often cultivated with maize; it demands a great of work, care, and good soil. The main exports come from the Manchurian ports of Newchwang and Dairen, and from Vladivostok. In 1908 some 859,200 tonnes of soybean and cake were exported from Manchurian ports, up from only 88,900 tonnes in 1905. Until 1908, Japan was the principal outlet for Manchurian soybeans (615,900 tonnes), but at the start of that year, exports to Europe began: 69,200 tonnes to Great Britain, 21,390 tonnes to France, 7,290 tonnes to Holland, etc.–for a total of 204,440 tonnes.

According to chemical analyses made at the Colonial garden of Nogent-sur-Marne, Manchurian soybean seeds contain 17.64% oil and 33.5% protein; yellow varieties contain more oil than black varieties. The soybean is used as a forage plant and for soil improvement, but its most important role in China and Japan is as a human food among people who consume little meat. According to Bloch (1908), it is most widely used in making a sauce [soy sauce] and a cheese [tofu]. It is also used to make numerous pastes and a sort of soymilk (*lait de soja*).

It also has industrial uses, thanks to its oil content of 16-18%. Indigenous mills can obtain only 8-10% oil, but modern hydraulic presses can obtain 12-14%. The oil and cake have made the soybean rise so rapidly on European markets. The oil, which has an agreeable smell and taste, is widely employed for culinary purposes in Manchuria. In England, as in France, it is used in making soap and margarine. It is more drying that cottonseed oil and can likewise be used in making paints. Soybean cakes (*Les torteaux de soja*) would give the same results as cottonseed cakes in terms of milk yield from dairy cows. As a fertilizer, they are used throughout Japan and on the sugarcane plantations of southern China.

The soybean could be introduced to Indo-China where, even if it has to compete against Manchurian soybeans, it could be service locally for soil improvement in the rice fields and as a food in the densely populated districts where there is hardly any room for animals, or where the animals have been decimated by disease. Address: Professeur à l'Ecole supérieure de Commerce (Graduate School of Commerce) de Lyon [France].

205. Demolon, A. 1911. Lait végétal? [Vegetable milk?]. *Journal d'Agriculture Pratique* 21:140-41. March 24. [Fre]

• ***Summary:*** The milk of the soybean contains constituents which correspond to those of cow's milk: casein, fats, sugars, and minerals. However, plant milk will never be the same as artificial mother's milk made by mixing one volume of cow's milk with one-half volume of lactose solution. Nonetheless soymilk is an economical and highly nutritious food. Since its introduction into the United States, production of soybeans has expanded significantly. Address: Directeur de la Station agronomique de l'Aisne.

206. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1911. The soya bean. April 22. p. 2.

• ***Summary:*** "Will the soya bean 'boom' extend to Victoria? [Australia], asks the *Age* [an Australian periodical]. Present indications are that it will. In the meantime the bean is here [in New Zealand], if not the 'boom,' and the plant is thriving remarkably well. Last year the Department of Agriculture obtained four tons of the seed from Shanghai, and planted some on its experimental plot at Cheltenham, where the bean attained a height of five feet on sandy soil, one variety yielding 13 tons and another 12 tons to the acre."

Note: Cheltenham is located just southeast of North Shore City, in the Auckland region of New Zealand's North Island."

"On different soil at Ballarat [a city in central Victoria, Australia] an even more vigorous growth is shown. Mr. J.M.B. Connor, Superintendent of Agriculture, said recently that he considered the plant greatly benefited the soil by the nitrogen which the nodules extracted from the air. The uses of the soya bean are manifold. A Chinese in Victoria was handed a parcel of the beans to convert them into merchantable goods. He made them into bottled preparations known as soya milk, soya currants, soya cheese [tofu], straws for making soup and soya curd, which the Japanese use as a cure for sciatica.

Note. This is the earliest English-language document seen (April 2013) that uses the term "soya cheese" to refer to tofu. This is also the earliest English-language document seen (April 2013) that uses the term "soya curd" however it

is not clear to what it refers.

"In Manchuria it is primarily utilised for its oil extract and the manufacture of cake. The *London Times* reports that soya beans are now one of the principal imports of Hull, and are likely to seriously affect the importation of cotton seed. Their value is widely recognised by soap makers. The first commercial crop was sent to Europe [from Manchuria] in 1906, and the requirements from Manchuria for the coming season are estimated at 1,000,000 tons, worth £6,500,000. That Victorian farmers are alive to the possibilities of the soya bean is shown by the fact that Mr. Connor disposed of two tons and a half of the seed in small lots in one day."

Note: The meaning of "soya currants" and of "straws for making soup" is unclear.

• ***Summary:*** Contents. Introduction. The plant: origin and history, species and varieties, culture, and production: USA, Japan, Manchuria, France, England, China, Korea, Indochina (it is cultivated for the needs of the population in Cochin China {especially in the provinces of Chaudoc and Baria}, Annam, Tonkin, Cambodia), Formosa, Java, India, Africa. The soybean–a food plant: The plant, the seed, large table showing many analyses from many countries of the chemical composition of many soybean seed varieties.

Introduction to food products made from soybeans in East Asia. Shoyu [soy sauce] (and koji). Miso. Natto (from Japan). Le Tao-yu (a Chinese condiment also widely used in Japan. It is a thick, clear liquid [sometimes] made from black-seeded soybeans) Tao-tjiung (doujiang, from China). Tuong (from Annam). Tofu. Li Yu-ying. Table showing composition of powdered soymilk, fresh tofu, and soy flour.

The soybean–an oilseed plant. The soybean as an oilseed in the Far East. Table showing exports of soybean cake and oil from various Manchurian and Chinese ports in 1908 and 1909. The soybean as an oilseed in Europe and the United States. Table showing imports of soybeans to various British ports in 1909 and 1910 (the leading port by far is Hull, followed in 1909 by Liverpool, London, Bristol Channel, Scotland, and Other ports {Rochester, etc.}). Table showing exports of soy oil from Great Britain in 1910: To Germany, Austria, Australia, USA, Belgium, Denmark, Egypt, France, Holland, Italy, the Indies (*Indes*), Norway, Russia, Sweden, other, total (115,372 barrels, each weighing 175 kg). Discussion of soy oil and cake in most of the above countries.

Trade in soybean seeds: Mitsui Bussan, Manchuria, England, China, Japan. Soybean cake.

Soy oil: Physical and chemical properties. Applications and uses as food and in industry: Margarine, for illumination, soaps, as a drying oil, paints and varnishes, linoleum, artificial rubber. An extensive bibliography is at the end of the last article in the series.

Note: This is the earliest document seen (May 2010) concerning the cultivation of soybeans in Cambodia. This document contains the earliest date seen for the cultivation of soybeans in Cambodia (April 1911). Earlier documents imply that soybeans were being cultivated in Cambodia by 1900, and it is highly likely that they were being cultivated for at least a century before that time. Address: Ingénieur-chimiste E.C.I.L., France.

208. Beltzer, Francis J.-G. 1911. Études sur la caséine végétale du "soja" et ses applications [Studies on the vegetable casein of soybeans and its applications]. *Revue Scientifique* 49(23):716-20. June 10. [4 ref. Fre]

• ***Summary:*** The author did his research in Cochin China [today's Vietnam], then a French colony. This is a very original and important article.

Contents: Introduction. Vegetable milk [soymilk]. Vegetable cheese [tofu and fermented tofu]. Industrial vegetable casein (*La caséine végétale industrielle;* i.e. soy protein). Production of vegetable casein: Cleaning and washing the soybean seeds, extraction of the oil (which can be used in soap), extraction of the casein. Industrial [non-food] applications of vegetable casein: Paint, paper coating, Galalith, etc. Conclusion.

The preparation of vegetable milk and vegetable cheese are widely practiced today in Cochin China and in Annam [today's North Vietnam], as recently discussed by Mr. Henri Labbé in *Revue Scientifique* (11 Feb. 1911).

Soymilk (*lait végétal*). After describing the process for preparing soymilk, the author notes: This soymilk serves for the feeding of infants and for general nutrition (*Le lait sert à l'allaitement des enfants et à l'alimentation génerale*)*;* it can also be used for the production of a vegetable cheese (*fromage végétal*).

Tofu (*fromage végétale*)*:* When vegetable milk is treated with a mineral salt or an acid, playing a role analogous to that of rennet, it produces curds through coagulation, resembling those of ordinary casein. By draining and washing, one obtains a sort of white cheese (*fromage blanc*) which plays a major role in the nutrition of the peoples of the Far East. In Indochina the milk is coagulated by the addition of a very small quantity of a powder called Tchach-Kao or plaster [calcium sulfate], which comes from a selenite pulverised by the action of fire.

Tofu is generally eaten fresh, the same day it is made, but it can also be preserved by salting or smoking. In Annam, three main varieties of tofu are found: 1. Fermented tofu, gray or yellow in color, with a flavor resembling Roquefort cheese; 2. White or salted tofu resembling goat's cheese; 3. Baked or smoked tofu, resembling Gruyere cheese. At the market in Saigon, Chinese sell regular tofu to the natives for

one-tenth the price of Gruyere cheese.

Industrial vegetable casein: Defatted soybean meal from oil presses is ground between millstones with cold water to give a slurry that is filtered to obtain soymilk. The soymilk is heated to boiling, then calcium sulfate is added to precipitate the protein, which is collected (just like tofu curds) on filter cloths. The presscake is mixed with forage and molasses, then fed to livestock. The curds are then dissolved in diluted soda lye (sodium hydroxide), filtered, precipitated with acetic acid. The finely divided precipitate is filtered out, washed on the filter, left to evaporate in the open air, then dried to a yellowish powder at a low temperature. The casein thus obtained is white, and, from an industrial viewpoint, very pure. It is insoluble in water, but soluble in dilute caustic alkalies and in ammonia. It exhibits almost precisely the same properties as the casein obtained from ordinary milk. It is found on experiment to be susceptible of the same industrial applications as animal casein, and may come to largely supersede this because of lower cost. 100 gm of soybeans yields about 25 gm of this "vegetable protein," which has both food and industrial uses.

Note 1. This is the earliest document seen (Aug. 2013) concerning isolated soy protein. The author says that his "vegetable protein" has both food and industrial uses.

Note 2. This is the earliest French-language document seen (Aug. 2003) that uses the term *caséine végétale du "soja"* or *caséine végétale industrielle* to refer to isolated soy protein.

Industrial applications of vegetable casein: "Like animal casein, industrial vegetable casein, free of fat or buttermilk, can be used in a host of applications. It can be used in making paints, and for the preparation of moisture-resistant products. Note 3. This is the earliest document seen (Oct. 2001) that mentions the use of soy protein in paints.

"It may be used also for the sizing (coating used to fill the pores) of paper, which consumes such large quantities of ordinary casein. Being soluble in ammonia and caustic solutions it is capable of forming a smooth and solid size.

Note 4. This is the earliest document seen (Oct. 2001) concerning the use of soy protein as a sizing for paper.

"Other uses are in certain manufacturing processes in the preparation of silks and artificial textiles, as well as of rubber, leathers, plastic materials, films, photographic emulsions, etc.

Note 5. This is the earliest document seen (Sept. 2001) concerning the use of soy protein to make silks, artificial textiles, or other industrial (non-food) fibers.

Note 6. This is the 2nd earliest document seen (Dec. 2001) concerning the use of soy protein as a raw material for making plastics.

Large amounts of animal casein are at present employed in the manufacture of 'Galalith,' from which are made numerous objects which imitate articles made from ivory, tortoise-shell, bone, horn, etc. The Soya casein, when free from fats, is equally well adapted for these purposes.

"Formol acts upon this casein in the same way as on ordinary casein, rendering it insoluble. Hence it may be used for the water-proofing of fabrics, straw hats, etc., as well as for the preparation of sizes and dressings... A solution of vegetable casein and borax can be successfully utilized in the process of calico printing."

"It will be seen from the foregoing rèsumè, that the fabrication of vegetable casein for industrial purposes has immense possibilities, only exceeded in importance by the alimentary value of its food products for man and for beast.

Note 7. *Webster's Third New International Dictionary* (1963) defines Galalith (a registered trademark)–as "used for a hornlike plastic [also resembling ivory or bone] made from casein [milk protein] and formaldehyde and used especially in making small molded objects (as buttons, beads, or combs)." This is the earliest document seen (Nov. 2003) that mentions Galalith in connection with soy protein. Galalith, "a new horn-like product from cow's milk," was sold commercially by Nov. 1905 and the process was protected by patents "in all civilized countries" (*Monthly Consular and Trade Reports*, USA. 1905. No. 302. Nov. p. 243.)

Conclusion: "A Chinese factory has already been established on the outskirts of Paris (at Vallées near Colombes) to make food products based on soya (*produits alimentaires à base de Soja*). This factory now produces tofu (*Caséo-Sojaïne*) and the following food products: Soy flour, soy bread, soy sauce, sweet soya preserves (*confiture de Soja*), soymilk (*lait de soja*), fermented soymilk (*lait de Soja fermenté*), tofu (*fromage de Soja*), etc.

Note 8. We wonder: Was Beltzer influence more by Li Yu-ying, or was Li influenced more by Beltzer? Both did independent and original research, however by Dec. 1910, some 6-7 months before this article was published, Li had applied for two French patents and three British patents which describe how to make various soy products in detail–including many of those products described by Beltzer. Therefore, we believe that Li influenced Beltzer more than Beltzer influenced Li.

"The Indochinese prepare, in addition, a fermented liquor, a concentrated milk, an alimentary flour, and a casein which forms the essential food of the people... Many Europeans are preoccupied with extracting part of the nutritive principles that exist so abundantly in the seeds, for the feeding of armies at war and of colonial troops... Hopefully the question of food uses of soy will be taken up at the same time as the manufacture of industrial casein, and that this will permit the utilization of the immense resources that our Indochinese colonies offer as raw materials."

Note 9. Later in 1911 this article was summarized in *Scientific American* Supplement and printed as a special booklet.

Note 10. This is the earliest document seen (May 2000) that uses the term *la Caséo-Sojaïne* to refer to a food–

clearly to tofu. Li Yu-ying coined this term, apparently after considerable thought and research. However the author also uses the term *fromage végétale* to refer to tofu–perhaps more generically. Martine Liguori, a native French speaker who is interested in tofu, noted in an interview (May 2000): "This term for tofu doesn't sound foreign. Rather it sounds somewhat scientific, learned, and upper-class, as from the techno-elite. If you don't know what it means, that's because you are not well enough educated. In France, people will adopt something that is upper class, but they resist foreign things–even foreign words. This whole idea originated in France when Napoleon created the *Grandes Ecoles* (French graduate schools) to develop an intellectual elite to replace the royal elite."

Note 11. This is the earliest document seen (April 2001) that mentions dried tofu. Address: Ingénieur-chimiste.

209. Figart, D. Milton. 1911. Notes from Malaysia. *Daily Consular and Trade Reports* (*U.S. Bureau of Manufactures, Department of Commerce and Labor*) 14(135):1114-16. June 10. See p. 1116.

• ***Summary:*** "The valuable soya bean: The soya bean has lately come into some prominence by reason of its extensive uses in the manufacture of oil and soap, and also because it forms return cargoes for tramp steamers bringing coal to the East. Dr. Gilbert Brooke, port health officer of Singapore, describes some new uses for the article:

"'The object of this paper is to show that we have at hand an article of diet which is cheap, which can be grown over large areas of the globe, which is palatable, which is not attacked by any known insect or fungus, which forms valuable by-products, and–most important of all–which contains, more nearly than any other known animal or vegetable substance, all the essential and properly proportionate constituents of a perfect diet.

"'Rice is a very badly balanced food, consisting mainly of starch, having next to no nitrogen, and hardly any fat or salts. In this rice stands, in the scale of food values, almost at the bottom, whereas the soya bean stands at the top. But it is remarkable that nature and experience seem to have taught rice-eating races that one of the best accompaniments to rice is some form of leguminous food, such, for instance, as dhal, the small yellow pea so much used by natives of India. Following out this analogy it would seem to be most desirable to foster among Asiatic races that depend mainly upon rice as a staple the simultaneous consumption of the soya bean as supplying in abundance those essential food elements that can not in the least be derived from rice.'

"Among the economic products derived from the soya Dr. Brooke enumerates these:

"'(1) Bean curd. A most nutritious jelly can be made from the soya bean. This has been known and widely used by all classes in north China for the last 2,000 years.

"'(2) Bean milk. The beans are dried, very finely ground, and made into an emulsion with water. This forms a valuable milk, which resembles cow's milk in that it coagulates when heated and acidified. The possibility of this is due to the fact that the proteid is composed of casein, as in the case of animal milk.

"'(3) Bean cheese. A nutritious cheese [tofu] is frequently made in Japan from bean milk.

"'(4) Bean flour. The dried and pulverized bean is most valuable as a soup basis. It is also useful for making biscuits and infant foods. Soya biscuits, produced by a Scotch firm, are supplied on several P. & O. mail boats.

"'(5) Bean oil. There is a very high percentage of fat in the soya bean. This is of commercial value. It is edible, and also forms an excellent basis for candle and soap manufacture.

"'(6) Bean cake. The seed cake left after expression of the oil from the soya bean forms one of the most valuable and rich cattle foods known.

"'(7) Bean sauce. The soya bean ground up and steeped in vinegar or brine forms a basis for Worcestershire and other sauces.

"'(8) Bean coffee. A substitute for coffee may be made from the soya bean, by dry toasting and grinding it, then adding boiling cow's milk or hot soya milk.

"'(9) The straw surpasses in nitrogenous value that of wheat or even hay. It is quite possible that the leaves or root may have medicinal properties, but this has not yet been worked out.'" Address: Vice Consul General, Singapore.

210. **Product Name:** [Soya Milk].
Foreign Name: Lait de Soja.
Manufacturer's Name: Usine de la Caseo-Sojaine.
Manufacturer's Address: Valles, Colombes (near Asnieres, Seine), northwest of Paris, France.
Date of Introduction: 1911. June.
New Product–Documentation: Beltzer, Francis J.-G. 1911. *"Études sur la caséine végétale du "soja" et ses applications* [Studies on the vegetable casein of soybeans and its applications"]. *Revue Scientifique* 49(23):716-20. June 10. See p. 720. Conclusion: "A Chinese factory has already been established on the outskirts of Paris (at Vallées near Colombes) to make food products based on soya (*produits alimentaires à base de Soja*)." This factory now produces various food products, including soymilk (*lait de soja*).

Scientific American Supplement. 1911. "Extended utilization of soya bean products: Milk, cheese, and a variety of other products from a vegetable seed." Aug. 19. p. 115. "A Chinese factory has been established [by Li Yu-ying] not far from Paris for the purpose of manufacturing alimentary products from Soya, and it has already put on the market... Soya milk,..."

Li and Grandvoinnet. 1912. Le soja. p. 92-93. A photo shows the equipment used to make soymilk (*lait de soja*) and Li's factory (*l'Usine de la Caséo-Sojaine*) on the outskirts of

Paris.

Fuerstenberg, Maurice. 1917. *Die Soja, eine Kulturpflanze der Zukunft und ihre Verwertungsmoeglichkeiten* [The soybean, a cultivated plant of the future, and possibilities for its utilization]. Berlin: Paul Parey. 40 p. See p. 5-6. The first manufacture of soyfoods in Europe took place in France, at Valees near Asnieres, where they made flour, bread, cakes, cheese [tofu], and soymilk (*Mehl, Brot, Kuchen und Käse, vegetabilischer Milch*)– though only in small quantities and, above all, for diabetics.

211. Barrau, Fernand de. 1911. La situation agricole dans l'Aveyron: La fève soja; Lait et fromage de soja [The agricultural situation in the department of Aveyron. Soybeans, soymilk, tofu]. *Journal d'Agriculture Pratique* 75(2):21-22. July 6. [Fre]

• ***Summary:*** The Roquefort cheese industry in the region of Roquefort is experiencing hard times and the author fears that soy cheese (*le fromage de Soja* [*tofu*]) may offer additional competition. "Many provinces of China, especially Manchuria, and all the countries of East Asia, cultivate on a vast scale the bean called *Soja* or *Soya* from which one can extract at will an excellent bread, oil, milk, butter, or cheese. Already, quite near Asnières (Seine), there exists a factory named *Caséo-Sojaïne,* supplied by soybeans imported from these distant countries. In this factory attempts have been made to make a special bread for diabetics using the flour of this bean. (Soybean seeds are very low in starch, which is the enemy of diabetics, and very rich in oils and protein.) The factory also produces confections, raw milk, cooked and sweetened milk, oil, various cheeses, not to mention the various cakes used to feed livestock.

"In the region of Roquefort, certain people are starting to ask themselves if they won't soon have to fight against another products besides the cheese made in Corsica, or in the Pyrenees region, or in the plains of the Crau (near Avignon in Bouches-du-Rhone province). This product which they see as a competitor in the near future is soy cheese."

"With special reference to soy cheeses, it is stated in the *Revue Scientifique* of last June 11, that the Orientals obtain three varieties of it: (1) A fermented variety, gray or yellow in color, reminiscent of Roquefort; (2) A white, salted variety resembling goat's cheese; (3) A broiled or smoked variety (*cuite ou fumée*) resembling Gruyère."

Since the Orientals themselves make a cheese from soya milk that reminds us of Roquefort, doesn't this tell us that tomorrow the factory at Asnières, with the same milk, won't also imitate Roquefort cheese very well? And how do we know that one day an industrialist won't come right here to Roquefort to establish a factory, similar to that at Asnières, to convert to cheese the milk drawn from soybeans (*fèves de Soja*)*?* "Thus speak those who are always trembling for our old and glorious Roquefort cheese. They would like to limit clearly the territory and the rights of soja, and have Parliament decide that one can never make from it a cheese resembling ours, and above all that such a soy cheese can never be imported into the commune of Roquefort. But is that possible? No. What is possible is to let it be known, by the local tribunals (courts of law), what has already been pronounced 100 times, that Roquefort cheese is made from the milk of sheep, and that a cheese made from vegetable milk cannot be sold under the name of 'Roquefort cheese.'"

"After all this time, we don't really see that soya cheese could jeopardize our Roquefort. And if ever there are measures to take against soya, ordinary local tribunals will doubtless suffice, without national legislators getting involved."

Note: This article also appeared in the *Le Cultivateur du Sud-Centre... Aveyron / Aveyronnais.* 1911. "Chronique agricole: La situation agricole dans l'Avetron." July 16. p. 420-21. Address: France.

212. *Los Angeles Times.* 1911. Wonderful soya bean: Has great food possibilities and is grown in great quantities in China and Japan. July 16. p. II-11.

• ***Summary:*** From *The Pathfinder.* "The Western world is only just beginning to appreciate the possibilities of the soy, soja, or soya bean, which is produced in such vast quantities in China, Japan and other parts of the East and which is adapted to so many different purposes. Large quantities of these beans are now being brought to Europe and this country, as they form a good return cargo for vessels that carry manufactured goods to the oriental markets."

"Dr. Gilbert Brooke, British health officer at Singapore, has issued a paper emphasizing the merits of the soya bean. He recommends it as a very desirable food... and–most important of all–which contains more nearly than any other known animal or vegetable substance, all the essential and properly proportioned constituents of a perfect diet. Among the economic products derived from the soya Dr. Brooks enumerates these:" Bean curd, bean milk, bean cheese [probably tofu–not fermented], bean flour, bean oil, bean cake, bean sauce ("the well-known 'soy' sauce"), and bean coffee.

"The straw surpasses in nitrogenous value that of wheat or even hay. Like other leguminous plants it enriches the land on which it grows, instead of impoverishing it."

Le lait végétal, la caséine végétale et les produits industriels retirés des graines de "soja" [Vegetable milk, vegetable casein, and industrial products extracted from soybeans]. *Revue de Chimie Industrielle et le Moniteur Scientifique, Quesneville* 22(259):209-15. July; 22(260):241-51. Aug. (Chem. Abst. 5:3597). Also published in Paris by Librairie Bernard Tignol (1911). Bibliotheque des Actualites Industrielles, No. 144. [13 ref. Fre]

• ***Summary:*** Contents: Introduction: Chemical composition of the soybean and of soy oil. Fermented soyfoods and koji: Li Yu-ying and his soyfoods plant established near Paris (at Vallées, near Colombes), the products it makes (tofu or soy casein {*Caséo-Sojaïne*}, soy flour, bread, sauce, confections, milk, fermented milk, tofu, etc.), soyfoods made in French Indochina. Soymilk (*lait végétal*). Tofu (*fromage végétal* or *to-fou*)*:* fresh tofu, fermented tofu (*La variété fermentée*, which is gray or yellow and has a piquant taste resembling that of Roquefort cheese), white and salted tofu (which resembles a goat's cheese), smoked tofu (which resembles a gruyère cheese)...

Industrial production of vegetable casein from soybeans (cleaning the seeds, extraction of the oil), cost of a plant to make vegetable casein, industrial applications of vegetable casein: in paints, glues, paper coatings, plastics resembling Galalith, conclusion.

An illustration (schematic drawing; p. 248) shows two views (a cross-sectional side view and an overhead floor plan) of a factory for producing vegetable casein, with a capacity to process 10 tons of soybeans per day.

Note: This is the earliest document seen (Sept. 2001) concerning the use of soy protein in glues or adhesives. Address: Ingénieur-chimiste, Expert, Professeur de Chimie Industrielle, France.

214. *Scientific American Supplement.* 1911. Extended utilization of soya bean products: Milk, cheese, and a variety of other products from a vegetable seed. 72(1859):115. Aug. 19. Summary of Beltzer 1911, in Revue Scientifique. [Eng]
• ***Summary:*** "A Chinese factory has been established [by Li Yu-ying] not far from Paris for the purpose of manufacturing alimentary products from Soya, and it has already put on the market Soya flour, Soya bread, Soya sauce, Soya Milk, Soya cheese, preserves, fermented milk, etc."

"The well-known chemical engineer, F.J.G. Beltzer, who has made a careful study of the whole subject, publishes in the *Revue Scientifique* a report of whose most important features we present an abstract."

"For purely industrial applications it is necessary, as we have said, that the vegetable casein be entirely free from fatty matters.

"In the industrial treatment of Soya, therefore, the process is somewhat different. The 3 objects sought are: the pure oil, the casein entirely free from oil, and the residuary cake.

"The oil is extracted by pressing, and 2 grades are obtained. The first or purest is sold for edible purposes, while the second is useful for soap-making and other manufactures where oils and fats are employed...

"The pure casein is prepared from the pulp which remains after the extraction of the oil. The milky liquid obtained by triturating the pulp with cold water, is filtered and treated with powdered gypsum. About 1 kilo of gypsum per 1,000 liters of the liquid is used. The mixture is brought to a boil and the resulting coagulate is drained and washed in cloth filters. The casein thus obtained is dissolved in a quantity of very dilute soda solution, so weak that the reaction is either neutral or very slightly alkaline. The solution is filtered and then precipitated by acetic acid. The finely divided precipitate obtained is filtered out, washed on the filter and finally dried at a low temperature.

"The casein thus obtained is white, and, from an industrial point of view, very pure. It is insoluble in water, but soluble in dilute caustic alkalies and in ammonia. It exhibits almost precisely the same properties as the casein obtained from ordinary milk. It is found on experiment to be susceptible of the same industrial applications as animal casein, and may come to largely supersede this because of lower cost.

"Among the various uses to which it may be applied we may mention its employment in painting, and for the preparation of products having a resistance to moisture.

"It may be used also for the sizing of paper, which consumes such large quantities of ordinary casein. Being soluble in ammonia and caustic solutions it is capable of forming a smooth and solid size.

"Other uses are in certain manufacturing processes in the preparation of silks and artificial textiles, as well as of rubber, leathers, plastic materials, films, photographic emulsions, etc. Large amounts of animal casein are at present employed in the manufacture of 'Galalith,' from which are made numerous objects which imitate articles made from ivory, tortoise-shell, bone, horn, etc. The Soya casein, when free from fats, is equally well adapted for these purposes...

"It will be seen from the foregoing résumé, that the fabrication of vegetable casein for industrial purposes has immense possibilities, only exceeded in importance by the alimentary value of its food products for man and for beast.

"The residuary cake left after the extraction of both oil and casein still retains sufficient nutritive qualities to be useful as an addition to the feed of animals."

Note 1. This is the earliest English-language document seen (Oct. 2011) that uses the term "soya cheese" to refer to fermented tofu.

By 1905 Li presented a paper (in French) describing how he had tofu to make "Fermented cheese (*Le fromage fermenté*). Its color is white, yellow, or gray, and it flavor is very strong, like that of Roquefort." In Dec. 1910 he applied for British Patent 30,275, titled "Vegetable milk and its derivatives." It was accepted / issued on 29 Feb. 1912. It stated: "For obtaining fermented cheese such as roquefort [Roquefort], parmezan [Parmesan], romatour [Romadur, Rahmatour], camambert [Camembert], and gruyere, suitable ferments are employed."

Note 2. This is the earliest document seen (Aug. 2013) that uses the term "Soya casein" to refer to an isolated soy protein product; it is used for industrial purposes.

Note 3. This is the earliest English-language document seen (Dec. 2004) that uses the term "silks" (or "silk") to refer to spun soy protein fiber used like a textile fiber.

215. Li, Yu-ying. 1911. Procédés et dispositifs pour la transformation intégrale du soja [Processes and apparatus for the complete transformation of soybeans]. *French Patent* 433,986. Application filed 6 Sept. 1911. Granted 20 Jan. 1912. [Fre]

• ***Summary:*** The beans, freed from stones and decorticated, are passed into a pipe from which they are withdrawn, through a number of branch-pipes, to be converted into flour (by dry grinding and bolting) suitable for bread-making, etc. They are also converted into oil and press-cake, or into "milk" (by wet grinding and pressing) and press-cake [okara], or into sauce, or after roasting into "coffee" or "chocolate." The "milk" may be concentrated or reduced to powder, or converted into "cheese," or into sauce, or it may be used for the preparation of casein (*sojalithe,* for various industrial uses). The cake obtained on expressing the "milk" may also be used for the preparation of casein, and the cake obtained on expressing the oil from the bean serves for the preparation of "milk" or meal.

Soybeans can be used in seven different food industries: (1) Milling. (2) Dairy and cheese. (3) Baking, pastry, and pâtes. (4) Confectionery. (5) Chocolate. (6) Charcuterie–Pork butcher deli business. (7) Preserves and canned foods.

They can also be used for industrial (non-food) uses in: (1) The casein industry (*Caséinerie,* incl. sojalithe for various industrial uses). (2) The oil industry (*Huilerie,* incl. soap, paint, candles {*bougies*}, and artificial rubber).

Note: This is the earliest document seen (Dec. 2005) that mentions the use of soy oil to make candles (one of two documents). However no description or details are given as to how the candles are actually made. Were they made from hydrogenated soybean oil? Address: Resident in France (Seine).

216. H.L. 1911. Le Haricot soja ou Fève de Mandchourie: Cultures exitoques [The soybean or Manchurian bean: Exotic crops]. *A Travers le Monde* 17(36):288. Sept. 9. Bound in the back of *Le Tour du Monde.* [Fre]

• ***Summary:*** Contents: Introduction. Its utilization by the Japanese: Fertilizer, oil, and oil cakes. Its utilization by the Annamites [Vietnamese]: Milk and cheese. How will soybeans be used: The first exports to Europe. Some figures on the present trade in soybeans. The Germans are becoming masters of the European soybean market. Soya in France: It is utilized by foreigners.

Concerning the Germans: "Until the spring of 1909, the Japanese were the masters of the soybean market. Some German companies have in turn entered into competition in places of production, and there followed a rather significant rise [in production]. There resulted as a counter-measure some soybean cultural trials in terrains that seemed favorable to them in China. The result of these trials is not yet known.

"Be that as it may, the Germans hasten to assume first rank among the importers of soybeans in Europe.

"In effect, it follows from a report published by *The Chemical Trade Journal* (10 June 1911) that the port of Stettin recently received from Vladivostok a shipment of 4,823 tonnes (metric tons) of soybeans; the manufacturers of Stettin have established a society with capitalization of 1,875,000 francs for the utilization of this product.

"Its importation into Germany duty-free will favor its use for several reasons: first, soybean oil, a substitute for linseed oil, can be sold at a price that is one-third lower; secondly, it can be used in soap-making; thirdly, the cakes remaining after the extraction of oil can be used to feed livestock in the same way as cottonseed cakes. Finally, after the appropriate extraction of oil, the pulp, reduced to a flour and mixed with cereal flour, yields an edible bread or biscuit.

"The nascent industry in Germany of cottonseed oil, flour, and oil cakes, whose primary material is cottonseed imported from America, will have before long to struggle against the formidable competition of soybean products."

Concerning soya in France. "Soya (*soja*) is hardly known in France except by a few products that are found in certain food stores and that are bought sometimes, but without realizing their origin. (Footnote: Notably many flour products whose fortifying qualities are incontestable.)

"For, there would be every advantage to introduce this industry into our country where the mechanical and chemical resources would permit an improvement of yields. The example, moreover, is already given, not by French industries, but by the Chinese, who have established a factory at Vallées, Colombes, near Paris, where a Chinese workforce, exclusively employed, make all types of soy-based food products.

"Our industries would draw great profit from entering this path and not allowing themselves to be surpassed by German chemistry any longer."

217. *Chemiker-Zeitung Chemisches Repertorium.* 1911. Pflanzenmilch [Plant milk (Abstract)]. 35(114):479. Sept. 23. [1 ref. Ger]

• ***Summary:*** A German-language summary of the following French-language article: Demolon, D.A. 1911. Lait végétal? [Vegetable milk?]. *Journal d'Agriculture Pratique* 21:140-41. March 24.

Note: This is the earliest German-language document seen (Aug. 2013) that uses the word *Pflanzenmilch* ("plant milk") to refer to soymilk.

218. Abel, Mary Hinman. 1911. Beans, peas, and other legumes as food. *Farmers' Bulletin* (*USDA*) No. 121. 38 p. See p. 11-13, 17-20, 35-36. Revised Nov. 15, 1906. Reprint, Sept. 30, 1911. [1 ref]

• ***Summary:*** This is a reprint of the 1906 revised edition. The information about soy is unchanged. On pages 17-18 is a section titled "The peanut" (*Arachis hypogæa*). On pages 35-36 is a section titled "Peanuts and peanut preparations" which includes a subsection titled "Peanut butter.–The roasted peanut ground to an oily meal has somewhat the consistency of butter and is now marketed under the name of peanut butter. Salt is perhaps quite generally added during the process of manufacture. Water is also sometimes added–usually before serving. Peanut butter is used like other butter to spread on bread, for the making of sandwiches, and in the preparation of a number of made dishes. Many persons like its flavor when it is fresh and of good quality, and it seems fair to say that the use of this and other sorts of nut butter is growing. As regards composition, peanut butter, which is essentially the ground roasted peanut, contains more protein and less fat than ordinary butter. Little is known regarding the digestibility of peanut butter, but the fine grinding would naturally seem to be of an advantage. Judged by Jaffa's experiments with a ration containing peanuts, it would be well digested. (See p. 26)

"Peanut oil.- At present the American peanut crop is not large enough to more than supply the roaster and the confectioner, hence the expressing of oil from the peanut has never become established here, but in Europe large quantities of the African-raised nuts are used for this purpose. The shelled nuts contain from 30 to 50 per cent. of oil. The oil is said to be of fairly good flavor, but inferior to olive oil. In 1899 some 80,000 tons of the nuts were used in Marseille alone for oil making. The unhusked nuts are passed between a pair of rapidly revolving grooved rollers and the shells and red inner skins are then removed by a winnowing process with the use of air currents and oscillating sieves. The cleaned kernels are ground and enveloped in fibrous mats and pressed to extract the oil.

"According to Brannt, "the first cold pressure yields 16 to 18 per cent of very fine table oil. The residue is then broken up, moistened with water, and again cold pressed, yielding 7 to 8 per cent of more or less valuable oil, used for table purposes and burning. The residue from this is heated and then pressed, giving 7 to 8 per cent more oil, unfit for table use, but used for soap and lubricating." The grades of oil are sold as salad oil alone or mixed with olive oil.

"Peanut cake.- When the oil has been pressed from the ground nut, the mass remaining, called oil cake, is used for fattening. Some experiments have also been made as to its food value for human beings. Containing, as it does, 47 per cent of protein and 9 per cent of fat and starch, and costing about 5 cents a pound, this attracted the attention of German scientists. The oil cake broken up and cooked a long time in water and eaten as a soup or porridge in a hospital. Most of those who tried it ate it with apparent relish, not once only, but again and again. No effort have been made to ascertain to what extent it was digested, and the use of the cake does not seem to have passed the experimental stage."

219. Ruhräh, John. 1911. Further observations on the soy bean. *Archives of Pediatrics* 28(10):841-43. Oct.
• ***Summary:*** "Read before the Twenty-third Annual Meeting of the American Pediatric Society, Lake Mohonk, June 1, 1911."

"In 1909, at the meeting at Lenox, I called the attention of the [American Pediatric] Society to the soy bean and suggested its use in infant feeding... Since that time I have had considerable experience with the use of the bean and also the flour made from it, and believe that it is a food of very considerable value in certain well-defined conditions, and I also believe that the bean will eventually be used as an article of diet in this country."

Three tables show the nutritional composition of the soy bean (on an "as-is" and on a water-free basis) and "of the [whole] soy flour made by the Cereo Company, Tappan, New York." This flour contains 44.64% protein, 19.43% fat, 9.34% cane sugar [sucrose], and no starch or reducing sugar.

A patent flour is made by Bayer & Company of Germany and patented in the USA [see Lampé 1911; U.S. Patent 980,292. Jan. 3. 1 p. Application filed Aug. 4, 1910].

The soy bean has three basic uses: (1) In the form of dilute gruels, either with or without the addition of some starchy flour, as barley flour, in summer diarrheas and in certain forms of intestinal digestion; (2) In cases where cow's milk disagrees with the child and in which there is difficulty in finding any food containing sufficient nourishment to nourish the child; (3) In "diabetes this food is of great value and serves two purposes. First, it may be prepared in a number of different ways and relieves the tedium of the ordinary diabetic diet to a very great extent, and secondly, as Friedenwald and I have shown, the use of the bean tends to lessen glycosuria [abnormal amounts of sugar in the urine], especially when used in connection with strict diabetic diets.

Dr. Ruräh concludes: "I feel that the soy bean has a very definite future assured for it, and it is chiefly for this reason that I again call your attention to it as an article of diet for infants." Address: M.D., Baltimore, Maryland.

220. Loew, Oscar. 1911. Ueber Sojabohnenmilch [On soymilk]. *Chemiker-Zeitung* 35(131):1222. Nov. 2. (Chem. Abst. 6:519). [2 ref. Ger]
• ***Summary:*** Gives a brief description of the process for making soymilk and a nutritional analysis; it contained 4.87% protein.

Note: This is the earliest German-language document seen (Aug. 2013) that uses the term *Sojabohnenmilch* ("soybean milk") to refer to soymilk. Address: Munich, Germany.

221. *Washington Post.* 1911. Manifactured [sic, manufactured] milk: Tid bits. Nov. 26. p. MS2.

• ***Summary:*** "Cows are not numerous in Japan, but the Japanese are fond of milk, and to meet this demand in the face of a natural shortage they long ago put their wits to work and evolved a product that the average person cannot distinguish from the regular dairy article.

"The artificial milk is derived from the soja bean, The beans are first soaked, then boiled in water. Presently the liquid turns white; sugar and phosphate of potash in proper quantities are added, and the boiling continues until a substance the thickness of molasses is obtained [sic]. This fluid corresponds very accurately with ordinary condensed milk, and when water is added cannot be told from fresh. If the present rise in the price of British milk continues we can foresee a big run on soja beans. Now, Mr. Milkman, beware!"

Note: A very similar article appeared about two months later on 14 Jan. 1912 in the *Boston Daily Globe.*

222. Li, Yu-ying; Grandvoinnet, L. 1911. Le soja [The soybean]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 11(105):459-74. Dec. [18 ref. Fre]
• ***Summary:*** Contents (continued): 2. The soybean in human nutrition. The soybean in general nutrition: From the viewpoints of physiology, economy, and gastronomy. The role of soybeans in special diets/regimens: Vegetarianism and vitalism, remineralization, anti-diabetic, others, lactose-free.

Foods made from soybeans (*Produits alimentaires à base de soja*)*:* 1. Soymilk and its derivatives: Soymilk (developed by the Chinese philosopher Whai Nain Tze {Liu An of Huai Nan} well before the Christian era, method of production, Chinese method, modern method used at Li's factory *l'Usine de la Caséo-Sojaïne* at Vallées (Seine)), cleaning the seeds, steps in soymilk preparation (grinding and filtration), the nature of soymilk (physical properties). A graphic illustration (p. 465) shows a comparison of nutritional elements between soybeans, tofu, and beef. A chart in outline form (p. 471) titled "Soy based food products" (*Produits alimentaires a base de soja*) shows the numerous and varied food products that can be derived from the soybean: I. Soymilk and its derivatives: Normal soymilk, concentrated soymilk, powdered soymilk, fermented soymilk (*lait fermenté*), soy cheese (*Caséo-Sojaïne; Fromage de soja* [*tofu*]), soy casein. II. Soy flour and its derivatives: Soy flour, soy bread for diabetics, whole-grain bread (*Pain complet*), cakes, biscuits (*Biscottes*). III. Soy oil and its by-products (cake). IV. The soybean used as a vegetable. V. Condiment products based on fermented soybeans. VI. Confectionery products: Soy confection, soy powder. VII. Soy coffee. Soy-based ferments: Kiu-tsee, lactic ferments based on soymilk. (*Ferments lactiques à base de lait de soja*).

Photos show: Inside view of Li's factory as the equipment is producing soymilk (p. 473). Microscopic view of soymilk, and of soy flour dissolved in water (p. 474). Also contains various tables, charts, and graphs from other sources.

Note: This is the earliest document seen (March 2000) written by Li Yu-ying which contains the term *Caséo-Sojaïne.* On p. 471 he states clearly that he uses it as a synonym for soy cheese (*Fromage de soja*) [tofu], which is made from soy milk–perhaps to avoid disputes over the word *fromage* with manufacturers of dairy cheese. On p. 472-73 he states that *Usine de la Caséo-Sojaïne* is the name of his modern factory at Vallées (Seine) which makes a variety of soy products. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

223. Nashville Sanitarium–Food Factory. 1911. High grade health foods (Ad). *Naturopath and Herald of Health* (*The*) (*New York City*) 16(12):Unnumbered page. Dec.
• ***Summary:*** "Made by expert bakers, from best selected materials, in a well-ventilated hygienic factory away out in the country, surrounded by farms and pure fresh air. Made by men who do things from principle.

"Contain no animal fat. Full line of nut foods, cereal foods... More than twenty-five kinds. Nutfoda is the great vegetable meat, pure, wholesome, delicious, a perfect meat substitute at 10, 15 and 25¢. for ½ lb., 1 lb and 2¼ lb. cans.

"Nutkysa–similar to cheese, 1 lb. can–$0.15.

"Nashville Malted Nuts, 1 lb. jar–$0.35...

"Baked Beans, Tomato or Plain, 1½ lb. can–$0.10. Note: It is possible, but unlikely, that these baked beans are soybeans.

"Cereal Coffee, Superb, 1 lb. pkg.–$0.10...

"Dixie Kernel (a Malted Breakfast Food) 1¼ lb. pkg.–$0.15.

"20 per cent Gluten Meal, Well Cooked, 1 lb. pkg.–$0.12."

"On sale at Naturopathic Supplies Store, 465 Lexington Ave., New York, N.Y." Address: Nashville, Tennessee.

224. Boname, P. 1911. Soja [Soybeans]. *Ile Maurice* (*Mauritius*), *Station Agronomique, Rapport Annuel* For the year 1910. p. 67-71. Also titled Bulletin No. 25. [1 ref. Fre]
• ***Summary:*** Summarizes the world soybean situation and soybean uses, then states: "We believe that this crop culture has been tried this year in various small plots on Maurice. We have distributed seed from various sources but we do not have precise information on the results obtained." The need for nitrogen fixing bacteria is discussed.

Note: Moutia (1975, p. 218) states that in this report "Boname called soybean a fashionable plant, referring to the huge quantities being imported into Europe and to the yields of 4 to 10 hectoliters of seed per acre being obtained in the United States. 'It is really a crop to try,' he wrote, 'being better than cowpeas in that flowering is uniform and pods come to maturity all at the same time.' The 1910 trials at Reduit had given better results than those obtained in the

past. When sown between December and March, soybean matured in 2½ to 3 months, yielding 7 to 8 hectoliters of well-formed seed per arpent of full stand, or 6,000 to 7,000 kg of green fodder. In addition to hares, the other pests were birds, snails, and the bean fly Agromyza.

"Soybean was planted on a small scale in Mauritius in 1910 and the not very encouraging results were thought to be perhaps due to the absence of the special bacteria–the particular Rhizobium strain–which the newly introduced legume required." Address: Directeur, Station Agronomique, Mauritius.

225. Hooper, David. 1911. Soy bean in India: Glycine hispida. *Agricultural Ledger* (*Calcutta*) No. 3. p. 17-33. (Vegetable Product Series No. 114). Also reprinted in Tropical Agriculturalist, 1912. 38:11-15, 99-103.
• ***Summary:*** Contents: Introduction. Experimental cultivation in India. Vernacular names of the soybean. Method of cultivation: Green manure, harvesting. Races and varieties. Races in India: Yellow [grown in Poona Experimental Farm, Burma, Darjeeling, Dehra Dun, Simla, Punjab], green [Poona], black [Poona, Kashmir to Darjeeling, Simla], brown [Kashmir, Kalimpong to Darjeeling], mottled [Shillong, Assam]. Composition of the seed: From Church, from König, from Dr. J.W. Leather (1903), tables showing analyses made in India of Indian-grown Soy beans from various provinces (Burma, Hill Tracts, United Provinces [black seeds], and Poona). Soy bean oil. Soy bean oil-cake. Composition of hay. Use as food: Soy-bean milk, bean cheese (topo, sic tofu, or "Soy-bean cheese"), shoyu ("Under the name of 'Soy sauce' and other fanciful names it has formed the basis of most of the important sauces of Europe for many years."), roasted soy beans as a coffee substitute, soy beans in diabetic diets. Trade (exports of Soy bean from Manchuria to England). Price.

"The plant was introduced into the United States of America in 1854 and was grown to a small extent in the Southern States, but from the year 1885 its cultivation as a forage crop has gained in importance in all the agricultural centres. Within the last two or three years a great deal of interest has been taken in the cultivation of Soy, and experiments are in progress in Government Farms in Cape Colony, Natal [South Africa], East Africa, Gambia, Mauritius and Australia.

Contains a good early history of the soybean in India: "It is difficult to ascertain the date of the introduction of Soy beans into India. There is no doubt that certain hill tribes, mostly of Mongolian origin, have cultivated the bean for a long time. At the Punjab Exhibition held at Lahore [later divided between India and Pakistan] in 1864 Soy beans identified by Dr. Cleghorn, were sent from the Hill States. This is the first record of the beans being exhibited in this country, and shows that the cultivation was on a insignificant scale.

"Experiments in India. In 1882 Messrs. Jardine, Matheson & Co. of Hong-Kong sent a sample of Soy beans for experimental cultivation in the Saidapet Experimental Farm, Madras. The plants raised from these seeds were healthy but the yield of the crop was small.

"In 1897 Surgeon-Colonel W.G. King, Sanitary Commissioner, Madras, strongly advocated the cultivation of Soy bean as a valuable food worthy of the attention of the people. In two experiments carried on at Saidapet during 1897-98, the yield of seed per acre was 468 to 495 lbs., respectively. Recent enquiries in Madras resulted in the opinion that the cultivation in the Presidency is still in an experimental stage.

"In 1882 some Japanese Soy beans were sent by the Government of India for trial to Saharanpur. In 1885 very good results were obtained, the black seeded variety giving a yield of 1,124 lbs. per acre, and the white seeded variety giving a yield of 561 lbs. per acre. In 1886 the acclimatised seed was widely distributed; in some cases the crop failed and in others it was fairly successful, but as a rule where seed was harvested it was said that the pulse was not popular in any form. The Botanical Gardens grew the crop for a few years longer but as there was no demand for the seeds the cultivation was abandoned. An interest in Soy bean, however, seems to have revived for the Agricultural Department has this year sent to the Reporter on Economic Products samples of the black variety of Soy beans from forty villages of the United Provinces.

"At the Experimental Farm at Nagpur, Central Provinces, the bean was grown experimentally from Japanese seed first planted in 1885. The yield at the end of the first year was at the rate of 180 lbs. per acre, but taking the average of five years the result was 88 lbs. per acre. In the Report for 1908-09 it is stated that Soy beans were grown on a small area under field conditions and the yield was fair, but there was little local demand for the seed. It was, however, ground and formed an excellent addition to the diet of the farm cattle. Last year only 43 lbs. were obtained on light soil on the Nagpur Farm, the crop being practically a complete failure; on heavier soil 380 lbs. of seed were raised.

"Soy beans have been grown at Poona for nine or ten years with varying results, and they have also been tried at Nadiad in Gujrat [Gujarat] and elsewhere in the Bombay Presidency. In the Experimental Farm Report for 1901 a large yield was chronicled, but next year the crops at Poona and Surat failed. In 1904 a yield of 300 lbs. per acre was obtained in light land. One year later nineteen plots were under trial but with unpromising results, for only five yielded seed enough to repay the cost of cultivation. The yield varied from 50 to 293 lbs. per acre, and it was found that only when the yield exceeded 200 lbs. was the crop profitable. In 1905-06 the Manjri Farm, Poona, grew nineteen plots with better results, probably due to better soil. The yield of some of the plots was on an average of 680 lbs. per acre–a highly

remunerative return. A year later it was reported by Mr. Fletcher, Deputy Director of Agriculture, that an experiment made on the edge of black cotton soil gave a yield of 1,166 lbs. per acre, while adjacent plots gave from 395 to 650 lbs. per acre.

"In the Agri.-Horticultural Gardens at Lahore Soy bean planted on a small area in 1894 yielded an estimated crop of 349 lbs. of seed per acre and 349 lbs. of fodder. Evidently it varies greatly in suitability to different soils and climates and does not seem to be adapted to the sea level plains of India.

"Gollan observed that the Japanese plant is erect, attaining a height of 12 to 15 inches, while the Himalayan form is a trailing plant. So far this vigorous growing plant does not appear in India to have been attacked by any insect or parasitic fungus.

"With regard to Burma, Mr. Burkill remarks: 'The Burmese grow it under the names of Pe-nga-pi and Pe-kyat-pyin, sowing it never in great quantities along with other beans on the mud banks as the falling rivers leave them bare in October, or more sparingly still away from the rivers. The Kachins and other hill tribes grow a little of it on their hill clearings, the Kachins call it Lasi. The Khasis, the Nagas and other tribes between the Brahmaputra and Upper Assam cultivate it similarly... In the Brahmaputra Valley it is grown as far as known only towards Barpeta in the Kamrup District.'

"Soy beans are called 'Bhut' in the Punjab, 'Bhat', 'Bhatwas' or 'Bhatmas' in the United Provinces and in the hills as far as Darjeeling, and 'Rymbai ktung' in Shillong and the Khasi Hills. Mr. B.C. Basu gives the Assamese name for *Glycine* as 'Patani jokra' and the corresponding Bengali name as 'Chhai.' In the Naga Hills it is called 'Tsudza' or 'Sudza.' It is grown by the Lepchas in Sikkim and is called by them 'Salyang' or 'Silliangdun.' 'Pe-nga-pi' is the usual name for Soy bean in Burma, but it has been received under the name of 'Lasi shapre tum' from Bhamo, and as 'Lasi N'Loi' and 'Lasi N'Hti' from Myitkyina. The Santali name appears to be 'Disom Horee.'"

"Dr. J.W. Leather in 1903 analysed the seeds of seven samples of Soy bean from Japanese seeds cultivated at Manjri, near Poona. The amount of oil in them varied from 14.92 to 23.05 per cent. being on the dry weight 15.97 to 24.41 per cent. with an average of 19.99. In 1902 Dr. Leather examined five samples grown on the Dumraon Farm. They yielded from 14.27 to 19.72 per cent of oil on the air-dried seeds.

"Fourteen samples of the seeds grown from Japanese seeds at the Manjri Experimental Farm were again analysed last year by a leading European firm. The percentage of moisture varied from 9.90 to 12.06, and the percentage of oil from 16.80 to 22.48...

"The following analyses of Indian-grown Soy beans were made in the laboratory of the Indian Museum in 1909 and 1910." Gives names and composition (oil [as is and on a dry basis], water, and ash) for 17 varieties from Burma, 21 from the Hill Tracts, 11 from the United Provinces [black seeds], and 15 varieties from Poona. "An attempt in 1903 to extract oil from these beans with the country *ghani* or indigenous oil-mill was a failure in Bombay."

Note: This is the earliest English-language document seen (April 2013) that uses the term "soy-bean cheese" to refer to tofu.

226. Marcuse, Julian; Woerner, Bernardine. 1911. Die fleischlose Kueche: Eine theoretische Einleitung und ein praktisches Kochbuch [Vegetarian cookery: A theoretical introduction and a practical cookbook]. Munich, Germany: Ernst Reinhardt. 2 + 552 p. Index. 21 cm. [Ger]

• ***Summary:*** Dr. Marcuse was born in 1862. The 3-part introduction by Dr. Marcuse discusses: The significance of a flesh-less [*fleischlosen*] diet for human nutrition. The practice of flesh-less cookery. Comparative summary of the main animal and vegetable food products. This is followed by recipes. In the back are some advertisements: (1) Nuxo foods made from nuts by Nuxo-Werke, Rothfritz & Co., Hamburg; (2) Protose, Vegetabilischer Aufschnitt (vegetable cutlet), Nuttolin, Granola, Granoseflocken and Bromose, from the Deutscher Verein für Gesundheitspflege, Friedensau Nr. 60 (Post Grabow, Bez. Magdeburg). This looks like a Seventh-day Adventist company with a health food factory in Germany.

There is a directory of Vegetarian eating houses, restaurants, and boarding houses (Pensionen) in Germany, and other nearby German-speaking countries (mostly Switzerland and Austria). Address: 1. Doctor of medicine.

227. Mexico. Ministerio de Fomento, Colonización e Industria. 1911. La soya: Traduccion de varias publicaciones extranjeras sobre la explotación de esta planta [Soya: Translations of various foreign publications on the development and cultivation of this plant]. Mexico: Secretaria de Fomento. 57 p. [3 ref. Spa]

• ***Summary:*** The *Ministerio de Fomento* is the Ministry of Public Works. The first three-fourths of this publication contains Spanish-language translations of the following three articles: (1) "The soybean: A valuable fodder plant" by H.J. Choles (p. 3-26). Contents: Introduction. Botany and history of the soybean (*de la Soya*). Varieties. Cultivation: Conditions of growth, methods of culture. Harvesting: When to harvest, curing, harvesting for seed, yield of forage, yield of seed. Chemical composition. Digestibility. Value and uses of the crop: For green forage, as a silage crop, as a hay crop, as a pasture plant, as manure, value of the soybean as human food.

(2) "Utilization of soybeans" by E.S. Edic [sic, Edie] from *Estación Agrícola Central–San Jacinto*. Jan. 1911 (p. 26-36). Contents: Introduction. Uses of the soyabean: As a forage plant, hay, ensilage, soy oil (*El aceite de soya*),

soymilk (*leche de soya*), a type of cheese (*una especie de queso*) [tofu], soy flour (*harina de soya*), use of soybean oil for margarine (*margarina*), for soap, illumination, paints and other industrial products, soy bean meal used as a fertilizer on Chinese sugar plantations, soybeans as a legume for enriching the soil with nitrogen. The cultivation of soybeans. Varieties of soybeans.

Note 1. This is the earliest Spanish-language document seen (April 2013) that uses the term *una especie de queso* to refer to tofu.

(3) "Importance of the Soybean: Products which can be obtained from the soybean. Its marvelous value as food." reprinted from *Milling* magazine, Aug. 1909 (p. 36-42).

The last one fourth of this publication (p. 42-57) discusses the following: The soybean (possibilities for importation to Mexico). The new world trade in soybeans. Soybean production in the British empire (Sir Alfred Jones, soya in Africa, trials in British Columbia). Consumers of soybeans (Countries that import the seeds, especially for their oil to make margarine, soap, and paints; Canadian research commission). As a food. Dark bread. Wheat gluten. The latest news about soya: Products that can be obtained (oil and meal), the soybean (vegetable casein), experiments making bread with soy flour, opportunity for the manufacture of biscuits or crackers (*galletas*). Summary.

Note 2. This is the earliest Spanish-language document seen (Sept. 2006) that mentions soy oil, which it calls *El aceite de soya.*

Note 3. This is the earliest Spanish-language document seen (Aug. 2013) that uses the term *leche de soya* to refer to soymilk. As of Oct. 2013 *leche de soya* is the modern Spanish term for soymilk. Address: Mexico.

228. Ward, Artemas. 1911. The grocer's encyclopedia–Encyclopedia of foods and beverages. New York, NY: Published by the author. 748 p. Illust. (color). 29 cm.
• ***Summary:*** Soy-related entries: Bean (p. 49-54): "The bean of European history is the Broad or Windsor variety,..." "The principal beans of United States cultivation are the Kidney and Lima, both of them believed to be native to South America.

"The Kidney Bean is the Haricot of the French and in Great Britain is sometimes called the French bean." The many varieties can be classified into "tough podded" and edible podded." "The 'tough podded' class produces the bulk of the dried beans of commerce, variously known as 'Kidney Beans,' 'Navy Beans,' 'Marrow Beans,' 'Black Beans,' 'Turtle Beans,' etc., in many colors, shapes and sizes." "'Flageolets' are cultivated with special regard to the consumption of the fresh seeds or beans." To the "edible podded" class of kidney beans belong Wax or Butter Beans, the Cranberry Bean or Red Speckled Bean, String Beans, Snap Beans, French Beans. "Pea Beans are the Cowpeas of the agriculturist." "Among numerous other 'special' varieties are the Soy Bean (which see), Asparagus Bean, Frijole, Lab-lab (or Egyptian Kidney), Red Bean, and Scarlet Runner." Asparagus Beans are known as *Tou Kok* by Chinese gardeners in California.

"Catsup, Catchup, Ketchup: a word derived from the name of an East Indian pickle, which was formerly applied specifically to the boiled spiced juice from salted mushrooms, but is now freely attached to various sauces (sold both bottled and in bulk) which consists of the pulp–bottled, strained and seasoned–of various fruits, as tomatoes, green walnuts, etc." Note 1. At "Catchup" and "Ketchup" we are told to see "Catsup."

Locksoy ([Lock Soy], p. 346): "Rice boiled into a paste and drawn into threads, imported from China. It is used to thicken soups."

Nuts (p. 412-13): A table shows the nutritional composition of all major American nuts, including almonds, chincapin [chinquapin] or water chestnut, chufa (earth almond), cocoanut, peanut, and peanut butter. "Many special nut foods, such as malted nuts, meat substitutes, etc., have been devised and extensively advertised by manufacturers for general dietetic use and for the special needs of vegetarians and fruitarians. It is said that some of these products contain soy beans, but apparently the peanut is very important in their composition.

Sauces (p. 552-53): In bottled sauces, vinegar is the most common liquid ingredient. "Commercial sauces of the Worcestershire kind, if of good quality, generally have Soy (which see) as their chief character ingredient. A typical formula of Worcestershire-style includes, in addition to Vinegar and Soy, a considerable percentage of lime juice, onions and tamarinds and small quantities of garlic, fish (as anchovies or pickled herrings), red chilies and spices. The product, after cooking, is strained through fine hair sieves. Leicester Sauce resembles Worcestershire in general characteristics but is less pungent."

Soy (p. 576): "A brown sauce, valuable to the commercial sauce market, made from the Soy Bean, a native of Southeastern Asia [sic] and widely grown in China and Japan. The beans are boiled, mixed with ground wheat or other grain, salt, etc., and allowed to ferment for a month or 6 months. The liquid is then strained off and clarified. Molasses is frequently added. In appearance it resembles Worcestershire Sauce, of which it is an important ingredient. It should not be too salt [salty] or too sweet, and although thick and syrupy, should be clear. When shaken in a bottle or glass it should, if it is genuine, leave a bright yellow film on the glass. Being a very desirable article, it is often counterfeited."

Soy bean (p. 577): "Commercial and government circles, both in Europe and this country are devoting increased attention to the cultivation of the Soy Bean as a food product, as it contains a large percentage of protein and a fair amount of fat, thus resembling meat in general nutritive

value. The cell-walls of the raw bean are very tough, but thorough cooking makes it readily digestible. Boiled with bacon and other fatty broths until soft and then seasoned, the result is a vegetable dish very pleasing to the average palate. If the beans are dry, a preliminary soaking to remove the skins is necessary.

"The Soy Bean is largely consumed in Japan, China and other parts of Asia as an adjunct to rice and other foods, taking the place of meat in the popular dietary. It is most popular in these countries in fermented form, the best known types being *Shoyu* or Soy Sauce; *Tofu,* a kind of cheese; *Miso,* Soy Bean 'Milk' [sic]; *Yuba,* the evaporated product of 'Miso" [sic], and *Matto* [sic, *Natto*], a product obtained by simple fermentation of the boiled beans. The various degrees and styles of fermentation serve the double purpose of rendering the beans more easily digestible and producing new flavors, just as by the fermentation of milk and cream we produce the different flavors of cheese.

Note 2. This is the earliest English-language document seen (Aug. 2013) that uses the term "Soy Bean 'Milk'" (regardless of capitalization) in to refer to soy bean milk.

"The plant is an annual, growing chiefly in bush form..." The different varieties are classified principally by the color of the beans: "Black, Yellow, White and Brown,... Types of all these four classes are grown to some extent in Germany, Austria, and Switzerland, and the first three also in this country, in North Carolina and other Southern States. Under favorable conditions a single plant may bear a hundred or more pods.

"Because of the fact that the beans contain little if any starch, they have been recommended as a desirable food for diabetics, and Soy Bean Bread and Soy Bean Meal are prepared for that purpose in Paris. The dried beans are also used in Switzerland and elsewhere as a coffee substitute." An illustration shows the top of a soy bean plant, with leaves, pods, and flowers.

Note 3. This book is full of fascinating information about the food system in the USA in 1911, with entries such as cold storage (first attempted in 1860, it has grown to extraordinary proportions), coloring matter (great improvements, no longer harmful), ice and refrigeration (ice manufacture dates from about 1870; today nearly 200 companies produce ice for general sale, mostly using the compressor and anhydrous ammonia). Dictionary of food names in five languages (English, French, German, Italian, and Swedish, p. 710-724) and a dictionary in English of "Culinary and bill-of-fare terms" (p. 741-45).

Note 4. The author, Artemas Ward, lived 1848-1925. His father was Henry Dana Ward (1797-1884), his grandfather was Thomas Walter Ward (1758-1835), and his great-grandfather was Artemas Ward (1727-1800), the first Commander-in-Chief of the colonial troops before the arrival of George Washington (a little-known Virginia planter) on 3 July 1775. Thereafter he served as second in command after Gen. Washington and was a Major General in the American Revolutionary War. Address: Formerly (from 1874) founder and editor of *The National Grocer,* 30 Union Square, New York.

229. *Boston Daily Globe.* 1912. Artificial milk: Japs make excellent imitation from soja beans. Jan. 14. p. 34.
• ***Summary:*** This article is very similar to one that appeared about two months earlier: *Washington Post.* 1911. "Manifactured [sic, manufactured] milk: Tid bits." Nov. 26. p. MS2.

230. Hooper, David. 1912. Soy bean in India: Glycine hispida. *Tropical Agriculturist* (*Ceylon*) 38(1):11-15. Jan. 15; 38(2):99-103. Feb. 15. [1 ref]
• ***Summary:*** This is a reprint of an article by the same author with the same title published in 1911 in *Agricultural Ledger* (Calcutta) No. 3. p. 17-33. Address: Australia.

231. Li, Yu-ying; Grandvoinnet, L. 1912. Le soja [The soybean]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 12(106):28-38. Jan. [16 ref. Fre]
• ***Summary:*** Contents (continued): Soymilk (continued): Chemical properties, composition (comparison with 8 animal milks–in bar chart form showing protein, lipids, carbohydrates, and ash), action of ferments [enzymes] and diastases [diastatic enzymes] on soymilk (*Action des ferments et des diastases sur le lait de soja*) (1. The lactic ferments {kefir, yogurt, etc.} act in the same way on vegetable milk and on animal milks. 2. The ferments of certain European cheeses make analogous vegetable cheeses {*fromage végétal d'une façon analogue*}. 3. Rennet coagulates soymilk, but the optimum temperature is a little higher than for cow's milk. 4. The ferments that we have extracted from shoyu [Japanese soy sauce] coagulate animal milks in the same way as vegetable milk).

Uses of soymilk (p. 30): They are the same as those of the animal milks. We will note, mostly, its use in China as a substitute for mother's milk. (Footnote 1. One of our parents was nourished, from the first phase of life, with soymilk. He/she is now 37 years old and has always been in excellent health).

Residues of the [soy] dairy (*residus de laiterie;* okara).

Condensed soymilk (*lait de soja concentré*). Powdered soymilk (*lait de soja en poudre*). Fermented soymilk (Kefir, yogurt, etc. are increasingly used therapeutically. One can compensate for the lack of carbohydrates in vegetable milk by the addition of lactose {or levulose for diabetics}). Tofu–which Li calls *Caséo-Sojaïne* (*fromage de soja*)–meaning "tofu or soy cheese": Method of production, coagulants used, perfected modern production methods at Li's factory (In this factory, tofu can be made into either non-fermented or fermented cheeses. The non-fermented cheeses {*Fromages non fermentés*} are of two types: Fresh and hard/firm. The

fresh are white in color and the consistency of hard-boiled eggs. The hard/firm are of two types: In diced sheets {salted or unsalted}, and in salted, semi-dry pieces/morsels. The fermented cheeses {*Fromages fermentés*} may be of the Gruyere, Roquefort, or Camembert types), tofu yields, preservation and storage, composition of tofu (compared with 4 meats on a moisture-free basic, in bar chart form showing protein, lipids, carbohydrates, and ash), digestibility of tofu, culinary preparations based on tofu (tofu omelette with egg, smoked tofu with shoyu, tofu pâté, soy sausage–made like regular sausage except that meat and fat are replaced by fresh, hard tofu plus butter or cocoa butter). Soy casein (*Caséine de soja;* for food or industrial uses). Contains various tables and charts from other sources.

Residues of the [soy] dairy (*residus de laiterie;* okara, p. 30-31): After filtering the [soy] milk, a slightly firm, aqueous oilcake remains in the filter cloth that is still very rich in nutrients (*substances alimentaires*). According to Dr. Bloch, it does not contain any trace of starch (our tests agree with this conclusion). Consisting of torn cells emptied of the largest part of their content, it would have the following percentage composition (see Bloch 1907):

Protein 0.248, water 88.75, ash 0.36, fat .04, other 10.85.

"The oilcake (*torteau*) obtained at the factory of 'Soy-Casein' (*Caséo-Sojaine*) and analyzed at the municipal laboratory of Paris yielded:

Water 80.04, protein 33, fat 8.44, carbohydrates 22.63, mineral salts 4.24.

"This oilcake was very easily dried to 10% water. The milk can only be filtered after boiling, thus according to Prinsen [Geerligs]:

Proteins 29.38, oil 12.81, ash 4.66, carbohydrates that are convertible to sugar 26.80, fiber 11.10, cellulose 10.2.

"The oilcake can be diluted in water. The liquid thus obtained is used in grinding to make the second extraction of [soy] milk."

Soy casein (p. 38): The casein or legumine of soymilk can be prepared by precipitation, purifying it by several dissolutions and precipitations, and finally drying it. One obtains a yellowish powder resembling animal casein obtained by the same processes.

It is generally admitted that vegetable albumins have a coefficient of assimilation greatly inferior to those of animal albumins. But confirmation of this is far from being definitive. The experiments of Messrs. H. [Henri] Labbé and Marchoisne have showed, in effect, that vegetable albumin is as well assimilated as animal albumin.

Legumine is different from animal casein, but the differences are of the same order as those which exist between the various animal caseins. The differences existing between the caseins of the various animal milks have been noted by many chemists.

The casein extracted from soymilk can be used in the same applications as casein from cow's milk. These are of two types: food and industrial. For food uses, one can point out the manufacture of powders, of lacteal flours (*farines lactées,* perhaps wheat flour enriched with soy casein), of whole-grain bread, etc.

Note 1. This is the earliest document seen (April 2001), worldwide, that mentions a Western-style soy cheese (Gruyere, Roquefort, or Camembert types), or a tofu sausage. This is also the earliest French-language document seen that mentions soy cheese, which it calls *fromage de soja.*

Note 2.

Note: This is the earliest document seen (April 2013) concerning the use of tofu in a second generation product.

Note 3. This is the earliest document seen, worldwide, that mentions powdered soymilk or dried soymilk.

Note 4. This is the earliest document seen, worldwide, that mentions soy kefir. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

232. *A Travers le Monde.* 1912. Le lait de soja, sa fabrication et ses propriétés: Cultures exotiques [Soymilk, its production and its properties: Exotic crops]. 18(10):80. March 9. Bound in the back of *Le Tour du Monde.* [Fre]

• ***Summary:*** The periodical *Bulletin de l'Agriculture Pratique des Pays Chauds* contains interesting information about the milk of this vegetable. The process for making soymilk (*lait de soja* or *lait végétale de soja*) is described briefly, both the "very rudimentary" process used in China and the modern process [resembling that used by Li Yu-ying at his factory outside Paris–See the 9 Sept. 1911 issue of this periodical].

"Soymilk has properties resembling those of animal milk. It rises upon boiling... The boiling does not become regular until after the milk has been withdrawn from the first several times; it forms a solid film on the surface. The milk has an odor of malt." Address: Paris.

233. Li, Yu-ying; Grandvoinnet, L. 1912. Le soja [The soybean]. *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) 12(108):213-23. March. [7 ref. Fre]

• ***Summary:*** Contents (continued): Products and condiments based on fermented soybeans. 5. Condiments in paste form (*Condiments pâteux*)*:* Miso (preparation, different varieties including white miso, Yeddo miso, Sandai [Sendai] miso or red miso, composition of miso {a table based on studies by Kellner and König}), Tao-Tjiung (Tou-chiang, doujiang) or Chinese-style miso (preparation, properties, composition {a table based on analyses by Prinsen-Geerligs}). Sauces: Shoyu (Schoyou, soyou, schoyu, or Phek-sze-You in Chinese; preparation, raw materials used and their proportions, formation of molds and koji, fermentation, perfection of the fermentation process in an aseptic environment using soymilk or soy bouillon inoculated with pure cultures), properties of shoyu, chemical composition

of shoyu (tables show: (1) Composition based on analyses by Kellner, Stift, Belohoubeck, Tahara & Kitao. (2) Composition and forms of nitrogen according to Suzuki, Azo [sic, Aso], and Mitarai (3 tables)), aroma of shoyu (2 tables based on analyses by Tahara and Kitao; Belohoubeck found two types of microbes in shoyu; the Saccharomyces and the bacteria). *Chiang-yu* (*Tsiang-yeou;* Chinese soy sauce), Ketjap (soy sauce from Java).

Note: This is the earliest French-language document seen (April 2012) that uses the word *Schoyou* or the term *Phek-sze-You* to refer to soy sauce. Address: 1. Counseiller de 1ere classe au Ministère de l'Agriculture de la Chine; 2. Ingénieur agricole (G.).

234. *Pure Products* (*New York*). 1912. Products of the soy bean. 8(3):157-60. March.
• ***Summary:*** "Three very interesting food products are manufactured from the soy bean, one known as vegetable milk, another known as vegetable cheese or vegetable casein, and soy sauce." "Vegetable milk, like animal milk, may be may be homogenized; that is to say, it may be passed through an apparatus known as a 'homogenizer'..." Concentrated or "condensed vegetable milk has a characteristic odor, but this can be improved by adding a little coumarin or vanillin, which corrects the taste so as to make it more nearly resemble that of cow's milk."

Vegetable cheese is coagulated "by the addition of a white mineral powder known as tchach-kao, which consists largely of plaster of paris."

"Soy sauce, or fermented soy,... may well serve as the basis of sauces of the Worcestershire type." Address: USA.

235. *Chicago Defender* (*Big weekend ed.*). 1912. Milk mills. May 11. p. 5.
• ***Summary:*** From the London Globe: According to *L'Opinion,* an "artificial milk" is "already consumed extensively in China, and a mill is to be set up in France. The Chinese drop a few grains of powder [sic] into water, stir it, and it becomes milk. The powder is the soja bean crushed, and the French mill is to treat the bean so as to enable the milk powder to be sold in packets. It is said that an excellent cheese [tofu?] is obtained by the same process."

236. *Washington Post.* 1912. A new kind of cow. June 30. p. M1.
• ***Summary:*** From The Vegetarian: "Notwithstanding vegetarians are being scoffed at and dubbed 'cranks,' more and more are coming into the field, and the cause is advancing at a rapid rate.

"This is not so much due to the effort of vegetarians as it is the result of sociological conditions." The human population is increasing so "that the raising of cattle for culinary purposes [meat or dairy products] is each year becoming more of a problem. Each year science gives us some new food element to replace the barbarian piece of roast flesh.

"The latest announcement reveals that milk, butter and cheese can be made out of beans. This milk-producing bean is a special variety, however–the Soja bean, a native of China. A Chinese chemist [Li Yu-ying] has a factory in France working out the problem of milk from beans. He has succeeded in making from this Soja bean milk, a fine quality of butter [made of whole soybeans that have been cooked, pureed, and seasoned], and a highly delectable cheese [tofu]."

237. *Christian Science Monitor.* 1912. Famous soya bean of China. July 31. p. 19.
• ***Summary:*** "It is interesting to note in conjunction with the awakening of China that a Chinese article of food, or at any rate a vegetable product which grows most profusely in Manchuria, is attracting the serious attention of Europe and America. Authorities say that the soya bean contains more of the ingredients of a perfect food than any other one known product, and an important experiment is being tried in France, where a wide assortment of foods is being made from soya beans [by Li Yuying, near Paris]. They include milk, cheese [tofu], casein, oil, jellies, flour, bread, biscuits, cakes and sauces.

"Now an article in the *Journal of Chemical Industry* [29 June 1912, p. 572-74] shows that the use of soya bean oil for paint purposes is established as a practical fact. While it is said that soya oil is not yet proved a perfect substitute for linseed oil in exterior painting, in interior painting it is entirely satisfactory and for some sorts of finishings, like 'baking japans,' it is even better than linseed oil.

"Soya beans to the number of 280 varieties are listed already by the United States governmental investigators. The orientals have made a close study of the product, and apparently know beans. Soya beans have been grown in Virginia and used as a substitute for corn to feed stock, Planted with the corn they act as a fertilizer, and the animals that can get soya beans let the corn alone.

"In China and Japan there is hardly a meal in which some preparation of the soya bean is not used. There would seem to be, after all, some subtle affiliation between bean-fed New England culture and the wisdom of the Orient.

"A Georgia man who tried the soya bean declares that he planted in rich soil and got stalks 20 feet high which he could harvest. It is plain that Jack's, then, was a soya beanstalk." Note: Soybean plants typically grow to height of 2-3 feet, never 20 feet.

238. *Medical Review of Reviews.* 1912. Soy bean and condensed milk. 18(8):513. Aug.
• ***Summary:*** In this review of the literature, a combination of the soy bean or its flour with sweetened condensed milk is recommended as an infant food as a substitute for fresh milk

when the latter is not safe. The soy bean is also a valuable food for diabetics because it contains no starch. "Soy bean flour" contains 44.6% protein, 19.4% fat, and 9.3% sucrose.

"For many years condensed milk has been regarded as unsafe owing to its low proportion of fat and proteids. To offset this shortcoming in condensed milk, soy bean deserves the attention of the profession.

"Soy beans really are the seeds of Dolichos soja Linn."

239. Li, Yu-ying; Grandvoinnet, L. 1912. Le soja: Sa culture. Ses usages alimentaires, thérapeutiques, agricoles et industriels [The soybean: Its culture. Its food, therapeutic, agricultural, and industrial uses]. Paris: Augustin Challamel (Rue Jacob 17). 150 p. Illust. Index. 25 cm. Translated into French and expanded from the Chinese edition, published by la Societé Biologique d'Extréme-Orient (1910). [151 ref. Fre]

• ***Summary:*** One of the earliest, most important, influential, creative, interesting, and carefully researched books ever written about soybeans and soyfoods. Its bibliography on soy is larger than any published prior to that time. It was first published as a series of eight articles in *Agriculture Pratique des Pays Chauds* (*Bulletin du Jardin Colonial*) from September 1911 to April 1912. Before being published as a book, it was revised slightly by adding a table of contents at the back, dividing the material into 5 parts with 19 chapters, and adding several photos (p. 16-17), a world map showing the distribution of soybean cultivation (p. 21), and an interesting 2-page table (p. 66-67).

Contents: The soybean: Origin and history. Part I: Soybean culture. 1. Species and varieties of soybeans: Botanical characteristics, species, varieties (Chinese, Japanese, Indian, Indochinese, Hawaiian, USA, European). 2. Needs of the soybean: Climatic, geographical area of the soybean by region worldwide, agrological/soil needs, fertilizers, soil preparation, the place of the soybean in crop rotations. 3. Soybean seeds: Study of seeds (by weight, by germination rate, selection of seeds), time of planting, plant spacing, depth of seeding, rate of seeding per hectare, method of seeding (broadcasting, in rows, in mounds). 4. The soybean during its vegetative stage: Germination, transplanting, types of care (e.g., second dressings), irrigation, flowering and fruiting, enemies of the soybean (e.g., insects). 5. Harvest of soybeans: Time for harvest (forage or grain), methods of harvesting (forage or grain; mechanical mower), threshing (use of machine), yields of soybeans (forage and grain in various countries, ratio of seeds harvested to straw is about 1 to 2, yield of nutrients). 6. Fixation of atmospheric nitrogen by soybeans, and improvement of the soil. 7. The soybean in mixed cultures and alternate rows: With corn, cowpeas, rice, sweet sorghum, or millet.

Part II: Chemical composition of the soybean. 1. Composition of the plant: Minerals in the leaves and total plant. 2. Study of the seed: Composition, chemical composition, microscopic comparisons, table of analyses by 28 previous researchers, albumins, sugars, starch, dextrin or dextrine, diastase, lipids, ash/minerals.

Part III: The soybean as human food and animal feed. 1. The soybean as feed for animals: Green forage and hay. 2. The soybean in human feeding: From the viewpoints of physiology, economy, and gastronomy. The role of soya in special diets: Vegetarianism, remineralization, diabetic, and lactose intolerant.

Part IV: Food products based on soya. 1. Soymilk and its derivatives: Soymilk (Methods of manufacture, Chinese and modern at l'Usine de la Caséo-Sojaïne, nature and properties [physical and chemical] and composition of the milk, action of ferments and diastases (enzymes) on the milk, uses of the milk, the residue from the soy dairy [okara], condensed soymilk, powdered soymilk, fermented soymilk (kefir, yogurt, etc.)), tofu (called Caséo-Sojaïne, or fromage de soya; methods of production, coagulants, yield of tofu, storing tofu, composition and comparison with various meats, digestibility, culinary preparations made from tofu (smoked tofu, tofu pâté, tofu sausages)), Soy casein (food and industrial uses). 2. Soy flour and its derivatives: Soy flour, soy bread, wholemeal bread, other products based on soy flour (as biscuits and cakes for diabetic diets). 3. Soy oil and its by-products: Soy oil, physical and chemical properties, usage, residue of the oil mill: the cake, price, uses. 4. Use of the soybean as a legume: Whole soybeans (composition and digestibility), soy sprouts (*germes de soja*), green vegetable soybeans (*le soja frais*). 5. Fermented soy condiments: Solid condiments from Japan: Tokyo natto (*Le Tokio-Natto*) and Ping-Ming natto or tao-tche (*Le Ping-ming-Natto;* fermented black soybeans with salt, ginger, orange rind, etc. A similar product is made in China and called tao-tche). Paste condiments: Miso (four types and composition), tao-tjung (Chinese miso). Sauces: Shoyu (its production, varieties, properties, composition), chiang-yu (*tsiang-yeou*), ketjap [kechap, from Java], tuong (from Annam, with rice or corn), tao-yu (widely used in China and Japan, described by Prinsen Geerligs). 6. Confectionery products: Comparison with chestnuts, roasted soy flour to replace chocolate. 7. Soy coffee (with analysis by Kornauth). 8. Special fermented products: Kiu-tsee (a special commercial ferment from Canton described by Thiersant), fermented soymilks.

Part V: Industrial uses of soybeans. Oil based: soap, wax candles (*bougie*), and paint oils. Protein based: sojalithe or soy stone which corresponds to lactite, insulators for electrical apparatus, glue, etc. Conclusion. Addendum (*Complément*) to Part III, Chapter 1: Soybean straw and stems. Composition of various seeds, including soybeans. Soy flour. The cakes from oil mills. Soymilk and the cake from soy dairies (*tourteau de laiterie*, okara).

A very interesting table (p. 66-67, which does not appear in the original 8 articles) shows earlier nutritional analyses

of the composition of soybeans by Steuf (from Hungary, Mongolia and China), Schroeder, Caplan, Pellet (from China, Hungary, Etampes), Muntz, Nikitin (black soybeans from Russia, 2 samples), Lipski [Lipskii] (yellow, from Russia), Giljaranski (yellow from Russia, China and Japan; black from China and Japan; green), König (*Hispida platycarpa* black, Tumida yellow, brown and black), Prinsen (white from Java and China), Goessmann, Kellner, USDA, Chemiker Zeitung (white from Java and China, 29 Jan. 1896), Scuff (misomame; miso soybeans), Zulkovski (yellow from China, reddish brown from Mongolia), Institut Agr. de Vienne (Austria; yellow from Vienna, reddish brown from Tirol), Ecole Imp. et Roy d'Ag. Hong (yellow from Mongolia and China, reddish brown from China), Chez M. Olivier Lecq (from Moravia), Lechartier (Etampes and black), Joulie (yellow), Stingl and Morawski, Bloch (yellow, green, and black), Balland, Cavendish Evelyn Liardet (yellow, brown, green, black, and white), Jardin Colonial (Laos, Tonkin, China), Aufray (Tonkin, Yun-nan), Homes Laboratory (black from China, or white). Photos and illustrations are the same as those referenced in individual sections of the book, except for the following: A field of soybeans (p. 16). A soybean plant growing in Europe (p. 17). Color illustrations appear facing pages 12, 22, and 64. Address: Li is from Societe Biologique d'Extreme-Orient (Chine). Grandvoinnet is from Ingenieur Agricole (G.).

240. *Lancet.* 1912. Synthetic milk [Solac]. ii(4651):1905. Oct. 19.
• ***Summary:*** This is an editorial on Solac, England's first commercial soymilk. "Last week the papers announced the production of 'synthetic milk,' and in response to an invitation from the company connected with the exploitation of this new food product, our consulting chemist was able to inspect and taste a sample of the first consignment sent to this country... The substance looks very like milk and has a round sweet fatty flavor not unlike that of rich milk. It appears to be an ingeniously made uniform emulsion, and is said to contain a rather larger proportion of the nutritive constituents of ordinary milk, derived from the soya bean amongst other vegetable sources... It is stated that the product can be retailed at 3d. a quart. Soya milk is referred to in certain text books on foods, and is said to be made by boiling the beans until they are soft and then beaten to a pulp. The theory of an ingenious preparation is that a vegetable casein then passes into solution and forms an opalescent fluid which resembles milk by the fact of a skin forming on its surface when boiled, just as in the case of cow's milk, and the casein further can be precipitated from solution, it is stated, by rennet or acids. But, of course, casein is only one of the constituents of cow's milk, and 'synthetic milk' is said to contain them all."

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "synthetic milk" to refer to soymilk.

241. **Product Name:** Solac (Soymilk).
Manufacturer's Name: Solac Company (Synthetic Milk Syndicate).
Manufacturer's Address: 221, Tottenham Court-road, London W., England. Also: Liverpool, England.
Date of Introduction: 1912. October.
Ingredients: Water, soybeans, lactose, sesame oil, sodium carbonate, salt, sodium phosphate.
New Product–Documentation: Lancet. 1912. Oct. 19. p. 1095. "Last week the papers announced the production of 'synthetic milk,' and in response to an invitation from the company connected with the exploitation of this new food product, our consulting chemist was able to inspect and taste a sample of the first consignment sent to this country... The substance looks very like milk and has a round sweet fatty flavor not unlike that of rich milk."

Note: Solac was England's first commercial soymilk.

Lancet. 1915. Dec. 4. p. 1263-64. "A milk similar." Made by Goessel's patented method. "By introducing a lactic culture of a selective strain at a certain stage of its production, the necessary biological activity is given to this artificial milk... A residue of bean cake [okara] is left which possesses high nutritive properties, and this has already been used for making a bread... Such a milk at once disarms all suspicion as to contamination with dirt and disease organisms... It has already been used with success by the bakery and confectionery trades."

242. Kuijper, J. 1912. Soja [Soya]. *Departement van den Landbouw, Suriname, Bulletin* No. 29. p. 24-29. Nov. [Dut]
• ***Summary:*** In recent years, since 1908, soya has become a product of great importance on the world market. There are few products whose exports have risen so dramatically in just a few years. The reason for the great expansion of trade in soya can be found in the great demand by industry for oilseeds. For more than 30 years, experiments have been conducted on growing soybeans in Europe, but the results have not been very promising. Some people have suggested that soya might be able to be grown in Suriname. It is grown in many tropical countries, including Siam, British India, and Java. Requirements for cultivation and yields are discussed. Japan reports the highest yields, 2,500 kg/ha, compared with 1,000 to 1,400 kg/ha from the USA. Soybeans produce more protein and oil per unit area of land than any other farm crop. The seed is used mainly for human consumption but the plant also yields, fresh or dried, an excellent livestock feed, which is why so much research on it is now being conducted in Australia and America. It is important for Suriname that soya can be used as a green fodder, for example interplanted and fed with corn.

From soya one can make numerous products such as soymilk (*soyamelk*), soy cheese [tofu] (*soyakaas*, whose

food value is higher than that of meat), soy flour, soy bread (*soyabrood*), oil (*olie*), various sauces (soya sauce, Worcester sauce, etc.), and various substitutes for coffee and chocolate, etc. (*surrogaten voor koffie en chocolade enz.*).

In Suriname soya is cultivated on a small scale by the Javanese, for example in Lelydorp and in the settlements of Johan and Margaretha. Many experiments with Soya have already been conducted in the experimental garden (*Cultuurtuin*). Seeds imported from America did not give good results; the plants remained small, yielded few fruits, and died quickly thereafter. It is a common occurrence that plants from temperate or subtropical regions do not grow well in the warm tropics in the rainy season. Of the seeds cultivated in Suriname, two varieties give good results. Those cultivated by the Javanese give hardy plants and a lot of seed though exact yield figures are not available; the planted area is still quite small. But the yield is about 1,000 kg/ha. Apparently the necessary bacteria are present in the soil, for the roots show nodulation.

In the experimental garden two beds of soya were planted on May 24. The first seeds ripened after 3 months and within 4 months all was harvested. Thus the plants developed during the rainy season, and they probably got too much water. The results would probably be better if this season could be avoided. Soya is sold in Suriname for hfl 30 per bag, a considerably higher price than that paid in Europe. On the plantations Peperpot and Jaglust experiments with soya have also been conducted. The European seed that was used gave very limited results. The experiments will be conducted again using Suriname seeds.

With the market price at hfl 10 per bag, it seems very unlikely that the cultivation of soya in Suriname will ever be profitable, unless high yields can be obtained. As mentioned above, this seems unlikely. Small scale cultivation for sale in Suriname, however, seems advantageous at present, while in areas where cattle are raised the use of soya as a green feed to replace more expensive secondary feeds will likely give good results.

Note 1 This is the earliest document seen (May 2009) concerning soybeans in Suriname, or the cultivation of soybeans in Suriname.

Note 2. This is the earliest Dutch-language document seen (Nov. 2012) that uses the term *surrogaten voor koffie* to refer to soy coffee.

Note 3. This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *soyamelk* to refer to soymilk.

Note 4. This is the earliest Dutch-language document seen (April 2013) that uses the term *soyakaas* to refer to tofu. Address: Surinam.

243. Tonnelier, Adolfo C. 1912. Soja hispida, Moench: Metodos industriales de elaboracion de sus diversos derivados [The soybean: Industrial methods of manufacturing its various derivatives]. *Revista Industrial y Agricola de Tucuman* (*Argentina*) 3(6):236-39. Nov. See also p. 396. With 5 photos of soybean plants and soybeans. [Spa]
• ***Summary:*** Contents: Introduction. Vegetable milk (*leche vegetal*, soymilk). Vegetable cheese (*queso vegetal*) [tofu]. Oil and casein (*aceite y caseina*, including preliminary operations of washing the seeds, extraction of the oil (*El aceite de Soja*), extraction of the vegetable casein {*caseina vegetal*} which has numerous industrial applications, as in the preparation of water-resistant paints, in the textile, paper, silk, and artificial textile industries, rubber, leather, plastic materials, films, photographic emulsions, etc.). Soy flour. Artificial rubber (*caucho artificial*). Shoyu or soy sauce (*choyou ó salsa de soja*).

"In the vicinity of Paris a factory for the production of soy-based food products has been founded. In England important manufacturers of soy flour, soybean cakes, and the extraction of the oil are in operation. Mr. Karajama [sic, Katayama (1906)], a Japanese chemist, uses soybean seeds to prepare a concentrated milk, a flour of the type that Nestlé makes, and biscuits (*biscochos;* not cookies), obtaining in this way a maximum of food and nutrition at very reduced volume.

"The experiments carried out since one year ago at this part of the Experiment Station, attached to the National School of Agriculture at Córdoba, have verified the easy acclimatization of this plant, the abundance and goodness of its products.

"It is to be hoped that its cultivation with be extensively propagated in the zones that are favorable for it. This leguminous oilseed is not only of interest to the farmer, agriculturist, and landowner, but also to the industrialist, and on no smaller scale.

"It is a new fountain / source of riches for the nation, that we must not neglect."

Note 1. This is the earliest Spanish-language document seen (Aug. 2003) that uses the term *caseina vegetal* to refer to isolated soy protein.

Note 2. This is the earliest Spanish-language document seen (Sept. 2006) that uses the term *El aceite de Soja* to refer to soy oil.

Note 3. This is the earliest Spanish-language document seen (April 2012) that uses the word *choyou* or the term *salsa de soja* to refer to soy sauce.

Note 4. This is the earliest Spanish-language document seen (April 2013) that uses the term *queso vegetal* to refer to tofu. Address: Chief of the Experiment Station, attached to the School of Agriculture, Argentina.

244. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1912. "Cowless" milk: Made in Germany. Dec. 7. p. 5 (Supplement).
• ***Summary:*** "London. October 18. Synthetic milk–cowless milk–has arrived. The first consignment has reached London.

It looked like milk, it smelt like milk, and it tasted like milk–some milk. At the best things look black for the cow. The machine-made milk was bottled in Germany, in Frankfort–patriotic cows will doubtless regard this as adding insult to injury–and opened in an office in the Strand.

"Half a dozen eminent analysts and some Government officials were there ready to taste, in the performance of their duty, and a good many other people who were also ready, even willing, to taste out of mere curiosity."

"To all questions as to the ingredients of cowless milk the same surprising and guarded answer was returned:–Soya beans–and other things."

245. *Grey River Argus* (*West Coast, New Zealand*). 1912. Milk made by machinery: Dairies turned into factories. Germ free and cheaper than cow's milk. Dec. 9. p. 1.
• ***Summary:*** "The familiar sign 'Milk from our own dairies' may soon be supplanted in London by the announcement 'Milk from our own factories.'

"This startling development of man's struggle to improve on nature is the result of the discoveries of Dr. Saner and Dr. Gooseell [sic, Gössel; Goessel], two German scientists, who claim to be able to make by machinery milk that is superior to that supplied by the cow.

"A demonstration of this synthetic milk was given at Dane's Inn House, London, in October, in the presence of medical men and Press representatives. Apart from a sort of clinging taste after drinking it, the synthetic draught passed the palate test. It went a little better with coffee.

"The inventors of synthetic milk have been experimenting in Germany for three years, and they claim they have now produced a perfect substitute for the natural article. Analysts in Germany have reported favourably on the new product.

It is claimed that the new milk is:–Free from bacilli; More wholesome than natural milk; Made in various grades to suit, the infant or the adult; Easily standardised; And that it is much, cheaper than the natural article.

"The raw material is said to be purely vegetable, one of the main ingredients being the Soya bean, which is grown in Japan and Corea [Korea], and much used in those countries. As to the process of manufacture. Mr. Faulding stated that various vegetables were put into a machine and subjected to great heat. In plain English the machine does the work of the cow, the raw material, in the scientific sense, being exactly the same as that which supplies the natural article. It takes about seven hours to turn out the finished milk, and it is proposed to 'brew' twice a day.

"The plant is not costly, and taking an average of the various grades of strength the inventors intend to make, the price to the public will be 3*d* per quart. Cheese [tofu] can also be made from synthetic milk, which would be sold for about 3*d* a pound.

"The substitute will not make butter, but it is possible that it may be used in the manufacture of margarine.

"Synthetic milk also gives cream, but it takes longer to make it, as the fat is more evenly distributed than in the case of natural milk.

"Other claims made for synthetic milk are that it is not touched by hand throughout the process of manufacture and that it is not exposed to the atmosphere while being made, except for the brief period required for bottling.

"This, the inventors claim, makes it absolutely free from bacilli [bacteria], and thus, it is claimed, the substitute will greatly diminish consumption [tuberculosis] and other illnesses which are due to or aggravated by, tuberculosis milk.

"It is said that the new milk will keep good twice as long as cow's milk, but as it will be offered for sale in bottles of all sizes, this is not very material.

"If the invention is favourably received it is intended to build a factory in London."

246. *Poverty Bay Herald* (*Gisborne, New Zealand*). 1912. An artificial milk,... Dec. 13. p. 2, col. 2.
• ***Summary:*** "... manufactured from vegetables, which is said to contain all the elements of the best cow's milk, and can be used for the same purpose, was shown to a gathering of scientists in London. Mr. A.J. Faulding, who will be responsible for the introduction of artificial (or synthetic) milk to this country, told a press representative that it was more digestible than ordinary milk, and its cream was for more nourishing. The milk could be used for all cooking purposes, and a very good cheese [tofu] could be made from it, but it would not produce butter. As the milk was germ-free, it would keep longer than cow's milk. The discovery was the work of three Germans, who spent three years in perfecting it. The soya bean in the principal source of the ingredients." Address: Prof.

247. Beltzer, Francis J.-G. 1912. Industries du lactose et de la caséine végétale du soja [Industries producing lactose and soy vegetable casein]. Paris: Librairie Bernard Tignol. 144 p. Undated. (Bibliotheque des Actualites Industrielles, No. 144). [17 ref. Fre]
• ***Summary:*** Contents: Preface. Part 1: The lactose industry (p. 9-95; 4 chapters). Part II: Vegetable milk, vegetable casein, and products from soybean seeds. Introduction. 1. Vegetable milk (*Le lait végétal;* soymilk), microscopic examination of vegetable milk. 2. Vegetable cheese (*Le fromage végétal;* tofu). 3. Industrial uses of vegetable casein, proximate analysis of soybean seeds, quantity and dosage determination, the price of soybeans, price of recovery of vegetable casein, industrial production of vegetable casein, cleaning the soybeans, extraction of soy oil, extraction of soy casein. 4. Plan and installation of a factory for processing (10 tons/day of) whole soybeans [to make industrial vegetable casein], estimate and specifications for special

materials, general materials, the buildings, price of recovery of vegetable casein, industrial uses of vegetable casein. Illustrations (line drawings) show: (1) Microscopic view of soymilk globules. (2) Microscopic view of soya bean tegument (exterior). (3) Schematic drawings (cross section and overview) of a factory for making vegetable casein.

Matagrin (1939, p. v) states that with this book, Francis G. Beltzer, a practical chemist, became a major force in visualizing new industrial uses for the soybean in the West.

The Preface notes that in Indochina, vegetable milk and vegetable cheese made from the soybean form the base of the people's nutrition. Cow's milk is largely unknown, and the people raise and nourish their children largely with soymilk. Tofu serves equally for the current nourishment of the poor (p. 6).

The Introduction (p. 101-07) notes that soy protein is a globulin, called glycinin or vegetable casein (*caséine végétale*). Osborne & Clapp submitted this substance to acid hydrolysis and found its composition, which is very rich in glutamic acid (p. 102). Soy flour (*farine de Soja*) contains little starch but a large amount of nitrogenous materials, similar to gluten; it is widely used in making bread for diabetics. It can also be used as the basis of foods that are rich in protein and very nutritious, as for colonial or European troops (p. 103).

Soy sauce (*Soja fermenté*) is made in Japan from a mixture of soy and wheat (*koji*). The number of brewers (*brasseurs*) of soy sauce exceeds 12,000 in the entire Japanese Empire, furnishing more than 2,500,000 hectoliters of this condiment (p. 103).

A Chinese factory has been founded on the outskirts of Paris (at Vallées, near Colombes) for the production soy-based food products (*produits alimentaires à base de soja*). This factory currently makes *Caséo-sojaïne* [tofu] and the following food products: Soy flour (*Farine de soja*), soy bread (*Pain de soja*), soy sauce (*Sauce de soja*), soymilk (*Lait de soja*), fermented soymilk (*Lait de soja fermenté*), soy cheese [tofu] (*Fromage de soja*), soy confections (*Confitures de soja*), etc. The Journal, in its issue of 9 Jan. 1911, under the title *"Une usine chinoise fonctionee dans la banlieue parisienne* [A Chinese factory is operating on the outskirts of Paris]" gives some details (p. 106).

In our colonies in Indo-China, the indigenous people have long prepared soymilk, tofu, and several other foods. Soymilk is used like regular milk for feeding babies. Soy cheese, when cooked, is analogous to gruyere cheese; fresh soy cheese resembles our goat cheese. Many Europeans are now preoccupied with making the best of the abundant nutritive principles found in the soybean. One can eat green vegetable soybeans (*Les fruits verts*) like green peas (*pois verts*). In Annam and Japan a sauce is also made from soybeans; its use has spread from East Asia just like that of tofu (*fromage végétal*) (p. 107).

The introduction into Europe and France of soyfoods (*aliments retirés du Soja*), especially soymilk and tofu, will enable us to combat periods of scarcity of animal milk and periods when the prices of certain foods are high. Will the substitution of vegetable casein for milk casein enable us to likewise conserve milk for food use instead of delivering it to industry? (p. 107).

Chapter one, "Soymilk" (p. 108-13), discusses the work of the Japanese chemist T. Katayama (1906) with soymilk and notes that it can be homogenized and condensed. Illustrations show a microscopic view of the globules of soymilk and of okara. The absence of starch in soybeans is a very positive characteristic.

Chapter two, "Tofu" (p. 114-18), notes that in Cochin-China, calcium sulfate is called *Tchack-kao*, and there are three main varieties of tofu: (1) The fermented variety, which is gray or yellow in color, has a piquant taste and resembles Roquefort cheese. (2) The white salted variety resembles goat's cheese. (3) The baked (*cuite*) or smoked variety resembles gruyere cheese and keeps as well as the salted variety.

Chapter three, "Industrial uses of vegetable casein" (p. 119-32), observes that the oil in soybeans must first be removed by pressing or extraction. A table (p. 120) gives the chemical composition of soybeans from Laos and Cochin China, Tonkin, and China and Manchuria. They contain 17.64 to 18.28% oil. In Indochina a food which Beltzer calls *La caséine végétale en lames* ("vegetable casein in sheets" = yuba) has a rather high oil content–about 25-28%. There follows a section (p. 126-32) which contains details on industrial production of soy casein. Chapter four, "Design and installation of a factory for processing soybeans into industrial vegetable casein," describes each piece of equipment and its cost, itemizes the costs of general and special materials plus, buildings and working capital. Also includes a detailed schematic diagram (p. 136-37) with three production lines, and both top and side views. Finally, it lists expenses, income, and profit (p. 139). The last section, applications of industrial vegetable casein, includes paints, paper coatings, silk and artificial textiles, Galalith, and waterproofing of textiles and straw hats. The book contains no bibliography, few footnotes, and no mention of the work of Li Yu-ying–from whom the author appears to have borrowed much.

Note: Although this book is undated, all major sources (except a Seattle Public Library bibliography) give its date as 1912. Address: Ingenieur-Chemiste-Expert, Professeur de Chimie Industrielle.

248. Hashimoto, Yojizaemon. 1912. The dairy industry in Japan. MSc thesis, University of Wisconsin. [2] + 67 p. See p. 41-42 [3 ref. Eng]

• ***Summary:*** Chapter X, "The manufacture of tofu," states: "Three gallons of Soya beans soaked in pure, cold water about 10 hours so that the beans absorb water until [they]

become of soft texture. Then grind the beans with a stone mortar, adding water little by little until you have 10 gallons of water. Then boil with water from about 20 to 30 minutes. If it boils over, add a little rape oil in order to prevent foam. After 20 or 30 minutes, pour into a hemp cloth bag and press with the hydraulic press so that a milky substance [soymilk] is squeezed out of the bag which is collected. The deposit remaining in the bag is cooled and is known as Kirazu [okara]. This is very palatable and is eaten by the people and domestic animals.

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the term "milky substance" to refer to soymilk.

"To this boiling, milky substance is added, little by little, saturated magnesium sulphate (obtained from sea salt) until about 1/20 of a gallon is added. Then cover about ten minutes without disturbing. This curd is poured into a wooden mold, which has a hoop of cheese cloth, and pressed about 30 minutes with light weights.

"The Tofu is a little firmer in texture than junket, which can be handled easily without breaking. Tofu has a mild, pleasant flavor and smooth texture. It is prepared economically and conveniently throughout the Japanese empire and is a most digestible food. It is cut into blocks about four or five inches square, weighing about one pound, which are sold for about one half cent each to consumers. It is eaten fresh or may be frozen and kept for a year or more."

\ Two tables (p. 42) give the "Chemical composition of tofu" and "Digestibility" [of tofu]. Digestibility: Crude protein: 2.7. Carbohydrates: 7.1? Fat 1.2.

\ Chapter XII (p. 63), "Future development of dairying in Japan" begins: "Some of the reasons why dairying has developed slowly in Japan are as follows:

"1. After introduction of Buddhism the slaughter of animals was forbidden under a severe penalty.

"2. Comparatively, our country is more thickly populated than any other civilized country, so that the entire area of fertile soil is cultivated and there are few pastures and meadows.

"3. Because our country is surrounded by oceans, fish are an abundant source of protein supplies.

"4. Tofu made out of soy beans is an economical, digestible food high in protein and is widely made by farmers and tofu makers throughout Japan.

"5. The native cattle are poor milk producers.

"In studying the future growth of the dairy industry in Japan, we have to consider, from an economical standpoint, (1) Whether there is room enough for the further development of the dairy industry in the island empire? (2) What quantities of dairy products will be consumed by the whole nation? (3) To what countries we might export dairy products? (4) What influence the dairy Industry would have on general agriculture?"

Note 2. This thesis was submitted for the Degree of Master of Science in Agriculture.

Note 3. At this time, the word "kirazu" appears to have been more popular than "okara" or "unohana."

Also a complete list of recipes and instructions for the hygienic preparation of the common food products with special lists of menus. 5th ed. Revised and enlarged. Dayton, Ohio: Health Publishing Co. 192 p. Portrait. Index. 20 cm.
• ***Summary:*** The title on the cover: "The practical hygienic preparation of foods." The author is a vegetarian. His book focuses on the keys to a long and healthy life. Contents: Preface. Prescription for a long life. Wise and healthful sayings suggest healthful thoughts–So these little messages may cause someone to think (13 quotations, including many by Shaftesbury and one by Snyder: "All sickness and sin originate in disobeying nature's laws"). Introduction. 1. The preservation of health a sacred duty. 2. The dining-room. 3. Cereals. 4. Bread and bread-stuffs. 5. Soups. 6, Meats. 7. Meat versus vegetarianism. 8. Meat imitations and meat substitutes. 9. Gravies and sauces. 10. Eggs. 11. Fats and oils. 12. Vegetables. 13. Beans, peas and lentils. 14. Rice and macaroni. 15. Salads. 16. Nuts, nut preparations, nut butters & nut cream. 17. Pies. 18. Desserts. 19. Scientific cake baking. 20. Menus. 21. Ice cream and ices. 22. Miscellaneous subjects. 23. Baby's food and care of children. 24. Foods for the sick. 25. Mastication. 26. The value of steam cooking. 27. Composition of foods. 28. Exercising. Address: Food specialist.

251. Tibbles, William. 1912. Foods: Their origin, composition and manufacture. London: Baillière, Tindall and Cox. viii + 950 p. See p. 372, 476, 529, 531-33, 535, 537-39, 776. Index. 23 cm. [5 soy ref]
• ***Summary:*** In the chapter on "The legumes or pulses," the section on "Beans" (p. 529) lists ten species of beans (including the soy bean) that "are used in dry condition in many parts of the world."

The section titled "The Soy Bean (*Dolichos soja*, or *Glycine hispida*) states (p. 531-33): "The soy bean is a native of Cochin-China, Java, and Japan, where it has been cultivated from the remotest antiquity. It is said to be the *shu* mentioned in the writings of Confucius, although the modern name is *ta-tou.* Its introduction into India is

comparatively modern. It was introduced into Southern Europe and America in 1880, where it is now cultivated chiefly as a forage plant. There are numerous varieties of the plant, but, excepting in colour, the seeds do not differ much from each other in size and appearance. Those sold in the Chinese markets of Australia and Western America are either yellow or black. The seed resembles a pea, but the botanical characteristics of the whole plant are those of the bean. The seeds are one of the most important beans of China, Japan, and some other Oriental countries, where they are eaten like other beans–viz., boiled or baked. But in China and Japan they are elaborated into a variety of products, all of which are valuable for their high proportion of protein, and, when eaten with rice–the staple food of the people–make a fairly well-balanced dietary. Some of these articles are eaten at every meal by rich and poor alike, particularly in the interior of China. Some of these preparations are as follows:

"Soy Sauce, or Shoyu, is prepared from a mixture of cooked beans, roasted wheaten flour, and salt, which are put into a cask and allowed to undergo a prolonged fermentation. The result is a thick brown liquid, of pungent and agreeable taste. It is used in Europe as a basis for various proprietary sauces.

"2. Bean Cheese, or Tao-hu [Tofu].–There are several preparations. According to Prinsen-Geerligs, bean cheeses are made from white beans, which are soaked in water for three hours, afterwards being reduced to a paste and cooked. The milky fluid is then strained through a coarse cloth to remove starch and fibre, and when cool is precipitated by the addition of crude salt–i.e., salt containing calcium and magnesium as well as sodium chloride. The precipitate, which is rich in protein and fat, is then kneaded and pressed into cakes, called fresh Tofu, or 'Taahuor tofu.' They are then dipped into an alkaline solution of curcuma. An analysis of fresh tofu gives the following composition: Water 81.35, protein 11.46, fat 5.19, carbohydrate 0.81, ash 0.79, per cent. There are several varieties of the cheese, known as 'Natto,' 'Miso,' and 'Tofu.' Natto is made from beans which have been boiled for several hours until they are soft. The hot mass is then pressed into small cakes, wrapped in bundles of straw, and kept in a warm, tightly-closed cellar for twenty-four hours, when the action of minute organisms from the air or straw work a change in the mass, and produce an agreeable flavour. Miso is made by boiling the beans until they are soft, when they are beaten to a pulp, mixed with concentrated sea-brine or crude salt, and boiled rice. The substance is then put into a barrel which has previously contained a fermented liquor, and allowed to ferment. It is ready for use in two months, and is eaten like butter. Soy Milk: When beans have been boiled until they are soft, and beaten to a pulp, a considerable portion of the vegetable casein passes into solution, and forms a milky-looking liquid. It further resembles milk by a thin pellicle or skin [yuba] forming on its surface when it is boiled, just as in the case of boiled cow's milk, and the casein can be precipitated from solution by rennet or acids. Such milk has many uses. Tofu is also prepared from soy milk by the addition of sea-brine, which precipitates the casein by virtue of the calcium and magnesium salts. The coagulum is then pressed into tablets, which are snow-white. Tofu made in this way is prepared fresh daily, and therefore but little bacterial action occurs. Moreover, dried cheeses are made in China and Japan by freezing such cakes, afterwards thawing them and drying them in the sun."

Section 4 (p. 535) titled "The legumin of soy beans" mentions glycinin, legumelin, proteose, and vegetable casein.

A table (p. 537) gives the chemical composition of the following: Soy beans (black, or yellow). Soy cheese (*tao-hu*)*:* Tofu (fresh, frozen, dry matter). Natto. Miso (white, red, or Swiss). Soy sauce (Tao-yu): Shoyu. Three sources for these figures are cited.

On page 537-38 is information about the fats, carbohydrates, and minerals of soy beans and other legumes.

In the section on "Sauces" (p. 776) we read: Many of these sauces, or relishes, consist of a basis of vinegar, with Indian soy, mushroom ketchup, walnut ketchup, cayenne pepper, allspice, garlic, and other condiments and aromatic spices, to give flavour, pungency, and aromatic properties. A notable example is *Worcestershire Sauce*, which is composed of the following ingredients: Soy–1 quart. Malt vinegar–7 pints. Lime-juice–3/4 pint. Tamarind–1 pound. Chillies–1¼ ounces. Cloves–1¼ ounces. Garlic–3 ounces. Shallots–6 ounces. Anchovies–3 ounces.

"These substances are prepared by peeling and bruising the garlic and shallots with the anchovies. They are then mixed with the vinegar, soy, and spices, boiled together for twenty minutes, allowed to get cold, and strained. There are many other examples; most of the ingredients have been described in the foregoing pages.

"An imitation [soy sauce]. called English soy, is made by heating together 10 parts treacle, 16 parts extract of malt, 4 parts mushroom ketchup, and 9 parts common salt; it is allowed to stand twenty-one days, and afterwards clarified." Recipes for Mushroom ketchup and Walnut ketchup are also given (p. 776).

The section on "Rice as a food" (p. 475-76) notes that rice is poor in protein and fat and rich in carbohydrates. "It is consumed enormously by the inhabitants of Eastern countries... It should not be overlooked, however, that the same people consume the soy bean and its preparations, especially soy cheese and sauce, which largely compensate for the deficiency of protein. The deficiency of rice in stimulating properties, infinitely less than those of oats and oatmeal, accounts to some extent for the indolence and apathy of many Orientals, and it is a significant fact that the advance of the Japanese as a nation [incl. winning two major wars] is contemporaneous with the larger consumption of flesh foods."

The section on "Common Wheat" (p. 372) states: "The Chinese grew wheat 2700 B.C., and considered it a special gift from Heaven. It was classed with rice, sorghum, and the soy-bean, which the Emperor Chin-nong [Shen-Nung] ordered to be sown annually with sacred rites."

Note: William Tibbles lived 1859-1928. Address: LL.D., M.D. (Hon. Causa) Chicago, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A. Lond. Medical Officer of Health, Fellow of the Royal Institute of Public Health, etc.

252. Tonnelier, Adolfo C. 1912. La Soja hispida y sus aplicaciones [The soybean and its applications]. Buenos Aires, Argentina: J. Carbone. 16 p. [Spa]

• ***Summary:*** Various tables give the chemical composition of soybeans based on different previous analyses (incl. moisture, ash, oils, nitrogenous substances / proteins {*materias azoadas, materias proteicas*}, cellulose, and carbohydrates).

"The results obtained during these last two periods in this Experimental Station permit us to predict a bright future for these industries. The soybean is adequate to use as green manure, green fodder and hay; it produces a grain with which flour is made for the maintenance of people and animals; it also produces oil which leaves a residue cake that can be fed to livestock. Besides these products, soybeans can be a source for artificial milk (*leche artificial;* soymilk), cheese (*queso*) [tofu], and a certain sauce (*cierta salsa;* soy sauce), all of which, even if their use has not yet become part of our custom, are at least widespread in the Chinese Empire" (p. 1).

"The main center for the utilization of the soybean and for the production of flour, oil and cakes is found in Hull, England." Tables show the composition of soy flour and the soybean cake, based on analyses by Maret and Delattre (p. 8).

On page 10 is a discussion of vegetable milk or soy milk. Page 12 discusses *"queso de Soja, ó To Fou"* ("soy cheese, or tofu") and *"la famosa salsa de Soja, llamada Soyou ó Choyou"* ("the famous soy sauce, called Soyou or Choyou" [actually shoyu]). A table gives the chemical composition of fresh and dry tofu.

A full-page table (p. 13) compares the chemical composition of soybeans and soyfoods with similar foods from other sources in six categories: Seeds or grains, cakes (for feed), flour, green forage, milk (incl. soymilk), and cheese (incl. fresh and dry tofu; *Queso de To Fou, fresco; Queso de To Fou, seco*). The dry tofu cheese may be dry-frozen tofu.

"Experiments carried out at this Experimental Station in Cordoba during the last three years plainly confirm the favorable effects that legumes produce as green/unripe manure over other crops such as corn, flax, wheat, barley, rye and potatoes. In the period 1910-1911, as is well known, was not a very favorable one for forage production. A yield corresponding to 36,000 kg/ha of green forage was obtained [from soybeans] at this Experimental Station" (p. 15). "The experimental cultivation of the hispid/hairy soybean in the period of 1910-1911 was carried out on soil of mediocre composition, inferior to that of the average crops in the region. As I stated earlier, that year was extremely unfavorable for all vegetation. Half of the crop either failed to bloom or did not ripen. As a result, by January 19, 1911, the harvest of green forage was 36,800 kg/ha, leaving the other half for seed" (p. 16).

Photos show: (1) A field of soy bean plants (Soja hispida). (2) Close-up view of a man standing with a measuring stick in a field of soy bean plants. (3) Close-up view of leaves of a soy bean plant. (4). Close-up of soybean pods on stem. (5). Soybean pods placed next to a ruler.

Note 1. This is the earliest document seen (May 2009) concerning the cultivation of soybeans in Argentina (one of three documents).

Note 2. The last two lines of the article read: "Cordoba, July 1911. A.C. Tonnelier." Therefore this document contains the earliest clear date seen for soybeans in Argentina, or the cultivation of soybeans in Argentina (1908). The source of these soybeans is unknown.

Note 3. This is the earliest Spanish-language document seen (Aug. 2003) that uses the term *materias azoadas* or *materias proteicas* to refer to nitrogenous substances or protein in connection with soybeans.

Note 3. This is the earliest Spanish-language document seen (April 2013) that uses the term *queso de Soja* refer to tofu. Address: Jefe de la Estación Experimental, anexa á la Escuela Nacional de Agricultura y Ganaderia de Córdoba (Chief of the Experiment Station, attached to the School of Agriculture and Cattle Raising of Cordoba, Argentina).

253. *Year-Book of Pharmacy* (*London*). 1912. The vegetable proteins. p. 490-91.

• ***Summary:*** The section titled "Soya bean protein" states that it "holds an important position amongst proteins with dietetic possibilities, but it is not in universal favour owing to its uncertain effects upon the organism. It merits the attention of pharmacists who desire to possess an inexpensive vegetable protein." "Soya bean protein is enjoying an extended use in connection with the treatment of diabetes and malnutrition."

254. Gerlei, Ludwig. 1913. Die Kunstmilch [Artificial milk]. *Milchwirtschaftliches Zentralblatt* 42(2):49-52. Jan. 15. [Ger]

• ***Summary:*** In this discussion of artificial milks, such a milk made from soyabeans is mentioned briefly on page 51. It is said to already be made and sold commercially in Japan and India. The product contains 92.5% water, 3% protein, 2.16% fat, and 0.41% ash. It is quite similar to cow's milk in appearance.

Note: This is the earliest German-language document seen (Aug. 2013) that uses the term *Kunstmilch* ("artificial milk") to refer to soymilk. Address: Direktor, Budapester Central Milchhalle-Genossenschaft.

255. Neuville, A. de. 1913. Les nouveaux aliments artificiels [The new artificial foods]. *Revue* (*La*) (*Paris*) 100(3):384-89. Feb. 1. 24th year. 6th Series. For translations see Literary Digest (8 March 1913, p. 509-510) and American Review of Reviews, April 1913 (p. 500-01). [Fre]

• ***Summary:*** Contents: Introduction. 1. Soymilk (*Le lait de soya*). 2. Meat alternatives (*La viandine*) developed by Belgian chemist M. Effront. 3. Miracle wheat. Note: The soybean is mentioned only in the section on soymilk.

By modifying the albuminoid and protein substances found in soy (Soya hispida, or Chinese pea), and extracting their proteids, we may obtain a milk that is similar to the milks secreted by the mammary glands of mammals. Soy is rich in nitrogen and in fatty matter. Made into flour it serves to make a bread that is prescribed for diabetes. A synthetic milk has been extracted from the beans, by a process that is still kept secret; it has the same nutritive effect as natural milk. "The invention was introduced into Germany and France almost at the same time. The parts of the plant are broken up mechanically, then chemically triturated and reduced to a lactescent substance that is cheaper than the product of the cow and may replace it perfectly."

A farmer can get six times as much milk from the same piece of land by planting it to soy beans, than by growing grass and letting a milch cow eat the grass. "The economy realized is considerable. A cow requires nearly a acre of pasturage. She turns only 53 per cent. of it into effective nutriment and about 5 per cent. into milk... Two milkings a day give on an average 15 quarts, varying with the breed. Soy grown on a field of one-sixth an acre yields the same quantity of artificial milk. The expense is far less.

"This soy milk presents other advantages over natural milk. It is not exposed to contact with impurities, as so often happens in farm stables and dairies... Besides, cows are not exempt from bacillary infections... Artificial milk is not exposed to these dangers. It is made with apparatus kept so scrupulously clean that there can be no question of microbial infection."

Soy "is a very nourishing food, but of an oily taste that makes it disagreeable to Europeans. Made into milk the soy has none of these disagreeable qualities. It is digestible, pleasant to the palate, and leaves no taste in the mouth. Being a complete food like natural milk, it is suited to children and invalids and all who are following a diet." Address: Dr.

256. *Revue Mondiale* (*La*) (*formerly Revue des Revues*). 1913. Le lait de soya [Soymilk]. Feb. 1. p. 385-86. [Fre]*

257. *Atlanta Constitution* (*Georgia*). 1913. Milk from soy beans. Feb. 2. p. A1.

• ***Summary:*** "Just now synthetic milk is a common topic in the German press, and is lauded as the highly important discovery of Dr. Rigler, professor of hygienics at the University of Klausenburg, Austria.

"This milk is produced from grain by a machine of simple construction and said to be equal to the best quality of cow's milk. Milk can also be made from soy beans; it has a peculiar flavor, but a German factory has for several years successfully produced from the soy bean milk of a reputed agreeable flavor, which sells at a low price."

258. *Literary Digest.* 1913. Vegetable milk. 46:509-10. March 8.

• ***Summary:*** This article begins: "Milk is not a chemical compound, but an emulsion... and it has, in fact, been imitated with more or less success, vegetable products having been mostly used for the purpose.

"The best known of these, 'soy milk,' made from a Chinese bean, has long been known. Witness Edward Lear's limerick about the man 'who lived on warm brandy and soy.' Children used to think that 'soy' was one of Lear's nonsense words, like his 'runcible spoon'; but it is now almost as common a food in Germany as it is in China." There follows a lengthy translation of an article by Dr. A. de Neuville titled "Artificial Foods" that appeared in *La Revue* (Paris, Feb. 1). "The economy realized is considerable. A cow requires nearly an acre of pasturage. She turns only 53 per cent of it into effective nutriment and about 5 per cent into milk... Two milkings a day give on an average 15 quarts, varying with the breed. Soy grown on a field of one-sixth of an acre yields the same quantity of artificial milk. The expense is far less...

"This soy milk presents advantages over natural milk. It is not exposed to contact with impurities, as often happens in farm stables and dairies... Besides, cows are not exempt from bacillary affections, and it has been proved that the pathogenic germs of their milk exist in the lacteal glands themselves. Artificial milk is not exposed to these dangers. It is made with apparatus kept so scrupulously clean that there can be no question of microbial infection."

Note. This is the earliest English-language document seen (Aug. 2013) that contains the word "lacteal" or the term "lacteal glands" in connection with soy milk.

"In China and Japan, soy has been abundantly cultivated since the earliest times... Made into milk the soy has none of these disagreeable qualities. It is digestible, pleasant to the palate, and leaves no taste in the mouth. Being a complete food like natural milk, it is suited to children and invalids and to all who are following a diet."

259. *Annales Coloniales* (*Les*). 1913. Un novel emploi du soya [A new use of the soybean] 14(31):2. Col. 1. March 13. [Fre]

• ***Summary:*** There is now a factory making soymilk in

England. It is sold in London for 30 centimes per quart.

Procédé pour la fabrication d'un produit alimentaire, ressemblant au lait, de la fève de soja et d'autres substances végétales similaires [Process for making a food product, resembling milk, from soybeans and other similar vegetable substances]. *French Patent* 451,447. April 18. 3 p. Application filed 2 Dec. 1912. Under International Convention, 4 Dec. 1911. [Fre]
• ***Summary:*** In the manufacture of a nourishing beverage from the soybean (*fève de soja*), similar to milk, purified finely ground soy beans (or pistachio or sesame kernels) are cooked up as rapidly as possible with sodium hydrogen phosphate and water 100 liters. Address: Germany.

262. *American Review of Reviews.* 1913. Vegetable milk and vegetable meat (Abstract). 47(4):500-01. April. [1 ref]
• ***Summary:*** An English-language summary of the following French-language article: Neuville, A. de. 1913. "Les nouveaux aliments artificiels" [The new artificial foods]. *Revue* (*La*) (Paris) 100(3):384-89. Feb. 1. 24th year. 6th Series.

This summary begins: "In most families the two heaviest items in the cost of food are the expenditures for milk and milk-products and for meat. Moreover, milk and meat are the most difficult foods to procure, to preserve, and to transport in a pure and wholesome condition. And it is this difficulty, coupled with modern standards of hygiene and sanitation, that has helped to make their cost mount steadily higher year by year. All of us, must be warmly interested in the successful efforts of certain foreign chemists to produce synthetically both milk and meat from vegetable sources, since it claimed that the 'near-milk' and 'near-meat' are not only as nutritious as their prototypes, but far freer from dirt and disease-germs, as well as very much cheaper."

The new artificial milk is made from the seed of the soy bean or the Chinese pea.

"From other sources we learn the interesting fact, not mentioned in *La Revue*, that an excellent cheese [tofu] can be made from this milk, which widens its usefulness materially.

The Belgian chemist, M. Effront, has proposed using the refuse from breweries to make a palatable and nutritious [non-soy] substitute for meat.

Note: This is the second earliest English-language document seen (Nov. 2003) that contains the term "vegetable meat" (or "vegetable meats"–with any combination of quotation marks)–and the first to mention "vegetable meat" in connection with soy.

263. Winkler, Gustav. 1913. Die Sojabohne: Vortrag gehalten in der Monatsversammlung des Gartenbau- und Verschoenerungsvereins Fechenheim [Mainkur] am 17. April 1913 [The soybean: Lecture presented at the monthly meeting of the Gardening and Beautification Society of Fechenheim {Mainkur} on 17 April 1913]. Frankfurt am Main, Germany: Published by the author. 14 p. [Ger] Address: Mainkur bei Frankfurt am Main, Kreis Hanau, Waldstrasse 55.

264. *Literary Digest.* 1913. Artificial meat. 46(21): May 24. Whole No. 1205.
• ***Summary:*** Excerpt from an article titled "The New Artificial Foods" in *Minerva* (Rome, April 1913) which begins by discussing soy milk, then states that a Belgian chemist named Effront has found a way to use spent brewers' yeast (from brewing beer) to make "Viandine," which he considers to be a complete substitute for meat–but one which is much less expensive. Experiments on both a man and on rats show that it has the same physiological effect on the digestive organs as real meat, and promotes growth as well or better than lean beef.

265. Houyet, A. 1913. La fève de soya [The soybean]. *Bulletin de la Societe Belge d'Etudes Coloniales* 20(5):367-90. May. [Fre]
• ***Summary:*** "The notes which follow have as their object the study of a commercial plant of East Asia which produces soybeans; it is interesting from the local point of view as a food plant and more specifically from the world viewpoint as an industrial plant.

"It appears useful to us to precede them with a geographic survey of the place of production of the plant, as well as some data on the population living there. After having studied the plant itself and the conditions of its agriculture, we will examine its uses, its commerce, and the possibilities for its development."

This is largely a discussion of soybean production and trade in Manchuria. But pages 378-80 contain a brief discussion of the many ways of using soybeans including in soy sauce, margarine, soap, as meal for livestock feed, as flour for fortifying biscuits, as soymilk, and (in Germany) as artificial rubber. "A Chinese manufacturer [Li Yu-ying] has established a factory near Paris that makes food products from the soybean" (*produits alimentaires à base de fève de soya*).

Concerning margarine: "Refined [soybean] oil can be used for the manufacture of margarine and as a salad oil" (*L'huile raffinée peut étre employée à la fabrication de la margarine et comme huile de salade*). Note: This is the earliest French-language document seen that uses the term *margarine* to refer to margarine.

266. Goessel, Fritz. 1913. Process of manufacturing

an alimentary product resembling milk from soy beans or similar vegetable seeds. *British Patent* 27,860. 3 p. Application filed 3 Dec. 1912. Accepted 12 June 1913. Under International Convention, 4 Dec. 1911.

• ***Summary:*** "This invention related to an improved process for producing a new alimentary substance, the composition and properties of which are similar to cow's milk or other natural milk but which is of vegetable origin. It is prepared from soya or soy beans or other similar seeds, earth or pistachio nuts [peanuts], sesame or teel seeds..." It is well know that soy beans are "particularly rich in albumen very similar to the albuminous substances contained in cow's milk. Soy-beans not only contain caseine-like albumen but also egg-albumen-like compounds."

If the seeds referred to "are suitably treated with water for the extraction of their alimentary substances, a milky liquor will be produced, but its composition would be such that it would never have the properties of cow's milk." It "is well-known that the finer the albumen is curdled and coagulated in the stomach the easier it will be digested... But a fine coagulation of the albumen is only obtainable if it be brought by means of a sufficient quantity of fat into as finely divided a condition as possible. Moreover to render possible the lactic fermentation of the product within the intestines, it is necessary to add milk-sugar or similar carbo-hydrates to make up for the shortage of same in the starting materials. In order to enable the new product to be used with coffee, tea and the like containing tannic acid substances without the albumen becoming curdled or coagulated by the latter, and so that it behaves like cow's milk, it is necessary to add small quantities of carbonate or bicarbonate of sodium or the like."

Example: Mix about 10 kg of finely ground soy-beans with about 100 liters water and about 5 gm of sodium phosphate or potassium phosphate. Allow the mixture to stand for about 1 hour then slowly bring it to the boiling point and only just allow it to boil. Allow it to cool to about 50ºC, then filter and press. Dissolve in the "liquor run off" [soybean milk] about 2.4 kg milk-sugar [lactose], 6 gm sodium chloride, and about 60 gm sodium carbonate. Mix in about 2 kg sesame oil. "The milky liquor obtained in this way is brought to the volume of 100 liters by the addition of pure water."

Note 1. This is the earliest document seen (Aug. 2013) that concerns sesame milk, or a non-dairy milk made from sesame seeds.

Note 2. This is the earliest English-language document seen (Aug. 2013) that uses the term "milky liquor" to refer to soymilk. Address: Doctor, Stockheim, Hessen, Germany.

267. Li, Yu-ying. 1913. Method of manufacturing products from soja. *U.S. Patent* 1,064,841. June 17. 3 p. Application filed 10 Oct. 1911.

• ***Summary:*** Li describes himself as "a subject of the Emperor of China, residing at Vallées, in France." "The object of this invention is to provide a simple, efficient and economical method of producing a product from soja beans, and from which product it is possible to obtain by adding certain substances a product resembling human or animal milk, and also to obtain fresh or fermented cheese, milk in the form of powder and concentrated milk, fermented milk, sauces, preserves, etc. The manufacture of this milk comprises a series of operations viz., the cleaning and decorticating of the beans, which are effected in the ordinary manner, the grinding of the said grain previously mixed with a certain quantity of water, the passing of the crude product through a filtering press, from which the liquid, which is of a milky color, runs off to cool through a filter and passes thence into a boiler heated with a water bath, where it is pasteurized or sterilized, and from which it is removed, ready to be delivered for consumption as milk, or for use in the manufacture of the products mentioned above.

"The apparatus necessary for this manufacture is illustrated in the accompanying drawings by a longitudinal sectional elevation." Li's signature, written "Yu Ying Li," is just below the mechanical drawing. A detailed description of the ingenious equipment and process follows. The ground paste is mixed with water; a pump "forces it under pressure into the filtering press..." The slurry is cooked in a "boiler or digester" which is actually a steam-jacketed kettle; there "it is heated to a variable temperature for the purpose of pasteurization or sterilization."

Concerning the okara: "When the operation is finished, the grain [okara] is removed from the filter-press and now forms cakes which can be utilized for feeding human beings (they are in that case dried and reduced to powder). They may also be used for feeding cattle, and, even if these cakes are greatly exhausted, they form a very good nitrated manure, after undergoing certain treatment; drying and dressing."

"The soja milk contains more casein and less lactose and butter than human or animal milk, but by reducing its quantity of casein by adding certain matters a product is obtained resembling human and animal milk. With this milk fresh or fermented cheese can be made as desired.

"In making fresh cheese [tofu], the milk is curdled or coagulated by means of magnesia salts, organic acids and ferments, rennet or lactic ferments.

"The coagulated milk is molded and pressed, and cheese of different forms and consistency obtained according to the degree of coagulation or pressure. The cheeses may be eaten fresh or they may be dried. They are salted or not according to the nature of the manufacture...

"In producing fermented cheese: Roquefort, Permesan, Romatour, Camembert, Gruyère, etc., ferments suitable for the manufacture of those products are employed...

"The fermented milk is obtained by using ferments such as the ferments employed in producing fermented milks– kephir [kefir], yoghourt [yogurt], koumis [koumiss], etc.

These are the *Saccharomyces cerevisiae, Dispora caucasica, Maya bulgare,* etc., and the manufacture is effected by modifying the said milk through the addition of sugar (glucose, levulose, etc.), and more particularly lactose.

"The casein derived from *Soja* is manufactured either from the milk itself obtained as indicated or with the cakes remaining after the extraction of the oil or fatty matter of the soja beans...

"In order to prepare it the soja milk is coagulated. The coagulation having been effected, the product is dried, asepticized or not, ground or not, and may be employed as an alimentary or as an industrial product. This latter product may be employed for all purposes; paste, bedding paper, manufacture of the objects, etc. the same as animal casein. To the casein thus obtained chemical products such as borax, oxid of zinc [zinc oxide], magnesia, gelatin, etc., may be added in different proportions in order to obtain solid casein. It is also possible to produce sauce with soja milk the fermentation of which is effected by means of special ferments such as sojaobacille and the acetomyces. This sauce is more or less salted with chlorid of sodium [sodium chloride] and an addition may be made of spices; pepper, clove, nutmeg, piment*, etc. The sauce having been made may be concentrated or dried by heating. Soja preserves may also be obtained with soja milk slightly thickened with sugar. In this case, the soja grains are cooked before being ground and may be mixed with or added to dry fruits, chestnuts, almonds, hazelnuts, cocoa, etc."

Note 1. This is the world's 2nd earliest patent seen (June 2011) concerning a fermented cheese made from soja, and also the earliest U.S. soymilk patent.

Note 2. *Webster's Third New International Dictionary* (1963) defines piment as "wine flavored with spice and honey." It defines pimento as a synonym for allspice.
Address: Vallées, France.

• ***Summary:*** An excellent and very detailed description of how shoyu is made in Japan, with many photos. Contents: Introduction. Overview of the process. The raw materials. Preparing the koji: Pre-preparation, mixing the beans with the wheat, the koji room (*muro*), handling the mass of koji, characteristics of koji. Part II: The fermentation process. Pressing. Scientific investigations of soy sauce brewing. Summary.

The author calls soy sauce *Soja* and *Sojasauce*. The two basic types of shoyu are made with soybeans and wheat, or just with soybeans. But some special sauce is also made with fish meat, such as Lintenfish. The addition of sugar and other sweeteners, and of colorings such as molasses to low-grade shoyu is not rare.

Preparation of soy sauce: The fermentation usually takes 6 to 12 months or more. Some years ago the "quick method" was widely introduced but after several years it unfortunately fell into ruin. The shoyu process has never been developed with modern processes like the sake processes, because sake must be a certain way when finished but shoyu is acceptable in many ways. The aroma from the roasted wheat adds a special component to Japanese shoyu, not found in Chinese soy sauce. The roasted wheat is coarsely ground (using a roller miller or, earlier, a granite mill), and the meal produced thereby serves to enrobe the steamed soybeans, while the larger particles hold the beans, thus aiding aeration. So the wheat must not be ground too fine. The beans are steamed, usually at a pressure less than 2 times atmospheric pressure; higher pressure creates a bad aroma. If the beans are cooked in an open kettle, a bamboo mat is placed in the bottom to prevent the beans from browning. The liquor left after cooking is called *amé*. The beans and wheat koji are then mixed. The beans, after being removed from the kettle, are spread out on the koji floor in front of the koji room (*koji-muro*) to a depth of about 3 cm. They are stirred from time to time until cooled to about 30-35ºC. The spores (*keim*) of *Aspergillus oryzae,* when they are used, are then sprinkled on. The mixture is put into wooden koji trays (*kojibuta*) each about 60 by 30 by 10 cm deep (24 by 12 by 4 inches), and holding 18 liters of raw material. In some places (such as Shozushima) a wide straw mat (80 by 180 cm) is used in place of these koji trays. The koji room is typically 10 by 3.5 by 2.2 meters high. The walls are thick. A modern room is of tiles in order to prevent changes of temperature from the outside. For cleanliness, the walls should be made of cement, with a door at one end and a window at the other. The room contains many vents to remove moisture and carbon dioxide. Steam pipes are laid in the floor, or a fire-pot is used instead. As noted above, the koji mold spores are either mixed in, or they settle from the air in the koji room, or come from the

koji trays. The koji trays are stacked in a zigzag fashion to allow ventilation, which is necessary for shoyu koji but not for sake koji. Dampness and lack of oxygen favor the growth of Mucor molds and undesirable bacteria. After 20 hours, the koji is mixed well in the trays, and the upper trays are placed on the bottom–and vice versa. Stir again after 7-10 hours; the temperature is now 38-40ºC. After 10-15 hours conidia formation begins. The koji is usually ready in 3 days. Good koji has yellow-green conidia, very numerous on the inside. The surface is white and the mass dry. Contaminants: *Mucor, Rhizopus* and bacteria due to too much moisture, especially with heat. Black koji has a bad aroma from the disease *kurotoko,* which is caused mostly by excessive moisture. During fermentation about 20% of the original mass is lost; starches are changed to sugars, which are used up by the koji mold. The goal is to obtain koji which is rich in enzymes.

The brewing process: The ingredients are mixed in a vat to make the mash (moromi), which contains enzymes. The vats are made of sugi wood (*Cryptomeria japonica* Don.) with bamboo hoops. In the large shoyu factories they usually have a capacity of 4,000 to 4,500 liters (1,057–1189 gallons). The proportions of raw materials are as follows: Soybeans (2,700 liters = 1,875 kg), wheat (2,700 liters = 2,025 kg), salt (NaCl, 2,700 liters = 1,690 kg), and water (5,400 liters = 5,400 kg). The salt may be dissolved in hot or cold water, usually to 20º baume. Less salt gives better quality. The mash is mixed with a pole or with compressed air. The mash must usually ferment for a year before it can be pressed. A longer fermentation improves the color and aroma, but the flavor becomes weaker. Where a 2 or 3 year mash is used, it is mixed with 1-year mash to improve the quality. In order to shorten the fermentation time, the mash is sometimes warmed; this and other suggestions for improving the process will be discussed later. The mash contains microbes, especially yeasts and bacteria.

Pressing: The mash, after it finishes aging, is pressed in cotton bags that have been dipped in tannin from astringent persimmons (*kaki-shibu*). Each bag holds about 2 liters. More than 2 liters may causes the bag to tear in the *fune* (literally "boat"), which is about 230 by 73 by 91 cm and which holds about 800 such bags. Formerly a log was used in the form of a lever press, but now screws and hydraulic presses are widely used. The yield of shoyu is about 70-80% of the volume of the moromi. The remaining presscake still contains soluble constituents, which are extracted by mixing the presscake (*Der Presskuchen*) with water. The remaining cake is sold as fodder.

Treatment of the pressed liquid: This liquid is heated in an iron kettle in order to partially pasteurize it, separate the coagulable constituents, and darken the color. Better grades are heated at a lower temperature (never above 70-80ºC), and poorer grades at a higher temperature, mainly to concentrate and darken the color. For good grades, darkening of the color is seen as a disadvantage, as is the resulting change of aroma. Kita then gives a detailed analysis of both shoyu and the second-pressed liquid. Shoyu contains 30-32% solids, has a specific weight of 1.189 to 1.234, and contains 16.15 to 18.61% minerals.

Scientific investigations and various proposals for the shoyu brewery: Kita experimented with the use of defatted soybean meal. He notes that koji contains a powerful proteolytic enzyme. Cooking under pressure and defatting promote decomposition. Pressure cooking is more and more widely used. Defatting of the beans proved to be disadvantageous since it lowered the quality of the final shoyu, but he thinks the problem lay in the improper treatment of the beans during defatting. He proved this hypothesis with coarse beans defatted with benzine (*Benzin*) to make flawless shoyu. Sake koji has stronger diastatic and weaker proteolytic enzymes than shoyu koji. The proteolytic and diastatic power of mold enzymes are inversely related. There are different varieties of *A. oryzae* with different morphologies. Photos (p. 550-51) show equipment used in making shoyu in a factory: (1) Presses for pressing the sauce from the aged moromi. (2) Brick roaster for the wheat, with a belt-driven mechanical stirrer. (3) Wooden fermentation vat. (4) Many wooden moromi fermentation vats, held together by braided bamboo hoops, with a wooden plank across the top of each. (5) A man in a white coat, with a moromi stirrer in one hand, standing among many tall fermentation vats. Address: Technical Inst., Tokyo Imperial University.

271. M.L. 1913. Synthetic milk production from soya beans in Liverpool. *Chemical World* (*London*) 2(10):332-33. Oct.
• ***Summary:*** "A factory for the making of synthetic milk from soya beans and other ingredients is shortly to be established at Liverpool... The company projecting to establish a factory in Liverpool is the 'Synthetic Milk Syndicate, Ltd.' in London, and they will work according to Dr. Fritz Goessel's process (of Stockheim, Essen, Germany)." A detailed description of the process and exact formula are given. "The 'milk' can be manufactured at a cost which will admit of its being sold to dealers at 2d. per quart.

Note: The article immediately after this one is titled "Contaminated Milk: Condition of the London Supply." Tests showed extensive bacteriological contamination in cow's milk.

Dec. 17. 2 p. Application filed 1 Aug. 1913. First addition 5 Jan. 1914. [Fre]
• ***Summary:*** This new product has as its principal constituent the milk obtained from soybeans (*pois de Chine ou graine de*

soja hispida). This milk, obtained by the current process, is used to make tofu (*teou-fou*).

The milk from the seeds of Soja hispida is treated with bases, e.g., ammonia, soda or pyridine in the proportion of 5-10 gm per liter; 10-15 gm of a mixture of acetic, lactic, phosphoric and nitric acids are added at a temperature of 35ºC. The material is then heated to boiling in a solution of aluminum sulfate and the reaction is allowed to proceed for 2-8 days. The plastic product obtained is gelatinized by solvents, such as pyridine, acetic acid and resorcinol and may be hardened by formaldehyde. Address: 1. Côte-d'Or, France; 2. Ain, France.

Address: Frankfurt am Main, Germany.

274. Goessel, Fritz. 1913. Process of manufacturing alimentary products from soy-beans. *U.S. Patent* 1,082,118. Dec. 23. 2 p. Application filed 7 Nov. 1912.
• ***Summary:*** A milk-like food is made from soybeans by grinding the beans, mixing with water containing 5% of sodium hydrogen phosphate or potassium phosphate and boiling, straining and pressing and adding to the liquor, for each 10 parts beans used, 2 parts milk sugar, 2 parts coconut, pistachio nut or sesame oil and 0.1 part sodium chloride or sodium bicarbonate. Cf. C.A., 7,3375. Address: Stockheim, Hesse, Germany.

275. Friedenwald, Julius; Ruhräh, John. 1913. Diet in health and disease. 4th ed. Thoroughly revised and enlarged. Philadelphia, Pennsylvania: W.B. Saunders Co. 857 p. Illust. 24 cm. [4 soy ref]
• ***Summary:*** The section titled "The soy bean" (p. 124-26) states: "This bean (glycine hispida), sometimes called the soja bean, is an annual leguminous plant extensively used as a food in China and Japan. Until recently it has been regarded as a botanical curiosity in the Occident. It has recently been extensively used in America as a forage crop and to improve the soil if plowed under... There are a large number of different varieties, which vary in size, shape, color, and length of time they take to mature. Some are grown exclusively for the oil they contain, and it is used for culinary, illuminating, and lubricating purposes. The light-colored beans are eaten in soups, and the pods are sometimes picked green, boiled, and served cold with a sprinkling of soy sauce. The green varieties are often pickled in brine and eaten moist or dried with meals as appetizers; the same varieties are often sprouted, scalded, and served with meals in winter as a green vegetable. The bean forms the basis of the so-called soy sauces, used as a condiment all over the world. The Oriental races most frequently eat the bean, in more or less cheesy-like foods, which are prepared from it. The most common of these are natto, tofu, miso, yuba, and shoyu. Natto is a sort of bean cheese made by boiling the beans until they become soft and then placing the resulting mass in a warm cellar where it ferments. Tofu is made by soaking the beans in water, crushing between millstones, and boiling in about three times their bulk of water. The protein is precipitated and the resulting cheese eaten. The white milky liquid of the above has nearly the composition of cows' milk, and tastes something like malt. It may be used in infant feeding to advantage (see same).

"Americans may eat the beans in numerous ways described under the head of soy bean cookery in the recipes at the end of this book. The bean is of particular value in diabetic diets (see same). It may be used to increase the protein of the diet.

There are variations in the composition of the different varieties." A table shows the chemical composition of yellow soy beans grown in the USA, both as is and calculated on a water-free basis. "The Cereo Company of Tappan, New York, have made a soy bean flour which is useful." Its composition is given. "The percentage of protein in this flour is almost one-third greater than the percentage of protein in the whole beans. This is caused by removing the coarse fibrous hulls which contain little protein.

"Vegetable food of such composition certainly is remarkable when compared with round beef, medium"– whose composition is given.

Soy flour can be used as a gruel, in broths, and in making biscuits. A table (p. 126) shows the "Composition of fresh and dried legumes (incl. soy beans, cow peas, chick-peas, peanuts) with that of other foods" (Based on Abel, Farmers' Bulletin No. 121 [1900, p. 17]).

The section on "vegetarianism" (p. 130-31) is the same as that in the 1909 edition (p. 113-14).

In the chapter on "Infant feeding," the section on "Other food for infants" has a subsection on "The soy bean" (p. 297-98) which begins: "In certain conditions the soy bean... is of great value. In cases when milk is badly borne, in certain forms of intestinal disorders, in diarrhea, and especially in the convalescence after diarrhea, in certain cases of marasmus and in malnutrition, the soy bean flour, properly used, is of great value. Each ounce contains 13 grams protein and 120 calories." A table shows the composition when mixed with various amounts of water. Recipes for making gruels are given.

In the chapter on "Diet in disease," in the section titled "Diseases in which diet is a primary factor," is a subsection on "The soy bean" (p. 592) states: "The bean contains about 8 per cent. of sugar and no starch, and furnishes a large amount of available protein and fat." "A patient on a strict

diabetic diet, who is excreting a certain amount of sugar, will excrete less sugar when the soy bean is added to the diet. It seems to be of particular value in severe cases. In addition to this action, it is a very valuable food, both on account of its nutritious properties and owing to the fact that it may be prepared in a number of different ways, and so serves to vary the diet."

In the section on "Diabetic Foods" (p. 601-02) is based on Winton (1906) and contains the same information, including that about The Health Food Company of New York.

In the chapter on "Recipes" is a section on "Bread" (p. 740-41) which includes whole-wheat bread, zwieback, and bran muffins for constipation. The same chapter has a section on "Soy bean cookery" (p. 766-69) with the following recipes: Introduction, gruels, broths, muffins, nut-cakes, soy bean cakes, breakfast food (like oatmeal), pancakes, soy bean cheese ("In Seattle, Washington, and other places in the West we are informed that tofu is made by the Japanese and sold to the Oriental residents").

Goff (1911) offers the following: Grilled soy bean [dry roasted soynuts], [whole] soy beans with butter, soy beans au gras (fried with onions and fat), bread or cakes of soy beans.

On page 822 is a "Short list of books on food and diet." 33 books are cited; some are in German or French.

Note 1. Julius Friedenwald lived 1866-1941. John Ruräh lived 1872-1925.

Note 2. This is the earliest English-language document seen (Dec. 2012) that uses the term "Grilled soy bean" to refer to dry roasted soybeans / soynuts. Address: 1. Prof. of Gastro-Enterology; 2. Prof. of Diseases of Children. Both: College of Physicians and Surgeons, Baltimore, Maryland.

276. Sornay, Pierre de. 1913. Les plantes tropicales alimentaires et industrielles de la famille des légumineuses [Edible and industrial tropical plants of the legume family]. Paris: Augustin Challamel. xii + 489 p. Illust. Index. 26 cm. [77* ref. Fre]

• ***Summary:*** This book is dedicated to "Mr. P. Boname, my excellent master and friend." Boname, who wrote the Preface and is now director of the agronomic station on Maurice, was the soybean pioneer in Maurice.

The section on the soybean (*Le Soja*, p. 195-205, 272, 276, 469, 471, 473, 475) is largely summarized from earlier writers, including Aiton, Bonâme, Bloch, Church, Grandeau, Joulie, Kaempfer, König, Korentschewski and Zimmermann, Lechartier, Li and Grandvoinnet, Paillieux, Paillieux and Bois, Pellet, Trimble, and Watt. Most of the section is about soybean production, but there are also subsections on soymilk, tofu (*Fromage de soja*), and shoyu (p. 204-05), plus soy coffee, soy bread and biscuits for diabetics, and trade in soybeans and soybean products (p. 205).

Also discusses: Alfalfa or Lucerne (*Medicago sativa*, p. 309, 453-54, 471, 474). Bambarra groundnuts (*Voandzeia subterranea, pistache voandzou*, 72-75, 277-78, 469, 473, 476). Kudzu (*Pueraria Thunbergiana*, p. 429-30). Lupins (*Lupinus albus*, p. 264, 309, 453-54, 468). Peanuts (*Arachis hypogæa, arachide* p. 47-72, 270, 273, 453-54, 467, 471, 472, 474-76). Winged bean (*Psophocarpus tetragonolobus, pois carré*, p. 183-94, 273, 276, 468, 471, 473-76). Address: Asst. Director, Agronomic Station, Mauritius (Station agronomique de l'Ile Maurice).

277. Grimme, Clemens. 1914. Die Sojabohne und ihre Verarbeitung zu Nahrungs- und Genussmitteln [The soybean and its processing for food and stimulants]. *Konserven-Zeitung* 15(1):1-3, 10-11. Jan. 2. [1 ref. Ger]

• ***Summary:*** The author discusses the many food uses of soybeans and how they are made and used, drawing heavily on *Le Soja* by Li & Grandvoinnet (1912). He notes that there is a steadily rising interest in soyfoods in almost all branches of the German food industry [perhaps in anticipation of World War I].

Foods made from natural [unfermented] soybeans include: Soymilk (*Sojamilch*), tofu (*Sojakäse*), frozen tofu (*Kori-Tofu*), soy flour (*Sojamehl*), soy bread (*Sojabrot*), soya confections (*Sojakonfekt*), soy chocolate (*Sojaschokolade*), soy coffee (*Sojakaffee*), and green vegetable soybeans (*Soja als Gemüse*). Foods and seasonings made from fermented soybeans include: (1) Solid seasonings: Natto (Japan; Tokio Natto, Ping-Ming Natto). Tao-tche (China [fermented black soybeans]. The process for making this Chinese food is exactly the same as that used to make natto in Japan [sic, almost completely different]); (2) Seasonings in paste form: Miso (4 types), and Tao-tjiung (Doujiang, Chinese miso); (3) Liquid seasonings: Shoyu (Schoyou), Tsiang-Yeou (Chinese soy sauce), Ketjap (Javanese soy sauce), Tuong (Annamite soy sauce, made with rice or corn), Tao-Yu (soy sauce made with black soybeans in China and Japan).

Note 1. This is the earliest German-language document seen (April 2013) that uses the word *Sojakäse* to refer to tofu.

Note 2. This is the earliest German-language document seen (June 2009) that mentions green vegetable soybeans, which it calls *Soja als Gemüse.*

Note 3. This is the earliest German-language document seen (Aug. 2013) that uses the term *Sojamilch* to refer to soymilk. As of Jan. 2009 *Sojamilch* is the modern German word for soymilk.

Note 4. This is the earliest German-language document seen (Jan. 2009) that uses the word *Sojaschokolade* to refer to soy chocolate. The German word for "chocolate" is *Schokolade.*

Note 5. This is the earliest German-language document seen (Dec. 2011) that mentions fermented black soybeans, which it calls *Tao-tche.* Address: Dr.

278. Langworthy, C.F.; Hunt, Caroline L. 1914. Corn meal as

a food and ways of using it. *Farmers' Bulletin* (*USDA*) No. 565. 24 p. Jan. See p. 14-15, 21.
• ***Summary:*** The section titled "Corn-meal bread" (p. 14-15) notes that the chief proteid of wheat is gluten, but the protein of corn has none of the properties of gluten. Thus, the best results are obtained if gluten flour (containing 35% protein). On page 21 is a recipe for "Gluten and corn bread" calling for 3/4 cup gluten flour. is added when making corn-meal bread.

The recipe for "Parched corn-meal biscuits" calls for "2 cups peanut cream." Address: 1. PhD, ScD, Chief of Nutrition Investigations; 2. A.B., Expert in Nutrition. Both: Office of Experiment Stations.

279. *Queensland Agricultural Journal*. 1914. The soya bean. 1(1):7-9. Jan. [3 ref]
• ***Summary:*** "Much has been written in the Australian Press during late years of the Soya bean as a profitable crop for farmers, and experiments have been made with it at the State Nursery at Kamerunga, but nothing has resulted from the experiments beyond proving that the soils and climate of some parts of Queensland are well adapted for the cultivation of this crop."

This article summarizes three articles received by the Department of Agriculture and Stock: (1) A communication from "Messrs. Thompson and Co., Dalny, South Manchuria, giving interesting information concerning the commercial possibilities of the [soy] bean, and suggesting that the Department experiment with the seed at the State Farms and in Western districts like the Marona, where the rainfall is comparatively small and uncertain, offering at the same time to supply the necessary seed, and, if the experiments proved successful, the firm would consider the taking up of a large tract of land in Queensland and growing the bean in quantity, as there would be no difficulty in disposing of the product. The present price of the beans in Europe is £9 per ton."

(2) "Messrs. Thompson and Co. furthermore enclosed an extract from the report (for 1912) of the Trades Commissioner for the Government of the Union of South Africa on the subject, which we summarise as follows,..." (see Turner 1914). The Queensland Journal then reflects: Profitability: "But the question to our mind is, whether, under our labor conditions, it would pay as well as it does in cheap-labor countries. A 1,000-lb. crop, at the highest prices for the beans, would sell for £4 10*s.* in Europe, and, deducting labour for production, freights, commission, &c., there would appear to be little in it to attract the attention of farmers, who can make far more [profit] out of dairying, sugar-planting, potato, onion, and maize growing. As a catch-crop amongst coconut and rubber trees, the Soya bean would doubtless prove of great value.

"As far as the feeding value of the [soy] bean is concerned, it is said to be at least twice as valuable for food as maize, as it is very rich in protein, but it is best fed in conjunction with maize. As a green manure, it is undoubtedly valuable in restoring the soil, being a leguminous plant.

"The expenses per ton for bags, railage, and freight to Harbin to Vladivostock [Vladivostok] are set down at £1 13*s.;* add ocean freight to England, £1 10*s.*–£3 3*s.*

"The expense of transport from South Africa to England is set down in the report we quote from at £1 9*s.*

"But Queensland is further from England than South Africa; and while it might pay to grow and export Soya beans thence to Europe, we cannot see that the crop could be profitably produced in this country."

(3) "The following summary of the uses of the Soya bean and its products given by *Tropical Life* [published in England], April, 1913 [p. 71-72], is interesting:–For dynamite and high explosives, soap, linoleum, India-rubber substitute, margarine, paints and varnishes, in place of linseed oil, various edible foods, toilet powder, salad oil, vegetable cooking oil in place of lard, oil, &c., preserving sardines, lamp oil, lubricating, as food in place of peas, flour for soups, biscuits, brown bread, artificial milk and cheese [soymilk and tofu], substitute for coffee, for sauces; cake for feeding cattle, and for manure."

Note: In this same Jan. 1914 issue (p. 3) of this journal, an article titled "Queensland Agricultural Journal," states: "With this number of the Journal we commence a New Series of issue, dating practically from the 1st July 1913, on which date the Journal completed its sixteenth year of publication." It first appeared in July 1897, and today some 60,000 copies a year [5,000 copies a month] are mailed to subscribers worldwide. From now on the Journal will accept "advertisments having reference solely to productions of the land or to manufactured articles needed by rural occupiers, thus not interfering in any way with the general run of advertisements in the public Press." Address: Australia.

280. Bois, D. 1914. Extraits des procés-verbaux des séances de la société. Cinquième section. Botanique. Séance du 16 Février [Excerpts of verbal proceedings from meetings of the society. 5th Section. Botany. Meeting of 16 Feb. 1914]. *Bulletin de la Societe d'Acclimatation* 61:304-10. Feb. See p. 307-08. [Fre]
• ***Summary:*** Page 307 states: Mr. Bois then presents information on the germination of two species of legumes: *Phaseolus Mungo* and *Soja hispida* (mung beans and soybeans), and confirms that the food product that is now widely sold in Paris under the name *germes de Soja* ("soybean sprouts") is actually mung bean sprouts (see the book *Potager d'un curieux* [The inquisitive person's kitchen garden], by A. Paillieux). He reads a note he wrote with the goal of highlighting and putting an end to this confusion. This note will be published in the society's Bulletin.

"Our colleagues Messrs. Rivière and Le Fort, recalled on this occasion the numerous food preparations that can be made with soybeans. Mr. Le Fort noted an article from

a German journal (*Molkerei Zeitung*), reproduced in the 29 January 1914 issue of *Journal des Halles et Marches*, according to which a company named Soyama-Werke has been founded in Germany near the Bockenheim railway station. The goal of this organization is to conduct trials for the production of an artificial milk made from soybeans and other substances." Address: France.

281. *Times* (*London*). 1914. Artificial milk. Butter and cheese from soya beans. Romance of a new industry. March 17. p. 4, col. 1.
• ***Summary:*** "A discovery which should prove of great interest to housewives and mothers has recently been brought to perfection in a London chemical laboratory. This is a process of manufacturing synthetically a pure and wholesome milk of high nutritive value, possessing all of the virtues of the original article, none of its many dangers." A German chemist has developed the process.

"The fluid, as far as its appearance is concerned, is quite indistinguishable from rich cow's milk. It is delightfully smooth on the palate. On the other hand, the taste seems to some persons slightly different from that of ordinary milk. It is said that even this slight 'taste' can be removed at will. A dairyman was recently asked to express his opinion of the new milk, and two glasses, one containing his own milk and the other the artificial milk, were placed before him. He praised what he supposed was his cow's milk and expressed a very modified appreciation of the other. His surprise on hearing of his error was naturally great.

"Introduction of bacteria. The new milk has been built up from a basis of casein obtained from the soya bean. Casein, of course, is likewise the basal constituent of cow's milk. The beans are treated by a special process whereby all oil and waste matter are removed and only the pure casein left. To this basis are added in exact proportions fatty acids, sugars, and salts, and emulsification carried out... In order that the synthetic milk may approximate in all respects to the real milk, bacteria of the required strains, including the lactic acid (sour milk) bacilli rendered famous by Metchnikoff a few years ago, are introduced to the fluid and permitted to act upon it until it reaches exactly that state of what may be termed maturity at which fresh cow's milk is obtained. That it is indeed a real milk is proved by the fact that excellent cheeses and 'butter' can be made from it.

"The advantages of the new milk are obvious. It is, of course, free from all suspicion of being contaminated with milk-borne diseases like tuberculosis, scarlet fever, or diphtheria."

The first consignment of soya beans was sent to Europe as recently as 1906. "In this country soya oil has now a very ready and extensive market. It is used instead of the cotton seed variety on account of cheapness. Soap manufacturers are also coming to depend upon it. The chief use, however, would seem to be as cattle cakes for winter feeding. That the article which has fed so many milch cows during the past few years should itself be used in the making of artificial milk is undoubtedly something of a coincidence.

"Most of the soya beans entering this country pass through Hull, which, with its great oil and seed mills, is the natural centre for such a commodity."

282. *Chemist and Druggist* (*London*). 1914. Westminster wisdom: This week in parliament. 84(15):576. April 11. Series No. 1785.
• ***Summary:*** Under the sub-heading "'Soya-bean' milk" we read: "In the House of Commons on Monday, Mr. C. Bathurst asked the President of the Local Government Board a question about the legality of the sale as milk of the compound made from the soya-bean. Mr. H. Samuel replied that if an article which is not milk is sold under that name it would be open to local authorities to take proceedings under the Sale of Food and Drugs Act against the vendor."

283. Meyer, Frank N. 1914. Re: Artificial milk, butter, and cheese from the soy bean. In: Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 1889-90. Letter of 29 April 1914 from Peking, China, to David Fairchild of USDA.
• ***Summary:*** "I am also enclosing a clipping re *artificial milk, butter* and *cheese* from the *soy bean!* Is the fact already known to our specialists?"

One week later, on 2 May 1914 (p. 1898) he adds: "No. 2038a, *Soya hispida*, is a rare local variety. I think I have only seen it once."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

284. *Asie Francaise* (*L'*). 1914. Le soja: Une légumineuse alimentaire Chinoise [The soybean. A Chinese food legume]. 14(158):196-98. May. [Fre]
• ***Summary:*** Begins with a good introduction to the soybean (*haricot soja*), including its early history in France and statistics of current trade between Europe and Manchuria. A footnote (p. 196) states that the statistics are from the Chinese maritime customs. The shipments to Europe for first reported in 1908 by the official statistics. The Suez Canal Company (*La Sociéteé du canal de Suez*) made it known that for some years when not a single kg of soybeans passed through the canal, but 35,000 passed through it in 1908.

At the Nanking Exposition [Nanjing] of 1910 in China, some 400 varieties of soybeans were on display.

Continues with a long discussion of the work and writings of Li Yu-ying (p. 197-98). "It was soymilk that Li first introduced to French vegetarians (*végétariens français*). In 1908 he established a laboratory in Paris for the study of tofu (*la caséo-sojaïne*). Then he set up a factory at Vallées, on the outskirts of Paris, where he employed about 30 specialist Chinese workers. The machinery was constructed

in France based on designs by Li and his collaborators.

"The creation of this Chinese factory, smack in the middle of France, was not lacking in originality. But it seems that its output could be as wide and varied as its founders had dreamed. In a shop which sells exotic products, we were told that the Parisian clientele scorned (looked down on) the soy preserves / jams (*confitures*), cheeses, condiments, eggs, and other unique soy products, but they remained faithful to flour, rusks / zwieback (*biscottes*, twice baked bread without added sugar), and the housewives appreciate the soy sprouts that are found today in all the markets of Paris and its outskirts."

285. *Le Monde des Plantes* (*le Mans, France*). 1914. Nouvelles: Lait, creme, beurre et fromage de soja [News: Soy milk, cream, butter and cheese]. 16(88):19. May. Series 2 [2 ref. Fre]

• ***Summary:*** According to the *Molkerei Zeitung*, an institute name Soyama Wecke [sic Soyama Wercke, Soyama-Werke, Soyamawerke] has been founded near the railway station of Bockenheim (Germany). The goal of this institute is the manufacture of artificial milk (*lait artificiel*) from the seeds of the soybean (*de Soja; Soja hispida*) and other substances. The soybean furnishes almost all of the product.

According to the Assembly of Agriculturists (*l'Assemblée des Agriculteurs*), which meets in Frankfurt, a few years ago 50,000 liters of soymilk arrived daily on the market when the factory was pushed to its full capacity. A deputy of the German parliament (*Reichstag*) is at the head of this enterprise which has several million dollars of capital. The Soyama-Werke also makes soy cream, butter and cheese [tofu].

Source: *Journal de la Société national d'Horticulture de France*, Feb. 1914.

Note: In May 1914 Germany was involved in World War I.

286. *Washington Post.* 1914. Beans for milk. June 14. p. M13.

• ***Summary:*** From Worcester (Massachusetts) Post: "Massachusetts lands which fail to give up forests and other crops of sufficient value to suit the tillers should be devoted to raising soya beans. A few Chinamen should be imported to show how that crop is produced to the best advantage. The experts claim it does best in hot climates, but that does not rob the beans of a change in Massachusetts. There is a great need of the beans here." Every session politicians urge less cows in the commonwealth. Farmers have long said, and keep saying, "that they cannot keep cows at the prevailing prices allowed for them for the milk. They are undoubtedly right." Let them quit. "But the soya beans in the course of scientific treatment give up a casein from which the best of butter and cheese are made.

"The imported figures indicate that an acre of land devoted to the beans will make more milk, butter or cheese than any cow in Massachusetts in a year, and no acre supports a cow. The milk and other products of the bean carry no bacteria, so far as reported by science, and that means they will keep indefinitely. There is nothing for the farmers to do but to raise the beans."

The state can save a lot of money by abolishing milk inspectors. "The beans can be sent to central points in bags without regard to special sanitary cars, and there be made into milk, butter and cheese for the community at hand."

This simple change would solve about half of the state's problems. "The soya bean of the Chinese is the solution."

287. *Independent* (*The*). 1914. Milk and cheese from the soya bean. 78:487. June 15.

• ***Summary:*** "A large concern known as the 'Synthetic Milk Syndicate, Ltd.' is about to establish a factory in Liverpool, at which soya milk will be made according to the process of Dr. Fritz Goessel, of Essen, Germany." A detailed description of the process follows. "It is expected that this milk will be retailed in England at 4 cents a quart. It is claimed to have the same nutritive value as natural milk, and will be free of the characteristic oily flavor which makes other soya bean products unpalatable to most people who have not acquired the tastes of the Orient... Treated with a mineral salt or an acid, which acts the part of rennet, vegetable milk can be converted into cheese of several varieties. In Indo-China, where the soya milk industry has assumed large proportions, three principal kinds of cheese are made: a fermented variety with a taste suggesting Roquefort; a white salted variety, resembling goat's milk cheese; and a cooked or smoked variety, like Gruyère."

Note: This is also the earliest English-language document seen (April 2013) that uses the word "smoked" (not including "smok'd") in connection with tofu. Address: England.

288. Hill, W. Stanley. 1914. The soya bean: Experience at Moumahaki Experimental Farm. *New Zealand J. of Agriculture* 8:594-96. June 20.

• ***Summary:*** "The failure of several attempts made to grow this crop under field conditions at Moumahaki Experimental Farm led to consideration of the cause or causes of these failures. In previous seasons only one variety of bean–viz., the Early Yellow–was experimented with. During the season just passed six varieties have been fairly successfully grown under severe field conditions. They were sown on the 20th September, 1912." A table (p. 594) shows that the varieties were (with the weight of 100 seeds of each), in descending order of seed size: Giant Yellow Santa Margherita (28.56 gm), Early Yellow (24.60 gm), Green Samarow (15.34 gm), Arlington (10.58 gm), Brownie (9.14 gm), and Meyer (7.10 gm). For each is given the average height (inches), period of growth (days), colour of seed, and weight per 100 seeds.

"Until the season 1912-13 no nodular development existed on any Soya-bean plants harvested at Moumahaki. During that season these nodules were obtained by means of a commercial culture." Address: B. Agriculture, New Zealand.

289. *Mercury* (*The*) (*Hobart, Tasmania, Australia*). 1914. Rival to milk. Produce from soya beans. Romance of an industry. June 20. p. 14.
• ***Summary:*** This is a summary of: *Times* (London). 1914. "Artificial milk. Butter and cheese from soya beans. Romance of a new industry." March 17. p. 4. The summary begins: "The keen rivalry between margarine and butter is to have a parallel in the fluid product of the soya bean threatening to knock cow's milk out of the market."

290. Monahan, Louis J.; Pope, Charles J. 1914. Soy-milk product and process of making the same. *U.S. Patent* 1,104,376. July 21. 3 p. Application filed 28 July 1913.
• ***Summary:*** Soy beans are emulsified with the addition of sodium bicarbonate and coconut oil; the emulsion is separated from the solid portion, heated, and filtered; the filtrate is mixed with malt extract and evaporated to dryness under reduced pressure. An illustration (line drawing) shows the equipment and plant layout used in the production of soy milk. Address: Oshkosh, Wisconsin.

291. Loomis, Henry M. 1914. Food products from the soy bean. *American Food Journal* 9(8):472-74. Aug.
• ***Summary:*** Loomis collected information on soybean products while stationed on the Pacific Coast. "Probably the most interesting and important of these food products is soy sauce, or shoyu, as the Japanese call it. It is the only one which is used to any extent among Occidental nations, with whom it forms the principal ingredient of Worcestershire and similar table sauces. It is also used to some extent as an ingredient of bouillon cubes. König estimates that the consumption of this product in Japan amounts to two or three fluid ounces per day for each person, which would make a total consumption for that country alone of three to four hundred million gallons. No figures are available as to the amount of this sauce which is used in China, but all except the poorest class eat it habitually on rice and fish, which form their principal articles of diet."

Japanese soy sauce "is prepared on more scientific principles and it is considered much superior to Chinese soy. Each manufacturer of Japanese soy has special brands or trade marks under which his products are sold. Japanese soy is usually imported into this country in wooden tubs holding about three gallons each and sells at wholesale price of from 75 cents to $1.50 per tub" [i.e. 25 to 50 cents per gallon]. A brief description of the Japanese process for making soy sauce follows; it mentions Koji.

Brief descriptions are also given of the following foods and their method of preparation: (1) "Soy bean curd, or, in Japanese, Tofu, is as its name implies prepared by coagulating or precipitating the legumin or vegetable proteid, of the soy bean by mineral salts. (2) "The frozen bean curd, or 'Koritofu,'..."

Note 1. This is the earliest English-language document seen (April 2013) that uses the word "Koritofu" to refer to frozen tofu. (3) [Yuba]. "The liquor or bean milk is the milky fluid produced in the manufacture of bean curd after straining and before coagulating. Chinese bean curd [sic], or Toufu-pi, is prepared by drying the scum produced on boiling the bean milk. It is imported in the form of vitreous, brittle, yellowish sticks in appearance like dried casein. (4) Soy bean oil. (5) "Kinako is prepared by roasting and grinding soy beans. It has a very agreeable flavor and is much used in the preparation of confections, particularly as a sort of coating powder. (6) Miso, which is made from "Koji, the same ferment as is used in the making of soy. There are two principal kinds imported into this country, the white and red Miso. They differ principally in the rapidity of fermentation and in the amount of salt used."

"Winton and others have suggested the use of soy bean products as foods for diabetics and it appears that there are many of the foods mentioned above which would serve a useful purpose in this regard. There are a number of firms now putting out soy bean meal or flour on a commercial scale and notices have appeared recently that soy bean curd and milk are to be manufactured on a large scale in Europe.

A large table contains nutritional analyses of four types of soy [sauce] (incl. Kikkoman, Kikkoraku, typical Japanese shoyu and Chinese soy) plus each of the foods mentioned above, including tofu (8.6% protein) made in Seattle, Washington, and "Bean milk (strained bean liquor before coagulating; 2.09% protein).

Mr. J.T. Willard notes: "I remember twenty years ago [i.e., 1894] that Prof. Georgeson of the Kansas Agricultural College had half a dozen varieties [of soy beans]. He was a teacher of agriculture in Japan and I suppose he learned as much there as he taught, and he became very enthusiastic over the soy bean. I remember there was a great difference in the different varieties of the soy bean." A portrait photo shows Mr. H.M. Loomis.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "soy bean curd" to refer to tofu. Address: Bureau of Chemistry, USDA.

292. Melhuish, William James. 1914. Improvements in the manufacture of vegetable milk and its derivatives. *British Patent* 24,572. Dec. 29. Application filed 29 Oct. 1913. Complete specification left 23 Dec. 1913.
• ***Summary:*** In manufacturing artificial milk from soy beans by a process similar to that of 27,860, 1912, the oil is first extracted from the beans or meal, or is centrifugally separated from the albuminous extract, which is obtained

by treating the meal at about 90º with water containing potassium phosphate, etc., and then filtering. Sesame or other oil mixed with butyric and other cream acids is then thoroughly emulsified in the liquid, which may be done by b. *in vacuo* or by a mixing or homogenizing machine. Dextrin and various sugars such as malt extract, dry maltose, cane sugar, milk sugar, dextrose, honey, etc., sodium bicarbonate, etc., sodium chloride, citric acid, and lactic bacteria are added. When the required acidity is reached, part is set aside, and the rest may be pasteurized. The part set aside is mixed with pasteurized soy milk and added to the next batch. The sesame oil, etc., may be omitted, or may be gradually added to obtain a thick cream, which may be made into margarine. Sugar may be replaced by saccharine, and medicinal iron may be added. Humanized, sterilized, fermented, condensed, or dried milk may be prepared. For making cheese, the casein may be coagulated by lemon juice, etc., rennet, or the ferments present. The soy cake in the filter press may be used as cattle food. Address: Highwood House, Upper Parkstone, County of Dorset [England].

293. Friedman, Jacob. 1914. Improvements in or connected with the treatment of soya beans and the production of a new or improved food preparation therefrom. *British Patent* 121. Dec. 24. Application filed 2 Jan. 1914. Complete specification left 8 June 1914.
• ***Summary:*** Soy beans are treated to remove the unpleasant flavor by decorticating, grinding, and then heating to 120º-300ºC with dry heat, with continuous stirring, to drive off the moisture, which carries off the flavor. The product is employed in making bread, chocolate, and other confectionery, soup, etc. Soy bean flour for bread-making, for example, is heated at 155ºC for about 70 minutes. Address: Confectionery Expert, 12, Parsons Green Lane, Fulham, County of London [England].

294. **Product Name:** [Soyama Soymilk (Regular Fresh, for Diabetics, for Baking)].
Foreign Name: Soyama Fruchtmilchpulver.
Manufacturer's Name: Soyamawerke Englehardt und Co.
Manufacturer's Address: Frankfurt am Main, Germany.
Date of Introduction: 1914.
New Product–Documentation: J.C. Friedrich. 1914. *Centralblatt für Bäcker und Conditoren.* No. 30. p. 627. "Die Soja in der Bäckerei."

295. Chiappini, C. du P. 1914. The trade of the Union: Soya beans. In: W.H. Hosking, ed. 1914. South African Year-Book 1914. London: George Routledge and Sons, Ltd. New York: E.P. Dutton & Co. See p. 192-261, especially p. 247-56.
• ***Summary:*** "The Annual Report of the Trades Commissioner in London for the Union Government of South Africa for the year ending 31st December, 1912, and dated 16th April, 1913, was presented to both houses of Parliament by command of His Excellency the Governor-General."

Soya Beans: Trials in connection with these beans have been, and are being, made by farmers in the Union–principally in Natal. During the past nine years many useful experiments have been made by the Agricultural Department, mainly at the Cedara, Winkle Spruit, and Weenen Government Farms (Natal), and also at Skinner's Court, Pretoria. A great deal of knowledge has thus been gained and made known to farmers by means of bulletins, etc., issued by the Government. I am, however, informed that there has been a check in the progress of this industry, and that in some parts farmers have been disheartened by their first trials, and have dropped the matter... I submit the [following] details in the hope that they will stimulate farmers through the Union to continue their experiments and carry them to a successful issue, my object being to support Mr. Burtt Davy and other officers of the Agricultural Department who are doing such good work in this direction.

"I have been fortunate in securing the valuable assistance of Mr. A. Grenville Turner, Grain and Oilseed Broker, and Assistant Secretary to the Seed, Oil, and Cake Trade Association, C 20, Exchange Buildings, Liverpool, and of Mr. Harold Beckwith, of Peter's Buildings, II, Romford Street, Liverpool, who is a specialist on the production of vegetable oil and on oil milling plant generally...

"During the year 1909 experiments were conducted in the Argentine Republic, Mr. A. Grenville Turner reporting that a crop of beans may be secured there in about thirteen weeks, as against six months in Manchuria, and ten weeks to five months in South Africa, according to zone and climatic conditions. Worldwide interest is now evinced in the culture of the Soya bean, and experiments are being conducted in practically every British Colony. The late Sir Alfred Jones, K.C.M.G., entrusted Mr. Turner with a mission to introduce the cultivation of the bean throughout West Africa, the result of the experiments being successful. On his return from the coast, Mr. Turner was entrusted with a mission by Messrs. Lever Brothers, Limited, to encourage the cultivation of the Soya bean throughout the Union of South Africa. The scheme was enthusiastically taken up by the farmers. Large quantities of seed (with descriptive pamphlets) were distributed by Messrs. Lever Brothers, the result of the experiments proving that South Africa can raise a crop of Soya beans equal, if not superior, to those from Manchuria...

"At the Government Experimental Farms in South Africa, over 80 varieties have been tested, and as high as 2,000 lb. per acre was recorded, while in many instances the yield was well over 1,000 lb. per acre. In Manchuria the yield per acre is from 1,100 to 1,600 lb. per acre...

"The subject has received the hearty support of the Union Government Agricultural Department, the Agricultural Unions, and Messrs. Lever Brothers, Limited, by whose assistance, through Mr. Turner, seed for the planting of

three to five acre plots was distributed to over 300 farmers in all parts of the Union, together with printed report forms and descriptive bulletins. One factor was proved–viz., the capability of the plant to resist a long sustained drought, and to grow under conditions that would probably in many instances be too severe even for maize.

A list is given of 18 products which can be obtained from the Soya bean, including "Human consumption, as a vegetable, like marrowfat peas, and in preparation of soups. As a substitute for meat, specially manufactured. Manufacture of a substitute for chocolate. Preparation of macaroni. As flour for biscuits and brown bread. As artificial cream and milk. Manufacture of cheese. As a substitute for coffee. Preparation of plastic substances and artificial horn." Diabetic foods, soy sauce, meal for feeding cattle, stallions or dairy cows, seasonings, beverages, industrial products, and livestock feeds.

The oil can be used for the manufacture of "Dynamite and high explosives. Soaps. Linoleum. India-rubber substitute. Margarine. Paints and varnishes in place of linseed oil. Edible goods and toilet powder. Waterproof cloth, paper umbrellas, and lanterns. Salad oil. Lubricating oil, in China, for greasing axles and native machinery. Lamp oil instead of kerosene oil. It is used on English railways for burning. The Soya oil is also used for preserving sardines, and in place of lard, and cotton-seed oil for cooking.

"Chemical analyses of the beans made in Europe show considerable variation in the percentages of the different constituents... of oil from 15.62 to 23.20 per cent., the latter oil content being the highest recorded, the beans being grown by Mr. Turner, at Sierra Leone (West Africa).

"At the latter end of the year 1908 the Soya beans started to be exported from Manchuria to Great Britain and Europe; the price on the London market being £4 15*s.* per ton, which recently rose to £9 2*s.* 6*d.* per ton in England; the value on the spot at Hull being now given as £8 7*s.* 6*d.* per ton; the value of soya oil on the spot, crushed, is £24 10*s.*, and extracted, £23 15*s.* per ton, and of Soya oilcake, £6 15*s.* per ton."

Note: This is the earliest English-language document seen that uses the term "oilcake" or "Soya oilcake" to refer to ground, defatted soybeans. Address: Trades Commissioner, South Africa.

296. Fischer, A. 1914. Kuhmilch und vegetabile Milch und ihre Unterschiede in der Magenverdauung besonders mit Ruecksicht auf das Problem der Kuhmilch-Intoleranz: Eine vergleichend-experimentell-diaetetisch Studie [Cow's milk and vegetable milk and the different ways they are digested in the human stomach, especially with regard to the problem of cow's milk intolerance: A comparative experimental dietetic study]. *Archiv fuer Verdauungs-Krankheiten* 20(1):13-48. [Ger]

• ***Summary:*** Page 18 gives the compositions of a number of nuts and seeds from which plant/vegetable milks can be made–including peanuts, coconuts, hazelnuts, walnuts, sweet almonds (*Amygdalus communis*), Brazil nuts (*Paranuss; Bertholletia excelsa*), cashews or cashew nuts (*Indische Mandel, Accajouness; Anacardium occidentale*), and soybeans. Of these, the soybean contains the highest percentage of protein and the lowest percentage of fat. In this long article, the soybean is mentioned only on page 18. Fischer focused his attention on almond milk and Brazil-nut milk, showing that they were more easily digested than cow's milk. He found that vegetable milks formed smaller, finer, more flocculant, and more easily digestible curds in the stomach, that these stayed in the stomach for less time, and that the peristaltic motion of the stomach was less after their consumption.

Note: On the basis of Fischer's observations, subsequent writers (such as von Nordon and Salomon in 1920 in Germany, and Dr. John Harvey Kellogg and Frances Dittes in the 1920s and 1930s in America), recommended the therapeutic use of soymilk for many digestive problems, including gastric and duodenal ulcer, peritoneal irritation, and disturbances of the motility of the stomach. Address: Dirig. Arzt des Sanatoriums Untere Waid-St. Gallen, Schweiz, Germany.

297. Gillmore, Maria McIlvaine. comp. 1914. Meatless cookery: With special reference to diet for heart disease, blood pressure and autointoxication. New York, NY: E.P. Dutton & Company. viii + 352 p. Introduction by Louis Faugeres Bishop. Illust. Index. 21 cm.

• ***Summary:*** The author's Preface begins: "Since auto-intoxication is now held to be the cause of many of the most serious diseases of humanity, too much stress cannot be laid upon the immediate necessity of looking into the question of diet and removing those foods which are responsible for the cause of ill health.

"In the case of heart trouble and high blood pressure, with the accompanying deterioration of other organs, Dr. Bishop has found from prolonged observation that the offending substance most often appears in meat, eggs, fish and meat stock soups, but is not the same in all cases."

"In a double sense, the way to a man's heart is by the food he is given, and the more elaborate the food, the more quickly does his heart succumb to the strain put upon it. So it falls upon the women to meet this condition, and without delay."

The author thanks: (1) The patients of Dr. Bishop (see below), who have been kind enough to share the result of their successful experience. (2) Dr. C.W. Langworthy, expert in charge of Nutrition Investigation at the United States Department of Agriculture. (3) Miss Lenna Frances Cooper, Head Dietitian of the Battle Creek Sanitarium [Michigan], for recipes published in *The New Cookery.*

In the Introduction, Dr. Louis F. Bishop, M.D. (Prof.

of Heart and Circulatory Diseases, Fordham Univ. School of Medicine, New York) begins by describing how difficult it is to bridge the gap between those of technical education and those who have not been so trained. After years of research he has found that, "under certain circumstances, the cells of the body become sensitive to the protein element of certain kinds of foods, and from that time on, as long as this sensitiveness lasts, that kind of food acts as a poison to the cells of the body. The only way to limit the damage is to exclude the offending article of food from the diet." Even small amounts of this kind of food can be as harmful as large amounts. Moreover, food damage can be entirely independent of any discomfort. "Food poisoning has generally existed for five or ten years before the heart is sufficiently damaged to cause distress on exertion... My own experience is that heart disease and hardening of the arteries have usually existed about five years at the time the sufferer comes under observation."

"The things that do damage are usually found in the group including eggs, fish, meat and stock soups, but there is no definite way of determining which of these things is at fault. This has to be accomplished by the study of each individual person, by means of the absolute withdrawal of all those things until there is an improvement in the action of the heart and blood vessels. Now one article of food, and then another is added to the diet, and it is discovered by experiment which one the person can use without a return of the disorder.

"In the beginning, it may be only eggs, or fish, or meat, that is a source of irritation to the cells of the body. In persons very seriously ill with hardening of the arteries, all of these things are a source of irritation."

There is a long chapter titled "Meat substitutes" (p. 81-127). The following recipes are of interest: Cereal coffee (p. 1). Almond milk (p. 2). Rice milk (p. 3). Peanut butter sandwiches (p. 209). Two charts near the back of the book give the nutritional composition of peanut butter, and peanuts.

Note 1. is the earliest document seen (June 2002) which states that diet (and specifically a meatless or vegetarian diet) can reduce the risk of coronary heart disease in humans.

Note 2. This is the earliest English-language document seen (Aug. 2013) that contains the term "rice milk," which it uses to refer to a recipe.

Note 2. This is the earliest English-language document seen (June 2003) that contains the word "autointoxication" (or "auto-intoxication").

Note 3. This is not a Seventh-day Adventist cookbook and no commercial products made by SDA companies are called for in the recipes. Soy is not mentioned. Maria Gillmore was born in 1871. Address: Clinical Prof. of Heart and Circulatory Diseases, Fordham Univ., Bronx, New York.

298. Street, John Phillips. 1914. Diabetic foods. *Connecticut Agricultural Experiment Station, Annual Report* 37:1-95. For the year ending Oct. 31, 1913. See p. 20-21, 30-33, 38, 45, 47-48, 56, 75-77. Part I. Eighteenth Report on Food Products and Sixth Report on Drug Products, 1913.

• ***Summary:*** Page 11: "What is a 'diabetic' food? Formerly an almost complete absence, or at least a very marked reduction, of carbohydrates was considered an essential characteristic of a true 'diabetic' food. A table of 12 different classes of diabetic foods shows that, of the 542 commercial products, "Beads, biscuits, cakes, etc." 150, and "Flours and meals" 109 were the top two classes.

In Table I, titled "Analyses of diabetic foods" (p. 18-39), the many commercial products are grouped into classes, starting with "Flours and meals." For each product is given: Year of analysis, name of manufacturer and brand, no. of pieces, net weight of package, cost per package, cost per pound, nutritional composition (water, ash, protein {Nx6.25}, fiber, nitrogen-free extract, fat {ether extract}, starch, weight supplying same amount of carbohydrates as 10 gms. of wheat bread, calculated calories per 100 gms.).

The summary (p. 75-77) groups the main commercial products into six groups based on their carbohydrate content. The first group contains less than 5% carbohydrates and the 6th group contains 25 to 35% carbohydrates. "The soy bean flours contained from 23 to 26 per cent. carbohydrates" and "cost from 30 to 65 cents per pound." Brands include: "Health Food Co., New York, Protosoy Soy Flour, Jireh Diabetic Food Co. (NY), Soja Bean Flour, Health Food Protosoy Diabetic Wafers (21.2% carbohydrates) and Protosoy Soy Flour (24.5%), Cereo Soy Bean Gruel Flour (23.7%), Metcalf's Soja Bean Meal (25.0%), Jireh Soja Bean Meal (25.8%; sometimes also named Jireh Diatetic [sic, Dietetic] Soja Bean Flour). Platschek (Karlsbad) Sojabohnenmehl (49%)."

The Health Food Co., New York, made the following products: Flours and meals: Almond meal (analyzed 1906, 1913), C B X Cold Blast Flour, 25% protein (1911), Glutosac Gluten Flour (1906, 1909, 1911, 1913), Pronireu (Gluten Griddle Cake Flour; 1913), Protosac Gluten Flour (1906, 1913), Protosoy Soy Flour (1913), Pure Washed Gluten Flour (1906, 1913). Soft breads–Protosac Bread (1906). Hard breads and bakery products: Alpha Best Diabetic Wafer (1913), Diabetic Biscuit (1906 & 1913), Gluten Nuggets (1913), Glutona (1906), Glutosac Butter Wafers (1906), Glutosac Rusks (1906), Glutosac Wafers, Plain (1906), Glutosac Zwieback (1906), No. 1 Proto Puffs (1906 & 1913), No. 2 Proto Puffs (1911 & 1913), Protosac Rusks (1906), Protosoy Diabetic Wafers (1913), Salvia Sticks (1906). Breakfast Foods–Manana (1913). Miscellaneous products–Kaffeebrod (1913).

Peanut butter was made or sold by the following (p. 36-37): Atlantic Peanut Refinery, Philadelphia (1899), J.W. Beardsley's Sons, New York, Acme Red Brand (1913), Beach Nut Packaging Co., Canajoharie, NY (1913), A.C.

Blenner & Co. New Haven, Connecticut (Distributor; 1913), D.W. Brooke (Newark, NJ; 1913), Dillon & Douglass, New Haven, CT, Perfection (Distributor), H.J. Heinz Co., Pittsburgh, Pennsylvania (1913), The Kellogg Food Co., Battle Creek, Michigan (1913), Francis H. Leggett & Co., New York, Premier (1913), MacLaren Imperial Cheese Co., Detroit, Michigan, Eagle (1913), Nut Products Co., New Haven, CT, Penolia (1913), Penolia Food Co., New Haven, CT, Penolia (1899), S.S. Pierce Co., Boston, MA, Acharis Brand (1914).

Almond paste [Almond butter] was made by: Chapman, Chicago (1902-03), Henry Heide, New York (1902-03), Spencer, New York (1902-03).

Many gluten-based foods are also discussed and analyzed in a table including Kellogg's Protose (3.6% carbohydrates), Barker's Gluten Food "A" (4.1%), Kellogg's 80% Gluten Biscuits (4.4%), Bischof's Gluten Flour (5.0%), Barker's Gluten Food "B" (5.9%), Barker's Gluten Food "C" (7.7%), Kellogg's 80% Gluten (1912) (7.8%), Plasmon Cocoa 9.3% (Made by Plasmon Co., London, analyzed 1903), Metcalf's Vegetable Gluten (1913) (9.8%), Kellogg's Pure Gluten Biscuit (1906) (10.2%), Kellogg's Potato Gluten Biscuit (1906, 1909) (11.9%, including fiber), Ferguson Gluten Bread (33.6%), Gum Gluten Breakfast Food (34.2%).

Many peanut-based foods are also discussed and analyzed including Rademann's Erdnuss-Brot [Peanut Bread 19.7%, p. 26, 77]. Frank & Co. (Bockenheim) Erdnuss-Kakes [Peanut Cakes, p. 28, 56]. Rademann's Erdnuss-Biskuits [Peanut Biscuits, p. 34]. Peanut butter: Manufacturers (with date of analysis in parentheses) are: Atlantic Peanut Refinery, Philadelphia, Pennsylvania (1899). J.W. Beardsley's Sons, New York (Acme Red Brand, 1913). Beech-Nut Packing Co., Canajoharie, New York (1913). A.C. Blenner & Co., New Haven, [Connecticut] (Distributed by D.W. Brooke, Newark, New Jersey, 1913). Dillon & Douglass, New Haven (Perfection brand; Distributed by H.J. Heinz Co., Pittsburgh, Pennsylvania, 1913). The Kellogg Food Co., Battle Creek, Michigan (2 samples, 1913). Francis H. Leggett & Co., New York (Premier brand, 1913). MacLaren Imperial Cheese Co., Detroit, Michigan (Eagle brand, 1913). Nut Products Co., New Haven (Penolia, 1913). Penolia Food Co., New Haven (Penolia, 1899). S.S. Pierce Co., Boston, Massachusetts (Acharis brand, 1913). Note the two brands that were on the market by 1899.

A host of products contain "almond" in the name, including Kellogg's Almond Butter (8.2% carbohydrates), Callard's almond shortbreads (21%), and Fritz's Mandelbrot (23%), Almond-form wafers with chocolate (from Fromm & Co., Dresden), Charasse Gluten Exquis Biscuits aux Amandes.

Other nut preparations (p. 38): The Kellogg Food Co., Battle Creek–Nut Bromose (Meltose [a malt preparation] and nuts, 1913), Nut Butter (Sanitas, 1906), Nut Meal (1906), Nuttolene (6.3%, 1906). Nashville Sanitarium-Food Co., Nashville, Tennessee–Nut Butter, Nutcysa, and Nutfoda (13.0% 6.3%, and 6.8%; Analyzed in 1913).

A section titled "Nut, Nuts Pastes, etc." (p. 62-64) notes: "Samples of peanut butter showed considerable uniformity; the carbohydrates ranged from 12 to 20, with 3.2 to 6.5 per cent. starch. Most of the peanut butters we have examined would seem to be useful additions to the diabetic's diet." The manufacturer of Kellogg's Malted Nuts claims that it "supplies the place of cow's milk as a liquid food. Its composition is similar to that of milk." The author thinks this statement is misleading, but he notes that "Kellogg's Nut Butter closely resembles peanut butter in composition, and has its same advantages as a diabetic food... Kellogg's Nut Meal is a peanut meal containing only 12 per cent. carbohydrates. Kellogg's Nuttolene and Protose likewise contained only 6 and 4 per cent. carbohydrates, respectively."

Webster's Dictionary defines "aleurone" (a word first used in about 1869) as "protein matter in the form of minute granules or grains occurring in seeds in endosperm or in a special peripheral layer." Many German products have the same root: Gerike's Aleuronat (3.1% carbohydrates, p. 76). F. Guenther, from Frankfurt, makes Aleuronat-Kakes (p. 56). R. Hundhausen, from Hamm, makes Aleuronatzweiback (high or low gluten) and Aleuronat Biskuits and Kakes (biscuits and cakes, p. 57, 30), or pure (4.0% carbohydrates, p. 76). Kirche, from Duesseldorf, makes Aleuronat-Kakes (p. 32).

Other well-known products. Protein preparations: Plasmon Co., London, makes Plasmon. Troponwerke, Mülheim, makes Tropon (p. 24). Address: Chemist of the Station, New Haven, Connecticut.

299. Fruwirth, C. 1915. Die Sojabohne [Soybeans]. *Fuehlings Landwirtschaftliche Zeitung* 64(3/4):65-96. Feb. 1 and 15. [65 ref. Ger]

• ***Summary:*** Contents: Introduction (work in East Asia and Europe from 1905-10). History. Botanical aspects. Varieties. Breeding. Needs of the plant (incl. "heat units," *Wärmesumme*). Utilization (incl. in German *Tofu, Miso, Chiang, Schoyu* or *Sojatunke* (shoyu, p. 83), *Natto, vegetabilische Milch* (soymilk), soy sprouts). Measures and precautions in cultivating soybeans (incl. yields). The soybean as a crop in central Europe. Conclusion.

Note 1. On p. 83 the term "Sojas" is used to refer to soybeans

Note 2. This is the earliest German-language document seen (April 2012) that uses the term *Sojatunke* to refer to soy sauce.

In 1905 the Japanese made the first attempt to import soybeans from Manchuria to Europe, but it failed because they did not arrive in good condition. The repetition of the attempt in 1908, however, gave good results. Then imports of soybeans grew, followed by imports of soybean cake (*Sojabohnenkuchen*). Major importers today are England, France, Germany, Denmark, Italy, Belgium, Netherlands,

Sweden. The high import duty hinders imports to Austria-Hungary.

Toward the end of the 1800s in Russia, Owinsky took early-ripening soybean varieties from China and Japan and requested the expansion of soybean cultivation. In 1899 in Kiev, Owinsky wrote the name of the soybean as Soja hispida praecox (p. 67). Owinsky in Derajne [Derazhne?] grew Podolie soybeans (p. 77). Sempolowsky in Derebzin, Russian Poland, also grew soybeans. European Russia gets soybeans overland (probably from Manchuria). Russia was one of the first countries to take an interest in growing soybeans after 1908. Russia now grows large amounts of soybeans in Podolia. In Germany, Prof. Kallo in Wiesbaden was a pioneer who recommended soybeans as an inexpensive food for the people. North America first started to import lots of soybeans as a source of oil because of a bad cottonseed harvest.

"Since the start of my teaching activities, I have had an interest in the soybean plant and have carried on my own investigations." In 1900 the author received 7 soybean varieties from L.V. Jurdiewicz from Deraznia in Podolia; these had been imported by Owinsky. In 1901 at Hohenheim he began to study the time needed for soybeans to mature; He found it ranged from 141 to 163 days. He continued this research at Hohenheim from 1901 to 1903, getting soybean seed yields of up to 1,560 kg/ha. From 1910 to 1914 he continued at Waldhof-Amstetten, with 5 varieties. The maturity range there was 112-166 days and the yields were up to 1,500 kg/ha (about 23 bushels/acre), but the yields of many varieties were low, about 300 to 500 kg/ha (4.5 to 7.5 bu/acre). Yields of soybean straw, however, were up to 3,600 kg/ha. Fruwirth uses three terms to refer to soybeans: (1) Die Sojabohne; (2) Die Soja; and (3) Sojas, as "Zuechtung von Sojas" or "Sojas, meist gemahlte." There are now a proposal to establish a joint stock company for growing soybeans in central Europe (probably in Germany), using big money. But it may not succeed because soybean yields in Germany and Austria are low. Seedsmen who sell soybeans commercially in 1915 include: Haage and Schmidt (Erfurt, Germany), Vilmorin Andrieux (Paris, France), Dammann & Co. (St. Giovanni at Tedaccio, near Naples, Italy), and Wood and Son (Richmond, Virginia, USA). The main soybean varieties sold by each of these companies are described in detail (p. 73-74).

Utilization (p. 82): Since soybeans are rich in protein and fat, they can be used as a good meat substitute. In Europe the use of soybeans for food is still very small. "In Europe, the first foods from soybeans were made in France, at Vallées near Asnieres: Flour, bread, and cakes for diabetics, and cheese. In Germany not long ago the Soyama-Works at Frankfurt am Main likewise began the production of such foods. Similar foods were also made in Romania. Soybeans sprouted in the dark yield a bitter-tasting salad. Production of vegetable milk started in France at 'Caséo Sojaine' at Vallées (Seine); and is now being studied by the Synthetic Milk Syndicate in England. Using the process developed by Fritz Goessel, this Syndicate made 100 liters of soymilk from 10 kg of ground soybeans at a factory at Liverpool." "It is in no way certain that soybeans will ever be widely used in human foods."

A fairly large amount of soybeans are ground for use as fodder. The main use is for oil extraction. Yet Haberlandt considered that since the soybean contained only about 18% fat (range: 13-22%), its use as a source of oil would not be economical. The main use of soy oil is in soaps, for which it is highly prized. It is also used in making paints as a partial substitute for linseed oil. The best quality may be used as food. In England soy oil is used for margarine production.

Conclusion: The soybean originated in central Asia and is now widely cultivated in China, Japan, Manchuria, and India. Its seeds are rich in protein and, unlike most other legumes, also rich in fat. The plant is used in its homeland mostly as a source of human foods and seasonings, made by fermentation; the oil is used mostly for industrial non-food purposes. In recent years soybean production has expanded significantly in the southern part of the United States. There it is used mainly as green fodder, hay, silage, and soil building. The main expansion of soybean cultivation in Europe has been in Italy, southern France, Hungary, and southern Russia. Good early varieties give yields of 1,100 to 1,300 kg/ha. A large expansion of soybean production in central Europe is possible only in southern Austria and Hungary, and maybe in a few other places where it is warm. But late-maturing soybeans may be grown for forage and silage in the cooler parts of Germany and Austria. Address: Prof., Dr., Wien (Vienna).

300. Cooper, Lenna F. 1915. The cost of foods in non-meat dietaries. *J. of Home Economics* 7(3):137-41. March.
• ***Summary:*** "The fact that meat is one of the most expensive articles of diet is illustrated by a comparison of the costs of a mixed diet and of a non-meat diet. The cost of foods given here are from the non-meat dietary in use at the Battle Creek Sanitarium." The cost of foods in the guests' dining room for the year 1912 amounted to 67.8 cents per capita per day. A copy of one day's menu is shown in order to give an idea of the variety of food in the guests' dining hall. Breakfast foods include: Scotch bran borse. Gluten gruel. Boiled protose. Scrambled eggs. Whole wheat bread. Entire graham bread. Toasted rice biscuit. Toasted granose (wheat) biscuit. Bran biscuit. Nut butter. Palm butter. Malt honey. Malt sugar. Yogurt buttermilk. Sanitas cocoa. Hot malted nuts [peanut milk]. Minute brew [coffee substitute] with sugar and cream. Kaffir tea. Dinner (afternoon meal) entrées include: Nut fillets. Nuttolene with piquant sauce. Supper (evening meal) includes many of the same foods served for breakfast.

In 1914 the total number of guest days at the Sanitarium was 115,590. The cost of vegetarian food for this same period was $67,866. Address: Head Dietitian, Battle Creek

Sanitarium, Michigan.

301. Meyer, Frank N. 1915. Re: Mr. J.H. [Julean] Arnold. In: Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 2033. Letter of 12 March 1915 from Tsingtau, China, to David Fairchild of USDA.
• ***Summary:*** "About this Mr. J.H. Arnold *not* being an American consul at Tsingtau. Well, at a dinner at the American legation here in May last year [May 1914], Mr. A. told me he was going to be a Consul there. It seems, however, that his appointment was cancelled and Mr. Willys R. Peck was given his post instead. Later on Mr. Arnold was appointed to the new post of Commercial Attache with our Legation here, where he is now. The whole trade of Tsingtau is upset now and many products exported before will have to find new channels now."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

302. Leimdoerfer, J. 1915. Unsere Fettversorgung [Our supply of fats]. *Oesterreichische Chemiker-Zeitung* 18(8):63-67. April 15. [Ger]
• ***Summary:*** This is the text of a lecture presented on 20 March 1914 at a plenary session of the Society of Austrian Chemists; Prof. Leimdörfer discusses the need to cultivate oilseeds, especially castor oil seeds and soybeans (p. 65).

The soybean, which makes a good livestock feed, can also be used in the preparation of bread, non-dairy milk, an alternative to coffee, and a non-dairy cheese [tofu]. Address: Prof., Budapest [Austria-Hungary].

303. *Independent.* 1915. Soy milk. 32:113. April 19. *

304. Goessel, Fritz. 1915. Manufacture of artificial milk [from soya beans]. *U.S. Patent* 1,139,031. May 11. 4 p. Application filed 5 May 1914. 1 drawing.
• ***Summary:*** This patent is similar to Goessel's U.S. patent of 23 Dec. 1913 (No. 1,082,118), however the "present invention is directed to a process of manufacturing such an artificial milk in a cheap and effective manner." It is also called a "synthetic milk." Note that the patent features use of hot water and vacuum stripping of volatiles. Soy beans are the main raw material used. An illustration (line drawing; in vertical section) shows the apparatus used.

Soy beans are washed, decorticated, then ground into a fine flour. Ten kg of this "soy bean flour" is fed into a hopper and moved by a screw conveyor into a chute, where it is mixed with 100 liters of steam-heated water at a temperature of 90-95ºC, to form a thin paste, to which is added 5 gm of sodium phosphate. The thin paste passes through a rubbing and mixing device composed of a sieve provided with a rotating brush. It is then run into a steam-jacketed mixing vat having a paddle in the bottom. The temperature here should be about 95ºC and "ordinarily the extraction will complete in about an hour." The liquid in the mixer will contain about 3.7 albumin, 2.0% fats and fatty acids, 1.8% carbohydrate, and 0.5% salts. This liquid is run into a centrifugal separator, where the insoluble solids are removed. The liquid is then run into a tank, where it is cooled to about room temperature. Then liquid is then run into a separator, where some or all of the fat may be removed "thereby reducing the particular flavor of the soy bean." The milk is best formulated during emulsification by adding 2.4 kg of carbohydrates (cane or beet sugar, milk sugar, malt extract, etc.), 6 gm of "sodium chlorid" (table salt), 60 gm of carbonate of soda, plus a fat. "If a thick creamy liquid is desired, a thick or heavy oil is used, such as cocoanut oil." Sesame oil may be used to give a thinner product. The emulsification may be conducted either under pressure or (ideally) in a vacuum. "During emulsification, the temperature may be maintained at 35 to 40ºC. At this temperature under vacuum the liquid may be boiled with a production of some vapors." The emulsified liquid is then cooled quickly and stored in tanks. Enough pure water is added to bring the volume back to 100 liters.

"If desired pure cultures of suitable bacteria such as *B. lactis acidl.* or *B. massal*, may be added to the milky material." Address: Frankfurt-am-Main, Germany.

305. Schieber, W. 1915. Die Sojabohne und deren volkswirtschaftliche Bedeutung als Nahrungsmittel [The soybean and its economic significance as a food]. *Oesterreichische Chemiker-Zeitung* (*Vienna*) 18(10):85-86. May 15. Excerpts from a lecture to the Austrian Chemical Society, 24 April 1915. [1 ref. Ger]
• ***Summary:*** Includes a summary of information from Li Yu-ying (1912) about foods and food adjuncts made from the soybean: Soymilk, tofu (*Sojakäse*), soy flour (*Sojamehl*), soya bread (*Sojabrot*), soya confections (*Sojakonfekt*), soy chocolate (*Sojaschokolade*), soy coffee (*Sojaskaffee*).

Japanese foods from fermented soybeans: Natto (*Feste Würzen*), miso (*Pasten*), soy sauce (*Saucen*). Plus original nutritional analyses. Address: Austria.

306. Meyer, Frank N. 1915. Re: Condensed soybean milk, made in Japan and sold in China. In: Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 2068-69. Letter of 21 May 1915 from Peking, China, to David Fairchild of USDA.
• ***Summary:*** "I am also enclosing a can of so-called condensed milk, as sold here in China under the name of 'The Eagle Brand.' I strongly suspect this stuff to have been made in Japan from Soybeans, with something added. It is of a brown color, quite lumpy, not very sweet and it dissolved but poorly. One also gets effects of flatulency from it, especially when taken on an empty stomach. Do you consider it worth while to have it analysed by the Bureau of Chemistry?"

In a letter of 15 Dec. 1915 (p. 2166, from Washington, DC) to Fairchild we read: "Morse soy beans are desired, especially from southern China. Prof. Tracy at Biloxi got a mutant among his soybeans which is of extremely great value to the Gulf Coast sections... The *Kudzu vine* is not as desirable as was first thought; it occupies the land too long and does not always make a dense stand."

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

307. Schieber, W. 1915. Die Sojabohne und deren volkswirtschaftliche Bedeutung als Nahrunsmittel [The soybean and its economic significance as a food]. *Seifensieder-Zeitung* 42(22):471-72. June 2. (Chem. Abst. 10:1558). [Ger]

• ***Summary:*** Descriptions and nutritional analyses are given of a number of different food products prepared from the unfermented and the fermented soy bean. Unfermented: soya milk, tofu (*Sojakäse*), soy flour ("because of its composition it can be recommended as a first class food for diabetics and vegetarians"), soya bread, soya confections (resembling marzipan), soya chocolate, soya coffee, soy grits, whole dry soybeans, and soy sprouts ([*Soja*] *Schoten, Bohnen, und Keime*). Fermented: Solid seasonings such as Japanese natto, pastes such as Japanese miso, sauces (in Japan each year 10,000 factories make 700 million liters of soy sauce), a new German fermented soyfood product is made by a secret process; its contains 45% protein, 6% nutritional salts, and about 2% lecithin.

Note. This is the earliest German-language document seen (Jan. 2013) that uses the term [Soja] Keime to refer to soy sprouts. Address: Dr.

308. Goessel, Fritz. 1915. Improvements in the manufacture of artificial milk [from soya beans]. *British Patent* 8,027. Application filed 30 March 1914. 7 p. Complete specification left 9 April 1914. Accepted 24 June 1915. 1 drawing. [1 ref]

• ***Summary:*** Pages 1-3 are titled "Provisional specification; pages 3-7 are "Complete specification."

"This invention relates to the manufacture of artificial or so called synthetic milk from vegetable seeds or beans such as described in my prior [British] Patent No. 27,860 of 1912 [Application filed 3 Dec. 1912]. The present invention is directed to the manufacture of such milk on a commercial scale and in a cheap and effective manner" (p. 1). A full-page illustration (line drawing) shows many pieces of equipment connected to allow a continuous flow of product.

Soy beans are washed, decorticated, ground to a flour which will pass a 100-mesh sieve, and rubbed to a thin paste with soft water at 90º-95ºC. The ratio of flour to water is 1:10, and 5 gm of sodium phosphate is added to each 100 liters of water. The mixture is centrifuged to remove insoluble matter, and the liquid is cooled and again centrifuged to remove fat. The extract is now analyzed, and according to the analysis sufficient fat or oil, sugar, and salts are added to make the composition similar to that of milk. These substances are added in an emulsifier and the mixture is emulsified in a partial vacuum at 35º-40ºC. The liquid leaving the emulsifier is cooled and made up to the proper volume.

"If desired pure cultures of suitable bacteria such as the organism known as *B. lactis acidi* or *B. Massol* may be added in the milk in the vessel" (p. 6). Address: Dr., Chemist, 60 Kurfuerstenstrasse, Frankfurt on the Main, Germany.

309. Melhuish, William James. 1915. A substitute for milk made from soya and arachide and the treatment of the residue. *British Patent* 9,626. Application filed 1 July 1915. 9 p. Complete specification left 7 Oct. 1915. Accepted 3 July 1916.

• ***Summary:*** About 200 pints of purified water are heated to 80ºC and made alkaline with 400 gm of potassium phosphate; a suitable quantity of malted dextrin syrup is then added and 40 lb of arachide nuts which have been shelled, boiled with sodium carbonate, partially dried, and ground to a coarse powder. The mixture is well stirred and the temperature maintained for half an hour. The liquid is then strained and one fourth oz of butyric acid stirred in gradually. Next about 18 lb of soya beans are stirred into 100 pints of hot water, a little sodium phosphate added to insure alkalinity, and the temperature maintained for three fourths of an hour. The mixture is then strained. The 2 extracts are drawn into a vacuum pan in the form of a spray. There are also added at the same time a further quantity of dextrin syrup, 250 grains of calcium phosphate, and 500 grains of sodium phosphate. The mixture is boiled for 30 minutes. The milk produced is drawn off, strained, and made up to 300 pints. It is treated with a culture of lactic bacteria to produce acidity, pasteurized at 60º-70ºC for 20 minutes, and cooled. About 0.1% citric acid is added to the completed product.

The inventor has gotten very good results with the Manchurian soya beans known as Sakura, and "from batches grown in South Africa under the names of Wilson, Haberlandt, and Hollybrook."

"The residue meals should be mixed together thoroughly and dried out to a ten *per cent.* moisture content. This should be done as soon as possible as the soya residue [okara] quickly ferments and becomes a sanitary menace. The combination makes an excellent cattle food, for the excess oil in the soya meal blends with the oil-free pea nut meal and gets over the extreme heating properties of the soya meal when used alone. The insoluble proteids in both meals, coupled with their carbo-hydrate residues tends to form an almost perfect food from the constituent point of view, and its sale enables the cost of the milk to be brought down to something near threepence per gallon."

Note 1. This is the earliest English-language document seen uses the word "Soya" as a noun (in the title or

elsewhere) to refer to soybeans.

Note 2. This is the earliest English-language document seen (June 2013) that uses the term "soya residue" to refer to okara. Address: Lecturer in Dietetics, Highwood House, Upper Parkstone, Borough of Poole, County of Dorset [England].

310. Robert, J.C. 1915. Preliminary report on the economic value of the soybean. Jackson, MS: Mississippi Agricultural College, Tucker Printing House. 15 p. July 1.
• ***Summary:*** Contents: Introduction (incl. brief soy bean history). Composition of soybeans. Feeding value. Relation to soil fertility (nitrogen fixation, vegetable matter or humus). Yield of soybeans (shelled seed and hay). Uses of soybeans (milk, paints, etc.). Soybeans a valuable crop for the Southern farmer.

"The refined oil is used as a substitute for olive oil. Soybean milk and soybean cheese [tofu] are extensively used as an article of diet in the Orient. The cheese is made as follows:... magnesium chloride being added to precipitate the solution, which is hung in fine mesh cloth–and cottage cheese is obtained.

"In 1912 there was established [by Li Yu-ying] at Les Vales [sic, Valles], France, a large factory for the production of a variety of soybean food. Among these varieties were milk, cheese, casein, oils, bread, biscuits, flour, jellies, cakes, and sauces" (p. 12-13).

Note: This is the earliest English-language document seen (Sept. 2011) that contains the term "soybean food."

"Varnishes made from soybean oil are extensively used, though when subjected to exposure they seem not to wear quite as well as those made from linseed oil. For internal painting purposes, however, these varnishes are equal in every respect to those made from linseed oil. Soybean oils are used extensively in the manufacture of linoleums and table cloths, and for the manufacture of printing ink, and of enamel paints" (p. 14).

"Soybeans a valuable crop for the Southern farmer: As an article of human food, soybeans may become an important factor with us. We have used soybean meal made from our crop of 1913 and 1914 and had for breakfast excellent cakes. These cakes were made from wheat flour and soybean meal, and wheat flour and corn meal. Various proportions were used, sour milk and soda being added. Cakes made from equal parts of wheat flour and soybean meal were very palatable.

"Soybeans seem to be one of the most promising crops before the Southern farmer. Every particle of the plant has economic value, and a great number of commercial products are produced from the seed. It seems that the machinery of our cotton seed oil mills is suited to the manufacture of soybean meal and oil. The soybean straw is a good stock food... Therefore, soybeans offer a golden opportunity to the grain and cotton farmers, the live stock producers and the soil builders" (p. 14).

Photos show: (1) Numerous sacks of soybeans and oil cake in the Orient awaiting shipment (front cover). (2) People cleaning and resacking soybeans for shipment (front cover). (3) Five different varieties of soybeans, Including Virginia (p. 2). (4) Soybean root tubercles, natural size (p. 7). (5) Several osier bins used for storing soybeans (p. 13). (6) Southern Manchurian railway cars, with sacks of soybeans (p. 13). (7) Seven varieties of soy pods and beans: Guelph, Ito San, Buckshot, Austin, Hollybrook, Haberlandt, Mammoth (p. 15).

Tables show: (1) Percentage composition of different soybean varieties (most have values for two years, 1913 and 1914): Wilson, Arlington, Jet, Brown, Tokyo, 19981-A, Mammoth, Small Yellow, Amherst, Ito San, Holly Brook [Hollybrook], Peking, Acme, Virginia, Black, Brachet [Barchet], Dwarf Green, Cloud. For each is given moisture, ash, fat, protein, nitrogen free extract, fiber. (2) Plant food elements in farm crops (N, P, and K, including soybeans as grain, hay, or straw). (3) Yield of soybeans (in lb shelled seed and lb of hay per acre): In 1911 in Mississippi: Hollybrook, Black Soybeans, Brown Soybeans, Small Yellow, Mammoth Yellow. The highest yields were from Small Yellow–2,600 lb seed and 5,500 lb hay. In 1912: Brown Soybean, Black Soybean, Hollybrook, Dwarf Green, Small Yellow, Mammoth Yellow, Haberlandt. Again the highest yields were from Small Yellow–2,680 lb seed and 5,200 lb hay. (4) Farm account with the soil in proposed three-year crop rotation (NPK balance incl. soybeans for hay, grain, or straw). (5) Proposed three-year rotation system for long-pine section of Mississippi (1915-1917).

Note 1. This is the earliest document seen (Jan. 2004) that mentions the soybean variety Virginia.

Note 2. This is the earliest published English-language document seen (Sept. 2006) that contains the term "Soybean oil."

Note 3. This is the earliest English-language document seen (Aug. 2013) that contains the term "Soybean milk."

Note 4. This is also the earliest English-language document seen (April 2013) that uses the term "soybean cheese" to refer to tofu. Address: Director of the Station, School of Agriculture, and Prof. of Agronomy, Agricultural College, Mississippi.

311. *Washington Post*. 1915. 'Soy' bean as war food: German dieticians experiment with it in many prison camps. Product used in Worcestershire sauce is declared by many to be highly nourishing. Aug. 1. p. M8.
• ***Summary:*** "Berlin, July 31.–Protracted experiments with the Japanese 'soy' or 'soja' bean, out of which, among other things, Worcestershire sauce is made, are being conducted with a view to determine whether this vegetable, which can be and is raised in Germany, cannot be used in the many prison camps."

"In the Far East the soja bean is in great demand, both for human and animal food products, and also for the oil it contains. Next to rice it forms one of the principal articles of the food supply in some Eastern countries, especially when combined with cereals and salt. It also plays an important part in sauces and spices. The milk from this bean approximates ordinary milk in nutritive value, and cheese can be made from it.

"When combined with 30 or 40 per cent white flour, the meal of the soja bean lends itself to a tasty and nourishing bread which has been found to be especially good for diabetics because of the high percentage of albumen and fat contained. The roasted soja beans also make a good substitute for coffee. The soja plant forms a good fodder for cattle."

312. *Los Angeles Times.* 1915. Alliance–Japanese beans for Germans: The soy and soja said to be valuable foods. Experiments are to be made to determine if they can be used in the prison camps–together they yield flour, meal, milk, cheese, coffee and fodder. Aug. 8. p. III25.
• ***Summary:*** This article, via A.P. [Associated Press] foreign correspondence, is very similar to one published a week earlier (Aug. 1) in the *Washington Post* titled "'Soy' bean as war food: German dieticians experiment with it in many prison camps." (p. M8).

The last sentence in the article, however, is new: "Exhaustive experiments with the soja bean have already been made at the agricultural station of the University of Wisconsin, all tending to bear out, it is said, the contention of German dieticians in favor of the bean."

313. Morse, W.J. 1915. Re: Report on visits to makers of soy products. Letter to Prof. C.V. Piper, Forage Crop Investigations, Bureau of Plant Industry, Washington, DC, Sept. 5. 2 p. Handwritten, with signature.
• ***Summary:*** "Dear Professor Piper:... At Clayville, New York, I looked up the soy bean factory recently started for the manufacture of flour and milk. I had a visit with the man in charge, a Mr. Spring/Sjurning (?) of Cussville (?), New York. The establishment is under the name of Spring (?) Corporation Co. and in addition to the soy products are to put out different kinds of breakfast food. The soy beans were to be purchased from (?) and Indiana growers, but Mr. Spring is going to get in touch with growers in eastern North Carolina... They have a patent process for making the milk called an emulsifier. The beans are crushed, put in the emulsifier with water, the mass churned about and the liquid drawn up. The bean mass is then dried and ground into flour. The milk is all to be sold to chocolate manufacturers while some biscuit concerns agree to take a certain amount of the flour.

"At Battle Creek, Michigan, the Kellogg concern are interested in trying out the soy bean both as a flour and as a substitute for coffee. Mr. Kellogg would like to have us send him about a bushel of the Mammoth Yellow for experiments. He will give us the results and furnish us some of the products made from the beans." He is at the Toasted Corn Flake Co. in Battle Creek.

Note: This is the earliest document seen (Jan. 2002) that mentions Mr. [W.K.] Kellogg or his Toasted Corn Flake Co. in connection with soybeans.

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 92–Morgan-Morse. Folder–Morse, W.J.–#1 F.C.I.

Sent to Soyfoods Center by Jacob Jones of Purdue Univ., Aug. 1998. Address: St. Paul, Minnesota: Scientific Asst., Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

314. *Tropical Life* (*England*). 1915. Vegetable oil notes. 11(9):164-66. Sept.
• ***Summary:*** "The Special Supplement to the London *Chamber of Commerce Journal*, dealing with the 'Trade Products of the Empire,' is full of useful information and statistics, including the following:" Using the process known as hydrogenation liquid oils can now be converted "into solid fats, and used for the manufacture of butter substitute,..." This fact is of "great importance to the trade in vegetable oils and oil-seeds." Many oils can be used to make butter substitute including "coco-nut oil, cotton-seed oil, palm oil, palm-kernel oil, ground-nut oil, sesamum oil, mowrah-seed fat, &c." Ground-nut oil is largely used, especially on the Continent. Efforts are being made to establish the crushing of ground-nuts on a much larger scale, but this is being hindered by the War.

"We are sorry to see, however, from the experiments that have been made by now in growing soya-beans in practically every British colony, it seems doubtful whether this crop can be profitably grown for export in competition with the Manchurian beans, which are raised under ideal climatic conditions, and by the cheapest possible labour. We still hope that results may prove to be otherwise before long, as soya-bean meal [flour] can be used for making bread, a use to which it is put on the Continent.

"Against this, *Fairplay* (of London) told us, some time ago that 'owing to the world-wide interest now evinced in the culture of the soya bean, experiments are being conducted in practically every British Colony. In West Africa, the bean arrives at maturity in six, eight or ten weeks, as against six months in Manchuria, while experiments carried out in South Africa prove that the crop could be matured in from ten weeks to five months, according to the zone and climatic conditions. It is expected that Ceylon will make shipments in the near future.

"'It is estimated that Great Britain and the Continent can

take ten million tons of [soya] beans per annum in the event of their being used for food purposes for human consumption in the form of milk [soymilk], cheese [tofu], butter, &c., as well as for industrial and other purposes. The Manchurian crop is estimated at over 1½ million tons per annum, but the fact that the experiments as to the cultivation of the bean, both in West and South Africa, have proved that the plant is well adapted to the soil and climate, gives every reason to suppose that large supplies will ultimately be obtained from the Colonies. In this event it will be seen that the South African farmer would be in a position to compete with the Manchurian growers, the latter costing in railage and ocean freight from Harbin to England £2 3*s.* as against £1 9*s.* for railage and freight from South Africa.

"'The storage of soya-beans requires special care. The grain should be thoroughly dry when put into storage, or placed where good ventilation can be afforded, otherwise it is almost certain to heat. During shipment a large number of pipe ventilators are placed in the ship's hold to prevent heating of the cargo, as sweating would otherwise occur on a long voyage from the East. The beans are shipped in bags, vessels being well dunnaged'" [packed to prevent damage].

315. *British Medical Journal.* 1915. Medicinal and dietetic preparations: "Synthetic milk" [made from ground-nuts / peanuts]. ii:646. Oct. 30.
• ***Summary:*** A demonstration of making synthetic milk from ground-nuts or pea-nuts (*Arachis hypogoea*) was recently given at the Melco Laboratories (56 Great Peter Street, Westminster, England). Near the end of the process, a "culture is added in the form of a special growth of lactic bacteria which has been acclimatized to the new milk. The cost price of the milk, including labour, is said to work out at 3*d.* [pence] a gallon, as against 8*d.* a gallon for cow's milk on the farm. The meal [okara] left over after the extraction of the milk-white fluid can also be used as a foodstuff. "The fluid certainly has all the appearance of cow's milk, but the flavour of the nut, which to many tastes would not be agreeable, is somewhat pronounced." The synthetic milk contains 13% solids versus 11.5% for standard cow's milk.

Note: Melco may stand for Melhuish + Company.

316. Ruhräh, John. 1915. The soy bean and condensed milk in infant feeding. *American J. of Medical Sciences* 150(4):502-12. Oct. Whole No. 523. [5 ref]
• ***Summary:*** From his experience in using soy bean, condensed dairy milk (Eagle brand) and some cereal (for additional carbohydrate) in proper proportions, Ruhräh feels that this method of feeding infants can be used without any danger. Address: M.D., Baltimore, Maryland.

317. *Advance* (*The*) (*Elizabeth City, North Carolina*). 1915. A better day for soy beans. Nov. 30. p. 2.
• ***Summary:*** "Farmers in this section will be glad to know that the Division of Agronomy at Raleigh, of which C.B. Williams is the head, is very much interested in the future of the soy bean crop, which is being more extensively grown now every year in this country.

"It is not strange that the State Department of Agriculture should be interested in soy beans, for the soy bean crop in North Carolina is larger than in any other state in the union. This year the soy bean acreage in nearly every county in this section was increased and it is said that Hyde County alone this year has harvested no less than 200,000 bushels.

"With a million bushels of soy beans now on their hands, Eastern Carolina farmers are wondering what they are going to do with them.

"In central New York, according to Mr. Williams, a factory has been established for the manufacture of soy bean milk and soy bean flour. The Kellogg Toasted Corn Flake Company of [Battle Creek] Michigan have conducted experiments with soy beans, and have expressed a desire to get in touch with growers of the product. Mr. Williams has recently visited this section and has obtained the promise of the Elizabeth City Oil and Fertilizer Company and of the Eastern Cotton Oil Company of Hertford [15 miles southwest of Elizabeth City] to conduct experiments with view to utilizing the soy bean to keep their mills running after the close of the cotton season. Also inquires have been received from the owners of factories which handle the soy bean and are able to use its by-products for information about factory sites in this section."

Note: This is the earliest document seen (June 2003) that mentions the Elizabeth City Oil and Fertilizer Company (or Elizabeth City, North Carolina) in connection with soybeans.

318. *Lancet.* 1915. A milk similar. ii(4814):1263-64. Dec. 4.
• ***Summary:*** Includes a discussion of Solac brand "synthetic milk" (soymilk), England's first commercial soymilk. This product was first announced in the *Lancet* (19 Oct. 1912). A large amount is presently produced by the Solac Company, "221, Tottenham Court-road, London, W., and our consulting chemist, who has witnessed it, reports that everything is carried out with scientific cleanliness...

"By introducing a lactic culture of a selective strain at a certain stage of its production, the necessary biological activity is given to this artificial milk. We have examined a good many samples of this 'vegetable milk' and have found that the non-fatty solids range from 8.96 per cent. (consisting of proteins, dextrin, and sugars) to 9.5 per cent., while the fat ranges from 3.69 to 3.9 per cent. The proteins consist chiefly of globulin, known as glycinin, which is a very rapidly digestible 'vegetable casein'; the fats are of vegetable origin, showing the same melting point and ease of hydrolysis as ordinary milk-fat; while the sugars and dextrin present are both again known to be of ready assimilability. The above figures are identical with those given by pure rich cow's

milk.

"The working basis of 'solac' or vegetable milk is the soya bean, which is particularly rich in oil and protein, the latter of an easily digestible type. The beans are very rigorously cleansed prior to the beginning of the extraction and emulsifying process. A residue of bean cake [okara] is left which possesses high nutritive properties, and this has already been used for making a bread, where its nourishing properties appear to be enhanced. The cake contains 10 to 11 per cent. of oil and 20 to 24 per cent. of protein.

"This novel invention is of some importance, especially at the present juncture, when the methods of practising food economies are upper-most in all minds. If it is proved that this vegetable milk can in the majority of purposes effectively replace cow's milk, the 'similar' will naturally claim considerable attention for many reasons. To begin with, such a milk at once disarms all suspicion as to contamination with dirt and disease organisms... It has already been used with success by the bakery and confectionery trades." Address: London.

319. Monahan, Louis J.; Pope, Charles J. 1915. Process of making soy-milk. *U.S. Patent* 1,165,199. Dec. 21. 2 p. Application filed 10 April 1913.

• ***Summary:*** Dry soybeans are reduced to a powder, which is rendered into an emulsion by slowly adding either fresh water or lime water and sodium bicarbonate; "the reason for using these agents is to counteract the taste of the bean as much as possible as well as to partially arrest the oily odor therefrom..." The emulsion is cooked and the insoluble matter is removed by filtration. Small amounts of "sodium chlorid" (table salt) and cocoanut oil may be added. "For giving a highly desirable sweet taste to the finished product we add about 8% of pecan or almond nut kernels during the emulsion processing so that the sweet nut oils are thoroughly emulsified." Chocolate and sugar may also be added. Address: Oshkosh, Winnebago County, Wisconsin.

320. Laxa, Otakar. 1915. Syrarstvi: Popis vyroby a upravy syra jako potraviny [Cheese production: Production of cheese and its productivity]. Prague, Czechoslovakia. 539 p. See p. 488-90. Chap. III, Vegetal Cheeses. Illust. 21 cm. [Cze]*

• ***Summary:*** A similar title was published in 1924. Address: Czechoslovakia.

321. Martindale, William Harrison; Westcott, W. Wynn. 1915. The extra pharmacopoeia of Martindale and Westcott. 16th ed. 2 vols. London: H.K. Lewis & Co., Ltd. See vol. I, p. 563, 849. Index. 17 cm. [14 ref]

• ***Summary:*** In Vol. I, the section titled "Oleum papaveris" (p. 562-63) is about "Suggested use of other oils to replace cod liver oil in malnutrition, phthisis and other forms of wasting disease." "Several nutritive oils... which rank almost as high as Cod Liver Oil in Iodine values, suggest themselves as suitable for therapeutic use. These oils are used both medicinally and as foods..." A table shows each oil with its iodine value. Cod liver oil 126-66. Poppy seed oil 138.1. Maize oil 111. Sunflower seed oil 136.1. Soya bean oil 122. Of these, poppy seed oil seems to be suited for use as an alternative to cod liver oil. Arachis oil, sesame oil, and henbane oil are also discussed briefly.

In the chapter titled "Supplementary list of drugs" is a long section (p. 805) on "Soya Bean.–*Glycine Hispida* (*Leguminosae*). This bean is extensively cultivated in China and Japan for human consumption and laterally in America and Europe, chiefly as a forage crop, is eaten as a vegetable, in soups, sometimes picked green, boiled and served cold with a sprinkling of Soy Sauce, and sometimes as a salad. A favourite method of preparing in the East is to boil until soft and place the resulting mass in a warm cellar until it ferments,–the resulting 'cheese' being known as 'Natto.'

"Analysis of the bean calculated on water free basis, indicated 38.5% Protein and 20% fat. It is probably due to this large amount of easily assimilable Nitrogenous matter that the Chinese and other rice eating people require so little meat. It contains practically no Starch–the latter fact is said to be due to presence of a diastase in the bean capable of converting Starch formed, two-thirds into Sugar, one-third into Dextrin. Has been used as an addition to ordinary diabetic dietary,–the beans may easily replace the Gluten of bread,–causes reduction in percentage of sugar (*Lancet* 1910, p. 1844). Soy Flour is even more serviceable, containing almost 1/3 more Protein than the bean, this being due to the removal of the fibrous hulls, which contain but little Protein (*British Medical Journal Epitome* 1911, p. 80).

"The protein of the Bean is being extensively used in connection with the treatment of diabetes and malnutrition. Soya Bean Meal from which it is made must be carefully examined for the toxic *Java Bean*.–F.W. Crossley Holland (*Pharmaceutical Journal and Pharmacist* (London) 1912, p. 154). Soya Beans average 8 m.m. in length and 7 m.m. in breadth and 6 m.m. in thickness. They are roundly ovoid in shape and about 99% are pale yellow in colour–there being a few darker coloured, smaller and more elongated. Structure of the bean. Soya Bean Cake and Meal is enormously adulterated.–T.E. Wallis (*Chemist and Druggist* (London) 1913, p. 278; *Pharmaceutical Journal and Pharmacist 1913,* p. 120).

"E.S. Peck states *Glycine Hispida* has been used in clinical experiments for the splitting up of Urea into Ammonium Carbonate.

"* Sarton is a preparation of the bean for use as a diabetic food.

"Soya Oil has Iodine value 121 to 123. Cowie found 131 (Chemist and Druggist 1910, p. 66). For further characters see (*Pharmaceutical Journal and Pharmacist* (London) 1911, p. 407)." See also p. 563.

In Vol. II, the section titled "Lecithin" (p. 76) states that it is a "Mono-amino Phosphatide" and contains a table listing the percentage of lecithin contained in 17 substances, including: Brain 160. Spinal cord 11.0. Nerve tissue (dry) 17.0. Kidneys 8.5. Egg yolk 12.0. Lupin seeds 2.0. Yeast (dry) 2.0. The soybean is not mentioned. A test of purity of lecithin made from fresh egg yolk, and the determination of lecithin in preparations are described.

William Martindale lived 1840-1902. Volume I also discusses Gluten (p. 546–Synonym: Vegetable Albumin), Diabetic foods (p. 546-47, incl. starchless bread; soy is not mentioned), *Oleum sesami* Sesame Oil (p. 571; also called Benné oil, gingelli oil, teel oil), *Arachis Hypogæa* (p. 805; also called Pea Nut, Ground Nut, Goober Nut, Manilla grain [Manila grain], Chinese Almond).

Volume II also discusses "glutin" (p. 86-89), proprietary medicines (incl. Ovaltine, and Pinkham's (Mrs. Lydia E.) Vegetable Compound, p. 162-63). Address: 1. Ph.D., F.C.S.; 2. M.B.Lond., D.P.H.

322. Associated Press (AP). 1916. Nutrition–Find soja bean valuable food. Blockade against Germany shows its merits. Chinese have used it extensively for the last 2000 years and it possesses more universal usefulness than almost any other common article of diet. *Los Angeles Times.* Jan. 13. p. 13.
• ***Summary:*** London, Dec. 15.–Discussion of the food blockade against Germany has served to bring attention to the merits of the soja bean, to which is given up more than twenty-five per cent. of the cultivated area in Manchuria. Although the soja is well known and highly regarded in Germany and the Scandinavian countries and is now second on the list of China's exports, it has hitherto achieved small general reputation in the English-speaking countries, and even the latest dictionaries dismiss it with the brief description: An Asiatic leguminous herb, Glycine Soja, the seeds of which are used to prepare sauce called soy."

The "first important shipment to Europe was made in 1908 by a British firm. The Germans almost immediately began to experiment with it and five years later were using the major part of an importation estimated at over $200,000,000 a year.

"The secret of the soja bean is its universal usefulness. A British government report gives the following list of soja products: 'Vegetable food (like marrowfat peas); soups; meat substitutes; chocolate substitute; macaroni preparation; flour; artificial milk; cheese [tofu]; coffee substitute; artificial horn; biscuit and food for diabetic patients; sauce; meal for cattle; oils, oil cake for fodder; fertilizer; beancake.'

"The same report points out that the oil from the bean is used in the manufacture of the following articles: 'dynamite and high explosives, soaps, linoleum, rubber substitute, margarine, paints, varnishes, toilet powder waterproof cloth, paper umbrellas and lanterns, salad oil, lubricants, lamp oil, preservative for sardines, substitute for lard.'"

"There are three principal varieties of the bean–yellow or huangtou [huangdou], green or chingtou [qingdou], and black or wutou [wudou]. The yellow contains more nutritive ingredients than the others, and this is the variety almost exclusively used for export. The quantity of oil extracted from the beans runs as high as 10 per cent. of the total weight.

"Sweden uses large quantities of the bean cake as food for milch cows; Denmark has a large pressing factory at Copenhagen; France has a factory built in Paris by a Chinese firm [Li Yu-ying]; and South Africa has recently begun to grow the bean in competition with the Manchurian Farmers. Germany in 1912 rescinded her former import duty and installed reduction plants for the far-eastern vegetable products in all her oil mills, importing the beans directly from Vladivostok by the shipload."

323. Goessel, Fritz. 1916. Verfahren zur Herstellung eines Ersatzes fuer Kuh- oder Muttermilch aus der Sojabohne oder aehnlichen Samen oder Samengemischen [Process for production of a substitute for cow's milk or mother's milk from the soybean or similar seeds or seed mixtures]. *German Patent* 289,929. Jan. 25. 1 p. Application filed 21 May 1914. Addition to German Patent 268,536. [Ger]
• ***Summary:*** In the application of the principal process an advantage has been found in reducing, in many cases, the amount of fat in the aqueous extracts of the soy beans, in order to secure a better taste in the product. The decrease or removal of the fat is effected by centrifuging the extract with the known separating centrifugal apparatus. The product is then emulsified with a fat or fat mixture suitable for human nourishment. Address: PhD, Frankfurt am Main.

324. Puig y Nattino, Juan. 1916. El cultivo de la soya [The cultivation of soybeans]. *Revista del Ministerio de Industrias* (*Montevideo, Uruguay*) 4(19):78-91. Jan. [7 ref. Spa]
• ***Summary:*** Describes variety trials conducted in Uruguay using seeds supplied by the USDA. The varieties harvested in March 1915 included Peking, Arlington, Pinsu [Pingsu], Jaba, and Mammoth. A table (p. 79) shows that the yields of seed were very small, but that Mammoth gave by far the largest seed yield, 320 kg/ha. Discusses the many ways that soybeans (*las habas de soya*) are used as food in Japan, including soy sauce (*Shoryu* [*sic, shoyu*]), cooked whole soybeans, tofu or soybean cheese (*Tofú ó Queso de habas de Soya*), and soymilk. They used Mammoth variety soybeans, grown in Uruguay, to make soymilk. Seven tables (p. 84-90) give the nutritional composition of five different soybean varieties tested in Uruguay, planted in 1914 or 1915. An 8th table (p. 91) gives the nutritional composition of soymilk.

Note 1. This is the earliest document seen (May 2009) concerning soybeans in Uruguay, or the cultivation of soybeans in Uruguay.

Note 2. This journal is published in Uruguay by the

Ministerio de Industrias y Trabajo.

Note 3. This is the earliest Spanish-language document seen (April 2013) that uses the word *Tofú* or the term *Queso de habas de Soya* to refer to tofu. Address: Ing. Agrón., Director del Laboratorio Agronómico en la Inspección Nacional de Ganaderia y Agricultura.

325. Latham, F.P. 1916. Soy beans as a cereal: Soy beans a great crop for southern farmer. *Progressive Farmer* 31(8):254-55. Feb. 19. See also p. 286 (Feb. 26) and p. 342 (March 4).

• ***Summary:*** "The first mention of the soy bean in this country was in the early part of the 19th century; however, it attracted little attention prior to 1854, when 2 varieties were brought to this country from Japan by the Perry expedition. It followed that other varieties were found and introduced, among them that 'old standard,' the Mammoth Yellow, which came to our shores sometime previous to 1882. The success with Mammoth furnished an encouraging lead to our diligent research workers, resulting in the importation into this country by the Department of Agriculture of some 800 distinct varieties."

As a cereal, it is widely produced in Japan, China, Korea, and Manchuria. "By certain processing of the ground beans a milk is extracted which is not such a poor substitute for the real article; from this a cheese [tofu] is made that resembles in texture and nutrient value, our cottage cheese. Another product is a heavy, rich sauce [miso], similar to our peanut butter, which is consumed in large quantities. Soys occupy the place in the diet of these people that navy and lima beans do in our own, and are prepared in a like manner. They furnish the brown man his 'peanut.' By the simple process of soaking in salt water, then roasting they at once become a close competitor of the famous American delicacy."

"So far as I have been able to ascertain there is but one mill in the United States built for and operating exclusively on soy beans. The Pacific Oil mills, of Seattle, Washington, have build up a lucrative business in this line and only get foreign beans for crushing, its output of both oil and meal meeting a ready demand in the West. That such can be done profitably in the South is no longer a question. The fact has already been demonstrated by several cotton oil mills in eastern North Carolina... If these satisfactory results can be obtained in mills not constructed for the purpose of handling beans, it is entirely reasonable to suppose that specially constructed machinery will in time be installed that will further enhance the profits accruing from such operations."

A portrait photo shows F.P. Latham.

Note 1. This is the earliest document seen (Aug. 2011) that mentions Pacific Oil Mills of Seattle, Washington.

Note 2. This is the earliest of many articles seen (Aug. 2011) that likens tofu to cottage cheese, or roasted soybeans to peanuts. Address: Belhaven, North Carolina.

326. Sinclair, John F. 1916. Recent observations in the use of soy bean in infant feeding. *New York State J. of Medicine* 16(2):83-88. Feb. Summarized in J. of the Am. Medical Assoc. (1916) 66:841.

• ***Summary:*** "Dr. John Ruhrah of Baltimore [Maryland] to whom I am indebted for the above details [on the nutritional composition of the "Soy Bean" and "Soy Bean Flour"] was the first to draw the attention of the medical profession in this country to the use of the Soy Bean in infant feeding. In 1909, he presented his preliminary report before the Twenty-first Annual Meeting of the American Pediatric Society. Subsequently in 1910 and 1911, he published the results of further studies.

"My own experience with Soy Bean began two years ago. I first employed it because of its high protein and fat content as a weak gruel to replace barley water, tea, and other liquids, in gastrointestinal disturbances in an effort to check the weight losses which occur so frequently. In this, it has proved most efficient. I have the records of 74 cases in which I have used Soy Bean in the wards of The Babies' Hospital of Philadelphia during the past two summers. All of these babies were under three years of age and were ill with summer diarrhea: 32 were diagnosed gastro-enteritis; 28 enteritis; and 12 ileo-colitis.

"In 38 cases the condition of the patient on admission was noted in the records as varying from 'bad' to 'dying'; while in 36 cases it is recorded as from 'fair' to 'good.'"

Of the 74 cases, 44 improved, 11 were unimproved, and 19 died. Details on each case are given in a semi-table format. Address: M.D., Philadelphia, Pennsylvania.

327. Melhuish, William James. 1916. Manufacture of vegetable milk and its derivatives. *U.S. Patent* 1,175,467. March 14. 3 p. Application filed 1 June 1914.

• ***Summary:*** "Within the last few years experiments have been carried out with the idea of making soy milk more palatable... It is found that the 'nutty' flavor hitherto associated with soy bean milk is to a large extent due to the presence of a small quantity of soy bean oil which comes out in the casein extractive process... This objectionable flavor is got rid of by (1) either crushing the oil from the beans in making the meal and before using the meal for the casein extraction, or (2) crushing the whole bean into meal without rupturing the oil cells, and then, after the casein extraction is complete, separating the oil from it. For this purpose a cream separator or any well-known form of centrifugal separator or filter may be used, and the oil so separated can be utilized for other commercial purposes."

Further, the addition of "citric acid greatly improves the flavor of the milk and destroys the slight nutty, beany or mealy taste which may remain in the finished product." A culture of lactic acid bacteria must also be added to insure proper digestion of the milk.

The first claim states: "The process of making vegetable milk from soy beans crushed into a meal for the purpose of extracting the casein by stirring the said meal in hot water, filtering the solution from the residue, extracting the nauseous soy oil, adding... sesame oil and fatty acids to make an imitation cow's milk cream, emulsifying same so that the said fats will not rise by the law of gravity, adding dry crystallized powdered maltose with other sugars, and the necessary alkaline salts." In claim 4 the citric acid and lactic culture are added.

Note 1. This is the earliest English-language document seen (May 2005) that contains the word "beany" in connection with flavor problems in soybeans or soyfoods (in this case the milk).

Note 2. This is the earliest English-language document seen (Sept. 2002) that mentions an "imitation cow's milk cream" made from soymilk. Address: Lecturer in dietetics, Upper Parkstone, Dorset County, England.

328. Suzuki, Tozaburo. 1916. Process of making foods. *U.S. Patent* 1,175,839. March 14. 1 p. Application filed 2 Sept. 1913.

• ***Summary:*** In the process of making soymilk, after boiling, a centrifugal machine is used to removed the lees [okara, or pulp]. Then the milky liquid [soymilk] is condensed by evaporation into a dough-like mass, which is placed on flat trays, fully dried, then powdered or molded into any desired forms.

Note: The author, a citizen of Japan, was also an inventor and innovator in the manufacture of soy sauce. Address: No. 401, Jineishinden, Sunamura, Minami-Katsushika, Japan.

329. Carver, G.W. 1916. How to grow the peanut and 105 ways for preparing it for human consumption. *Tuskegee Institute Experiment Station, Bulletin* No. 31. 35 p. March.

• ***Summary:*** Contents: Varieties. Soil. Preparation. Fertilizers for peanuts. Planting. Cultivation...

Peanut butter is mentioned in several places: No. 3, Peanut Bisque. Add half cup of peanut butter (p. 10). No. 4, Peanut Soup... Add a cup of peanut butter (p. 10). No. 14, Peanut rolls number one, calls for 4 tablespoons peanut butter (p. 12). No. 41, Brown sauce, calls for 1 teaspoon of peanut butter (p. 20). No. 51, Peanut butter. Describes how to make it at home (p. 22). No. 59, Peanut butter sandwiches (p. 24). No. 67, Peanut cream (Professional way), calls for 1 teaspoon peanut butter (p. 25). No. 70, Peanut butter candy, calls for 2 tablespoons peanut butter (p. 26). No. 80, Peanut butter fudge, calls for 2 heaping teaspoons peanut butter (p. 28).

Note 1. Linda McMurry called this Carver's "three-fold" bulletin on the peanut. It was based on the results of earlier work.

Note 2. David Manber (1967, p. 125) states: "Carver published recipes for cooking peanuts for the home in 1913, but the original bulletin was in its sixth printing by 1916. It gave directions for growing, and 105 different ways of preparing the peanut for eating." Address: M.S. Agr., Director of the Station.

330. *Washington Post.* 1916. Uses of soya bean: Merits not sufficiently appreciated, food experts point out. April 3. p. 10.

• ***Summary:*** "The general value of the soya bean has not attracted the general attention it deserves, according to experts who are bringing it to the attention of the American people. The Japan Society Trade Bulletin points out that the secret of the soya bean is its universal usefulness. Almost more remarkable than the rise of the bean trade itself is the number of discoveries of the uses to which it can be put. The trades commissioner for the government of South Africa gave the following list of soya bean products: Vegetable (like marrowfat peas) soups, meat substitute, chocolate substitute, macaroni preparation, flour, artificial milk, coffee substitute, cheese [tofu], biscuits, [soy] sauce, meal for cattle, oil, oilcake, fertilizer, beancake.

"The oil extracted from the soya bean, he pointed out, was used in the manufacture of the following articles: Dynamite and high explosives, soaps, linoleum, rubber substitute, margarine, paints and varnishes, toilet powder, waterproof cloth, paper umbrellas and lanterns, salad oil, lubricating oil, lamp oil, preserving sardines, lard substitute."

331. *Prescriber* (*The*) (*Edinburgh, Scotland*). 1916. Synthetic milk. 10(115):79-81. April.

• ***Summary:*** "The development of synthetic milk on practical lines is due to the researches of Mr. W.J. Melhuish. His processes are protected by numerous patents worldwide. His earliest work was with the soya bean (*Soja hispida*). "Soya milk can be made profitably only in large quantities," but the process has been used successfully. The rights for the British Empire are owned by a company named Solac, Inc., 221 Tottenham Court Road, London, W. The rights in the rest of the world are still controlled by Mr. Melhuish of the Melco Laboratories, 56 Great Peter St., Westminster, S.W.

The process for making Solac from pale yellow soya beans is then described in detail. The soya oil, which is "nauseous to the taste," is carefully removed, and arachis oil or sesame oil are added and emulsified to make up the synthetic cream content. A certain strain of "lactic bacillus" is also added.

The author has tasted Solac and finds that it is very similar to good cow's milk. Mr. Melhuish has also developed and patented a process for making a synthetic milk from "ground-nuts or pea-nuts (*Arachis hypogæa*) in conjunction with soya beans." The new process is trade-marked "Melcom." These new milks have certain advantages over dairy milk. First, they are prepared in a way that ensures

freedom from the organisms of disease. Second, it can be made to a standard composition, and this can be changed to suit the user. Third, "its price is lower than that of cow's milk, and neither price nor quality will vary with the season of the year." The cost of production is said to be about 3 pence per gallon.

Note: *The Prescriber* is "A monthly journal dealing with therapeutics and treatment."

332. Beille, L. 1916. Le Soja [Soya]. *Gazette Hebdomadaire des Sciences Medicales de Bordeaux* 37(9):67-70. May 7; 37(10):73-76. May 21. [4 ref. Fre]

• ***Summary:*** "The question of the soybean (*haricot Soya or Soja*) reappears in our scientific and medical journals from time to time; the importance that this grain has acquired in the diet of the essentially vegetarian peoples of the Far East, and its richness in oil, albuminous materials, and minerals, have long called it to the attention of hygienists. Some authors have wanted to portray the soybean as an ideal food, a little jewel with a nutritive power comparable to that of eggs and meat; others have extolled the milk-like emulsion, obtained by grinding soybeans with water, as an advantageous substitute for cow's milk.

A factory, established on the outskirts of Paris, at Vallées (Seine), was able to supply French consumers with flour, cheeses [tofu], sauces, and many other soy-based preparations used in China and Japan.

"Leaving aside the inevitable exaggerations that accompany a product which is new to us, but which already has an established reputation elsewhere, it is necessary to recognize that the chemical composition of the soybean is of real interest. The Parisian clientele promptly abandoned the sauces, cheeses, and milk made from soya, but they appreciated the sprouts, which are still selling well as vegetables in the markets of Paris and its suburbs; soy-based flour and biscuits are very well adapted for use in diabetic diets."

The author then gives an overview of the soybeans from a medical viewpoint, including a brief history and review of worldwide production and nutritional studies. "In 1779 this plant was introduced to France and cultivated in Paris at the Jardin du Roi. Since that period, despite the laudable efforts of the National Society for Acclimatization, the cultivation of the soybean has not gone beyond botanical gardens and some experimental fields. Nor has it had any more success in England or Italy. However in North America it is cultivated in all the southern parts of the United States, but as a forage plant."

Through the merchant and importer Mr. A. Denis of Bordeaux, the author obtained two varieties of soybeans, one from Manchuria and one from Japan. He conducted a nutritional and microscopic analysis of these.

The author concludes that the soybean has great potential as both a food and an in industrial uses, where the precipitated protein for example, can be used in place of milk casein to make Galalith, artificial ivory, glue, and paper coating.

Part II of this article discusses more about the general nutritional value of soybeans. He then discusses soy flour (*farine de soja;* he has a sample produced by the factory at Valées), soy milk (*lait de soja*), tofu (*fromage de soja*), shoyu and various soy-based sauces (such as *Tao-Tjung* of China, or *Touong* of Indo China).

"In summary the soybean is of great interest from the industrial point of view. The place that it occupies in the oil mills of Europe is already important... Its oil, for food or industrial uses, and its by-product, soy casein, are likely to receive a host of diverse applications. On the other hand, the future of the soybean as a food substance in Europe would seem to be more modest: its disagreeable taste removes it from daily consumption and enables it to be used only as an ingredient in mixtures."

"If, in Europe, with a few reservations, we can include soya in the diet of healthy people, then there will be even stronger reasons to give it to sick people. At first glance soya, which is rich in fats and protein, with little or no carbohydrates, appears to be a food of choice for diabetics. And we must recognize that it has attained the greatest success among these sick people. But, here again, it would be appropriate to give soya in the form of rusks/zwieback (*biscottes*), or mixed with vegetables or fruits; if it is not tolerated by sick people in these forms, then we should not hesitate to stop using it." Note: In Europe, rusks are widely given to sick people, like chicken soup in the USA. Both are considered to be good medicinal foods that are easy to digest. Address: Professeur â la Faculté de médecine et de pharmacie de Bordeaux.

333. *Advertiser* (*The*) (*Adelaide, South Australia*). 1916. Milk substitute. July 3. p. 6.

• ***Summary:*** "The South Australian Trade Commissioner in London, writing on May 18, said:–'I have been shown a liquid manufactured from soya beans, which in appearance resembles milk, and which has, I understand, many of the chemical properties usually found in milk. The finished product inspected was the outcome of the investigations of a company that has a manufacturing plant installed in London, and that is hopeful of working up an industry. At present the product is undergoing an examination by one of the leading American houses in London, with a view of testing, from a commercial standpoint, the advisability of placing, it on the market. It is through their courtesy that I was permitted to see a sample, and I have also been promised full particulars regarding any further developments in this alleged discovery, and will watch the progress of the investigations with interest.'"

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "milk substitute" to refer

to soymilk.

334. Johnson, Nelson Trusler. 1916. Manufacture of bean milk at Changsha. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 19(183):468-69. Aug. 5.
• ***Summary:*** "A firm composed of Chinese from the Province of Chekiang has recently opened a small factory at Changsha for the manufacture of milk from beans. This milk has long been known to the Chinese under the name of *to fu chiang* [soy milk] or bean-curd sauce. This is not to be confused with the product known as *chiang yu*, a fermented sauce made from beans which is well known as the soy of the Japanese and as one of the constituents of the famous sauces of Europe [such as Worcestershire sauce].

"Bean milk is made from small yellow beans, the same variety from which the Chinese bean curd [tofu] and *chiang yu* or soy [sauce] are made. The process appears to be a very simple one. The beans are soaked and then crushed between two stones. The crushed mass is allowed to run off into a tub and is then strained through cheesecloth and diluted with water and boiled. After boiling, it is again strained and the white milk run off into bottles and sold to the factory's customers." Note 1. The milk is first filtered when cold, before it is heated or boiled.

"An analysis of the bean-curd milk [soy milk] shows that it has a specific gravity of 1.020 and a fat content of 3.125 [percent], contrasted with a specific gravity of 1.029 and a fat content of 3.9 [percent] for good average cow's milk in America.

"No complicated machinery: The factory is a very small one. The proprietors informed me that they did all their work at night, in order to have fresh milk for delivery the following morning. They begin their work at about 10 o'clock. The milk is ready and bottled by daylight, when it is sent out by coolie to the various customers." Note 2. See photo in Piper & Morse 1923, p. 231.

"The room where the milk is made shows that no complicated machinery is necessary in the manufacture of the milk. At one end of the room are found two of the small stone mills in which the beans were ground. Large numbers of bottles were arranged on a rack near the wall, clean and ready to receive the morning's supply of milk. At the opposite end of the room there were three wooden [sic, metal] vats built into a concrete foundation, which proved to be a furnace. The prepared product is poured into these vats and boiled, the furnace being supplied with fuel from a hole in the outside wall. On either side were two earthenware jars into which the boiled product is poured and through which it is allowed to run through stop cocks into the bottles.

"The manufacturers of this milk seem to be endeavoring to conduct their factory along hygienic lines. They invited inspection of their factory and expressed a desire to carry out the suggestions made by the inspecting physician. These suggestions related principally to the sterilization of the bottles before allowing the milk to run into them. The whole room was very clean.

"Possible opening for milk bottle manufacturers: The manufacture and sale of this milk appears to be a new enterprise in Changsha, although I am informed by the natives of Shanghai and its neighborhood that it is an old and well-known product in that part of the country. To the eye the product looks exactly like unskimmed cow's milk. It has an odor of raw beans and is said to be not unpleasant to the taste. I am informed that a member of the family of Li Hung Chang is now engaged in manufacturing the various products of beans in Paris, his factory turning out, among other things, this bean milk.

"The product is very cheap compared with cow's milk. The factory undertakes to supply one pint each morning for approximately 50 cents gold a month. If this industry proves a success, manufacturers of milk bottles and patent milk-bottle tops should find a market for their wares here at Changsha, if they could be brought in cheaply... The milk bottle manufacturer will, of course, have to compete with the enormous numbers of empty bottles discarded by families who use aerated waters and wines. These bottles are sold by the servants, and are purchased for use in just such factories."

Note 3. This is the earliest document seen (Dec. 2006) describing the selling of soymilk in bottles in China. Changsha is in southeastern China, far to the southwest of Shanghai. Note 4. Consul Johnson seems to be a careful and well informed observer and reporter. Address: Consulate, Changsha, China.

335. Friedman, Jacob. 1916. Soy-bean products and method of preparation. *U.S. Patent* 1,194,495. Aug. 15. 2 p. Application filed 17 Dec. 1914.
• ***Summary:*** See author's British Patent No. 121 of 1914 titled "Improvements in or connected with the treatment of soya beans and the production of a new or improved food preparation therefrom." Address: Chicago, Illinois.

336. *Washington Post.* 1916. Beans milked in China: Beverage made from seed is not unlike cow's product. Aug. 20. p. MT5.
• ***Summary:*** "Consular advices report that a firm composed of Chinese from the Province of Chekiang has recently opened a small factory at Changsha for the manufacture of milk from beans. This milk has long been known to the Chinese under the name of fa chiang [sic, to fu chiang] or bean-curd sauce" [sic, soymilk].

This article contains long excerpts from: Johnson, Nelson Trusler. 1916. "Manufacture of bean milk at Changsha." *Commerce Reports* (Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce,

Department of Commerce) No. 183. p. 468-69. Aug. 5. Johnson is the U.S. Consul at Changsha, China.

337. Golby, P.J. 1916. Synthetic milk. *Pharmaceutical J. and Pharmacist* (*London*) 97(2,785):214. Aug. 26. [5 ref]
• ***Summary:*** "A 'synthetic' or 'vegetable milk' has recently been introduced to the London market–under the trade name of 'Solac.' For this the following advantages are claimed: That its source and the conditions under which it is prepared practically guarantee its freedom from contamination with dirt or disease organisms; that it is equal in nutritive value to cow's milk; and that its price is little more than half that now generally charged for the latter.

"I recently bought a bottle of this milk, and 'took it home.' In appearance it is scarcely distinguishable from a good cow's milk; the flavour is pleasant, at first similar to ordinary milk, but leaving a somewhat nutty, in no way disagreeable, after-taste."

"I have heard that it may prove of some value as a diet for infants and invalids, on account of the absence of any tendency to form indigestible clots of curd in the stomach; but this is not claimed in the circular accompanying the milk.

"The actual source of this so-called 'synthetic' milk is not stated, but it is assumed to be an emulsion prepared from the Soja bean (*Soja hispida*)."

338. *Boston Daily Globe.* 1916. Beans milked in China: Beverage made by the Orientals is not unlike cow's product. Aug. 27. p. 33.
• ***Summary:*** This article is quite similar to, but shorter than, the one which appeared in the *Washington Post* one week earlier (Aug. 20. p. MT5) under the same title.

339. Meyer, Frank N. 1916. Re: Loneliness, depression, and hardships. In: Letters of Frank N. Meyer. 4 vols. Compiled by Bureau of Plant Introduction, USDA. 2444 p. See p. 2195, 2197. Letter of 1 Sept. 1916 from Hotel Seward, Portland, Oregon, to P.H. Dorsett.
• ***Summary:*** "Last night I landed here in Portland [Oregon], having come direct from Mandan [Experiment Farm, North Dakota] where I spent a night and a day and where [at Mandan] I found that a remarkable progress has taken place since you and I were here in Sept. 1912."

"And you are just a little bit surprised about I feeling lonely! My, Mr. Dorsett, there are times that my lonesomeness may destroy me. I wish I could tell you face to face some problems we go through, but I can assure you that the specter of a lonely old age looms up larger and larger and the spectacular office of an active explorer does not hold it down any longer!"

In a follow-up letter to David Fairchild dated 19 Sept. 1916 (written from Seattle, Washington) Meyer writes: "I am thankful to you for your interest in my recent illness, but I feel quite all right now, except of course that I have a touch of what the Germans and Swiss call "Heimweh" [homesickness]. It seems that it created almost somewhat of a sensation in the Office when I wrote that I felt lonesome. Well, that's not crime! Even wanderers like I, we find it hard to break ties of friendship! And the prospect of having to live again for several years among a race of people with whom one never becomes familiar, after having enjoyed the pleasure of our own white man's civilization for several months, well, that makes one feel lonesome. If I knew I could find a congenial white assistant in China I would feel better..."

"My illness was caused by being tired and then becoming over-heated in striking an unexpected hot wave. I got feverish, lost appetite almost entirely, could not sleep any more and for a few days I was in that strange borderland where sanity has slipped away and where insanity is entering. It is a dangerous, delirious borderland, and I really was afraid I would become seriously ill. The visions I have had are too strange to describe them; just fancy yourself visiting this early a million of years ago when Pithecanthropus erectus lived in small families and Aeantropus and all the strange beasts were all around. Well, I went thru it and marvelled. When I began to get better the animals and fishes went away and landscapes and forests came in succession but not landscapes of today, all was way, way back. I cannot explain all these matters!"

Location: University of California at Davis, Special Collections SB108 A7M49. Address: USDA Plant Explorer.

340. Ritchie, D.F. 1916. Synthetic milk. *Pharmaceutical J. and Pharmacist* (*London*) 97(2,759):244. Sept. 2. [1 ref]
• ***Summary:*** The author is writing in response to the article by Mr. F. Golby in the Aug. 26 issue of this Journal. "I have not seen the preparation to which he refers [Solac], but some years ago I experimented a good deal in trying to make a milk from Soya beans. This is quite easily done by grinding up the raw beans with a small proportion of water at a time, then adding sufficient water to make a uniform emulsion. A quite palatable milk is the result, which will keep good for several days." The author did not heat or cook the milk he obtained, believing that some "ferment" in the beans might be destroyed. When his raw soymilk was consumed, he observed that "it causes very great flatulence and disturbance. If boiled or used in cooking this effect would be minimised to a certain extent." This should "be a subject for careful investigation before being administered in a raw state to infants or invalids." Address: Ph.C., Newport, I.W. [Isle of Wight].

341. *Atlanta Constitution* (*Georgia*). 1916. The future of the domestic cow has been jeopardized by certain Japanese savants. Sept. 10. p. A12.
• ***Summary:*** "Owing to the scarcity of cattle in that country and the consequent scarcity of milk, these investigators of

the secrets of nature have had recourse to the soja bean, and, after treating it with water, sugar, and phosphate of potash, they have been able to produce a compound that is scarcely distinguishable from fresh milk."

342. *Pharmaceutical J. and Pharmacist* (*London*). 1916. Synthetic milk. 97(2,762):297. Sept. 23. [1 ref]
• ***Summary:*** This is a long summary of an article that first appeared in the *Prescriber* (vol. x, No. 115, p. 80) and which was in response to two earlier articles in the *Pharmaceutical J. and Pharmacist* (Aug. 26 and Sept. 2). "The development of synthetic milk on practical lines is due, it appears, to the researches of Mr. W.J. Melhuish, who was devised several processes which are protected by numerous patents all over the world. His earliest work was on the soya bean. Soya milk can only be made profitably on the large scale."

A detailed description of the process for making Solac from pale yellow soybeans is given. After soybeans are ground to a coarse flour and stirred vigorously in an alkaline water, the milk is filtered from the undissolved residue [okara]. The "next process is the separation of the oil; this requires great care, as the oil is nauseous to the taste, and, however carefully it is removed, will still leave a flavour in the milk. Certain oils are then added, such as arachis and sesame oils, to make up the synthetic cream content." Some sugar (dextrin) and the remaining salts are then added. "Emulsification is then completed in a vacuum pan, which gets rid of the greater part of the flavour and whitens the milk. A special strain of lactic bacillus is added to give the necessary biological activity, and the product is pasteurised [cooked] and cooled. The result is a rich, milk-like liquid, which tastes very much like cow's milk, with a slight, though not unpleasant, nutty flavor. In composition it is somewhat richer than cow's milk, the total solids being about 13 per cent., as against 11.5 in an average specimen of cow's milk." It remains fresh 24 hours longer than dairy milk and has a more creamy and rich consistency. "As an addition to tea or coffee it is, if anything, better than ordinary milk. A milk on similar lines is made from peanuts as the source of albumin, casein, and fat; it is only necessary to add the sugar, the salts, and the lactic ferment. The name given to this peanut milk is 'Melco,' and the product is said to be about the last word in synthetic milk production."

343. Piper, C.V.; Morse, W.J. 1916. The soy bean, with special reference to its utilization for oil, cake, and other products: Soy-bean meal as human food (Document part). *USDA Bulletin* No. 439. 20 p. Dec. 22. See p. 11-13. [2 ref]
• ***Summary:*** "The meal remaining after the oil is extracted from Mammoth soy beans is bright yellow in color when fresh and has a sweet, nutty flavor. The use of the meal as flour for human food has become an important factor in several European countries during the last few years and to some extent in America as a food of low starch content."

"In England, manufacturers have placed on the market a so-called 'soya flour,' which is 25% soy-bean meal and 75% wheat flour. This soya flour is being used by bakers in making a soy bread which is very palatable and may be found on the market. A similar product has been manufactured in Amsterdam [Netherlands] for 25 years. 'Soya biscuits' are also manufactured from this flour and constitute an article of export from England. German millers have been experimenting to some extent with soy meal in making brown bread by mixing with rye flour... Soy-bean flour enters largely as a constituent in many of the so-called diabetic breads, biscuits, and crackers manufactured as food specialties.

"As a human food, soy-bean flour has been used principally in the U.S. as a special article of diet and is sold by a number of food companies manufacturing special foods. Extensive tests are being conducted by the USDA with soy-bean flour in the making of bread. The flour or meal can be successfully used as a constituent for muffins, bread, and biscuits in much the same way as corn meal. In these various food products about ¼ soy flour and 3/4 wheat flour have been found to be the proper proportions." Note: This is the earliest document seen (Sept. 2004) which clearly states that soy-bean flour has been used to make bread in the USA.

"Although soy-bean milk has been used in both the fresh and condensed form and in the manufacture of cheese [tofu] in Japan and China for centuries, it only recently has been considered of possible importance in the United States. Soy-bean milk, owing to its food value and for sanitary reasons, is said to be of the greatest importance for cooking purposes and can be used by bakers, confectioners, and chocolate manufacturers. In Asiatic countries the whole bean is utilized in the manufacture of the milk, but quite recently it has been discovered that soy-bean meal, after the oil is extracted, is fully as useful for milk purposes as the whole bean.

"If the milk from the soy bean is used in the manufacture of products as a substitute for milk, the labels of such products should indicate that the substitution has been made, otherwise it would constitute adulteration under the food and drugs act.

"In addition to its uses for flour and milk, the soy bean can be prepared as human food in numerous ways. The green bean, when from three-fourths to full grown, has been found to compare favorably with the butter or Lima bean... The soy bean has been utilized not only in the U.S. but in European countries as a substitute for the coffee bean. When roasted and prepared, it makes an excellent substitute for coffee." Address: 1. Agrostologist in Charge; 2. Scientific Asst. Forage-Crop Investigations, USDA, Washington, DC.

344. Combe, Ad. 1916. Comment se nourrir en temps de guerre? Troisième partie [Where can one find proper nutrition in time of war? Part III]. *Bibliothèque Universelle et Revue Suisse* 84:446-73. Dec. See p. 450-51. [Fre]

• ***Summary:*** Vegetable milk (*Le lait végetal*)–For a long time in infant medicine we have used Lahmann's vegetable milk (*Le lait végetal de Lahmann*) which is nothing more than concentrated almond milk, sterilized and preserved in tin cans. It was formerly widely used by German pediatricians to prepare an artificial milk. But its high price does not recommend it as a war food.

Soymilk (*Le lait de soya*)–We will not say as much about other artificial milks, widely used in Germany since the war, as about that prepared from soybeans (*fève de soya*). But there is no need to get excited about a German discovery; soymilk comes from Japan where it has been used for a long time to replace natural milk; it has been used only rarely in France. It is prepared as follows: Soybeans are cooked until the liquid becomes white [sic], then sugar is added along with phosphates and potash [potassium]. It is then condensed into a creamy liquid analogous to condensed milk; this is soy butter [sic]. By diluting it with water, one obtains an artificial milk which somewhat resembles regular milk in taste and appearance.

Apparently inspired by this [Japanese] method, soymilk has been prepared in Germany for some years in ever larger amounts–so much so that in 1913 Germany imported 125,448 metric tons (tonnes) of soybeans a year, from which they obtained that year 18,000 tonnes of soy oil and soymilk. This artificial milk, it must be said in passing, is the ideal milk for diabetics, for whom it is suited because of its high content of fats and protein and its low content of carbohydrates. A table show the content of protein, fat, carbohydrates and calories in whole soy flour, soymilk, and cow's milk.

Soymilk is used with great advantage is times of war. Because of its high fat [vegetable oil] content, it can replace butter in the diet, to which it adds calories, for it is easy to digest and inexpensive. Address: Prof. of children's clinical studies, Univ. of Lausanne (Professeur de clinique infantile à l'Université de Lausanne).

345. Williams, C.B. 1916. Soy-bean products and their uses. *North Carolina Agricultural Experiment Station, Circular* No. 34. p. 1-7. Dec.

• ***Summary:*** Contents: Introduction. First commercial crushing from domestic beans (started on 13 Dec. 1915 by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina). Soy-bean oil. Uses for the oil. Soy-bean meal. Composition and exchange value of the meal. Prices paid for beans by the oil mills. Soy-bean oil industry in England, Manchuria, and Japan. Importation of oil. Soy-bean meal as feed. Soy beans and products for human food.

The article begins: "In order that any people may maintain their soils in the highest state of productivity in an economical way it will be necessary that proper systems of crop rotation are used, and in these rotations it will be necessary to bring in leguminous crops at as frequent intervals as practicable. For North Carolina conditions one of the crops of this nature that may be used to good advantage in all parts of the State is the soy bean. If properly handled, this crop may be used as the means of adding to the productivity of the soils as well as to increase the net returns from the farm. Recently there has been a marked interest throughout this State and the South in the growing of soy beans." A "new outlet for the beans has developed from the crushing of the seed by a number of oil mills of the State..." The spread of the boll weevil should lead to increased interest in the soy bean.

"This crop was introduced into the State something like thirty-five years ago, yet very little was heard of it, outside of very limited areas, until quite recently, when a campaign was begun to induce the cotton oil mills of the State to use beans for crushing purposes in the same general way that cotton seed had been used for many years before. This campaign not only opened the eyes of the oil crushers to the possibilities of the soy bean in a commercial way, but of the farmers, also, to the great opportunities of this crop.

"During the spring of 1915 farmers, particularly in the Eastern part of the State, were casting about to find a crop or crops that might be substituted, satisfactorily, for cotton, as the price of this latter crop during the previous fall had been, in many cases, below the cost of production. Many farmers increased their acreage of soy beans, and as a result of this increase at least a million bushels or more of beans were produced last year." Something like 80,000 to 100,000 bushels of soy beans were used by the cotton oil mills of the State during the past fall, winter, and spring.

"The first commercial manufacture of soy-bean oil and meal from domestic soy beans in the United States was started on December 13, 1915, by the Elizabeth City Oil and Fertilizer Company of Elizabeth City, North Carolina.

"From the start this mill operated night and day solely on soy beans until it had crushed it supply of about 20,000 bushels. This mill was able to crush about twenty tons during each twenty-four hours...

"It is understood that before the mill had ground a single bean they had contracted their entire output of oil to one of the leading manufacturers of the country at fairly reasonable prices. It, too, had no difficulty in selling its entire output of soy-bean meal, most of it going to a fertilizer manufacturer. From a ton of the beans this mill was able to secure something like 32 to 35 gallons of oil and about 1,650 pounds of meal... Other oil mills in North Carolina that crushed more or less soy beans during the past season were those located at New Bern, Hertford, Winterville, Washington, Wilson, Farmville, Lattimore, and at a few other places."

"Uses for the oil: At the present time the oil is used in this country chiefly in the manufacture of soaps, varnishes, paints, enamels, linoleums, and water-proofing materials. It has entered, also, to some extent in the manufacture of edible

salad oil and butter substitutes" (p. 3). "Soy-bean meal: The meal secured from crushing the beans is the most valuable product and will have the widest usefulness. That secured from the crushing of yellow-colored beans is of a bright yellow color... Meal, too, that has been treated with ordinary solvents, employed for this purpose to remove the oil, is of a brighter color than are those meals from which the oil has been removed by heating and pressure. The oil, however, secured by a solvent process would be of a darker color... The soy-bean cake secured by expression methods, has a pleasant taste, not unlike malted milk, and when ground into meal may be used, at the present time, chiefly for feeding to livestock or for fertilizing purposes. The meal as a feed is highly concentrated and nutritious, and all kinds of stock seem to relish it when fed to them properly. It should not be fed in large quantities for any great length of time, because of its highly concentrated nature. As a fertilizer it acts satisfactorily. Much of the meal produced by the oil mills of the State during the past year seems to have been sold, without any difficulty, to manufacturers for the making of mixed fertilizers."

"... during 1913 and 1914 the British Oil Mills, located mainly at Hull, England, paid from $1.00 to $1.17 per bushel for Asiatic beans. During 1915 the price paid at the mills at Hull varied from $1.04 per bushel in January to $1.82 per bushel at the end of the year.

"In England, the oil from the soy bean is extracted largely by a secret process owned by an oil extracting company of Hull. By this process the seed are ground finely and are then treated directly by means of a solvent, which is thought to be benzine. Afterwards the oil is removed from the solvent by distilling off the latter, the solvent being used over and over again in the extractive process."

"By use of gasoline extraction the whole of the oil may be secured, the oil being of a clear, pure color, and hardly bearing any resemblance at all to the dark, muddy oil secured by the old hand-press method.

"The machinery used by the larger operators of England, Continental Europe, as well as of Japan, Korea, Manchuria, and China, is of Anglo-American manufacture, which is the kind ordinarily used in the expression of oil from cotton seed. In 1910 Stewart and Chard secured patents in England for a special machine which was particularly adapted for breaking up the beans. This machine has been very useful in solving some of the difficulties experienced in the soy-bean crushing industry in England.

"In England soy-bean oil for general purposes is not refined, as is cotton-seed oil in America, by the use of caustic soda, but by means of sulphuric acid and fuller's earth.

"Processes of refining soy-bean oil for edible purposes have been devised, but these, like those used for extracting the oil from the seed, have been kept secret; but they are thought in most cases to be by means of superheated steam."

"Importation of oil: In this connection it may be of interest to know that for the five years ending with 1916 there were imported into this country more than 174,000,000 pounds of soy-bean oil, which represented crushings amounting to more than 12,000,000 bushels. Of these, 47.6 per cent came through the port of New York; 36.1 per cent through Seattle [Washington]; 9.6 per cent through San Francisco [California]; 2.2 per cent through Philadelphia [Pennsylvania]; 1.6 per cent through Boston [Massachusetts]; 1.1 per cent through Chicago [Illinois]; and 1.3 per cent through all other ports of the United States. In 1916, 75 per cent of the importations came through the ports of Seattle and of San Francisco, the chief port of entry being Seattle, with 62.9 per cent of the total importation. During 1916 more than 98,000,000 pounds of soy-bean oil came in from other countries, 99.9 per cent of the total coming from Asia. Of the total amount imported from Asia, almost 72 per cent were shipped from Japanese ports. The total importations during 1916 wore valued at little more than $5,000,000."

"Soy beans, before crushing, and the meal secured by crushing, seem to have great possibilities in the way of different human foods. They are not only rich in food nutrients, but when properly prepared make very appetizing products...

"In this country some enterprising manufacturers are putting out prepared pork and beans, part of all of the beans being soy beans. A regular preparation of these which the writer has tried proved to be of as high grade as could be desired...

"Muffins made from soy-bean flour have been found to be very palatable [a recipe is included]...

"The chief value of the flour lies in its high content of protein (muscle-forming material) and mineral matter, one pound of it containing as much protein as two pounds of meat. Bread made from the soy-bean flour in Germany, where it is being largely used at the present time, secures about the same amount of food value as six dollars spent for meat. The flour seems to have especial value in the preparation of foods for delicate infants which have difficulty with digesting cows' milk, and for persons suffering with diabetic troubles." A diagram (p. 7) shows "Products secured from the crushing of a ton of soy beans by the oil mill, and the material made from these products." One ton yields 1,650 lb of meal, 32 gallons of oil, and 120 lb of trash and moisture. From the meal one can make food (human and animal), fertilizer, and celluloid. The human food can be macaroni, flour, sauce, milk, cheese, coffee, and lard. From the oil one can make food (cooking oils, butter [margarine?]), paints, enamels, blown oil (linoleum, India rubber substitutes, varnishes), and soap stock (soaps, glycerine). Note: This is the earliest English-language document seen (August 1996) that contains a diagram of this type. Address: Chief, Div. of Agronomy, North Carolina Agric. Exp. Station.

346. **Product Name:** Soy Lac (Soybean Milk Powder).
Manufacturer's Name: J.A. Chard, Soy Products.
Manufacturer's Address: 263 W. 12th St., New York City, New York.
Date of Introduction: 1916-1917.
New Product–Documentation: This is the earliest known commercial soymilk product made in the United States, and the earliest known powdered or dry soymilk made in the USA.

Piper and Morse. 1916. USDA Bulletin No. 439. p. 9. "The soy bean, with special reference to its utilization for oil, cake, and other products." "An industry which promises to be of importance in a further utilization of the soy bean is the manufacture of 'vegetable milk.' At the present time a factory in New York State is being equipped for this purpose. The development of this new enterprise will depend primarily upon the demand created among different industries not only for the milk, but for the flour or meal [okara] remaining after the milk is manufactured, which is valuable either as stock feed or for human consumption." Note: No specific mention is made of the company name, or address, or its owners.

Stoddard, William Leavitt. 1917. "Soy: The coming bean." *Good Housekeeping* 65:77, 126-28. Sept. The American housewife probably does not care "that there is a factory in New York is making a 'vegetable milk' of soy beans; the "flour or meal [okara] which remains after the milk is manufactured is valuable both as a stock for feed and for human consumption;..."

Kempski. 1923. *Die Sojabohne.* p. 20. In 1916 in the state of New York, a large establishment for the production of soybean milk was being created.

Horvath. 1927. *The Soybean as Human Food.* p. 47 (footnote). "In the United States some very good breakfast foods and an excellent finely powdered soybean milk powder "Soy Lac" is made by J.A. Chard, Soy Products, 263 W. 12th St., New York City, who has been experimenting for some time with soybeans." Page 62 states: A fine soybean milk powder, called *Soy Lac,* has recently been prepared in America by Chard.

New York City, City Directories. 1915 and 1918. No listing for this company.

Shurtleff & Aoyagi. 1979. Soymilk Industry and Market. p. 10, 23-24. This was probably America's first commercial soymilk produced by a Caucasian-run company.

347. Caspari, Charles, Jr. 1916. A treatise on pharmacy for students and pharmacists. 5th ed. Enlarged and revised. Philadelphia and New York: Lea & Febiger. 929 p. Illust. Index. 24 cm.
• ***Summary:*** Chapter 21 is an introduction to and history of the major pharmacopoeias of the Western world. The first was the London Pharmacopoeia, established in 1618, followed by that of Paris [France] in 1639, and of Edinburgh [Scotland] in 1699. The first truly national standard was that of France, issued in 1818. The first United States Pharmacopoeia was established in 1820. A new revision is published every ten years.

Chapter 12, titled "Classification of the natural products used in pharmacy" includes a discussion of "Fats" (p. 217-25), which begins: "The fats used in pharmacy are derived mainly from the vegetable kingdom..." These include expressed oil of almond, linseed oil, olive oil, sesame oil, and oil of theobroma (p. 220). Details are given on each (p. 223-25).

In chapter 26, titled "Emulsions" is a table titled "The official emulsions." The first of four recognized by the Pharmacopoeia (U.S.P.), is Emulsum Amygdalæ or Emulsion of Almond (p. 372-73) "Made by triturating sweet almond, acacia, and sugar with water." The "Special remarks" on this (p. 373) state: "Emulsion of almond is also known as *milk of almond,* and should always be made fresh when wanted."

Also discusses: Fluidextractum Cannabis, also known as Fluidextract of Hemp (p. 331; The Pharmacopoeia now recognizes both the American and Indian varieties of hemp under the official title Cannabis; the fluidextract can be made from either variety, but the name of the variety used should be indicated on the label. Not more than 0.03 mil. of fluidextract per kilogram of body weight shall be required to produce incoördination when given to dogs). Almond oil, expressed from sweet almonds (p. 752). Linseed oil (p. 756). Sesame oil (p. 757; also known as benne oil or teel oil).

Petroleum products (p. 763-65). Closely allied to the fats but chemically entirely distinct, these are mixtures of hydrocarbons. They are recognized in the Pharmacopoeia by the names Paraffin (also: Hard Paraffin), Petrolatum (also: Petroleum Jelly, Soft Paraffin, Vaseline, and Cosmoline), Liquid Petrolatum (also: Mineral Oil), and White Petrolatum (also: White Petroleum Jelly, White Vaseline). "Purified Petroleum Benzin," the commercial product usually designated simply as "benzin, is a mixture of hydrocarbons, chiefly pentane, C_5H_{12} and hexane, C_6H_{14}.

Note: This is the earliest document seen (July 2002) that mentions "hexane." Charles Caspari, Jr. lived 1850-1917. Address: Prof. of Pharmacy in the Dep. of Pharmacy, Univ. of Maryland, Baltimore (Maryland College of Pahrmacy 1841-1904).

348. Cooper, Lenna Frances. 1916. The new cookery. 3rd ed. Revised and enlarged. Battle Creek, Michigan: The Good Health Publishing Co. 412 p. 22 cm.
• ***Summary:*** This is a Seventh-day Adventist vegetarian cookbook. Contents: 1. Food values. 2. The art of preparing foods. 3. Beverages. 4. Cereals. 5. Fermented breads. 6. Unfermented breads. 7. Sandwiches. 8. Dairy products. 9. Cream soups. 10. Plain soups. 11. Meat substitutes and entrees. 12. Macaroni and Italian pastes. 13. Eggs. 14. Gravies and sauces. 15. Vegetables. 16. Salads and relishes.

17. Toasts. 18. Fruit desserts. 19. Custards and cold desserts. 20. Frozen desserts. 21. Pastry and pies. 22. Cakes. 23. Cake fillings and frostings. 24. Hot puddings. 25. Sauces for puddings. 26. Canning and preserving. 27. Special dishes for invalids. 28. Balanced menus."

In the Foreword, the author states: "We are indebted to Professor Ivan Pawlow [Pavlov], of Russia, for demonstrating the relation between appetite and digestion." "Many food reformers and faddists have attempted to prepare wholesome foods but have neglected the almost equally important requirement–palatability." "The author wishes to express her indebtedness to Dr. and Mrs. John Harvey Kellogg, of the Battle Creek Sanitarium, who first inspired her with a love for the study of foods and their scientific preparation and who have since been constant sources of help and encouragement. She would also acknowledge her indebtedness to Miss Clara B. Lambert, who for several years was associated with the author and has contributed to this volume both by helpful suggestions and by numerous recipes."

Soy is not mentioned in this Seventh-day Adventist vegetarian cookbook. The following commercial products are mentioned: Minute Brew (cereal coffee [coffee substitute], p. 32). Cereal coffee (p. 33). Kaffir Tea (p. 33). Sanitas Health Koko (p. 33). Yogurt buttermilk (p. 33-34). Sterilized bran (p. 44). Gluten mush (p. 47). Graham bread (p. 54). Bran bread (p. 62). Bran gems (p. 76). Protose (p. 129-35). Gluten flour (p. 136). Nuttolene (p. 138-41). Peanut butter (p. 144-145). Nut chops (p. 144, with peanut butter). Savora (p. 145). Granola (p. 147). Mock turkey (p. 152). Salted almonds (p. 300). Strawberry gelee (p. 306, with Vegetable Gelatin and egg whites). Yogurt ice cream (p. 307). Meltose dressing (p. 361). Hot Malted Nuts (p. 386. Pour 3/4 cup boiling water into ¼ cup dry Malted Nuts, stirring while so doing. Add salt if desired. It is ready to serve at once. Calories in the recipe: 34 from protein, 88 from fat, 61 from carbohydrate. Total 183. Note: Malted Nuts was a dry powder or meal. The resulting beverage was almost certainly a mixture of peanut milk and almond milk). Almond ice (p. 389, with "almond butter"). Gluten bread (p. 390). Gluten puffs (p. 391).

Note: This cookbook calls for abundant use of dairy products (milk, cream, butter), eggs, and sugar (up to 2 cups in some recipes). Address: Director of the Battle Creek Sanitarium School of Home Economics, Head Dietitian of the Battle Creek Sanitarium [Battle Creek, Michigan].

349. Fuerstenberg, Maurice. 1916. Die Einfuehrung der Soja, eine Umwaelzung der Volksernaehrung [The introduction of soya, a revolution in the food of the people]. Berlin: Paul Parey. 30 p. Foreword by Dr. Gottlieb Haberlandt, Director of the Plant Physiology Institute, Univ. of Berlin. [5 ref. Ger] Address: Germany.

350. Laxa, Otakar. 1916. Rostlinné mléko, levna nahrazka mleka kravskeho [Vegetable milk, an inexpensive substitute for cow's milk]. *Zpravy Laktologickeho Ustavu* (*Dairy Institute News*) (*Prague*) No. 5. 10 p. [26 ref. Cze; ger]
• ***Summary:*** According to Horvath (1927, p. 65) this article recommends the following procedure: "100 gms. of good yellow or green soybeans washed in cold water until the water is absolutely clear. After the cleaning soak for 24 hours in an amount of cold water just sufficient to cover them. After the beans become soft, mash in an almond-mill of the kitchen type. Pour the resulting milk mass in a bottle with a capacity of 2 liters to which are added 900 cc. of cold water, 10-15 gms. of cane sugar, 1 gm. of sodium chloride and one drop of essence of fresh hay, in order to cover the beany taste and smell with an aroma similar to cow's milk. Close the bottle and shake the contents from time to time. Filter the liquid through a clean linen bag after 4 hours so the residue is pressed out. In this way about 750 cc. of soybean milk are obtained.

Note: This is the earliest document seen (Jan. 2010) that contains a detailed description of how to make soymilk at home or in a typical European kitchen.

The chemical composition (without adding the values for cane sugar and sodium chloride) is: water, 94.85%; fat, 1.00%; protein, 1.78%; reducing sugar, 0.11%; galactanes and other soluble carbohydrates, 2.02%; ash 0.34%; dry substance, 5.15%. The addition of 10 gms. cane sugar and 1 gm. table salt to 1 liter raises the amount of dry substance to about 6% and also the ash content and the nutritive value. The food value of such soybean milk is estimated by Prof. Laxa to be equal to about one-half of the food value of whole cow's milk, or two-thirds the value of skimmed milk. The cost of one liter of this soybean milk in Prague in 1916 was estimated by Laxa to be two and a half cents (Mex.) if made at home." Notice that no mention is made of cooking the soymilk!

Horvath (1927, p. 60) continues: "According to Prof. Laxa, the fresh soybean milk shows a slight alkaline reaction. 'At 12 degrees of acidity of Soxhlet-Henkel it coagulates on boiling. The fresh soybean milk gives a strong peroxidase reaction of Storch [Starch]. It is also rich in katalase [catalase]. If hydrogen peroxide (a 10% solution) is added to soybean milk in proportion 5 cc. to 15 cc., 15cc. of oxygen are formed (liberated) in two hours. The reductase test, on the contrary, goes very slowly. No change can be observed if rennet is added to slightly warmed soybean milk. But if one increases the content of soluble calcium salts (adding f.e. calcium citrate), a finely flocculated precipitate is formed. The soybean milk curdles spontaneously at room temperature if the developed acidity reaches 14.8 degrees of Soxhlet-Henkel. In order to inhibit the putrefication [putrefaction] of soybean milk it is advisable to add a few drops of a culture of lactic acid bacteria. Soybean milk supplemented with lactose and inoculated with a culture of yoghourt [yogurt]

bacteria, coagulates at 40ºC in 4 hours and gives a curd-like acid mass.'

Yeu (1933, p. 14) states: "It was not until 1916 that a study of soymilk as a substitute for cow's milk was undertaken. O. Laxa gives the composition of milk obtained from soybeans cultivated near Prague. He made a soy yogurt. He concluded that soymilk was not important except in places totally lacking animal milks."

The author is a doctor. Hromadko (1926, p. 321) and Pume (1941 #069) cited this article correctly. Horvath (1927, p. 85) and L'Heureux (1933, p. 370) cited it as if it were a German journal article (from Berichte der Laktologischen Anstalt an der K.K. Boehm. Technischen Hochschule in Prag. 1916). Several subsequent French authors (Maillet et al. 1932, p. 490; Yeu 1933, p. 103) cited this as if it were a French journal article (from *Rapports de l'Institut de l'Ecole Polytechnique, tchèque*. No. 5. Prague). Nakazawa cited him as publishing in Extr. de la Rev. gener. du Lait, and Zbl. Bakt. II. 51, 423 (1920). or II. 86, 160 (1932). Or Biol. Abst. 7, 19020 (1933). Address: Prof., Dr., Czechoslovakia.

351. Sornay, Pierre de. 1916. Green manures and manuring in the tropics, including an account of the economic value of leguminosæ as sources of foodstuffs, vegetable oils, drugs, etc. Translated from the French by F.W. Flattely. London: John Bole, Sons and Danielson, Ltd. xvi + 466 p. Illust. 26 cm. [12 soy ref]

• ***Summary:*** This book is dedicated "To my esteemed Master and Friend M.P. Bonâme. A token of deep gratitude and sincere admiration." It "was awarded a gold medal by the *Société Nationale d'Agricole de France."* The translator is from the International Institute of Agriculture, Rome, and the Dep. of Zoology, University College of Wales, Aberystwth. In the introduction H. Pellet states (p. viii) "M. de Sornay, who for a number of years has been a member of the Agronomic Station of Mauritius, had already published, some time ago, in the *Bulletin* of the Station, a short treatise on the Leguminosæ." This volume is a major expansion of that work. The author was one of the first to study intercropping of sugar cane with legumes. Working in Mauritius, he found that legumes used in mixed cultivation with sugar prevented the growth of weeds and retained the soluble salts which would have been washed away by rain. A trailing variety of peanut was used. He also suggested soybean as an intercrop because "it does not interfere in any way with the small canes; the soybean may be used on a mixed cultivation and may even be sown in two rows in interspaces of canes" (p. 184). Also includes concise information about the cultivation and yield of soybeans.

Chapter 1, "General remarks" (p. 1-9) begins: "The family of the Leguminosæ, which numbers not less than 7,000 species distributed over every portion of the globe, contains, according to Van Tieghem, 430 genera." "The Leguminosae are generally divided into three great sub-families: Cæsalpineæ, Mimoseæ, and Papilionaceæ." The first two sub-families prefer tropical climates, whereas the Papilionaceæ "adapt themselves to every climate and are found distributed from the Equator [Ecuador] to the Poles." The Papilionaceæ are divided into eleven tribes; a table shows these and the subtribes or genera they contain. The genus Glycine is in the tribe Phaseoleæ, subtribe Glycina.

Chapter 2 is an "Account [history] of the theories on the absorption of nitrogen from the air by the leguminosæ." Chapter 3 (p. 9-46) is a "Description of the various leguminous plants of agricultural value." The 37 species discussed include the peanut (p. 47-70), Bambarra ground-nut or Voandzou (p. 70-72, native of Madagascar), *pois carré* [winged bean] (*Psophocarpus tetragonolobus*), and Soja, or Soy bean (p. 182-92).

The rambling treatment of the soy bean discusses bits and pieces of its history, botany, and yields in India, South Africa, and Mauritius. Nineteen tables show its composition. Concerning uses: "The seed of the soy bean is eaten as a vegetable by the majority of Chinese and Japanese, and they make numerous other uses of it." The chief ones are: Soy milk, soy cheese [tofu], and shoyu. "The roasted seeds of the soy bean are used in the United States and Switzerland as a substitute for coffee. Not containing any starch, these breads are used in the manufacture of breads and biscuits for people suffering from diabetes. They are found on the European market... The seeds are pressed in order to extract the oil, the oil resulting from the first expression being used in the manufacture of soap, whilst that from the second is used as machine oil. The cake is given to cattle mixed with other nutriments of lower nitrogen content. The trade in soy has increased considerably during the last five years." Trade statistics (exports of soy beans from Manchuria and imports to Europe) and prices on the London market (of soy beans, oil, and cake) are given.

Chapter 7, "Starch in the leguminosæ" (p. 246+) discusses the "Characters of the principal starches in the Leguminosæ." It contains an illustration (line drawing) of the starch in Soja hispida (Fig. 42, p. 251), and a description (p. 255) as follows: "Soja hispida.–Soy contains very little starch. The shape of the grains is fairly uniform, whilst their size is very variable. All the grains polarize clearly. The hilum is linear, occasionally stellate, but of rather rare occurrence. The striations are only visible at the edges and are very close together. Starch only very slightly homogeneous." Address: Chemist, Ex-Asst. Director of the Station Agronomique of Mauritius, Laureate of the Association des Chimistes de Sucrerie et de Distillerie de France et des Colonies, Laureate of the Société Nationale d'Agriculture de France.

352. Zhu Chen. 1916. Dongting Dongshan wuchankao [Survey of products of the Eastern Mountain of Dongting lake]. China. Passage on soy reprinted in C.N. Li 1958 #351,

p. 249-50. [Chi]
• ***Summary:*** Wade-Giles reference: *Tung T'ing Tung Shan Wu Ch'an K'ao,* by Chu Chên. Republican period. The section titled "Yellow soybeans" (*huangdou*) states: When fresh, they are called green vegetable soybeans (*maodou;* "hairy beans"); when dry, they are called yellow soybeans. Plant them in the 4th lunar month. The stem grows to a height of 2 feet. The leaves are round with pointed tips. The color is deep green, with little yellow flowers. The pods are a little more than an inch (*cun*) long, have green hairs, and contain 2-3 beans. When the beans are fresh, they are green; but when they grow old, they turn yellow. They are round like pearls. After removing the skin [seed coat] from the individual beans, you will find two parts [cotyledons]. They are like almond seeds. Most beans have that same structure. Green vegetable soybeans (*maodou*) are boiled in the summer and served on a plate as a vegetable.

There are two kinds of green vegetable soybeans. One kind is called *guanbangqing;* in the 5th month you can harvest them as green vegetable soybeans, or in the 7th month you can harvest them as yellow soybeans (mature). Another kind is called *shijiaxiang;* in the 7th month you can harvest them as green vegetable soybeans, or in the 9th month you can harvest them as yellow soybeans.

For some, you do not wait until they are mature; just harvest the [green] pods and boil them, then spread them in the sun until dry; they are called dry green soybeans (*xunqingdou*). They are also called *maodougan* ("green vegetable soybeans dried").

Green vegetable soybeans (*maodou*) are easily infested by worms. There is no way to prevent this, whereas [mature, dry] yellow soybeans can be stored for a long time. After you get rid of the pods, they do not become wormy.

There are many ways to eat yellow soybeans. You can boil them, roast them, use them to make jiang or tofu (*doufu*), or to obtain oil. These are methods handed down to us from antiquity. Their nature is warm. They benefit the large intestine. If you eat them raw, the flavor is not good; they have an unnatural flavor. If you have an ulcer, then their flavor is sweet. Western doctors say the efficacy of yellow soybeans is better than cow's milk. Therefore, in recent years, many Westerners [in this part of China] have begun to drink soymilk (*doufujiang*), so its price has risen. When you put yellow soybeans among the rice straw and pour water on them, after 6-7 days, the soybeans will sprout to a length of 2-3 inches to become soybean sprouts (*douyacai*). The villagers call them *ruyicai* ("as you wish vegetable") [probably because you can grow soy sprouts quickly, for use as a vegetable, whenever you wish, year-round]. The stalks can be dried and used as fuel. (Translated by H.T. Huang, PhD, April 2003).

353. Melhuish, William J. 1917. Process for the manufacture of artificial milk and the treatment of its residues. *U.S. Patent* 1,210,667. Jan. 2. 4 p. Application filed 22 Oct. 1915.
• ***Summary:*** This is a patent for making artificial milk from the arachis or ground nut, which is commonly known in America as the pea nut. It represents an improvement on his U.S. patent (No. 1,175,467, issued 14 March 1916), in which he describes "a method for making artificial milk deriving the casein from the soy bean. While good milk can be made under this patent long experience has shown difficulties which the present invention is designed to overcome. The soy is not marketed as one would wish: it contains impurities and the meal varies much. The enzym in the bean causes frequent anxiety and the nauseous oil has to be removed thus delaying the process and involving considerable expense in separators, their cleaning and upkeep. Furthermore the production of milk from the soy beans can only be worked profitably on a large scale; the expense and complexity of the machinery required make it utterly impossible to produce a daily output of from 5 to 50 gallons at a sufficiently low cost to compare favorably with cow's milk.

"In the manufacture of my new artificial milk I have to arrange synthetically for all the ingredients in the varied proportions of ordinary cow's milk." Address: Lecturer in dietetics, Highwood House, Parkstone, Dorset County, England.

354. *Chemisch Weekblad.* 1917. Algemeene vergadering de Nederlandsche Chemische Vereeniging te 's-Gravenhage op 28 December 1916 [General assembly of the Dutch Chemical Union at the Hague on 28 Dec. 1916]. 14(1):4-15. Jan. 6. [Dut]
• ***Summary:*** Includes the paper *"Ueber die Anwendung von Enzymwirkungen in der Ostasiatischen Hausindustrie* [On the application of enzymes in East Asian cottage industries"], by H.C. Prinsen Geerligs, followed by a long discussion.

355. *San Francisco Chronicle.* 1917. Gotham now has the soja bean. Jan. 12. p. 15.
• ***Summary:*** New York. January 11–When it comes to the matter of beans, Boston would do well to look to its laurels, because New York has welcomed into its capacious midst a rival to the famous New England Saturday night and Sunday morning food staple. And if you don't believe it go to 6 East Thirty-ninth street, make your way into the soja bean room of the School of Modern Cookery and gaze reverently on the soy, or soja bean, there on exhibition.

"The soy in its native haunts is said to have red hair, and somewhat of the temperament generally associated with that style of adornment.

"Forty-nine soybean specimens are on display, shorn of their hirsute appendages, the pods, leaves, and stems.

"In its original condition the bean, which is about the size and form of a green pea, is served in soup and is used in the preparation of meat sauces [such as Worcestershire sauce]. It can be found in the mysterious concoctions [soy

sauce] which the adventurous eater absorbs in chop suey establishments, it is said.

"The soja bean, according to its sponsors in the bean room, forms the principal article of diet of Chinese and Japanese soldiers, and it is also popular in Germany, where it forms an auxiliary to the cow and goat in furnishing substitutes for milk. Information as to how a soja bean was milked was refused, by the way.

"It was predicted that the soja bean as a great future in this country."

356. *Washington Post.* 1917. Putting it over on the cow: Japanese manufacture artificial milk from vegetables. Jan. 26. p. 6.
• ***Summary:*** From the Youth's Companion: "The milk problem is by way of being solved in Japan, where cows are scarce, by an extensive use of artificial milk derived from the soy bean. First, the Japanese soak the beans, then boil them [sic, after grinding] until the liquid turns white, when [after filtering] they add sugar and phosphate of potash. The boiling is resumed until a fluid results very similar in consistency and appearance to ordinary condensed milk. When water is added, soy milk is hardly to be distinguished from fresh cow's milk.

"In composition also the artificial milk is almost like genuine milk. Its proteins, fats and sugars are in very nearly the same proportion, although, of course, they are wholly vegetable in origin.

"Whether the substitute is equal to real cow's milk as a form of nourishment is not quite clear, for much of the value of milk as a food comes from the enzymes or vitamines it contains. The Japanese, however, declare that it serves all the purposes of cow's milk, and that it has the advantage of being less liable to infection when properly and carefully manufactures."

357. *Weekly News Letter* (*USDA*). 1917. Soy bean useful crop. May be utilized in greater number of ways than almost any other agricultural product. 4(27):3. Feb. 7. [1 ref]
• ***Summary:*** "The soy bean... may be utilized in a greater number and a greater variety of ways than almost any other agricultural product...

"In Japan the soybean forms one of the most important articles of food in use. It is one of the principal ingredients in the manufacture of shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are eaten also as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, forming the basis for the manufacture of the different kinds of vegetable cheese. This milk is used fresh, and a form of condensed milk is manufactured from it."

In several European countries and to some extent in America, soy-bean "flour enters largely as a constituent in many of the so-called diabetic breads, biscuits, and crackers manufactured as food specialties.

"Soy-bean milk... has been produced in small quantities in the United States, and recently a factory has been equipped to make this product." In Europe and America soybeans are roasted to make "an excellent substitute for coffee. In Asia the dried beans, especially the green-seeded varieties, are soaked in salt water and then roasted, this product being eaten after the manner of roasted peanuts."

Soy-bean meal (for use as a stock feed) and soy-bean oil are also discussed. "In addition to its availability as a food, soy-bean oil has found important uses in the markets of the world for making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, and lubricants. It is also used in the Orient for lighting and in the manufacture of printing ink."

• ***Summary:*** Reprinted from the *USDA Weekly News Letter* 4(27):3 (7 Feb. 1917). Address: Cleveland, Ohio.

361. Mairin, C. 1917. Le Soja hispida [Soja hispida]. *Annales Africaines* 24(6):71. March 15. New Series. [24 ref. Fre]
• ***Summary:*** Praises the many benefits of the soybean. From it one can make soy milk (which is equivalent to animal

milk), cream and butter and cheese (tofu). Combined with wheat flour, it can furnish, at a low price, a complete bread–and, I would add, one that is good for diabetics. This flour can be used to make all the different types of pastries and cakes. Finally, roasted like coffee, it makes an excellent alternative–with all the aroma of mocha.

362. Williams, C.G.; Park, J.B. 1917. Soybeans: Their culture and use. *Ohio Agricultural Experiment Station, Bulletin* No. 312. p. 577-600. March. [3 ref]
• ***Summary:*** This bulletin consists of two articles: "Soybean Culture" by Williams, and "Uses of Soybeans" by Park. The latter, which contains extensive information on soyfoods, is an extract of Park's paper titled "Soybeans as Human Food. Palatable Dishes Made from a Comparatively New Legume"; it was printed in Ohio Agricultural Experiment Station Monthly Bulletin 2(9, whole no. 21):299-303. Sept. 1917.

Contents: I. Soybean culture. Introduction: Production in Ohio, place. Climate and soil requirements: Climate, soil, fertilizers, inoculation. Seeding and cultivation: Seed bed, time of seeding, manner of seeding, depth seeding, rate of seeding, cultivation. Harvesting: For hay, for silage, for seed ("The best implements for cutting soybeans for seed are the mowing machine with side-delivery attachment, the self-rake reaper and the grain binder."), threshing. Varieties: For seed production, for hay. The effect of soybeans in crop rotations.

Tables show: (0) Acreage planted to five legumes in Ohio. Red and alsike clover: 880,676 acres (No. 1). Soybeans: 4,921 acres (No. 4). (1) Rate of seeding and yields of soybeans in Ohio from 1909 to 1916. Best rate–3 pecks/acre–gave 6-year average yield of 3,540 lb/acre of beans. (2) Description of 25 varieties: Amherst, Auburn, Cloud, Ebony, Elton (Chestnut)* (* = The Elton was first sent out by the U.S. Department of Agriculture under the name of Chestnut), Habaro, Hollybrook, Ito San, Ito San 17268, Manchuria, Medium Green, Mongol, Mikado, Ohio 7491, Ohio 7496, Ohio 9001, Ohio 9016, Ohio 9035, Ohio 9100, Ohio 9110, Sable, Shingto, Taha, Wing's No. 1, Yosho. The five highest yielders of grain are: Ohio 9016 (29.22 bu/acre, 5 year average), Ohio 7496, Elton, Ito San 17268, and Shingto.

(3) Yields of grain and straw of these 25 varieties. (4) Variety tests at the county experiment farms (yields of 8 varieties). (5) Soybean hay test (yields of 10 varieties, 1912-1916). (6) Wheat yields following crops of corn, soybeans (the highest), potatoes, or oats.

Part II. Uses of soybeans. Introduction. Use for animal food: Hay, grain, soiling crop. Special uses and products: Soybean meal, soybean oil. Use for human food: Soy sauce, soybean milk, use of the whole beans.

Concerning soymilk and tofu (p. 300): "If a small amount either of acid or of magnesium or calcium salts is added to the liquid [soybean milk], or if it is allowed to stand until sour, a curd is formed which settles out, leaving a clear, yellowish, watery liquid. The grayish white curd can be drained, pressed and eaten like cottage cheese. When salted and fried it is palatable, and can be used as a salad. This bean curd is the tofu which is so extensively eaten in the Orient. It is made fresh every day, and is as staple an article of diet of Oriental peoples as bread is of ours. As used by the Japanese these cakes contain 83 to 88 percent of water, 7 to 11 percent of protein and 4 to 5 percent of fat."

Concerning use of the whole beans: "When properly roasted and prepared, the ripe soybean makes a good substitute for coffee, equal to many of the cereal preparations on the market" (p. 302).

Photos show: (1) A soybean plant with its leaves removed to show pods (front cover). (2) A field of soybeans, with about half the leaves fallen, ready to be cut for seed (opposite p. 581). (3) Root system of a soybean plant with "numerous nodules in which nitrogen-fixing bacteria live" (p. 583).

Tables show: (7) Percentage composition and digestibility of soybean meal (pressed, or extracted) and other foodstuffs [oil meals and feed grains] for comparison. (8) Quantity and value of imports of soybeans, soybean cake, and soybean oil into the United States, 1910-1915.

Bar charts show (p. 600): (1) Pounds of digestible protein in 100 pounds of 14 food materials; soy beans are highest at 28.3 lb. (2) Pounds of digestible protein and digestible carbohydrate that one dollar will buy in the form of the same 14 food materials; in the form of soy beans, it will buy the most digestible protein (9.43 lbs at 3 cents/pound) and the 4th most digestible carbohydrate (after corn meal, rice, and wheat flour). Address: Wooster, Ohio.

363. Li, Yu-ying. 1917. Procédés et dispositifs pour la transformation intégrale du soya [Processes and technology for the transformation of whole soybeans]. *Chemisch Weekblad* 14(15):348-51. April 14. Included within a longer paper in this journal by de Waal, p. 344-56. [Fre; dut]
• ***Summary:*** This lecture, delivered in French on 11 Nov. 1911, includes a description of and an interesting, complex diagram showing the basic processes by which the many food and industrial uses of the soybean are created. "In the soybean industry, it is not only the whole seed / bean which constitutes the usable raw material, but also its derivatives such as soy flour, milk, etc., and even the by-products (cakes), which can, themselves, serve as the basis for a large number of products." A table (p. 349) shows these raw materials in five degrees: 1st. Whole soybeans. 2nd. Dehulled soybeans, cellulose/fiber, cakes, oil-rubber, milk, cakes. 3rd. Flour, cakes, oil, milk, cakes. 4th. Flour, milk, cakes, casein (*caséine*), flour. 5th. Casein, flour. "These five groups are composed of 19 products which can be considered as the raw materials which derive from a series of transformations leading up to the complete utilization of the bean.

"The course of operations to obtain the announced products comprises the following phases which are represented in figure 1.

"Dehulling of the beans. Grinding of the dehulled product, of oilcakes (*tourteau d'huilerie*), cakes for [soy] dairy production (*tourteaux de laiterie*), of casein.

"Pressing to obtain oil, or to obtain *sojalithe* (an industrial soy casein resembling ivory or horn).

"Drying of the casein, of the soymilk cake [okara] (*tourteaux de lait*), of the powder for preserves (*confiture*) [such as chestnut cream (*crème de marron*)].

"Cooking for the production of preserves, or for making sauce.

"Roasting / grilling for the manufacture of [soy] chocolate or [soy] coffee.

"Wet-grinding to obtain milk [from soybeans], or to obtain milk from okara (*lait provenant de tourteaux*).

"Fermentation for the manufacture of sauce [jiang or soy sauce], cooked soybeans, or milk.

"Concentration for the manufacture of milk, [okara] (*torteaux de lait*), or sauce.

"Desiccation / drying to obtain powdered [soy] milk, powdered [soy] milk cake [okara] (*poudre de lait de tourteaux*), powdered soy sauce.

A chart (fig. 2, p. 350) describes the progress and combination of different necessary operations to obtain these products.

"You can see that the soybean is first dehulled so that it can be cooked or ground either dry or with the addition of water. The dry-ground products, made into flour, are used for baking, pastry-making, and the fabrication of pasta (*pâtes alimentaires*).

"Dehulled soybeans treated by wet-grinding yield soymilk, which can itself be transformed into fermented milk, concentrated milk, powdered milk, or it can serve for the production of fresh or fermented cheeses, of [soy] sauce (by fermentation), as well as to obtain casein that can be dried or powdered; by pressing casein one obtains 'sojalithe.' The oilcakes [okara] resulting from the fabrication of milk are pressed and ground and can be used to make casein.

"Soybeans are pressed to obtain oil which can itself serve as a base to make candles, soaps, paint, artificial rubber, etc. Oilcakes remaining as by-products can be ground to make milk or pulverized to obtain flour.

"Cooked soybeans are also used to make condiments, fermented [soy] sauce, liquid sauce, solid [sauce], [sauce] concentrated into a paste or in dry powder. Cooked soybeans are also used to make pasty preserves (*confitures pâteuses*) or in powder.

"Cooked and grilled soybeans again serve to make [soy] coffee and chocolate." Address: Seine, France.

364. Waal, A.J.C. de. 1917. Over soja-producten [On soy products]. *Chemisch Weekblad* 14(15):344-56. April 14. (Chem. Abst. 11:2001). [22 ref. Dut]

• ***Summary:*** Describes the work done by men in different countries on various soybean preparations and includes a paper by Li Yu Ying (cited separately) titled "Procédés et Dispositifs pour la Transformation Intégrale du Soya," including food and industrial uses of soybeans. A complex, full-page French-language diagram (p. 350) shows the basic processes by which the many food and industrial products that can be derived from the soy bean, and summarizes patents related to many of these. By milling and baking: soya meal (*soja-meel*) and soy bread (*soja brood*). Soya milk (*soja-melk*) and Western-style cheeses. Coffee and chocolate substitutes: Soy coffee (*soja-koffie*) and soy chocolate (*soja-chocolade*). Pork-butcher products, incl. soy sausages (*soja-worst*) in which one can use soy cheese (*soja-kaas*). Soy protein (*soja-eiwit*). Worcestershire sauce (*Worcestershire-saus*). Li is a resident of Seine France. This paper was presented on 11 Nov. 1911, and published on 20 Jan. 1912.

Note 1. This is the earliest Dutch-language document seen (March 2001) that used the term *soja-koffie* to refer to soy coffee.

Note 2. This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *soja-melk* to refer to soymilk. Address: s' Gravenhage (The Hague), Netherlands.

365. Melhuish, William James. 1917. Fremgangsmaate ved fremstilling av kunstig melk av soyabenner eller soyafroe [Artificial milk from soy beans]. *Norwegian Patent* 27,895. April 30. 5 p. Application filed 4 Dec. 1914. [Nor]

• ***Summary:*** The soybean oil is removed from the soybeans, then replaced with sesame oil, which is emulsified with the soymilk. Address: Prof. of Chemistry, London [England].

366. *J. of Home Economics.* 1917. The soy bean. 9:183-84. April.

• ***Summary:*** "The soy bean, already one of the most important crops of Asia, promises to take an important place in the agricultural industry of the United States. It is said that it may be utilized in a greater number and a greater variety of ways than almost any other agricultural product. Not only are the beans, and the oil expressed from them, available as food, but soy bean oil is used for making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, and lubricants, besides its use in the Orient for lighting and other purposes.

"In Japan the soy bean is one of the principal ingredients in the manufacture of shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are eaten also as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, not only forming the basis for the manufacture of the different kinds of vegetable cheese, but used fresh, while a form of condensed milk is also made

from it. All of these food stuffs are used daily in Japanese homes, and for the poorer classes are the principal source of protein.

"Soy bean oil resembles that of cotton seed in many ways. The meal remaining after the oil is extracted from the beans has become important during the last few years as a food of low starch content, and so adapted to the use of diabetic patients.

"Soy bean flour enters as a constituent into many of the so-called diabetic breads, biscuits, and crackers manufactured as food specialties. The flour or meal may be used successfully in the household as a constituent of muffins, bread, and biscuits in much the way in which corn meal is used.

"An artificial milk like that manufactured in the Orient has been produced in small quantities in the United States, and recently a factory has been equipped to make this product. Such milk may be used for cooking in the household, and by bakers, confectioners, and chocolate manufacturers. Such products must, of course, be properly labeled.

"The soy bean has also been utilized as a substitute for the coffee bean. When roasted and prepared, it makes an excellent substitute for coffee."

367. Prinsen Geerligs, H.C. 1917. Ueber die Anwendung von Enzymwirkungen in der Ostasiatischen Hausindustrie [On the application of enzymes in East Asian cottage industries]. *Zeitschrift fuer Angewandte Chemie, Wirtschaftlicher Teil* 30(3):256-57. May 8. [Ger]

• ***Summary:*** Paper read before the *Niederlaendische Chemische Vereinigung* (Dutch Chemical Union), General session in The Hague, December 28, 1916.

This paper is on the domestic application of enzyme actions in Eastern countries, and describes, among other things, the making of fermented and non-fermented soybean food products. "To make soymilk (*Milchersatz*), only white soybeans are used, softened in water for 3 hours until they have swollen to 3 times their original size. Then, while water is added continuously, they are milled between two hard stones and fall through a hole in the bottom stone into a pail. A very small amount of the thin soybean slurry is set aside; through the proliferation of lactic acid bacteria it quickly becomes so sour that after several hours that lactic acid content has risen to 1.5%. The above mass is cooked in a large pan. The now pasteurized liquid is filtered through a large sieve to remove the hulls and hard pieces. The filtered milk-white liquid has, in appearance and chemical composition, the greatest similarity with animal milk. A sample contains 6.9% solids, 3.13% protein, and 1.89% fat. It gives an alkaline reaction and contains a solution of legumin bound to potassium phosphate, while the fat is emulsified in the thick protein solution. Unfortunately this soymilk (*Bohnenmilch*) tastes very much like raw French-beans (*Schneidebohnen*), so that people who are accustomed to cow's milk do not enjoy it much. But infants should be very content with it.

"If cheese is to be made from this milk, a small amount of the slurry soured with lactic acid is added to it. Thereby, the legumin (protein) is dissolved from the potassium phosphate and coagulated, then settles out with the fat with which it is emulsified. When the milk, through several hours mixing with the coagulation liquid, has become fully firm, it is packed in cloths and pressed between boards, in order to remove any excess water. Then the cakes are cut into square pieces; if they are to be eaten raw, it must be done quickly, lest they continuing souring and spoil. In order to impart a pleasant color to the cakes, they may be placed for several moments in a Curcuma [turmeric] decoction. Mostly the cakes of cheese (*Kaesekuchen*) are dried in the sun or fried (*gebraten*). They then keep better and acquire a pleasant flavor."

"Of much greater significance is the preparation of the most popular and prevalent soybean preparation, soy sauce (*der Soja*), which in East Asia is an indispensable seasoning for a variety of dishes, and is produced and used in unbelievably large quantities. There are various types, some of which contain wheat flour. But here we will consider only the type that is made [in the Dutch East Indies] with soybeans plus some added ingredients to improve the flavor.

Note: This is the earliest German-language document seen (April 2012) that uses the term *der Soja* to refer to soy sauce.

For the preparation of soy sauce, brown or black soybeans are cooked for several hours. After pouring off the cooking water, the beans are placed in flat trays (*Hürden* [*tampah*]) of woven bamboo and dried for half a day in the sun, then cooled in the shade. When they are cooled, the beans are covered with leaves of *Hibiscus tiliaceus*, a species of mallow, and they are soon covered with a layer of Aspergillus mold, which is usually found on the tiny hairs or cilia on the underside of the hibiscus leaves and so is transferred to the beans. The mold filaments or hyphae penetrate between the tough and thick cell walls, dissolve these through hydrolysis, and thus make the cell contents accessible to the influence of the molds. The mold is allowed to work until it forms spores (*Fruchtstaende*). The beans then appear to be covered with a brownish green felt. The beans are then dried in the sun and placed in a strong, cold salt solution. The mixture is placed in the sun for several days and then cooked. The brine solution, which contains the soybean extract, is poured off and the beans are cooked several more times until they have lost their salty taste. The various cooking extracts are mixed, filtered through a fine sieve, then mixed with palm sugar, aniseed [*Pimpinella anisum*], and an herb extract, which one can buy at a druggist's shop, and finally cooked until salt crystals appear. The soy sauce (*Soja*), which is now ready to use, is

a dark brown, thick, very salty liquid, in which a viscous sediment forms. By diluting with water, it becomes turbid. But the solution again becomes clear with the addition of salt. This thorough investigation has shown that the mold hyphae branch out into the cell walls, hydrolyze and dissolve the pectin substances, and likewise break down the protein content of the cells to leucine, tyrosine, asparagine, and other decomposition products of legumes.

"But this action and result is of secondary importance. The main point is the dissolution of the cell walls, whereby the protein becomes free and can be dissolved in the concentrated salt solution. The composition of soy sauce, except for the salt content, is very similar to that of meat extract, so that it can completely replace meat in the largely vegetarian diets of the people of the East.

"In a similar way, various other foods are obtained, whereby a mold dissolves the cell wall and so fulfills the function otherwise accomplished by cooking. We mention here only the bean paste (*Bohnenbrei*) [*tao-tjo*], for the preparation of which, dehulled white soybeans are cooked and then mixed with rice flour and glutinous rice flour (*Kleereismehl*). The mixture is placed in a small basket that is lined with the same hibiscus leaves mentioned above, and the Aspergillus molds growing on the leaves are allowed to develop. This saccharifies the rice starch flour and dissolves the bean cell walls. Thereby, the mixture becomes sticky and glutinous, and tastes sweet. It is dried and placed in a pot with saltwater. There it remains until each bean is permeated with salt and a sample tastes salty. Palm sugar is added to taste and it is ready for use without further cooking. Microscopic analysis showed that the cell walls were completely dissolved and the contents lay free, so that the mold growth had greatly improved the digestibility of the beans.

"In Java, soybeans are also cooked and made into flat cakes on a flat bamboo lattice. A small piece of an old cake is added and the mass is covered with banana leaves. One soon observes a rise in temperature and the development of moisture. The mass is penetrated by hyphae of *Rhizopus Oryzae*, which again dissolves the cell walls and frees their contents. The cake [tempeh, though the term is not mentioned] with its covering of mold, is consumed without further processing, raw or fried (*gebraten*).

Also discusses the preparation of onchom from peanut press-cake. Address: PhD, Netherlands.

368. Dacy, George H. 1917. Cheap foods from soy beans. *Country Gentleman* 82(19):863. May 12.
• ***Summary:*** A soybean substitute is available for nearly every ordinary dish on the average menu. "Soys" can be substituted for navy beans in the baked pork-and-beans dish. "A mixture of one part navy beans to three parts of soy beans, supplemented by a juicy piece of pork, makes an article for the menu that surpasses Boston baked beans.

"A Michigan cannery profitably canned green soy beans during the past season... the soy may in time supplant the lima bean in the canning business."

"A New York factory is now engaged in making vegetable milk from the whole bean, converting the by-product meal [sic, okara] into livestock feeds."

"When bread, biscuits, muffins or griddle cakes are to be made it is customary to use one part of soy-bean flour to three parts of wheat flour. The Germans use bean flour in combination with rye flour in making brown bread."

The soy bean "is a crop possessed of the camel's ability to do without drink for long periods. On the other hand it is not afraid of wet feet." "W.J. Morse, soy bean expert in the Division of Forage Crop Investigations of the Department of Agriculture at Washington [DC], knows almost all there is knowable about the thousand-odd varieties that have been acclimated to American conditions, and he will gladly help you solve your problems." A photo shows a typical soybean plant with pods.

369. Van Meter, Anna R. 1917. How to cook soybeans. *Ohio Farmer* 139(20):701-02. May 19.
• ***Summary:*** "At this time of high food prices and of immanent food shortage, it is a matter of satisfaction to be able to call attention to so promising a food material as the soybean." Gives the composition of the soybean, and describes how to make and use soybean milk and "the curd or cheese-like substance which forms in the soybean milk on treating with an acid" [i.e. tofu].

The section titled "Some recipes" states: "Dry soybeans possess a strong, characteristic flavor which must be gotten rid of before they can be served palatably. In order to do this, it is best to soak them over night using a large amount of hot water. The beans should be suspended in the water in a colander or cheesecloth bag. In the morning, they should be well rinsed, and put to cook in water to which baking soda has been added (about one teaspoonful of soda to each cup of beans). This is poured off after 40 minutes boiling, and fresh, hot water added. Four to five hours of cooking will usually be found sufficient (best done in a fireless cooker), after which the beans may be seasoned in a variety of ways."

Gives recipes for soybeans cooked as described above with: Tomato sauce. Sour pickle sauce or gravy. Also recipes for: Baked soybeans. Green soybeans. Soybean meal [i.e. flour, "a useful substitute for wheat flour in bread, biscuits and muffins"]. Soybean meal soup.

"Green Soybeans.–These are excellent. Altho the pods are too tough to be eaten, the beans should be boiled in the pods, since they can then be shelled much more easily than when raw."

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "Green Soybeans" to refer to green vegetable soybeans.

Note 2. This is the earliest English-language document

seen (June 2013) that recommends the use of baking soda when preparing dry soybeans for food. Address: Dep. of Home Economics, Ohio State Univ.

370. Hagerty, Michael J. trans. 1917. The beans: Imperial encyclopedia (*T'u shu shih ch'eng.* Published, 1728). Washington, DC: U.S. Department of Agriculture. 18 p. May. 28 cm.

• ***Summary:*** This section on beans (including soy beans) appears in the encyclopedia in Category IV–Science (*Po Wu Hui Pien*), Section 20–Vegetable Kingdom (*Ts'ao Mu Tien*), Subheading–Beans (*Tou Pu*), Book 35. Virtually all of the translation concerns a General Chronological Survey (*Hui K'ao*), No. 1. p. 1-24. For many of the longer detailed sections concerning soy beans, the translator refers the reader to his 1917 translation of: Wu Ch'i-chün, ed. 1848. *Chih wu ming shih t'u k'ao.*

"*The Shih Ching,* or Book of Odes, under the heading of 'Pin Feng Seventh Month', says: N. B.–Translated; see Chih (*Chih wu ming shih t'u k'ao*) translation–Pai ta tou, p. 31.

"In the *Hsiao ya* (Lesser Eulogium–Section of *Shih ching*), there is a poem entitled the *Pai chu,* or White colt, in which it says: "Let the brilliant White colt graze in my field. of Huo, or young bean plants." In the *Ta ch'üan* (Complete Commentaries on the Classics, by Chu Hsi), there is a. passage as follows: 'Hua Ku-yen says the name *Huo* denotes the leaf of the bean plant and is used in making Kêng, or broth.'

"In the *Ta ya* (Greater Eulogiums–Section of *Shih ching*) there is a poem entitled *Sheng min,* or Decade of Shêng-min, in which it says: N. B.–Translated; see Ch. translation, p. 3, 27.

"The *Erh Ya,* or Ancient Dictionary of Classical Terms, says: N. B.–Translated.; see Ch. translation, *Pai ta tou,* p. 2, 27.

"The *Sheng Shu,* or Canons of Yao and. Shun, says: N. B.–Translated.; see Ch. translation, *Pai ta tou,* p. 25.

The *Ch'un ch'iu,* or Spring and Autumn Annals, says: "The term Shu is a general one for the bean, and it grows in the spring and ripens in the autumn. They are classified according to their uses and form. The *Chih,* or Scarlet, and the *Hei,* or Black beans are suitable for the *yin,* or negative principle, while the *Sheng* or fresh beans are good for the *yang,* or positive principle. When the Shu becomes scarlet and black it changes gradually from the negative to the positive. In general it has the same character but it changes a little in order to have the positive appearance.

"According to the *Tso chu chih* the god of beans has the name of *Ling Chih,* and his family name is *Lao,* is seven feet tall, has large eyes, and he understands the change of the seasons."

The *Hsiao ching,* or Book of Filial Piety, by Pa Shen-ch'i, says: "Red soil is suitable for the Shu."

The Hsia hsiao chêng says: N. B.–Translated; see Ch. Pai ta tou translation, p. 17.

"*Huai nan-tzu* says: 'The mud from the river bottoms is good for the Shu.'

"The *Po ya,* or Ancient Dictionary, by Chang I, describing the Tonu (1 Cc), or bean, says: 'The *Ta tou* (2 Cc) [soybean] is identical with the Shu (1 Cc);, while the *Hsiao tou* (2 Cc) [azuki bean] is called the *Ta* (1 Cc). There are also the *P'i tou* (2 Cc), which is also known as the *Wan tou* (2 Cc), and *Liu tou.* The *Hu tou* (2 Cc) is also known as the *Chiang tou* (2 Cc) and *Shuang tou* (2 Cc). The bean pods are called *Chia* (1 Cc), the leaf is called *Huo* (1 Cc). The *Pa shu,* is identical with the *Pa tou* (2 Cc).'

"*The Chung shu shu* (See Bretschneider, *Botanicon Sinicum,* 1:79), a Treatise on the Art of Planting, by Kuo T'o-t'o, a work of the 7th or 8th century, describing the bean, says: 'Plant the bean, *Yu ma* (2 Cc), and *Ta ma* (2 Cc) (*Cannabis sativa*). If the beans are not planted at the proper time they will be injured by weeds, and even if they bear some pods, there will not be many beans. There is a maxim which says: *Ma yun ti tou yün hua,* "Cultivate the Ma, or hemp earth; cultivate the Tou, or bean blossom." This means that the *Ma,* or hemp, should be cultivated before it has even sprouted, while the *Tou,* or bean should not be cultivated until it has blossomed. The Ta tou, or Large bean [soybean], should not be planted on a Shên day.

"The *Erh ya i* (Appendix to the Erh Ya, by Lo Yüan, a writer of the 12th century), describing the Shu, says: 'The *Shu* is identical with the Tou and this class includes very many varieties. All mention of grains included these two names. In ancient times it was said that the hundred grains were made of varieties of *Liang* (1 Cc) (now *Setaria italica,* Kunth), which was a general name for grains like *Shu,* or glutinous variety of *Panicum miliaceum,* L., and *Chi* (1 Cc), also *Panicum miliaceum,* and *Tao* (1 Cc), or *Oryza sativa* [rice]. The term *Shu* is generally used to denote all *Tou* (1 Cc), or beans. These three classes each had twenty varieties, making a total of sixty, while the *Shu* (1 Cc), or Vegetables, and *Kuo* (1 Cc), or Fruits, each had twenty varieties, making a grand total of one hundred. But I (Lo Yuan) think that each kind of grain includes not under ten varieties, so that we do not need to include the vegetables and fruits in order to make up the total of one-hundred.' The *Kuang ya* (Ancient Dictionary), says: 'The *Ta tou* is identical with the *Shu.* The *Hsiao tou* [azuki] is the same as the Ta. The *Pi tou* is also known as the *Wan tou* and *Liu tou.* The *Hu tou* is also known as the *Chiang tou* and *Shuang tou.* The pods of the been plant are called *Chia,* while the leaves are known as *Huo.* The *Pa shu* is identical with the Pa tou.' The *Kuang chih* (See Bretschneider, *Botanicon Sinicum,* 1:164), or Ancient Records, by Kuo I-kung of the Liang dynasty (AD 502-556), says: 'In one year there are three crops of *Hsiao tou,* or Small beans [azuki] ripened. There is an inscription which reads, *Kan pai tou ts'u* 'sweet, coarse, white large bean.' The large bean may be eaten (?), and the *Tzu tou* (2 Cc) may also

be eaten. The *Chü tou* (2 Cc) has a sprout or stem similar to that of the *Hsiao tou* (2 Cc), has a purple blossom and may be utilized in making Mien, or noodles. These beans grow in Chu-ti and Chien-ning. The *Hu tou* class of beans includes both green and yellow varieties. This is a general summary of the different kinds of beans. The *Ta tou,* or Large bean [soybean], is planted during the second decade of the second month, this being the best season. If the planting is delayed up to the third or fourth month, much of the seed will be wasted. The *Hsiao tou,* or Small bean [azuki], should be planted in the fifth month, as this is the best season for this bean. The *shang fu* (2 Cc), or first part of the three decades of summer, is regarded as the second best period, while the *chung fu* (2 Cc), or middle summer period, is considered third best. These beans are harvested in the autumn in the eighth month, and for this reason, the rains of the eighth month are called the *Ta hua yü,* or Bean blossom rains.' The *Lu Shih Ch'un ch'iu* (Spring and Autumn Annals of the Lu Shih), says: 'When the Shu is planted at the proper time, it will have a long stalk and short root, and its pods usually grow in groups of from two to seven. This plant grows many branches with a number of joints. The leaves grow very profusely and the plant bears many beans. The Shu class of grains is considered inferior to the other Ku, or grains. This is why the *P'in fêng* poem of the *Shih ching* says that in the ninth month, for food, they gather the Shu (1 Cc), or Bean, and *Chü* (1 Cc), or seeds of the female nettle hemp plant (*Boehmeria nivea*), and *T'u* (1 Cc), or Sow thistle (*Sonchus oleraceus*), while for fuel they gather the wood of the *Ch'u* (1 Cc), (*Ailantus glandiculosia,* Desf.). The farmers are made to eat the Shu, or beans, and *Chu,* or Nettle hemp seeds, for food, although they are very coarse and poor, and the T'u ts'ai, or Sow thistle, which is very bitter, while for fuel, they are compelled to use the *Ch'u,* or fetid tree (*Ailantus*), which makes a very ill-smelling firewood. This is the reason why the farming people were considered coarse and were forced to be frugal and industrious, yet in spite of these hardships, as a class they were happy. Even Confucius said that to eat the Shu and drink water could be called proper conduct, and demonstrated filial piety better than the indulgence in ease and luxury and worship of material things.' The *Han shu* (History of the Han dynasty), says: 'At the present time, when there is a famine and the people are poverty stricken, half their diet consists of Shu, or Beans, and when food for the soldiers was scarce, the Shu was mixed with other grains and eaten by them. The Shu is put to very many uses, and is also placed in the sacrificial vessels used for worship. There are four preparations made from Tao mi, or rice and Shu, or Millet, which are called *Chou* (1 Cc), *Erh* (1 Cc), *Fen* (1Cc), and *Tzu* (*1 Cc*). When both are mixed together and boiled the substance is called *Erh;* when made into cakes, it is called *Tzu.* Because of their sticky glutinous nature, these grains are ground into flour. The Ta tou, or Large bean [soybean], is boiled and used as *Piao* (1 Cc), an outside coating or garnish for food. According to the commentary of the second Ch'êng, the term *Erh* is identical with *Ch'ou* and *Tzu* is identical with *Fên.* In the commentary of the former *Chêng,* these are separated into different classes and the Fên is described as being a *Tou hsieh* (2 Cc), or Bean flour. This is not the same. The bean was also used to make *Shih* or Bean relish' [fermented black soybeans]. The *Ch'u tzu* (See Bretschneider, *Botanicon Sinicum,* 1:203) (Elegies of Ch'u, by Ch'ü Yüan, 4th century BC), mentions a preparation called *Ta ku hsien suan hsin kan hsing.* Some one has said that the *Ta ku* (1 Cc) here mentioned refers to *Shih* (1 Cc). This description would seem to refer to liquid bean relish, a. mixture obtained by mixing salt, pepper, ginger, and honey with beans. These ingredients, when mixed together, make a substance which has an acrid-sweet taste and is used in preparing *Chou,* or Congee. It is said that Kung Kung (A legendary being. See Giles, CBD, p. 393) had a stupid son, who, on one occasion of the winter solstice, died of a plague. His ghost feared the *Chih hsiao tou,* or Small scarlet bean, and for this reason congee is made and eaten, at the winter solstice to ward off the evil spirits.' The *Yang shêng lun* (See Bretschneider, *Botanicon Sinicum,* 1:210), by Chi K'ang, says: 'The bean diet will cause the body to become heavy, and if it is eaten for three years, the body will become very heavy and movement difficult. If it is constantly eaten, it will cause the body to become very fat and the flesh very coarse and dry. In the tenth month of the first year of Duke Ting, the bean crop was killed by frost. Formerly the learned men regarded the Shu, or bean plant, as being very resistant to frost, and there was a saying that if the bean plant was killed, all plants would perish.' A table (p. 11) compares the nutritional composition of [soy] bean milk and cow's milk.

Note: This book was presented to the U.S. Department of Agriculture Library by Mr. W.T. Swingle. Address: Translator of Chinese, Office of Crop Physiology, Bureau of Plant Industry, USDA.

371. *New York Times Magazine.* 1917. Woman off to China as government agent to study soy bean. Dr. Kin will make report for United States on the most useful food of her native land. June 10. p. 9. (New York Times section 6).

• ***Summary:*** The *New York Times Magazine* is part of the Sunday *New York Times* and may be simply cited as such. Dr. Yamei Kin is "the only Chinese woman with a physician's diploma from an American college," the Woman's Medical College of New York. "She left New York a few days ago for the orient to gather data on that humble but nutritious food [the soy bean] for the Department of Agriculture at Washington." During World War I, new demands are being placed on America to feed its citizens and allies. "The appointment of Dr. Kin marks the first time the United States Government has given so much authority to a Chinese. That it is a woman in whom such extraordinary confidence is now reposed detracts nothing from the interest of the story."

China was the first country to invent paper, printing, gunpowder, porcelain, chess, playing cards, and silk. "And now Dr. Kin is going to see if her native land can teach the United States how to develop a taste for the soy bean in its numerous disguises...

"'The world is in need of tissue-building foods,' said Dr. Kin, 'and cannot very well afford to wait to grow animals in order to obtain the necessary percentage of protein. Waiting for an animal to become big enough to eat is a long proposition. First you feed grain to a cow, and, finally, you get a return in protein from milk and meat. A terribly high percentage of the energy is lost in transit from grain to cow to a human being."

"'The statement is frequently made that the Orientals live almost exclusively upon rice, eating little meat. It is not generally known, perhaps, that deficiency in protein is made up by the consumption of large quantities of products of the soy bean, which take the place in our dietary of meat and other costly nitrogenous foods. They are eaten in some form by rich and poor at almost every meal. Instead of taking the long and expensive method of feeding grain to an animal until the animal is ready to be killed and eaten, in China we take a short cut by eating the soy bean, which is protein, meat, and milk in itself. We do not eat the plain bean in China at all. It is never eaten there as a vegetable, but in the complex food products–natto, tofu, miso, yuba, shoyu, and similar dishes.

"'The chief reason why people can live so cheaply in China and yet produce for that nation a man power so tremendous that this country must pass an Exclusion act against them is that they eat beans instead of meat.'"

She then describes how to make tofu. "'Soup noodles are made out of bean curd. Entrées made of bean curd are served with cream mushroom sauce or a hot Spanish tomato sauce. A salad of bean sprouts, accompanied by cheese–the cheese [fermented tofu] a cross between Camembert and Roquefort, and made from the soy bean–is very nutritious and palatable. Americans do not know how to use the soy bean. It must be made attractive or they will not take to it. It must taste good. That can be done. We make from it a delightful chocolate pudding. A black soy bean sauce we use as a foundation for sweetmeats in China."

Note: None of the various Chinese food experts whom we have asked can understand what Dr. Kin means by the previous sentence. None has ever heard of a "black soy bean sauce" that is used as a foundation for confections or sweets in China. The two black soy bean sauces made in China, from either fermented black soybeans or jiang, are both salty. (WRS Jan. 2009). Nevertheless: This is the earliest English-language document seen (Oct. 2008) that uses the term "black soy bean sauce" to refer to a kind of sauce made from soybeans.

"The soy bean contains practically no starch, which means that it is a most desirable food for diabetics, and also, of course, for vegetarians. Buddhists kill no animals–they thrive by making a specialty of the soy bean, which, by the way, is already being used in the French Army. They find there that soy bean mixed with flour makes a good cracker, more nourishing than any other cracker.'"

"The Chinese do not know what worn-out soil is. Some places are so fertile and are cultivated with so much care and skill that three or four crops a year are regularly gathered... it is very common to see two crops in the same field at the same time... The Chinese have a passion for fertilizing the soil..."

"Dr. Kin is a graduate of the Woman's Medical College of New York, and her great interests have always been domestic sanitation, civic hygiene, the conservation of life, and questions of nutrition. She is the head of the Imperial Peiyang Woman's Medical School and Hospital, near Peking... the Imperial Infant Asylum in Tien-tsin, the Widows' Home, and the Girls' Refuge all come under her supervision as head of the woman's hospital work of Northern China. She will return to this country in October, bringing to our Government the detailed results of her study of the uses of the soy bean as a foodstuff needed by this country and by the world in the campaign of food raising and conservation." An illustration (line drawing) shows a portrait of Dr. Yamei Kin.

Note 2. This is the earliest published document seen (July 2000) that mentions Dr. Yamei Kin. Frank N. Meyer wrote letters about her in 1911 and 1916.

Note 3. This is the earliest document seen (Aug. 2013) that mentions a soy pudding (a "delightful chocolate pudding" made from bean curd).

372. Prinsen Geerligs, H.C. 1917. Domestic application of enzyme actions in Eastern countries (Abstract). *J. of the Society of Chemical Industry* (*London*) 36(12):662-63. June 30. [1 ref]

• ***Summary:*** A summary of a paper read before the *Niederlaendische Chemische Vereinigung* (Dec. 28, 1916) and published in the *Zeitschrift für Angewandte Chemie, Wirtschaftlicher Teil* 30(3):256-57 (1917, May 8).

"A milk-like product produced by grinding soya beans with water contains 6.9% of total solids, 3.13% of proteins, and 1.89% of fat; this product, unless boiled, rapidly undergoes lactic acid fermentation, and a cheese may be obtained by the addition of a quantity of the fermented liquid to a larger volume of the normal liquid. To prepare an extract [soy sauce] resembling meat extract, the cooked beans are subjected to the action of fungi which are found on the leaves of a species of mallow (*Hibiscus tiliaceus*), the mass is then extracted with salt solution, spices are added to the extract, and this is then concentrated to a thick syrup. A similar product is prepared from a mixture of soya beans and rice by the action of fungi. Another food [tempeh] is obtained by submitting soya bean cakes to the action of

fungi found on banana leaves, etc. The fungi found in rice meal and rice straw are utilised for converting rice meal into alcohol; rice meal may be saccharified by treatment with the fungi occurring on banana leaves and the liquid obtained is subsequently converted into rice wine. One of the most important results of enzyme action is the production of sugar in the palm; the stem of the latter is free from sugar but contains large quantities of starch; the conversion of the starch into sucrose proceeds in the tree, but laboratory experiments with the separated enzyme resulted in the formation of dextrose alone."

Note: This early English-language document describes tempeh, although the term is not actually mentioned.

373. *Literary Digest.* 1917. To study the soy-bean for Uncle Sam. 55(2):52-53, 55. July 14. Whole No. 1421.
• ***Summary:*** This is a lengthy summary of an interview with Dr. Yamei Kin, published in *The New York Times Magazine* on 10 June 1917. It includes several lengthy excerpts. "So interested has the United States become in this discovery [China's knowledge of the soy-bean] that Dr. Yamei Kin, a Chinese woman graduate of an American college, has been sent back home to gather for the Agricultural Department at Washington [DC] all the facts that are known in China about the soy-bean."

"'Instead of taking the long and expensive method of feeding grain to an animal until the animal is ready to be killed and eaten, in China we take a short cut by eating the soy-bean, which is protein, milk, and meat in itself,' says Dr. Kin.

"The plain bean, however, is never eaten, but it furnishes such products as natto, tofu, miso, yuba, shoya [sic, shoyu], and other dishes with queer-sounding names..."

A letter dated 26 March 1917 from Frank N. Meyer in China gives the address of Dr. Mrs. Yamei Kin as 500 W. 111th St., New York City.

374. *San Francisco Chronicle.* 1917. Milk of the soy bean. July 27. p. 16.
• ***Summary:*** From Philadelphia Public Ledger: "The milk from soy beans, which cannot be distinguished from cows' milk by taste or by chemical analysis, is wholly practical, asserts Dr. Arao Itano, of the Massachusetts Agricultural College at Amherst. Dr. Itano, who is a native of Japan, and studied at European universities before coming to the United States, says that the soy bean is identical with cow's milk in composition. In Manchuria soy bean milk is in general use. Dr. Itano has improved upon the Manchurian process so that the slight bean flavor has been wholly eliminated. Soy bean milk can be produced at low cost, and Dr. Itano believes that it can be made to yield butter and other products. Members of the New England Milk Producers' Association, which has announced the intention of boosting the price of milk 2 cents a quart this month, says that while soy beans are rich in protein, the beans needed to produce a given amount of milk would produce more if fed to high-bred dairy stock."

375. *Ladies' Home Journal.* 1917. The most nourishing of all beans. Plant soy beans: They will come in handy next winter. 34:29. July.
• ***Summary:*** "Now that we are taking stock of our food resources we find these beans a palatable, nutritious food... they make an emergency addition to our daily food and, most important of all, they can be used as a meat substitute. The fact that they contain no starch makes them valuable for invalids who cannot eat starchy foods."

Soy beans "may be boiled and served as a vegetable, roasted like peanuts and made into soy-bean coffee and soy-bean cheese. There is a soy-bean milk rich in protein, which makes an excellent substitute for condensed milk and is particularly valuable in cooking. There is also a soy-bean oil, which is valuable as a food product.

"The beans may be grown easily in practically all sections of the country where corn is grown, and they will give heavier yields than most other beans."

"The dried beans may be purchased now in some markets in various parts of the country, often under the name of togo beans, or Manchurian or Chinese or black beans, but, with the increased acreage which will be given to raising them this summer, will be more generally available."

"Soy beans have been canned in considerable quantities during the past season, baked with pork, and are on sale in this form in numerous markets. Canned green soy beans, which may be compared with lima beans, also are on the market in some sections of the country."

"There are several varieties of bean cheese made from the soy bean." The article then describes how natto and tofu are made and eaten. Gives a recipe for soy beans with bacon and molasses.

Note 1. This article, published about 3 months after the United States entered World War I, is based in part on *USDA Weekly News Letter* (11 April 1917, p. 7).

Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "soy-bean coffee" to refer to soy coffee.

Note 4. This is the earliest article on soy seen (Aug. 2002) in *Ladies' Home Journal* magazine.

376. *New York Produce Review and American Creamery.* 1917. Navy bean has rival: Soybean has higher food value–Bean milk preparation. 44(14):565. Aug. 1. [1 ref]
• ***Summary:*** Discusses the advantages of soybeans over navy beans, based in part on *Ohio Agric. Exp. Station Bulletin* 312. "Soybeans are rapidly finding a place as human food, used as common white beans and in new preparations, but more nutritious and economical. Less risk and labor are involved in growing and harvesting soybeans as compared with navy beans.

"Boiled or baked alone, or in combination with pork, potatoes or rice, soybeans take the place of navybeans. Soaking over night in considerable water is necessary to remove the strong flavor of the beans. A little soda in the water during cooking makes them softer.

"Green soybeans cooked in the pod shell easily, and make a palatable dish when served with butter or milk. The pods are tough and seldom eaten.

"A little soybean flour added to cornmeal makes mush made from the mixture brown and quicker and increases its food value."

"Soy sauce, bean milk, bean curd and a ripened vegetable cheese called 'miso' are common foods made of soybeans in Japan and China."

Note: This is the earliest English-language document seen (Oct. 2001) that uses the term "soybean flour." Address: New York.

377. H.W.C. 1917. Hope farm notes: Cow peas vs. soy beans. *Rural New-Yorker* 76:1008. Aug. 25.
• ***Summary:*** The author is conducting a contest between "Black-eye cow peas and Wilson Early Soy bean... to see which is more valuable as a food or manurial plant... I think the Soy bean will finally come out ahead." It stands upright and is easier to harvest. "The Soy beans are not generally eaten as food, though they can be used in various ways. As stock food they are very useful."

"They even make an artificial milk out of the bean." After the war between Japan and Russia, the "crop has made it possible for Korea and Manchuria to get on the map as respected and prosperous provinces. Just as Alfalfa has made the strip of limestone land through Central New York rich and famous, I believe the heavy culture of Soy beans will bring back prosperity to any section where the soil has begun to fail and where Red clover and Alfalfa have not done well. I do believe that dairymen and poultrymen have in this Soy bean a plant which will come close to solving the problem of providing fat and protein foods."

"This Wilson's Early Soy is a small black bean. I have carried a handful in my pocket. Whenever I meet some friend moping around with what they call a grouch, I offer him a few beans. 'Here try my new remedy for that tired feeling. Nature's true remedy for the liver; swallow them whole. Don't stop to chew!'

"In many cases people have become so used to dosing that they will swallow three of these raw beans. They do look something like a black capsule. In some instances I have met these parties a few days later and they say: 'That was fine dope you gave me. Where do you get it? I want more!' I have no doubt that a black Soy bean with full faith will do more for health than a barrel of medicine taken because one has acquired the dope habit." Address: New York.

378. Goessel, Fritz. 1917. Werkwijze voor de bereiding van kunstmelk uit sojaboonen of dergelijke zaden of mengsels daarvan [Method for the preparation of artificial milk from soya beans or similar seeds or mixtures thereof]. *Dutch Patent* 2,122. Sept. 5. 3 p. Application filed 4 Dec. 1912. Opened to the public 15 July 1914. [Dut]
• ***Summary:*** This milk can be made from soybeans, sesame seeds, peanuts, nuts, etc. For example, finely ground soybeans are mixed with cold water and small quantities of alkali phosphate. The mixture is heated to boiling for a short time, cooled, and then pressed. The resulting liquid is then emulsified with edible fats and table salt (NaCl) or sodium sulfate (Na_2So_4).

Note: This is the earliest Dutch-language document seen (Aug. 2013) that uses the term *kunstmelk uit sojaboonen* or *melk uit sojaboonen* to refer to soymilk. Address: Stockheim in Oberhessen, Germany.

379. Park, J.B. 1917. Soybeans as human food: Palatable dishes made from a comparatively new legume. *Ohio Agricultural Experiment Station, Monthly Bulletin* 2(9):299-303. Sept. Extract from Ohio Agric. Exp. Station, Bulletin No. 312, "Soybeans: Their Culture and Use." [2 ref]
• ***Summary:*** For details, see Williams and Park. 1917. "Soybeans: Their Culture and Use." Address: Ohio.

380. Stoddard, William Leavitt. 1917. Soy: The coming bean. *Good Housekeeping* 65:77, 126-28. Sept. [4 ref]
• ***Summary:*** "*Good Housekeeping* asked the Department of Agriculture to tell its readers the truth about the soy bean. This article is the department's answer. In the [Good Housekeeping] Institute Kitchen new recipes and methods of using the soy bean were evolved and tested. These recipes will be found at the end of this article. A list of dealers in various sections of the country who carry a supply of soy beans will be mailed upon request accompanied by a stamped addressed envelope.

"'The soy bean, also called the soja bean, is a native of southeastern Asia, and has been extensively cultivated in Japan, China, and India since ancient times... The beans are there grown almost entirely for human food, being prepared for consumption in many different ways. Their flavor, however, does not commend them to Caucasian appetites and thus far they have found but small favor as human food in either Europe or America.' Thus declared a bulletin of the Department of Agriculture [Piper and Nielsen. 1909. Farmers' Bulletin 372] before the war. Less than three months after our entrance into the war–and the entrance of the United States as a nation for the first time into a food moderation and conservation campaign–this same authority stated that 'the soy bean has already reached a place of high economic importance in America and Europe as a foodstuff... During the past season the demand for seed by food manufacturers has resulted in greatly increased prices.' The soy is a coming bean if not *the* coming bean."

Sold in some American markets under the name Togo bean, the soy bean "now flourishes in an increasingly large acreage in Tennessee, North Carolina, Virginia, Maryland, Kentucky, and the southern parts of Illinois and Indiana. The earlier varieties even mature in Ontario [Canada] and our Northern states."

The American housewife probably does not care "that there is a factory in New York is making a 'vegetable milk' of soy beans; the "flour or meal [okara] which remains after the milk is manufactured is valuable both as a stock for feed and for human consumption; that soap manufacturers and paint manufacturers are using the oil of soy beans to replace more expensive oils; and that the substitute butter makers are using the fat of the soy bean in products which thousands of consumers are using all unwitting of its true nature.

"The thing that the American housewife wants to know today is where soy beans can be bought and what are the simplest uses of them... Probably the easiest and commonest method of cooking soy beans is to use them either for soup or to bake them."

Eight recipes are given; all but two call for "soy beans." Soy-bean bread (containing 20% of the flour in the form of "soy-bean meal" [a full-fat soy flour]), Soy beans and rice (with "1 tablespoonful Worcestershire sauce"), Soy-bean loaf with tomato sauce, Vegetable roast (baked), Savory baked soy beans, Soy-bean soup, Soy-bean muffins (with "1 cupful cold baked soy-bean pulp"), and Salted soy beans (deep fried).

Photos show: (1) Muffins made with soy-bean meal. (2) Soy-bean meal ground at the Good Housekeeping Institute; the hand-turned mill and two small piles of soy beans are shown. (3) A dish of soy beans and rice. (4) A soy bean plant. (5) A vegetable roast with soy beans as an ingredient.

Note 1. Theodore Hymowitz writes (12 Feb. 1990): "I have no idea if William Leavitt Stoddard was related to Illinois soybean pioneer William Hoyt Stoddard. William Hoyt had one brother named Charles Lumas Stoddard."

Note 2. This is the 2nd earliest document seen concerning soybeans in connection with (but not yet in) Togo.

Note 3. This is the earliest English-language document seen (Dec. 2012) that uses the term "Salted soy beans" to refer to soynuts. It is also the earliest document seen in any language describing the frying or deep-frying of whole soybeans to make soynuts. Previously soynuts had always been dry roasted.

Note 4. This is the earliest article on soy seen (Aug. 2002) in *Good Housekeeping* magazine.

Note 5. In the recipe for Soy-bean muffins the meaning of the ingredient "1 cupful cold baked soy-bean pulp" is not completely clear. This is the earliest document seen (June 2013) that uses the term "soy-bean pulp" (regardless of hyphenation). It probably refers to whole soybeans that have been baked then ground or mashed to a pulp and allowed to cool. However, the writer discusses okara earlier in this article, and this recipe may be calling for okara as an ingredient. If it is, this would be the earliest English-language document seen (June 2013) that calls for okara as an ingredient in a recipe.

381. Melhuish, William J. 1917. Substitute for milk, made from soya-beans and arachis (pea) nuts. *U.S. Patent* 1,243,855. Oct. 23. 4 p. Application filed 22 Oct. 1915.
• ***Summary:*** Arachis (pea) nuts are cleaned and coarsely ground, and the soluble nitrogenous and oily matter is extracted from them by treatment with a hot, slightly alkaline aqueous solution containing also salts usually found in milk. The residue is strained and pressed and a very small amount of butyric acid is added to it. Ground soya-beans are treated with a hot, very dilute alkali solution of a phosphate to extract nitrogenous and fatty constituents and the strained and pressed extract is mixed with the extract from the peanuts in a vacuum pan and with added fats as desired, warmed to about 40º, mixed with sugar syrup and boiled under a vacuum of 26-29 inches, and finally treated with milk ripening bacteria and citric acid and evaporated to the desired concentrate. Address: Lecturer in dietetics, Highwood House, Parkstone, Dorset, England.

382. *Times Trade Supplement* (*London*). 1917. Soy beans: Cultivation in the United States. Nov. 5. p. 170, col. 4.
• ***Summary:*** During the past few years the soy bean has become an important crop in the United States. The plant is grown mostly for forage, but in some states, such as eastern North Carolina, growing the beans has become a profitable industry. In 1910, soy beans were first processed in the USA for their oil by a mill on the Pacific Coast. These beans were imported from Manchuria, the oil was expressed using a hydraulic press, and the oil was sold to makers of soap and paint. The soy bean cake, ground and sold under a trade name, was soon recognized as a valuable feed by dairymen in the western states.

In late 1915 a shortage of cotton seed prompted several cotton mills in North Carolina to profitably produce soy bean oil and meal from home-grown soy beans. In several English mills, a solvent extraction process, using benzene, is employed. Another industry plans to make "vegetable milk" from soy beans. Note: This article was written by "a correspondent."

383. **Product Name:** [Soyama Fresh Soymilk, Dried Soymilk, and Fresh Soy Cream, Dried Soy Cream].
Foreign Name: Soyama Fruchtmilchpulver.
Manufacturer's Name: Soyamawerke Englehardt und Co.
Manufacturer's Address: Frankfurt am Main, Germany.
Date of Introduction: 1917.
How Stored: Shelf stable.
New Product–Documentation: Fuerstenberg. 1917.

Die Soja. p. 7, 32-33. The Soyamawerke in Frankfurt am Main makes, largely from soybeans, a fresh and dried milk (*Frisch- und Trockenmilch*) as well as fresh and dried cream (*Frisch- und Trockenrahm*). Their soymilk is named Soyama.

Soyama Werke Englehardt und Co. 1921. German Patent 378,180.

384. Combe, A.D. 1917. Les succédanés du beurre [Butter substitutes]. *Bulletin de la Societe Scientifique d'Hygiene Alimentaire et d'Alimentation Rationelle* 5(3):183-84. [Fre]
• ***Summary:*** Vegetable butters, made from cocoa butter or coconuts, are very useful as butter substitutes. There are many kinds of artificial milk; they are easily digested and low in cost. Vegetable milk is the concentrated milk of almonds, sterilized and sold in cans. It is used as a medicine for infants, but it's high price makes it unsuited as a wartime food.

Soya milk (*Le lait de soya*), a milk extracted from soya beans, comes from Japan where it has long replaced natural milk that is very rare in that country. It is easy to digest and inexpensive. In times of war, it can be used advantageously to replace butter. In 1913 Germany was already importing 125,448 tonnes of soybeans, from which it extracted 18,000 tonnes of oil and milk. A table shows the nutritional composition of soy flour, soymilk, and cow's milk.

385. Crevost, Charles; Lemarié, Charles. 1917. Catalogue des produits de l'Indochine. 5 vols [Catalog of the products of Indochina. 5 vols.]. Hanoi: Imprimerie d'Extrême-Orient. 29 cm. Formerly published in Bulletin Economique de l'Indochine, Vols. 25 and 26. [Fre]
• ***Summary:*** Volume 1 (published in 1917; 175 p.), titled *Produits Alimentaires et Plantes Fourragères* (*Nutritious Products and Forage Plants*), describes plants grown in Indochina and the nutritive value of each. Pages 106-09 describe "Soja–Glycine Soja," the soybean. Local names are given in Annam and Tonkin, Cambodia, China, and Japan. "The plant is widely cultivated in Indochina for its seeds, which are consumed in various forms. Soybean seeds in Indochina are typically yellowish white... It is well known that the Japanese use the soybean to prepare a sauce named *shoyu* (*teou yeou* in China), as well as a *fromage de pâte* or vegetable cheese named *to fu* [tofu], or *teou fou* in Chinese. The Annamites also prepare an analogous sauce named *tuong* and a *fromage de pâte* named *dau phu* and *dau phu-ao.* Cambodia and the Indochinese province of Châu-dôc produce significant quantities of soybeans, of which a part is sent down to Saigon to be consumed or exported. There are good varieties on the high plateaus of Tonkin, especially in the province of Lang-son, whence large amounts can be obtained for export.

"The dead leaves are ordinarily burned. However some indigenous people partially burn the stems of the soybean plants, stripped of their leaves, to obtain a very fine charcoal dust or ash, which they mix with the resinous balm of *Canarium commune,* to use in making joss sticks. These are slender incense sticks burned as offerings in the pagodas and at the altars of their ancestors in their family homes." [Note: A joss house is a Chinese temple or shrine.] A large, excellent, and very detailed illustration (p. 108) shows a soybean plant, with leaves, pods, seeds, and flowers. Nutritional analyses of soybeans from Laos, Tonkin, and Manchuria are given (from other sources).

Volume 3, titled *Matières Grasses Végétales* (*Fats and Vegetable Matter*), includes analyses of Indochinese plants and their fat and oil contents. The contents of Vol. 3. was first published in the *Bulletin Économique de l'Indochine* 1922-1924. Pages 75-78 discuss "Soja–Soja Max (Lin.) Piper," the soybean. "Mr. Li Yu-ying, a member of the Biological Society of the Far East, has greatly contributed, following several attempts made for more than a century by naturalists and those who acclimatize plants, to popularize in France this plant of many uses. He introduced cultivation of the plant in the area around Paris and, in Paris itself, in 1908 he established a laboratory for the study of the soybean, since completed by a soyfoods factory (*l'usine de la caséo-sojaïne*), where all the products derived from this plant are manufactured: Soymilk (regular, concentrated, powdered, or fermented), tofu (*fromage de soja*), soya patés (*pâtes de soja*), soya casein (*caséïne de soja*), soy flour and bread, etc." The rest of the article is concerned mostly with characteristics, uses, and trade of soybean oil.

Crevost was born in 1858. Note: The meaning of soya casein is not clear. Address: 1. Inspecteur des Services agricoles et commerciaux; Conservateur du Musée [Maurice Long] agricole et commercial de Hanoi; 2. Ingénieur-Agronome, Directeur des Services agricoles et commerciaux du Tonkin, Lauréat de la Société nationale d'acclimatation.

386. Fuerstenberg, Maurice. 1917. Die Soja, eine Kulturpflanze der Zukunft und ihre Verwertungsmoeglichkeiten [The soybean, a cultivated plant of the future, and possibilities for its utilization]. Berlin: Paul Parey. 40 p. Illust. No index. 21 cm. [59 ref. Ger]
• ***Summary:*** Dedicated to the Prof. Friedrich Haberlandt, who introduced the soybean to Central Europe. Contents: Foreword. Introduction: The soybean. Ways of using the soybean in its homeland (East Asia, especially Japan and China). Shoyu or soy-sauce. Miso (vegetable cheese). Natto. Tofu of the Japanese or Tao-hu of the Chinese (bean cheese). The soybean as an oilseed. Soybean meal (and flour). Soy as a coffee substitute or extender. Soybean milk. Soy meat substitutes. Soybeans as a chocolate substitute. Soy rubber substitute. The utilization of the soybean in agriculture: As cow fodder. Summary. Bibliography.

Photos show: (1) A field of soybeans (p. 6). (2) A soybean plant with the leaves removed to show the pods (p. 12). (3) Soy beans and pods from inoculated and

uninoculated plants (p. 13).

Contains numerous tables, most without captions and mostly from other sources–See pages 11, 16-17, 19, 25, 27, 30, 35-37. Contains one of the best early European bibliographies on the soybean.

The author wrote this book during World War I. In his first book, published one year earlier in 1916 and titled "The Introduction of Soya, a Revolution in the Food of the People," he discussed what he believed to be the great agricultural and nutritional value of the soybean. He uses two terms, *Die Soja* and *Die Sojabohnen* to refer to soybeans.

Chapter 1 (p. 5-7): In 1908 England started to import large quantities of soybeans; in 1909 these increased to 400,000 tonnes and in 1910 to 800,000 tons. Also in Germany, in the years just before World War I, imports of soybeans climbed in an unexpected way, reaching 43,500 tonnes in 1910, 90,600 tonnes in 1911 and 125,200 tonnes in 1912. Note: These units are given in dz. One dz (*doppelzentner*) = 100 kg.

The first manufacture of soyfoods in Europe took place in France, at Valees near Asnieres, where they made flour, bread, cakes, cheese [tofu], and soymilk (*Mehl, Brot, Kuchen und Käse, vegetabilischer Milch*)–though only in small quantities and, above all, for diabetics. In England, soy flour has been used for a long time in the preparation of cakes (p. 5-6).

However it was in Germany that the utilization of soybeans for food took place on a large scale; this began shortly before the war. The supply of foods to Germany was almost completely cut off during the war, so general attention soon turned to the new foods prepared from soybeans and people quickly became aware of their great nutritional value. Thus, in the middle of the war, a soybean industry was built in Germany. Unfortunately this youngest twig of the food industry was left crippled due to lack of raw materials. However one can predict that this industry has a bright future because of the great encouragement given to these products in so short a time. For example, in October 1914 the *Agumawerke* (Aguma Works) located in Harburg (near Hamburg) on the Elbe, first began mass production of a soy flour according to its own process. During the next few years it made many thousands of tonnes of this meal, until the production had to be stopped for lack of raw materials (p. 6).

Equally gigantic sales of soy products were made by the *Soyamawerke* (Soyama Works) in Frankfurt am Main; this company made only soy food products. In addition to a meal (flour), it also produced a meat substitute (*Fleischersatz*), and, largely from soybeans, fresh and dried milk (*Frisch- und Trockenmilch*) as well as a fresh and dried cream preparation (*ein Frisch- und Trockenrahm-Präparat*). Likewise, this firm had to cease production of most of its soy products because of difficulties in soybean procurement, and concentrate only on the production of meat substitutes (*Fleischersatz*). These articles likewise entered all classes of the population splendidly as is seen from the large demand for them. Within 3-4 weeks this firm had orders for more than 1½ million pound cans, of which unfortunately it was able to satisfy only a small part. In addition to these two well-known firms, there are in Germany still a number others that are occupied with the production of foods from the soybean.

In Austria [the Austro-Hungarian empire], there exists a unique firm, the food factory Santosa in Prague [in the Czech Republic as of Sept. 2002], which is still processing soybeans. They introduced soy coffee into commerce. I understand that in Austria a large-scale soy processing venture is now being planned.

Certainly the soy processing industry finds itself in a beginning state and, like all young industries, in need of improvement. Remember the sugar-beet industry was also once young but it made improvements and went on to great success, as will be expected of this new twig on the food industry. In any case, the beginning of utilization of the soybean as food for the people has been made, and in the foreseeable future the soybean may, as in China and Japan, become an indispensable part of our people's food.

It is different with the introduction of the soybean as a cultivated plant in Central Europe. Forty years ago Friedrich Haberlandt showed (and after him countless others have shown) that the soybean grows well in Central Europe. Although additional new tests verify this, there are still those who object to soybean culture. One objection is the long time required by the soybean to come to maturity; the answer is the development of new varieties. Another is the relatively low yield compared with other beans; the answer lies in the use of inoculation. The author then discusses nutrient yield per acre and per unit of money, showing both to be high for soybeans.

Pages 10-11: It is well know that legumes possess the ability to transform and fix free nitrogen from the air. In 1886 Prof. Hellriegel discovered that this capability is due to certain bacteria that live in the soil and move through the root hairs into the root, where they cause nodule formation. The nitrogen-fixing bacteria living in the nodules nourish the plant. The author then talks about inoculation using either soil from a previous planting or "Nitragin," a pure culture of root bacteria, which is well known and has recently been improved. Dr. Kuehn of Berlin-Grunewald showed that soil inoculated with Nitragin gave a 3- to 4-fold increase in yield, plus an increase in protein in the roots and leaves. He then discusses improved cultural practices. Winkler says that transplanting improves yields. Continued. Address: Frohnleiten, Steiermark [Austria].

387. Fuerstenberg, Maurice. 1917. Die Soja, eine Kulturpflanze der Zukunft und ihre Verwertungsmoeglichkeiten [The soybean, a cultivated plant of the future, and possibilities for its utilization. Part II

(Document part)]. Berlin: Paul Parey. 40 p. 28 cm. [59 ref. Ger]

• ***Summary:*** Continued on p. 14. Ways of using the soybean in its homeland (East Asia, especially Japan and China): Note: In this section, starting on p. 15, the author repeatedly uses the word *Sojaspeisen* meaning "soyfoods." The soybean probably originated in India. The Chinese and Japanese used it to fortify their rice-based, protein-poor diet. The practice came before the theory. The author says (incorrectly, p. 15) that all the basic soyfoods are fermented. He then gives a long description of koji and how it is made.

Shoyu or soy sauce (*Shoju oder Soja-Sauce*) (p. 15-17): In Japan, 540-720 million liters are manufactured each year so each Japanese uses 60-100 ml/year. The fermentation time is 8 months to 5 years. The best soy sauce is fermented for 3 to 5 years. He explains how, as soy sauce is fermented, the protein is broken down into amino acids such as leucine, tyrosine, and members of the "Xanthin" group.

Miso (vegetable cheese, p. 17-18): Miso is widely used in soups. More than half of the yearly Japanese soybean harvest is used for making miso. This is 30 million kg per year. Types of miso include *shiro miso* and Sendai miso. Winkler, in his small work titled "The Soybean of Manchuria," mentions two other types of miso: Aka or red miso and nuka miso. Kellner investigated five types of miso; a table shows their composition. Loew reports that this vegetable cheese (miso) is consumed either raw or in soups. Kellner, Nagasaka and Kurashima report that, based on their investigations, the amount of amino-nitrogen increases 3-fold and the quantity of carbohydrates is significantly diminished through lactic acid and alcoholic fermentation. The carbonic acid created thereby rises significantly during fermentation (Loew).

Natto (p. 18): Discusses the findings of Yabe.

Japanese tofu or Chinese Tao-hu (p. 18-20): This is the so-called "bean cheese" (*Bohnenkäse*). A table (p. 19, from König) shows the nutritional value of fresh tofu (84.8% moisture) and frozen tofu (17.0% moisture). E. Senft studied frozen tofu, a Japanese military preserved food (*Militärkonserve*) that is not canned; he found it had a beige color and a unique, slightly sour aroma which was at times reminiscent of dextrin. It has a uniform texture throughout, with many tiny pores. Winkler refers to five other types of soy cheese. Concerning the military preserved foods, they were highly regarded during the Russo-Japanese War and (according to Senft) played a key role in the war. (Footnote: The descriptions of the various preparations made from soya make E. Senft's treatises (1906 and 1907) valuable; in them he published his investigations of a number of Japanese vegetable foods and military preserved foods or conserves). The well-known food manufacturer Maggi in Kempttal, Switzerland, has tried for many years to introduce a commercial miso-like product, but was not successful.

The soybean as an oil plant (p. 20-26): Winkler, in his brochure, discusses the uses of soybeans in Manchuria. After 1908, soybeans were sold in Europe at incredibly low prices which resulted in the expansion of imports and production. Then tariffs were levied on soybeans. There were some major problems in the Austrian oil industry.

Soybean flour (*Sojabohnenmehl;* p. 26-28): In recent years, various processes have been patented. One manufacturer is Soyamewerke in Frankfurt am Main, which makes *Soyama Kraftmehl*. Yellow soybeans are mechanically cleaned, washed, dried, and dehulled according to the process of Dr. Fritz Goessel. Agumawerke in Harburg also makes soy flour.

The soybean as a coffee substitute and extender (p. 28-31): Coffee is known to be detrimental to good health and void of nutrients. Rye, for example, has been used since the 17th century as a coffee substitute. Barley also plays a major role, especially as malt. A table (p. 30) shows the nutritional composition of ten coffee substitutes, including chicory, figs, lupin, and carob. Soy coffee tastes remarkably similar to real coffee. In Istria (*Istrien*), in the Austrian alps, in Switzerland as well as in Alsace (*Elsass*), the soybean has been used since its introduction as a coffee substitute. Haberlandt reported in his work that a teacher from Capo d'Istria told him that the soybean was used as a coffee substitute in Istria, and a friend told him that there was no difference between the flavor of the two. The Thunschen is used to make good soy coffee. The soybeans are mechanically cleaned, put into a trommel, agitated with water at 65-70ºC, brushed and thereby freed of a large number of impurities which can leave a burned smell. The aroma of soy coffee can be improved by impregnation with an extract of largely decaffeinated coffee. It has roughly twice the nutrients of regular coffee and no harmful constituents.

Soybean milk (*Sojabohnen-Milch*, p. 32-33): The most popular vegetable milk is Dr. Lahmann's Vegetable Milk (*Lahmannsche Vegetabile Milch*), an emulsion made from almonds and nuts. In Japan, they make milk from soybeans; he describes the process, inaccurately, based on information from Winkler. This milk is also used to make cheese [tofu]. Also in Europe there have been successful attempts to make a soymilk adapted to European tastes, as in France by the Caseo-Sojaine at Vallées near Asnieres, and in England by the Synthetic Milk Syndicate. Using the process of Dr. Fritz Goessel, the latter company has a factory in Liverpool; it makes 100 liters of soymilk from: 10 kg ground soybeans plus 5 gm sodium phosphate, 2.4 kg lactose, 2 kg sesame oil, 6 gm common salt, and 60 gm sodium carbonate. Also the Soyamawerke in Frankfurt makes a soybean milk, named Soyama, as mentioned above (fresh and dried milk and cream). Recently Prof. Melhuish developed a new method using soybean, peanuts, and added coconut milk fat.

Soy meat substitutes (*Soja-Fleischersatz;* p. 33): Soyamawerke makes a product named *Soyama-Fleisch-Ersatz.*

Soybean as a chocolate substitute (p. 34): Haberlandt reports such a product.

Soya rubber substitute (p. 34): Goessel and Sauer have developed a rubber substitute made from soybean oil.

The utilization of soya in agriculture (p. 34-38): Use as fodder for cows. In 1880 Blascowicz [Blaskovics], Assistant at the Royal Hungarian Academy in Hungarian Altenburg, conducted fodder tests, whose results are given in various tables.

Conclusions (p. 38).

Note: This is the earliest document seen that uses the word *Ersatz* or the word *Fleischersatz.* They mean "artificial or inferior substitute" and "meat substitute" respectively. Though often associated with World War I, the word "ersatz" (which means simply "substitute" in German) was actually adopted into English as early as 1875, in reference to the German army's "Ersatz reserve," or second-string force, made up of men unqualified for the regular army and drawn upon only as needed to replace missing soldiers. Hence the meaning "inferior substitute." Address: Frohnleiten, Steiermark [Austria].

388. Holt, Emily. 1917. The complete housekeeper. Garden City, New York: Doubleday, Page & Company. 402 p. See p. 202.

• ***Summary:*** In Chapter 8, "War time foods and recipes," is a recipe (p. 202) for Parched corn-meal biscuits, which calls for "2 cups peanut cream." Make the nut cream by mixing peanut butter with cold water and heating. It should be the consistency of thick cream. While the nut cream is hot, stir in the corn meal."

On pages 147-59 is a section titled "Substitutes for meat," with recipes.

Note: This book is copyright 1903, but it must have been revised during World War I (1917), since it contains the above chapter on war time foods. Address: Author of Encyclopedia of Etiquette.

389. Lyman, Benjamin Smith. 1917. Vegetarian diet and dishes. Philadelphia, Pennsylvania: Ferris & Leach. 416 p. See p. 155-58. Index. Portrait. 21 cm. [3 ref]

• ***Summary:*** Discusses the physiological, economical, and ethical advantages of a vegetarian diet, with recipes and principles of preparation. The author, who wrote mostly about geology, lived 1835-1920.

A large table titled "Composition of foods" (p. 44-47) gives the percentage of protein, fat, carbohydrates, and ash (on a dry basis) for many foods, including natto, fresh tofu, soy bean–dried, Swiss miso, soy [shoyu] No. 1 and 2, and white miso (all figures from Abel 1900), plus peanuts–dried.

In the chapter titled "Foods of vegetable origin" (p. 141-267), the section on "Pulse" (p. 152-78) contains a subsection titled "Soy bean" (p. 155-58), which begins: "The soy bean of China and Japan is perhaps the most important food plant there, next to rice. The bean is eaten to a small extent boiled like other beans; but is generally elaborated into a variety of products remarkably rich in protein and fat and therefore going well with rice so deficient in those constituents." The following soy-related subjects are discussed, based largely on the writings of others: Soy sauce (Abel), natto (Abel), miso (R. Takahashi), tofu (Abel), *aburage*, *koritofu*, substitutes for milk and cheese, and nutritional comparison with eggs, milk and cheese (Abel, Atwater).

The section titled "Substitutes for milk and cheese" states: "The Chinese in Paris [probably Li Yu-ying] have been urging the culture of the soy bean. The seeds, when boiled, mashed, and pressed, yield both milk and cheese; if thinned with water, a very good substitute for animal milk; and if coagulated with mineral salt, a cheese that is usually eaten fresh, though it may be preserved by salting or smoking, after being cooked. Three varieties of the cheese are common in the oriental markets; a fermented kind [fermented tofu], white, yellow, or gray in color, with a piquant taste, like roquefort; a salty and white kind, like goats' milk cheese; and a third kind, smoky and resembling Gruyére. The soy cheese costs about a fiftieth as much as animal cheese; and in nutritive value, like the vegetable milk, compares very favorably with the ordinary products of the cow. ('Phila. Ledger,' Sept. 27, 1906)."

Note 1. No such article in the *Philadelphia Ledger* or the *Public Ledger* (Philadelphia, Pennsylvania), of this date, can be found.

Note 2. This is the earliest U.S. document seen (Dec. 2008) that mentions smoked tofu.

The section on peanuts (p. 158-62) includes roasted peanuts, peanut butter, peanut taffy, and "Terralac or peanut-milk (here first published)." Details on how to make peanut-milk at home are given, followed by many recipes for its use–each preceded by the word "Terralac." Thus: Terralac custards, Terralac punch. Terralac cream, salad dressing, sauce, cream sauce, creams, blanc-mange [blancmange], cream pie, Bavarian cheese, Terralac in soup, "Ice-Terralac, or peanut ice-cream," peanut soup, salted peanuts.

There are also sections on the cowpea (p. 163+), almonds (p. 263-65; incl. salted almonds, marchpane, macaroons, nougat or almond cake, almond milk, orgeat syrup, burnt almonds, replacing almonds), vegetable-gelatine (p. 384-87, incl. carrageen or carragheen [carrageenan], Irish moss, and kanten), sesame oil or gingelly oil (p. 388), peanut oil or groundnut oil (p. 388), almond oil (p. 389), and sago and sago recipes (p. 390-91, incl. three sago puddings).

Note: *Merriam-Webster's Collegiate Dictionary* (1998) defines orgeat (a word first used in 1754) as "a sweet almond-flavored nonalcoholic syrup used as a cocktail ingredient or food flavoring."

390. Nigay, Antoine. 1917. Le regime alimentaire des

diabétiques [The food regimen for diabetics]. Paris: Librairie O. Berthier, E. Bougault, Successeur. 91 p. Preface by M. Marcel Labbé. [Fre]

• ***Summary:*** At the top of the title page is a quotation from Voltaire: *Règime vaut mieux que médecine* (A good diet is worth more than medicine).

At the end of the section on "Cheeses" (*Fromages*) we read: Soy cheese (*le fromage de Soja*), a food much liked by the Japanese (who call it *Tofu*), the Chinese (*Téou-fou*), and the Annamites (*Dau-Phu*), is obtained by the coagulation of a concentrated soymilk (*d'un lait de Soja concentré*) (Footnote: Soybean milk is obtained by the maceration / grinding of soybean seeds in water; it has nothing in common with cow's milk, except in appearance), with the aid of magnesium chloride or of bittern [nigari]; it is not, strictly speaking, a cheese; rather, it is unique. It contains only 4.33% oils and fats, and 1.30% nitrogenous materials, which is to say that it is not very nutritive, however it does not contain any carbohydrates. It is therefore permissible [in diabetic diets].

Soy cheese must be consumed the same day it is prepared, or the next day; however, dehydrated, it can last for several months. In the Orient, it is consumed after having been cooked in a decoction of the rhizome of curcuma (turmeric, which is yellow). The factory at Vallées (Seine) [Li Yu-ying] furnishes this cheese, as well as other soy-based products. Address: Dr., Consulting physician at Vichy. Physician at the Thermal Hospital of Vichy. Director of the *Journal de Médicine de Paris.*

391. Whittle, Charles A. 1917? Why soy beans? Southern Fertilizer Association, Soil Improvement Committee, Circular No. 3. 4 p. Undated. But it was received by the USDA National Agricultural Library on 24 May 1918.

• ***Summary:*** *"If the boll weevil takes from 30 to 50 per cent of the cotton crop then something else must be grown to supplement cotton. Soy Beans can lay strong claims for a place. The demand for its oil and meal is rapidly increasing." Contents: For human food: Soya biscuits* (*containing soya flour*), *soy bean milk* (*used for centuries in Japan and China "Because of its food value and for sanitary reasons, it is of greatest importance to bakeries and confectioners"*). *For stock feed. For industrial uses: Soap and paint. Wide adaptation to soil and climate. The increasing demand. Varieties. Yields and returns. Fertilization. Address: Atlanta, Georgia.*

392. Bottari, Paolo. 1918. La soja ed il latte di soja [*The soybean and soymilk*]. *Cronaca Agricola* (*Torino*) *No. 1. Jan. 17; No. 3. Feb. 4.* [*Ita*]*

• ***Summary:*** *Discusses soymilk experiments as the Bonafous Institute in 1916 and 1917.*

Note: This is the earliest Italian-language document seen (*Aug. 2013*) *that mentions soymilk, which it calls Èlatte di soja.*

393. Howell, E.V. 1918. Soy beans and soy bean oil. *J. of the American Pharmaceutical Association* 7(2):159-63. Feb. [14 ref]

• ***Summary:*** "This bean is a native of southeastern Asia. It is at present the most important legume grown in China and Japan, where it is grown almost exclusively for human food. It has been cultivated from a remote period, each district having its own distinct variety, some two hundred kinds in all... The bean was introduced into England in 1790. Apparently the first mention of soy beans in American literature was in the *New England Farmer,* October 23, 1829, in an article by Thomas Nuttall." There follows a summary of this article and several other early U.S. documents that mention the soy bean.

"Importance: I think the soy bean is the most important plant introduced into the South within a hundred years. This opinion is based on the range of the plant, the value as a soil improver, and the numerous uses of the seed and oil, together with the fact that the present cottonseed oil mills can produce the oil with practically no change in machinery and thus double their mill season. The beans can be stored, as they are practically immune to insects. Especial emphasis is placed on this statement in the present demand for food on account of the war. In Japan the bean forms one of the most important articles of food, by nature a meat, to go with the starch of rice. The Chinese make from the beans a cheese resembling our own cheese, while the Japanese make the well-known sauce for rice or fish, soy or suey sauce. It is one of the principal ingredients in 'Tofu' (bean curd), natto (steamed beans), and white and brown miso, which is like our molasses brown bread."

"A factory for the production of this [soy] milk has recently been established in America. This can be used in cooking, by bakers, confectioners, and chocolate manufacturers. I have before me the following food articles in which soy bean meal is the principal ingredient: Egg substitute No. 1, egg substitute No. 2, colored cocoanuts, coffee substitute, cocoa substitute, roasted malted nuts, coloring curry powder, cutlet powder, soy and navy beans with pork, the equal of any pork and beans.

"The use of the soy meal for soups, for proportional use in muffins, cookies, fritters, croquettes, biscuit, and loaf bread is unlimited. Its use is checked only by our prejudice for certain customary flavors, just as northern people and Europeans do not use corn meal. In other words, North Carolina, if forced to by war conditions, could largely exist on the soy beans crushed in the State this year, including the imported and native beans crushed, the oil from which I estimate to yield this year 400,000 gallons. This oil can be used for frying, and for a salad oil in French dressing or in mayonnaise. I fried a partridge in the crude unrefined oil, and found it delicious.

"While the chief use, so far, of the oil has been for soaps and paints, the particular object of this paper has been to call attention to the use of soy oil in pharmaceutical preparations."

Tables show: (1) The specific gravity, saponification value, and iodine for three samples of Manchurian soy oil purchased in New York. (2) The chemical composition of soy bean meal (8.77% fat), compared with the meal of five other seeds (including cottonseed, linseed {old and new process}, decorticated peanut, and sunflower seed). (3) Four chemical constants of seven samples of domestic and imported soy oils (from L.P. Nemzek). (4) The food values (nutritional composition) of soy beans and six other foods, including lean beef, milk, and eggs.

Because of World War I: "During the past six or seven months there has been produced in this country in the neighborhood of one hundred thousand gallons of soy oil. The largest part of this quantity has been produced in North Carolina by the Elizabeth City Oil & Fertilizer Co., Winterville Cotton Oil Co., and the New Bern Cotton Oil & Fertilizer Mills. Samples from the different crushings have been examined in comparison with the imported oil."

"Medicinal use: In England a diabetic biscuit is manufactured. In this country an infant's food from the soy bean is on the market. The enzyme in the bean is also attracting attention and opening a field for investigation."

Note 1. This paper was presented at the Scientific Section, American Pharmaceutical Assoc., Indianapolis meeting, 1917.

Note 2. This is the earliest English-language document seen (Oct. 2008) that contains the word "crushings."

394. Kellogg, John Harvey. 1918. The soy bean. *Good Health* (*Battle Creek, Michigan*) 53(2):111. Feb.
• ***Summary:*** "A new food product has made its appearance in the United States, although up to the present time it has been little appreciated. This new food is a legume, the famous Japanese soy bean, which has for unknown centuries been a staple food in Japan and China."

"Another point in favor of the soy bean is the fact that the protein which it contains is a complete protein. That is, it is capable of fully supplying the place of lean meat, milk or eggs. It is for this reason that the Chinese and Japanese are able to prepare from the soy a very good substitute for milk. A very fine cheese is also made from the soy which is in many respects superior to ordinary cheese.

"The fat or oil of the soy is of excellent flavor and is more easily digestible than animal fats."

"The soy bean has been grown quite freely of late years in the South as a forage plant and for feeding cattle, but has been little used for human food. The chief obstacle in the way of its introduction as a food product has been the difficulty of preparing palatable dishes from it. Ordinary cooking even when prolonged left the beans so tough as to be hard to chew and unpalatable. A few months ago the interesting discovery was made that by cooking the bean under pressure it became remarkably tender and toothsome. A temperature of about 225 degrees F. is required and the cooking must be continued for four to six hours."

A recipe is then given for "pressure cooking" whole dry soybeans without a pressure cooker. "Soak the beans over night in sufficient water to cover them. Provide an empty stone jar with a tight fitting top, also prepare a strong brine by adding to a gallon of water five pounds of common salt. Put the soaked beans in the stone jar with a little salt, adding tomato sauce if desired. Screw in the top, taking care to make it tight. Immerse the jar in the brine and boil for five or six hours. The brine has a boiling temperature of about 225 degrees F. Higher temperatures may be obtained by adding chloride of calcium to the brine.

"Prepared in this way, the soy bean makes an exceedingly rich and savory dish with a meaty taste and very great staying and satisfying qualities."

Note 1. The USA entered World War I in April 1917. Starting in about 1916 there was great interest in finding alternatives to meat and dairy products, so that the latter foods could be shipped to American and allied soldiers.

Note 2. This is the earliest document seen (Oct. 2006) that uses the term "complete protein" (or "complete proteins") and also the earliest that uses this term in connection with soy.

Note 3. This is the earliest document seen (June 2013) that mentions the cooking of soybeans under pressure or in a pressure cooker. Note that the soybeans are apparently in a separate container inside the pressure cooker so that their skins do not clog the pressure-release valve. Address: M.D.

395. Winkler, Gustav. 1918. Die Sojabohne: Vortrag gehalten in der Monatsversammlung des Gartenbau- und Verschoenerungsvereins Fechenheim-Mainkur am 17. April 1913. 2 Auflage [The soybean: Lecture presented at the monthly meeting of Gardening and Beautification Society of Fechenheim-Mainkur on 17 April 1913. 2nd ed.]. Mainkur bei Frankfurt am Main, Germany: Published by the author. 16 p. 21 cm. [5 ref. Ger]
• ***Summary:*** On the cover is written (in German): The soybean: What is it? What can it do? Is its cultivation possible in Germany? Contents: The significance of the soybean industry for the German economy (based on Grossmann 1910. From Tag, 23 Dec. 1910). Significance of the soybean for healthy and sick people, and the forms in which it is used (based on Neumann 1913). The soybean and its lecithin content, etc. (based on *Naturarzt*, March 1918). Addendum: Is the cultivation of soybeans in Germany possible? ("After my eight years of observations and cultural trials, I can say with confidence that the soybean that the soybean is no more sensitive than our usual bean varieties"). Address: Mainkur bei Frankfurt am Main, Post Fechenheim

a, M., Mainkur train station, Circle Hanau.

396. Makino, Magotaro. 1918. Soy-bean food (tofu). *U.S. Patent* 1,258,427. March 5. 2 p. Application filed 5 Dec. 1916.
• ***Summary:*** Soy bean flour is mixed with water and a small quantity of an edible oil, the mixture is heated, filtered, and the proteins in the filtrate are precipitated/coagulated with Epsom salts and separated from the liquid.

Note: This is the earliest document seen (Sept. 2011) with the term "Soy-bean food" (or "soy bean food") in the title. Address: San Francisco, California.

397. Johnson, Nelson Trusler. 1918. Process used by Chinese in making bean curd. *Commerce Reports* [*USA*] (*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 21(58):926-28. March 11.
• ***Summary:*** This report begins: "Probably the first article of diet that attracts the attention of the foreigner coming to China is the bean curd which is served to him at the Chinese restaurant or hotel, or in the Chinese family in many ways. Bean curd is only one of a number of products derived from soya beans. Among these are bean meal, a kind of spaghetti, bean cheese, bean sauce (known as shoyu to the Japanese, chiang yu to the Chinese, and soy in commerce), bean milk, and bean oil. All of these products are used by the Chinese as foods. The shoyu is used as a foundation for a certain well-known brand of sauce." Note: Probably Lea & Perrin's Worcestershire Sauce.

The next section, titled "Product called an ideal food," is largely a summary of a 1917 article by John E.S. Han titled *The Yale-in-China Student* (Changsha, China) 1(2):8-14. Nov. Contents: Introduction. Product called an ideal food. Uniform quantities of beans used. Specific gravity near that of milk. Method of coagulating emulsion. Suggested improvements in process.

On the last point, Mr. Johnson notes that the changes Mr. Han recommends "are largely the same as those proposed by Li Yu-ying." Address: Consul, Changsha [China].

398. Howe, H.E. 1918. A lesson from the Orient. *Scientific American* 118(11):230. March 16.
• ***Summary:*** "In the south are many acres where the boll weevil makes it impossible to continue the profitable production of cotton. The search for a substitute crop has introduced the soya bean from Manchuria where it is a very important staple and it bids fair to become most useful. The soya bean yields an oil upon hot pressing and just prior to the war, the Germans set up a naphtha solvent process in the Orient but the oil recovered was considered inferior to that from the native presses. The potentialities of soya bean oil have not been fully determined. It has become established in the industries and we are learning how to make better use of it as a food product. The oil cake or meal left after pressing is a valuable component of stock foods, being high in nitrogen compounds.

"Some of the varieties of the soya bean are suitable for human food and in combination with peanuts, a foundation for several materials high in fat and protein is obtained. The soya bean alone comprises a ration that is nearly complete, for it contains a large amount of protein, fat in the form of oil and the starch furnishes a carbohydrate. The bean also carries a vitamine which is necessary to sustain and promote bodily growth but the mineral content is deficient."

"In the Orient soya beans are used to make a kind of cheese and a milk substitute. A peculiar cake is also made from them as well as a sort of fermented beverage.

"Experiments are under way to improve greatly the food values in soya beans and increase the oil content...

"And so these cotton lands of the south which have so long contributed to our clothing may now greatly supplement our food supply." Address: Chemical engineer.

399. Itano, Arao. 1918. Soy beans (Glycine hispida) as human food. *Massachusetts Agricultural Experiment Station, Bulletin* No. 182. 10 p. March. [16 ref]
• ***Summary:*** Contents: Introduction. Chemical composition and digestibility. Human food prepared from soy beans (practical recipes for making Japanese foods at home; names in parentheses indicate the Japanese name). Soy bean milk (*Toniu*)*:* The ordinary method employed in Japan, toniu from soy bean meal (made by grinding soybeans in a wheat flour mill or fine coffee mill), author's method [from soy bean meal, plus inoculation with *Bacillus coli* and *B. lactis aerogenes*], synthetic toniu, condensed soy bean milk (condensed toniu). Evaporated soy bean milk (yuba). Soy bean curd (tofu): Fresh curd (tofu), frozen tofu (*kori tofu*), fried tofu (*abura-age*). Baked beans. Boiled beans. Roasted beans.

"Powdered beans–Roasted: 1. Roast as in the roasted beans [either in an oven or in an ordinary corn popper]. 2. Let them stand until cool to harden them. 3. Grind them in a coffee mill or any other suitable grinder. Note.–The powder can be used as a salad dressing or cooked with cookies like peanuts or other nuts, or employed as a substitute for coffee."

Powdered beans, raw (soy bean meal). Green beans. Soy bean pulp (*kara*). Fermented boiled beans (natto). Ripened vegetable cheese (miso; discusses koji). Soy bean sauce (shoyu). Vegetable butter, ice cream, oil (table use) and lard (cooking): "The manufacture of these articles from soy beans needs further investigation." How to make "Evaporated soy bean milk (Yuba)" at home (p. 5): "1. Boil the soy bean milk until a film is formed on the surface. 2. Collect the film and cut it into any shape desired. Note.–The film consists of coagulated albuminoids and fat. It may be used as an article of food, cooked in soup, etc."

Note 1. Even though it is very brief and inadequate,

this is the earliest document seen (Oct. 2012) that contains a description of how to make yuba at home.

How to make "Baked beans" at home: (p. 7). "1. Soak the beans, suspended in a cloth bag, in a large quantity of hot water over night. (Soaking for twenty-four hours in ice-cold water which is changed occasionally will give the same result.) 2. Change the water, when hot water is applied, in the morning and an hour or two before cooking. 3. Add 1 teaspoonful of soda [sodium bicarbonate] per quart of beans and boil until the beans become soft. 4. Bake like other beans. Note.–The characteristic strong flavor of the beans is removed by soaking before cooking; the addition of soda [sodium bicarbonate] makes the beans soft. Cooking with salt pork, potatoes, onions, molasses and other substances makes the beans more palatable to some tastes."

Concerning the "Roasted beans" (p. 7). "1. Roasting can be done either in an oven or in an ordinary corn popper. 2. Roast until the skin of the bean is burst by popping. Note.–The beans can be kept soft by immersing them in a syrup while they are hot. Thus very wholesome candy is prepared."

Concerning the "Powdered beans: Roasted" (p. 7). "1. Roast as in the roasted beans. 2. Let them stand until they cool to harden them. Grind them in a coffee mill or other suitable grinder. Note.–The powder can be used as a salad dressing or cooked [baked] with cookies like peanuts and other nuts, or employed as a substitute for coffee." Note 2. This is the earliest English-language document seen (Nov. 2012) that uses the term "Powdered beans: Roasted" to refer to roasted soy flour.

Concerning "Green beans: 1. Pick them when the beans are three-fourths to full grown. Boil them in salt water. 3. Discard the pods. 4. Serve the beans with butter or milk. Note–The pods are tough and they can be removed easily on boiling."

Concerning "Soy bean pulp (kara): 1. This is the residue after the milk is extracted in the process of preparation of soy bean milk. 2. Cooked like any other vegetable with proper seasoning. Note.–Makes a very rich dish; an addition of green onions, cabbage or parsnip may improve it."

Tables contain analyses of the chemical composition of each of the basic foods discussed.

Note 3. This is the earliest English-language document seen (March 2007) concerning soy ice cream, which it calls simply "ice cream." This is also the earliest document seen (March 2007) concerning the etymology of soy ice cream.

Note 4. This is the earliest English-language document seen (June 2013) that uses the term "soy bean pulp" to refer to okara.

Note 5. This is the earliest English-language document seen (June 2013) that describes how to use okara in a recipe.

Note 6. This is the earliest English-language document seen (Aug. 2013) that uses the word "toniu" to refer to soymilk; the Japanese word is *tônyû*. Address: Amherst, Massachusetts.

400. *British Medical Journal*. 1918. A vegetable milk. i(2889):430. April 13.

• ***Summary:*** "From a correspondent: In these days of agalactia [failure of the secretion of milk in mammals] any reasonable substitute for milk is certain of a welcome, so that particular interest attaches to the soy bean, an alimentary plant grown on a very large scale in China, and imported into this country [Britain] by hundreds of thousands of tons annually for the sake of the oil it contains, which is utilized in the manufacture of soap, margarine, etc.

"More interesting from the alimentary point of view is the fact that it can be made to yield a substitute for milk, which in respect of appearance and composition so nearly approximates the familiar article as to be wellnigh indistinguishable therefrom.

"The process is simple. Five ounces of the bean are soaked overnight in a quart of cold water; it is then coarsely ground, mixed with the water in which it has been soaking, and filtered through muslin [coarse cotton fabric]. The result is a milky fluid with a rather strong smell of haricot bean, which disappears after it has been raised to boiling point. Infants take it readily, and, mixed with tea or coffee, the taste is imperceptible. Fresh soy bean milk has a fairly acid reaction; it is quite homogeneous under the microscope, and its physical properties are those of cow's milk; rennet causes it to curdle, lactic acid germs cause it to undergo lactic acid fermentation. When boiled it 'rises' like ordinary milk and forms a pellicle [yuba] on the surface.

"Its composition is: Casein 3.13 per cent., fats 9.89, but it lacks carbohydrates, a shortcoming which can easily be remedied. As the fatty constituent is an oil, butter cannot be made from soy bean milk, but it can be made to provide cheese (120 grams of the bean yields 184 grams of cheese), and the cheese [fermented tofu] can be made to resemble any of the popular cheeses in the market; it is merely a question of employing the proper flavouring ferment. Soy-bean milk can be retailed at 3 centimes a litre. The residue, after making milk, is still very rich in alimentary principles, and can be worked up into very palatable 'almond' cakes and biscuits. Being practically free from starch, these cakes are especially suited for consumption by diabetics.

"Roasted, the bean provides a colourable imitation of coffee, just as do barley and oats, to what a satisfactory degree only those who make use of these substitutes will understand."

"A practical idea of its alimentary value may be formed by contrasting the cost of this as compared with other albumins: 100 grams of albumin, at before-the-war prices, would cost–from egg 1s. 8d. [1 shilling 8 pence], from meat 1s. 4d., from pork 8d, dried peas 3d., and from soy bean 2d. The bean contains four times as much mineral constituents as meat, and is twice as rich in phosphoric acid." A table compares the nutritional composition of soy beans (water

plus 5 nutrients) with lentils, haricot beans, peas, and broad beans.

401. *Bulletin Bi-Mensuel, Office de Gouvernement Général de l'Algérie.* 1918. La culture et l'utilisation du soja [The cultivation and utilization of the soybean]. 24(4):54. April 1-15. [3 ref. Fre]

• ***Summary:*** This article appears in the section on "Agriculture" (p. 51-55). We reproduce the following note published by "Algerian Information" (*Informations algériennes*) on a question that presents a reality and an interest of the first order for Algeria:

"We can hope to see taken up, from this year forth, the cultivation of soybeans (*graine de soja*) even more as a letter received from Palestro gives us full confidence; the movement was already begun two years ago."

Having found a letter on this subject in the July issue of the *Bulletin of the Society of Agriculture* from Mr. Aimé Zurcher, of Zaatra near Courbet, we wrote him and he responds to us:

"I have, in fact, cultivated soybeans for 7 years from the point of view of industry. For, as you know, this precious bean furnishes several food products: milk, cheese [tofu] that is equal to meat, confections, oils, coffee, etc. I ate all these foods that I ordered from Paris where a company [founded by Li Yu-ying] makes them. And it was with the goal of selling my products to this company that I cultivated soybeans. I had distributed many grains and beans.

"The war having cut off my relations with this company, a certain quantity of soybeans remained. At the end of 3 years, they no longer germinated. I abandoned cultivation.

"I occupied myself with yellow soybeans with round seeds. I have had very high yields, even in nonirrigated, plowed soil and in slightly humid soil with ordinary labor.

"The lively, robust plant adapts to almost all terrain and completes its entire development in 3-4 months; it attains a height of 1-1.4 meters. It requires the same care as the ordinary haricot bean and more especially the dwarf haricot (*haricot nain*). It is then in March, even at the end of March and April that it should be sown (2 seeds/hole; but too much humidity can damage it).

"Nothing is lost of this precious plant. After threshing, the leaves and stems are very esteemed by livestock."

"... We also remark that for a liter of milk, that has nothing in common in taste with cow's milk but which is just as nourishing, 100-200 g [of soybeans] is used [to make the milk]; little matter, it's an insignificant expense. In any case the remains [okara] that the mincer (*hâche-viande*) (business M.F.G. Co., Philadelphia [Pennsylvania]) leaves must be used to obtain the result. We believe that we should give the recipe furnished by an ingenious experiment:

"[To] the okara (*drèche,* which originally meant dregs) that produced the milk [sic, that is a by-product of producing soymilk] is added half its weight in sugar and enough water to dissolve this sugar; it is then cooked to have confections that you can flavor.

"These confections, instead of being consumed as is, can be mixed with an egg, 4-5 bitter peeled almonds, [or] 2 spoonfuls of flour and divided into small cakes, macaroons, that are cooked in the oven again on a lightly buttered pan. These cakes are delicious, a true luxury product rivaling the best *petits fours* (a small cake cut from pound or sponge cake and frosted) of pastry-makers."

Two more articles on soy are cited, both published in *Nature*, in 1907 and 1910.

Note: Spine title on bound volumes: "Bulletin de L'Office du Gouvernement General." Address: Govt. of Algeria.

402. Dorsey, Henry. 1918. Growing soybeans. *West Virginia Univ., College of Agriculture, Extension Dept., Circular* No. 204. p. 1-8. April. [1 ref]

• ***Summary:*** "Within the last five years soybeans have assumed, due to their many desirable qualities, an important place in West Virginia agriculture and their importance is quite likely to increase. Less than a decade ago the crop was practically unknown. A conservative estimate derived from county agents' annual reports indicates an acreage of more than 6,000 in 1917. This acreage is almost equal to that of clover alone according to the census figures of 1910."

Contains sections on the importance of the crop, harvesting, yields, suitable varieties, special uses, human food, and in crop rotations.

The section on human food uses states: "The scarcity of meats will doubtless lead to a wider use of soybeans in the human dietary. For centuries they have supplied a large proportion of the nitrogenous part of the food of the Chinese and Japanese. In the Orient the whole beans are not eaten directly but soy sauce, bean milk, bean curd, and vegetable cheese are made from them. Americans would doubtless object to many of these products. The whole beans have often been used like other beans–boiled, baked, or with pork. They need to be soaked several hours to remove the strong flavor. Soybean flour has great possibilities as a substitute for part of the constituents of various breads. When Americans learn to use the products of the seed, then there will be a ready market for the crop and it will take a regular place in our cropping scheme." Address: Asst. Prof. of Agronomy, West Virginia Univ., Morgantown.

403. Trabut, Louis. 1918. Le Soja: Soja Max (L.) Soja hispida *Savi* [The soybean]. *Algerie, Service Botanique, Informations Agricoles. Bulletin* No. 55. 16 p. April. [7 ref. Fre]

• ***Summary:*** One cannot say that the soybean has been introduced to the Western world only relatively recently; it has been cultivated at the Jardin des Plantes since 1779. There the soybean has always produced seeds, which have

been distributed to botanical gardens and amateurs interested in plants. It would be unjust to say that for 138 years no one has been involved in the utilization of soya in Europe. In fact, there have been a number of fervent popularizers and propagators of the plant. A history of this work is given, including the Vienna Exposition of 1873, the work of Prof. Haberlandt in Austria disseminating and testing soybeans and his remarkable book on the soybean published in 1878, the work of the Society for Acclimatization in France from 1855 (they made the vegetable cheese, tofu [To-fou]), and exports from Manchuria to Europe.

Since 1898, Manchuria, which can no longer cultivate the opium poppy, has greatly expanded its cultivation of soybeans and has looked for outlets in European markets. In 1909 Manchuria exported 410,000 tonnes of soya, a figure which rose to 650,000 tonnes in 1912.

A that time, according to Mr. Brenier, Director General of the Chamber of Commerce at Marseilles, the industry of Marseilles, confronted with a influx of new oilseeds, tried to obtain soya but ran into customs problems. It wasn't clear whether soya should be classified as a legume (because it is a bean) or as an oilseed (*graine oléagineuse*). While the matter was being debated, all the available beans had been purchased by Hull, England, and Hamburg, Germany (*Académie d'Agriculture de France,* 1917, p. 189).

"As the Director of the Chamber of Commerce of Marseilles informs us, in England, Germany, and the Netherlands, the industrial use of the soybean has been growing in importance for several years. In Germany there even existed an important manufacture of soymilk.

"A Chinese factory [run by Li Yu-ying] was installed a few years ago near Paris to enable the soybean to realize its full potential and to introduce various commercial food products made from this seed. In 1912 Messrs. Li Yu-ying and Grandvoinnet published a work on the soybean, recommending its cultivation in France.

"In 1917 Mr. Balland notified the Academy of Sciences of the utilization of soya in war bread, biscuits, etc. All these products, said the knowledgeable chemist, can contribute to a good diet because of their rich nutrient content.

"The Swiss, who consume many coffee substitutes, roast the soybean seeds to make a coffee.

In Algeria, starting in 1894, soybean agronomic trials were started at the botanical station of Rouïba. The results were communicated to the other French colonies in 1898 [by Louis Trabut] in Bulletin No. 16 of the Botanical Service." The results of these and subsequent trials in 1896 and 1897 in Algeria are summarized.

In 1896 a soybean with a green seed coat yielded 2,980 kg/ha of soybeans.

Pages 7-11 include discussions of the nutritional value of soybeans, their use in diabetic diets, the fact that soybeans are rarely consumed as such but are almost always processed into more sophisticated foods (including fermented foods). Following these trials, that were focused on a very important collection (80 soybeans in number) received [in France] from a missionary in China through the intermediary of Mr. H. de Vilmorin, the seeds were distributed and the results of their cultivation were generally good. There follows a letter from a person in Bou-Medfa [Bou Medfaa, Algeria]. Also discusses the availability, benefits, and method of producing soybean milk which the Chinese prefer to animal milks, and which is free of bacteria that can cause tuberculosis. In Algeria, soybean yields range from 12 to 30 quintals per hectare. Note: 1 quintal = 100 kg. The Arabs consume soybeans boiled in salted water. In England a Soya Flour is sold which contains 75% wheat flour and 25% soy flour. This flour is used commercially to make a soy bread. A Soja Biscuit is made in the Netherlands.

Pages 12-14 list 26 soybean varieties in order of their earliness. Synonyms and characteristics are also given: *Soja très hatif à grain noir* (Extra Early Black; Vilmorin or Ogema [Ogemaw] of Michigan. Matures in 80-90 days). *Brun précoce* (Early Brown from Indiana). Vireo (Tokyo). Chernie (Khabarovsk, Siberia; black seed). Auburn (American selection). Merko (Mekoechofka of Siberia; brown seed). Elton (Khabarovsk, Siberia; yellow seed). Chestnut (American selection 1907; brown seeds). *Jaune d'Etampes* (Yellow Etampes, or Ito San in America; One of the earliest varieties introduced to Europe and America). *Vert de Samarow* (Green Samarow, or Guelph in America; green seeds, matures in 120 days). Butterball (or *Jaune géant* {Yellow Giant} from Dammann, from Tokyo; yellow seeds. Matures in 110 days). *Soja noir de Podolie* (Black Podolia, or Buckshot in America; black seeds). Wilson Black (Manchuria). Meyer. Austin. Haberlandt. *Huang-Tou* (Yellow Bean, from Ningouta {Ninguta, see Ning'an}). Bhetmas (from India; seed chocolate and yellow). Medium Yellow. Shingto (From Tieling {T'ieh-ling or Tiehling, Liaoning prov.}, Manchuria). Swan (from Canton). *Soja tigré* (Striped, spotted, or speckled soybean from Peking; seeds are grilled and eaten like peanuts). Brooks (Manchuria and China). *Maculata gigantea* (Large spotted, sold under this name by Dammann; probably the same as the American variety Meyer). Mammoth (American selection). Riceland (From China).

The importance of inoculation with bacteria is emphasized. Soybeans can be cultivated with cowpeas for forage. An illustration (line drawing) on the cover shows the soy bean plant, with a close-up of the pods.

Note 2. This is the earliest document seen (Oct. 2004) that mentions the soybean variety Wilson Black. Address: Director of the Botanical Service for the Government of Algeria.

404. Kiesselbach, T.A. 1918. Soy beans. *Nebraska Agricultural Experiment Station, Bulletin* No. 166. 16 p. May 1.

• ***Summary:*** Contents: Uses. Food values. Composition. Adaptation and varieties. Relative yields of soy beans and cereal crops. Time, rate, and manner of planting. Cultivation. Harvesting and threshing. Soy beans as a forage crop. How to use soy beans for human food: Soy bean flour, method of using flour, recipes for using soy bean flour, dishes prepared from whole soy beans boiled.

"Altho soy beans are an excellent supplementary protein stock feed, with a feeding value about equal to that of oil meal, investigations indicate that the yield is not sufficiently large to justify growing them for this purpose in Nebraska where alfalfa can be grown successfully. An acre bearing three tons of alfalfa hay produces approximately two times as much digestible protein and five times as much energy value in the form of carbohydrates and fat as one acre of soybeans yielding 15 bushels. On the other hand, soy beans are the most productive of protein and energy value of any of the leguminous concentrates suitable for human consumption."

"The yield of soy beans in the southern states in proportion to the yield of cereal crops is so much greater than in Nebraska that a natural adjustment of production is not likely to make it profitable for Nebraska farmers to compete extensively in the growing of soy beans for commercial purposes."

"The Experiment Station ground and sold considerable soy flour during the winter 1917-1918, in an experimental way, to a rather large number of people. This flour was relished and held in high favor by nearly all who used it. It was without doubt one of the most satisfactory substitutes for wheat flour on the market. The keeping qualities of this flour have proved very satisfactory during the winter time. A sack full has been retained in good condition at ordinary living room temperature (70 degrees F.) during the five months from October until March."

Ideas for using soy bean flour in recipes include: Raised wheat bread with soy bean flour. Raised whole wheat bread with soy bean flour. Steamed Boston brown bread. Muffins. Biscuits with soy bean flour. Corn bread. Mush for frying. Corn griddle cakes. Soy bean soup. Soy bean milk.

Ideas for using whole soy beans boiled in recipes include: Soy bean loaf. Soy bean croquettes. Soy bean soup. Roasted soy beans (like peanuts).

Photos show: A man standing in a field of soy beans. Fifty seeds of five soy bean varieties (Early Yellow, S.P.I. No. 36576, Habaro, Haberlandt, and Cloud). Tables give experimental data and compositional analyses of soy beans. Address: A.M. Agronomy, Lincoln, Nebraska.

405. Gray, Olive. 1918. The new. Latest view in stores and homes. Novelties, ideas, and practical suggestions. *Los Angeles Times*. May 19. p. III-15, III-15.
• ***Summary:*** The section titled "Soy dairy products" states: "At a Japanese place, where groceries and produce popular with the orientals are always in stock, I was interested in observing the 'soy bean milk,' 'soy bean cottage cheese'– maybe it is pagoda cheese [probably tofu]. Soy bean flour [probably roasted] is also there, and recipes are issued which teach many ways of utilizing this so-nutritious food product."

406. *Weekly News Letter* (*USDA*). 1918. Soy beans, used like navy kind, make valuable food: Ancient China's product can be served in numerous desirable ways. 5(42):3. May 22.
• ***Summary:*** "While the soy bean has been grown in the United States primarily as a forage crop, its availability as a valuable food for human beings is being given increasing attention. Many schools of cookery and domestic science in this country, as well as home economics experts and home-demonstration agents of the United States Department of Agriculture, have shown that dried beans can be used successfully in the same manner as navy beans." After the beans are soaked, then boiled slowly, they "may be seasoned and used as the principal part of a meal, as they are or may be made into bean loaf, bean croquettes, or other dishes.

"When soy beans are three-fourths or more grown, the seed make a palatable and nutritious green vegetable."

Also discusses "soy-bean milk" ("a milky emulsion is obtained which is similar in appearance and properties to cow's milk"), "tofu or bean curd" (the addition of either magnesium chlorid [chloride] or calcium sulphate to soy-bean milk precipitates some of the proteid substances, forming a grayish-white curd).

"Soy or shoyu sauce is a dark-brown liquid prepared from a mixture of cooked and ground soy beans, roasted and pulverized wheat or barley, salt, and water, inoculated with a culture known as rice ferment and left in casks to ferment for six months to a year or longer. The liquid obtained is used in many countries, including the United States, as a sauce for meat or vegetables." '

Note: This is the earliest English-language document seen (Aug. 2013) (one of three documents) that uses the term "milky emulsion" to refer to soy-bean milk. Address: Washington, DC.

407. *Good Health* (*Battle Creek, Michigan*). 1918. Milk from beans. 53(5):285. May.
• ***Summary:*** "A recent patent application in England is based upon a process for the manufacture of artificial milk for human consumption It is claimed that a wholesome and inexpensive substitute can be made from peanuts, soy beans, sugar, water, and the mineral salts found in milk." Contains a summary of the process.

408. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1918. Make good bread from soy bean flour. 1(1):38. June.
• ***Summary:*** Alameda, California–The humble and hitherto despised soy bean has come into its own. This particular legume is better known as the horse bean [sic], and it has appeared in the face of the serious wheat situation as the

savior of the day. A demonstration of the use of the soy bean was made by Mrs. H. Ward, head of the food conservation movement, before the Lincoln school class of conservation.

"The demonstration proved that not only bread, that is as rich in protein as bread made from wheat, but milk much like the ordinary condensed milk, can be made by cooking soy bean flour and water together. The soy bean is native to southwestern [sic, East] Asia and is largely cultivated in Japan for food purposes. In the west it has been used only for cattle fodder, but has been recommended by the food administration as an excellent substitute for wheat."

409. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1918. The soy bean. 1(1):43. June.
• ***Summary:*** Contents: Wide use of soy beans [in North Carolina]. Soy bean has food value. Soy beans for hay. Concerning food value: "This remarkable legume has a composition very closely resembling fat meat. Chemical analysis shows in its composition one-third protein, or more than is found in beef, and one-fifth of its weight in fat. And so the soy bean serves the Chinaman for both beef and butter.

"Another point in favor of the soy bean is the fact that the protein which it contains is a complete protein. That is, it is capable of fully supplying the place of lean meat, milk or eggs. It is for this reason that Chinese and Japanese are able to prepare from the soy a very good substitute for milk. A very fine cheese is also made from the soy, which is in many respects superior to ordinary cheese.

"The fat or oil of the soy is of excellent flavor and is more easily digestible than animal fat.

"The soy is a vigorous grower and produces more bushels to the acre than does the ordinary bean. Pound for pound the soy bean supplies one-half more nutriment, so that a parcel of ground planted to the soy bean supplies one-half more nutriment than if planted with ordinary beans."

410. *Scientific American Supplement.* 1918. Soy beans make valuable food (Abstract). 86(2218):8. July 6.
• ***Summary:*** A near reprint of: *USDA Weekly News Letter.* 1918. "Soy beans, used like navy kind, make valuable food." May 22, p. 3.

411. Burdick, Alfred S.; Nielsen, Carl. Assignors to Abbott Laboratories, Chicago. 1918. Vegetable milk. *U.S. Patent* 1,273,145. July 23. 2 p. Application filed 13 July 1917.
• ***Summary:*** Soy beans are washed, soaked in water, and drained. The inventors prefer not to remove the skins so as "to obtain in the final product the maximum percentage of the so-called vitamins which... are principally contained in the skin coating of the grain or in the layer immediately under the husk." The wet beans are then mashed and extracted with 5-10 times their weight of cold water. Address: Chicago, Illinois.

412. Burdick, Alfred S.; Nielsen, Carl. Assignors to Abbott Laboratories, Chicago. 1918. Prepared food. *U.S. Patent* 1,273,144. July 23. 2 p. Application filed 13 July 1917.
• ***Summary:*** Soak soy beans in water, drain off the water, mash the beans, extract the mash with water, and mechanically remove the liquid extract from the insoluble residue. "The milky liquid, which may be termed vegetable milk... is now evaporated in vacuum at approximately 55º to 60ºC until a liquid of the consistence of thick condensed milk is obtained.

Malt cereal flour gruel, made from ground rice or other suitable cereal, to produce a syrupy liquid containing dextrins and sugar, then filter out the insoluble and inextractable substances to produce a malt liquid. Mix the thick soy-bean milk with the malt liquid (rice syrup), then add tissue salts in the desired proportions. If desired, evaporate the mixture to dryness in a vacuum, then add the tissue salts. Address: Abbott Labs, Chicago, Illinois.

413. Morse, W.J. 1918. The soy bean: Its culture and uses. *Farmers' Bulletin* (*USDA*) No. 973. 32 p. July. Superseded by Farmers' Bulletin 1520. [27 ref]
• ***Summary:*** Contents: Summary. Commercial importance. Climatic adaptations. Soil requirements. Preparation of the seed bed. Fertilizers. Inoculation. Time of planting. Depth of planting. Rate of seeding. Method of seeding. Cultivation. Varieties: Barchet, Biloxi, Black Eyebrow, Chiquita, Early Brown, Elton, Guelph ("also known as Medium Green, Early Green, Medium Early Green, and Large Medium"), Haberlandt, Hahto, Hollybrook, Ito San ("has been known under the names of Japan Pea, Yellow, Medium Yellow, Dwarf Yellow, Early Yellow, Early White, and Coffee Berry"), Lexington, Mammoth, Manchu, Medium Yellow ("has been grown under the names Early Yellow, Mongol, Banner, and Roosevelt"), Mikado, Peking ("In variety tests the Peking, Sable, and Royal varieties appear to be identical, and it is quite evident that the latter two are selections from the Peking."), Shanghai ("has been grown in North Carolina under the name of Tarheel Black"), Tokyo, Virginia, Wilson-Five [black seeded], Yokotenn [Yokoten].

Soy beans in rotations. Soy beans in mixtures: With cowpeas, corn, sorghums, or Sudan grass. Soy beans for seed: Yields of seed, feeding value, for human food, for oil and meal, viability of soy-bean seed, cost of production, soy-bean straw. Soy beans for hay: Time of cutting, curing soy-bean hay, feeding value of soy-bean hay, yields of soy-bean hay. Soy beans for soiling. Soy beans for pasture. Soy beans for ensilage. Soy beans for soil improvement. Enemies of the soy bean: Rabbits, root-knot caused by a nematode, cowpea wilt due to a Fusarium, caterpillars, and black blister beetles.

"Commercial importance: The soy bean, also called the soya bean, the soja bean, and in North Carolina the stock pea, is an annual leguminous plant, a native of southeastern Asia. It has been cultivated in China, India, and Japan for

more than 5,000 years and in extent of use and value is the most important legume now grown in these countries."

"The soy bean was introduced into the United States as early as 1804, but it is only during the last decade that it has become a crop of much importance. At the present time it is most largely grown for forage. In many sections, especially southward and in some parts of the corn belt, a very profitable industry has developed from that growing of seed. During the past few years the acreage has increased to a very considerable extent. The large yield of seed, the excellent quality of forage, the ease of growing and harvesting the crop, its freedom from insect enemies and plant diseases, and the possibilities of the seed for the production of oil and meal and as a food all tend to give this crop a high potential importance and assure its greater agricultural development in America" (p. 3).

Concerning the variety Hahto (p. 14): "This variety recently introduced from Japan is a large producer of seed and forage, and the seeds when from three-fourths to full grown make an excellent green vegetable, similar to the Lima or butter bean. Plants stout, erect, maturing in about 135 days; pubescence tawny; flowers purple; seeds olive yellow, with a black seed scar, much flattened, very large, about 75,000 to the bushel; oil, 14.8%; protein, 40.6%." Note 1. This is the earliest English-language document seen (May 2003) that uses the term "butter bean" to refer to the lima bean.

Uses for human food (p. 22-23): "Until 1916 the soy bean had been used but little in the United States for food and only as a special diet for persons [diabetics] requiring foods of a low starch content. Much interest has been shown during the last two years in the possibilities of the soy bean for food. The United States Department of Agriculture and many schools of cookery and domestic science have conducted successful experiments in utilizing the dried beans in the manner of the navy bean and the green beans when three-fourths grown to full grown as a green-vegetable bean. The variety and palatability of the forms in which the bean can be served make it a very desirable article of food, and undoubtedly it will grow in favor as it becomes better known. Soy-bean meal or flour may be used as a constituent of bread and muffins and in pastry."

Photos show: (1) A man standing in a field of soy beans (front cover). (2) A typical mature soy-bean plant (p. 4).

(3) Roots of a soy-bean plant with abundant development of nodules (p. 7).

(4) Cultivating soy beans. Cultivation should begin as soon as the seedling plants appear. Two horses pull a man on a harrow or weeder. (5) A field of the Biloxi variety of soy beans in Mississippi (p. 13). (6) A field of the Black Eyebrow variety of soy beans in South Dakota. (7) Plats of the Mammoth and Virginia varieties of soy beans at Arlington Farm, Virginia (p. 15). (8) A man standing in a field of the Peking variety of soy beans grown in 24-inch rows. (9) A field of soy beans and corn grown for ensilage (p. 17). (10) A field of soy bean and Sudan grass grown in mixture for hay (p. 22).

(11) Opened pods of Hahto variety soy beans on a plate, showing the large seeds (p. 23). (12) Soy-bean hay on frames (p. 25).

A diagram (p. 5) shows 67 different ways in which soy bean plants and seeds are utilized. The plants are used for green manure, forage (hay, ensilage, soiling), and pasture. The seeds are used to make oil, meal, and food products. The oil is used to make various non-food industrial products (glycerin, explosives, enamels, varnish, waterproof goods, linoleum, paints, soap stock {for hard or soft soaps}, celluloid, rubber substitute, printing inks, lighting oil {illuminants}, and lubricating oil), and four food products (butter substitute, lard substitutes, edible oils, and salad oils). Food products include dried beans and green beans. From dried beans are made soy sauce, boiled beans, baked beans, soups, coffee substitute, roasted beans, breakfast foods, and vegetable milk (from which is made soy cheese {fresh, dried, smoked, or fermented}, condensed milk, fresh milk, confections, and casein). The green beans are used as green vegetables, canned, or in salads.

An outline map of the United States (p. 6) shows the areas to which the soy bean is especially adapted, as to varieties and purpose. The eastern half of the country is divided horizontally into 3 zones: Southern, for later and larger varieties for seed production; Central, for medium and medium-late varieties for seed and the same varieties and later varieties for forage; Northern (the line runs through central Ohio, Indiana, and Illinois, and southern Iowa) for very early varieties for grain production and the medium and medium-late varieties for forage and ensilage.

Note 2. This is the earliest document seen (July 2013) that mentions the soybean varieties Hahto, Yokoten, or Wilson-Five.

Note 3. This is the earliest document seen (June 2009) that describes a vegetable-type soybean variety (Hahto), or says that a specific variety makes an excellent "green vegetable."

Note 4. This is the earliest English-language document seen (June 2009) that contains the term "green-vegetable bean." Address: Scientific Asst., Forage-Crop Investigations, USDA Bureau of Plant Industry, Washington, DC.

414. Evans, W.A. 1918. How to keep well. *Chicago Daily Tribune.* Aug. 28. p. 6.

• ***Summary:*** "Soy beans offer large possibilities as a food. They contain 17 per cent fat, 36 per cent proteid, and 14 per cent starch. Soy bean milk has been used for feeding children for a long time. Le Wall says that soy bean cheese and soy bean croquettes resembling meat croquettes are in use. According to the same author, soy bean is the basis of Worcestershire and other sauces. Among orientals soy

bean foods are: Tashir, a bean natto and miso, also soy bean cheeses. Ordinary soy milk and Yuba or soy cream are in use. Shoyer [sic, shoyu] is an oriental sauce in making which soy beans are used."

Note: This is the earliest document seen (July 2013) that refers to yuba as "soy cream." That is certainly a better term than "tofu skin." Address: Dr.

415. *J. of Agriculture and Horticulture* (*Quebec*). 1918. Soy beans as food. 22:48. Sept. 1.

• ***Summary:*** "The housewife of to-day who desires to patriotically conserve needed foods for overseas and at the same time provide adequately for her own household is naturally on the lookout for new articles to add to her dietary list. Such a one which has much to recommend it is soy beans...

"Most varieties require a longer season for maturity than our northern climate provides but there are one or two that appear to thrive in Quebec and a number of people are trying them this year. They are said to produce abundantly so it is probable that many housewives will be giving them a trial this season for the first time, and a few suggestions as to their treatment may be welcome.

"In Japan and China soy bean milk is prepared and used extensively. This milk is also sold in a condensed form and as curd [tofu]. Other preparations are vegetable butter and cheese, and the extracted oil is sold for table use and for cookery.

"The Food Preservation Demonstrations of the Canada Food Board form an interesting feature of the fall fairs this year."

Describes the preparation of: (1) Green soybeans. "If cooked when about three-fourths grown as green beans the water should be changed once during cooking". (2) Dry soybeans. Long soaking in a large quantity of water improves the flavor by assisting "in the removal of any disagreeable principle." To serve as baked beans, in a crock, add to 2 cups cooked beans, ¼ teaspoon mustard, salt, a few grains of cayenne pepper, ½ cup tomato catsup, or if desired a few drops of onion juice, or 2-3 tablespoons molasses, or a teaspoonful of Worcestershire sauce. (3) Soy flour. "The raw soy beans may be ground into meal and combined with flour for bread, biscuits, or muffins. In the bread 1/3 soy bean meal may be used, in the biscuits and muffins a larger proportion." The meal tastes best if slightly browned.

Note 1. This is the 2nd earliest document seen (Jan. 2010) concerning soybeans in Quebec province, Canada, or the cultivation of soybeans in Quebec province (one of two documents).

Note 2. This is the earliest English-language document seen (June 2013) that contains the term "raw soy beans" (or raw soy-beans). Address: Canada.

416. Melhuish, William James. 1918. Improvements in the manufacture of soya bean milk and the complete utilization of bye products. *British Patent* 118,535. Sept. 5. 5 p. Application filed 10 Dec. 1917.

• ***Summary:*** Soybeans are immersed in water at 60ºC, allowed to cool in the water for 24 hours, then drained and ground; 16 lb of the meal is mixed with 100 lb of water containing 140 grains of potassium phosphate, and the mixture is stirred and heated at 95ºC for 45 minutes. The mixture is then passed through a filter-press, the press-cake being afterwards transferred to a hydraulic press to obtain a feeding cake and separate the oil. The liquid from the filter-press is centrifuged, heated under reduced pressure, and stirred with the addition of suitable oils (sesame, earthnut, coconut, etc.), then cooled to 36ºC, and treated with a culture. Salts and acids (e.g., butyric acid) are added, and after the lapse of sufficient time for the culture to grow, the whole mixture is sterilized at 70ºC, cooled to 16ºC, and stored. The separator slime may be mixed with the foots obtained in clarifying the soy bean oil, and the mixture used as a soap base. Address: Lecturer in Dietetics, Highwood House, Upper Parkstone, Borough of Poole, County of Dorset [England].

417. Jordan, Sam. 1918. Soy beans from soup to nuts: A new crop with many uses both on farms and in factories. *Country Gentleman* 83(39):7, 34. Sept. 28.

• ***Summary:*** Begins by discussing: The possibilities of soy beans "as a substitute for meat." The rising demand for "soy oil" which started a few years ago when the flax crop was little better than a total failure. "Industrial uses" of soy oil in soap, paint, and varnish. "Several packing houses were experimenting with the oil as a possibility in oleomargarine manufacture." "Soys fix soils for cotton." "Varieties of soy beans have been matured as far north as Quebec" [Canada]. The "development of the soy in the cotton sections will no doubt be swifter from an industrial standpoint because of the already existing facilities for oil extraction."

Concerning food uses, the author believes that "the soy bean as human food is destined to play a leading part in the way of a substitute for meat. From studies made of soy beans as food, the use of flour seems to be one form in which their use will suit the American taste and palate best."

"I have heard that the soy-bean milkman comes around before breakfast each morning in the Orient and leaves soy-bean milk." A Chinese student recently verified this story and said that in his family's household "it was customary to drink a glass of the milk upon arising." The student added that fried bean curd was often served for breakfast, and with soy sauce for dinner. "This soy sauce is something more or less familiar to Americans, the acquaintance being contingent upon the frequency with which our Chinese restaurants are patronized. It is the dark-brown liquid usually on the tables in the vinegar bottles. It is also the base of our Worcestershire sauces.

"For supper a favorite dish is sprouted beans in salad form, mixed with small pieces of meat or egg. They usually have also some form of bean cheese or fermented boiled beans. Next to baked and boiled beans, the preparation of soy-bean milk is a thing which should be more widely known."

"The author gives a brief description of how this milk is made, noting that it can be used in "cream sauces, puddings, custards, and even ice cream when some high flavoring is added to kill the beany taste. Much of the strong taste can be eliminated by boiling the milk slowly and stirring to prevent scalding.

"The residue [okara] obtained by straining the milk makes an excellent base for muffins and even bread, when it is used in the proportion of one part to three or four parts of wheat flour."

"In regard to fresh bean curd or 'tofu,' as the Chinese call it, it is hardly probable that we shall use it generally at an early date. The process of making it will no doubt come through the activities of our increasing number of women home-demonstration agents and, also, it is being made commercially by several Chinese firms in this country. When it does become more widely known, however, it is destined to be used extensively. It has very little taste of its own, and takes the flavor of everything with which it is used, generally as a base. It is also highly nutritious.

"Soy sauce is likewise destined for greater use, but the process of its manufacture is too complicated for domestic preparation. It can be purchased at Chinese groceries in this country, and probably from the majority of Chinese restaurants.

"Another dish which tastes as good as it looks or sounds is soy-bean sprouts. The smaller beans, of some yellow or green variety, are usually used." They are excellent because of "their use in the winter, acting as a green vegetable, and the fact that the vegetable can be had whenever wanted."

"And here is one for vegetarians–a 'vegetarian roast.' This is made by using equal parts of soy beans and peanuts, with the peanuts roasted and the beans boiled until soft before both are mixed and treated as an ordinary meat loaf. Such a roast as this is now being prepared by several food-manufacturing firms in the South, where both peanuts and soy beans are plentiful. It is being placed on the market in one and two pound containers."

"The beans served as a green vegetable are treated after hulling in much the same manner as Lima beans or peas. To hull, however, they should be boiled in the pods for about five minutes, then dipped into cold water, after which they shell easily. They can also be canned in this way, treating them after hulling the same as Lima beans. It is often desirable to serve them with rice or potatoes."

"So here we have a small glimpse of what their [soy beans'] future really is. A crop with a great industrial importance, a crop with known forage and manurial possibilities, and a crop holding forth a beneficent promise as an essential food, soy beans will soon be giving corn and wheat a close race for the more prominent places on our agricultural map."

Photos show: (1) Soy beans after being soaked but before boiling. (2) Piles of hay, used for forage. (3) Side view of a soy-bean harvester (with a man on top, pulled by two horses) used in the South, showing the bags filled. (4) A rear view of the same separating and bagging soy-bean harvester.

Note 1. This is the earliest document seen (March 2012) that uses the term "from soup to nuts" in connection with soybeans.

Note 2. This is the earliest English-language document seen (Jan. 2013) that uses the term "soy-bean sprouts" to refer to these sprouts. Address: Columbia, Missouri.

418. *J. of Agriculture and Horticulture* (*Quebec, Canada*). 1918. Soy beans, used like navy kind, make valuable food: Ancient China's product can be serve in numerous ways. Oct. 1. p. 67.

• ***Summary:*** From Weekly News Letter, U.S. Dept. of Agriculture [22 May 1918, p. 3]: "When prepared like the ordinary field or navy beans, soy beans should be soaked for 10 or 12 hours or more, if necessary, and boiled slowly. The boiled soy beans,... may be seasoned and used as a principal part of a meal as they are or may be made into bean loaf, bean croquettes, or other dishes.

When soy beans are three-fourths or more grown, the seed make a palatable and nutritious green vegetable.

Also discusses "soy-bean milk" ("a milky emulsion is obtained which is similar in appearance and properties to cow's milk"), "tofu or bean curd" (the addition of either magnesium chlorid [chloride] or calcium sulphate to soy-bean milk precipitates some of the proteid substances, forming a grayish-white curd).

"Soy or shoyu sauce is a dark-brown liquid prepared from a mixture of cooked and ground soy beans, roasted and pulverized wheat or barley, salt, and water, inoculated with a culture known as rice ferment and left in casks to ferment for six months to a year or longer. The liquid obtained is used in many countries, including the United States, as a sauce for meat or vegetables."

419. MacDougal, Sarah. 1918. The soy bean's many aliases: An artistic and appetizing demonstration of the many-sidedness of a 2,000-year-old Chinese vegetable that is meat, fish, milk, butter, cheese and many more in one. *San Antonio Light* (*Texas*). Oct. 6. p. 44. [1 ref]

• ***Summary:*** "Soy beans: Once I tried to cook them. After that I never wanted to hear any more about them. But that was before I went the other day to see Dr. Yamei Kin, a Chinese woman who is giving her time and talents to the Government to help solve the food problem.

"I found her in a blue silk kimono and a big white apron hustling about the kitchen in the United States Department of Agriculture Laboratory on Washington St., New York. The place looked as if some one had just milked the cows and brought in the milk pails. On the floor near the stove were two twelve-quart pails filled with warm milk. The Chinese boy helper strained the stuff through an aluminum strainer and cheesecloth. They were going to make cheese.

"That same Chinese lad had just finished milking the soy bean before I came in. That may sound queer, but it's all very simple. If we knew as much as we ought to know about soy beans there wouldn't be any absolute necessity for cattle or grazing lands or winter fodder. Because soybeans are ready to supply meat and milk and butter and cheese and all the rest of it. Dr. Kin said so and there were rows of jars and bottles on shelves and tables in that kitchen to prove it."

"'I might talk to you until doomsday about the manifold uses of soy beans, but you wouldn't understand,' she told me candidly, and then invited me to have luncheon in her apartment [at No. 56 West Eleventh St., New York City], promising a practical and palatable demonstration."

Since her guest had said that Roquefort was her favorite kind of cheese, Dr. Kin said she would serve that–[fermented tofu] made from soy beans–at the luncheon.

"Dr. Kin was born of Christian parents at Ningpo, south of Shanghai. Her father was a native pastor. Both parents died when she was three years old, and the Chinese child was taken into the home of medical missionaries, Dr. and Mrs. D.B. McCarter. When they came to the United States on furlough, she came with them. When she was sixteen she entered the Woman's Medical College of New York Infirmary for Women and Children, was graduated three years later, took a post graduate course for two years, and went back to China to practice medicine. She was appointed head of the Imperial Peiyang Woman's Medical School and Hospital, and later she was made head of woman's hospital work in northern China. She was married in 1894 and retired to private life. Her husband died a few years later, and in order to support herself and her son, Dr. Kin embarked on a lecture tour.

"Food is only one of the subjects she is interested in. She is recognized as an authority on Chinese art and literature.

"The one thing uppermost in her mind to-day is the winning of the war. She believes that food is one of the greatest agencies to that end.

"'My boy [Alexander] is at the front doing his bit,' she told me simply, and added: 'I want to do mine, too.'"

An excellent portrait photo shows Dr. Yamei Kin.

420. Moses, Albert Barnes. 1918. Process of producing liquid food from soy-beans. *U.S. Patent* 1,281,411. Oct. 15. 1 p. Application filed 27 Dec. 1917.

• ***Summary:*** Soya beans are disintegrated and allowed to stand with water until the nutritious matters are dissolved; then the mass is heated, and is afterwards cooled and strained. The residue is subjected to mechanical pressure and the expressed liquid is added to the strained liquid. Address: Seattle, Washington.

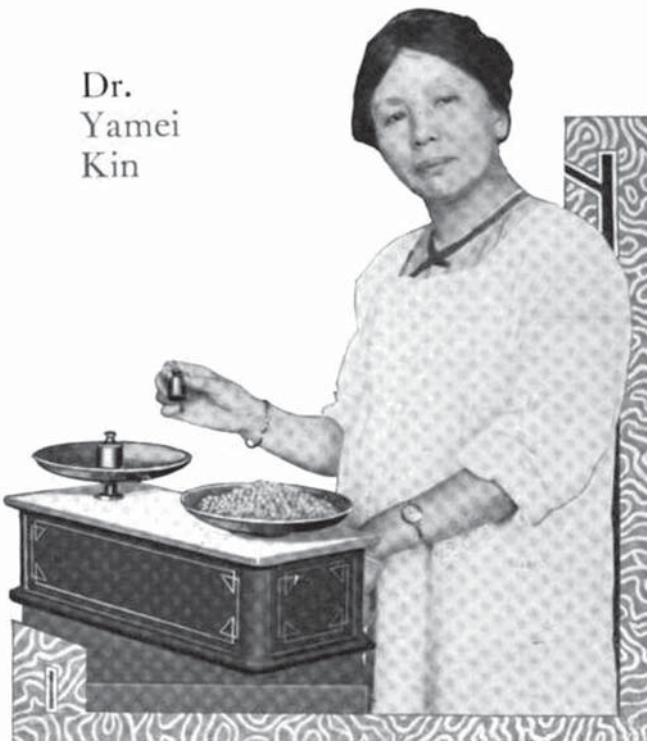
421. *Bean-Bag* (*The*) (*St. Louis, Missouri*). 1918. Products secured from a ton of soybeans (Diagram). 1(5):37. Oct.

• ***Summary:*** This diagram shows all the things that can be made from 2,000 pounds of soybeans: Meal 1,650 lb. Oil 32 gallons. Trash and moisture: 120 pounds.

From the meal: Food (animal or human), fertilizer, and cellulose. Human foods include macaroni, flour, soy sauce, milk [soymilk], cheese [tofu], coffee, lard [sic].

From the oil: Food (cooking oils, butter [substitute, lard substitute]), paints, enamels, blown oil (linoleum, varnishes, India rubber substitutes), soap stock (soaps, glycerine).

422. MacDougall, Sarah. 1918. Introducing to America an entirely new food–The soy bean: Dr. Yamei Kin. *Bean-Bag* (*The*) (*St. Louis, Missouri*) 1(5):17-19. Oct.



• ***Summary:*** From St. Louis Post-Dispatch Sunday Magazine: "Soy beans! Once I tried to cook them. After that I never wanted to hear any more about them. But that was before I was invited to a soy bean luncheon in a Greenwich Village apartment. Whenever anyone said 'soy beans,' I would recall that bowl of pebbles and then an unspeakably unpalatable mass of stuff that had to be thrown away. But now! As long as I live soy beans will seem like a symbol of pleasant sensations inside and out. I must tell you about that

luncheon.

"I went the other day to see Dr. Yamei Kin, a charming Chinese woman, who is giving her time and talents to the Government to help solve the food problem. Her specialty is Oriental food, especially soy beans, and she has been spending the summer showing how that food can be adapted to Occidental appetites. I found her in a blue silk kimono and a big white apron, hustling about the kitchen of the United States Department of Agriculture Laboratory in New York.

"The place looked as if somebody had just milked the cows and brought in the milk pails. On the floor near the stove were two 12-quart pails filled with warm milk. Dr. Kin was starting to make curds and whey. I watched her put a couple of spoonsful of fluid into each pail and saw the milk curdle in the good old way. Then the Chinese boy helper strained the stuff through an aluminum strainer and cheesecloth. They were going to make cheese.

"The Chinese lad had just finished milking the soy beans before I came in. That may sound queer to a mind that doesn't orientate toward those beans. But its all very simple. If we knew as much as we ought to know about soy beans there wouldn't need to be any cattle or grazing lands or winter fodder. Because soy beans are ready to supply meat and milk and butter and cheese and all the rest of it. Dr. Kin says so. And there are rows of jars and bottles on shelves and tables in that kitchen to prove it. Besides, there was a soy bean luncheon.

"The beans from which the milk had been extracted were soaked the night before. In the morning the Chinese lad put them through the mill, which is part of the kitchen equipment. It looks primitive, being made of two huge pieces of granite, imported from China. In its homeland this mill is worked by coolies, in New York by electricity. When the grist comes out of the mill it is strained. That was the stuff that filled those two pails. Dr. Kin told me that in China people eat the curds and cheese in their natural state. Here, however, she is making that cheese a base for a series of camouflage experiments.

"'We made ours into fish for dinner last night,' said a man from a nearby laboratory, who comes in every day to find out whatever happens to be new about soy beans.

"'How was it?' asked Dr. Kin.

"'Great,' said the man. 'My wife fried a couple of fish and then fried some soy bean cheese in the gravy, and, honest to goodness, I couldn't tell which was which. It has a way of absorbing the flavor of whatever it's cooked with,' he explained to me.

"'We had ours with chops,' remarked another laboratory expert who joined us. His name was Mr. Gleason. He declared that if he didn't know the difference he might have thought he was eating an extra chop. Everybody in the place was ready to root for soy beans.

"Dr. Kin explained that the reason the soy bean has been misunderstood in America was because people didn't take the trouble to investigate and analyze It, and to find out what are its food properties with reference to the nutrition we get from meat and vegetable.

"'Don't try to think about soy beans in a scientific way,' she advised me. 'This thing I am working with is in reality a vegetable cheese. It takes the place of meat. We've been using soy beans in China for over 2,000 years, and they are really very delicious and nutritious,' this in an offhand way, as if an experiment of 20 centuries or so ought to pave the way for the American appetite. She didn't want me to get my mind cluttered with such terms as carbohydrates and proteins.

"'I wouldn't waste a minute experimenting with food that was merely nutritious,' she told me. 'This whole movement about finding out the possibilities of food is part of the cultural development of the American people. The older a civilization becomes, the more people like to be surrounded by beautiful things. Chinese art, you know, is the most highly developed art in the world. All this bother about beans is not a question of science or of what is good for us, but it is a question of what is dainty, what is nice, what appeals to the taste. Making a study of eating is a part of the fine art of living.

"'American women, you must admit, are lacking in artistic sense. That is because the country is so young. When the process of refinement is farther advanced they will not regard household work, and especially cooking, as drudgery. It is really art. The older nations, being more cultured, make a deeper study of things. Chinese, for instance. But the Americans are very susceptible, very open-minded and frank and eager to acquire new ideas.

"'The trouble with vegetarians was that they expected us to eat such awful things. I'm not a vegetarian, but I must admit that I find great satisfaction in being able to sit down to most of my meals without facing the fact that I am eating slices of what was once a palpitating little animal, filled with the joy of life. I shouldn't be surprised if the soy bean will save the lives of many American animals.'

"On a long table was a row of glass jars filled with what looked like slices of white cheese [fermented tofu]. It was soy bean cheese. A jar was filled with a brownish paste [probably a type of Chinese jiang]. It was soy beans. There were bottles filled with the condiment we get with chop suey. That, too. was made from soy beans. Talk about dual personalities! The soy bean has so many aliases that if you couldn't like it in one form you would be pretty sure to like it in another.

"Dr. Kin has been trying any number of experiments with a view to boosting the bean to a bigger place commercially. In due time the results of all these experiments will be catalogued at Washington [DC]. Perhaps some day there will be a Bureau of Beans, from which may be obtained for the asking recipes on a thousand ways to prepare soy beans.

"Because she is working for the Government Dr. Kin doesn't disclose many details about the things she is doing. All that is worth while will be public information in due time, she says. Canning curds and cheese so they can be kept an indefinite length of time and then utilized in various forms is something she is trying to perfect.

"'I might talk to you until doomsday about the manifold uses of soy beans, but you wouldn't understand,' she told me candidly. Then she invited me to have luncheon in her apartment, promising me a practical and palatable demonstration that would make an impression in the way food ought to interest us. Of course, I was charmed with the idea. The only hitch was that I had to have luncheon without my hostess. Dr. Kin was going out of town early in the afternoon.

"While the Chinese lad was getting his instructions about piloting me to the apartment and serving luncheon, Dr. Kin turned to me and asked what kind of cheese I liked best.

"'Roquefort,' said I.

"'That's good,' said she, and then she told the boy something else in Chinese, told me she hoped I'd enjoy the luncheon and invited me to spend all afternoon at the flat if I cared to read any of her books or look at her pictures.

"Before we turned in at 56 West Eleventh street, I discovered that Wei, my amiable escort, was somewhat limited as to English vocabulary. He had been here only six months. When he entered the apartment he ushered me into a cool-looking parlor, indicated a comfortable big chair beside an open window, and disappeared with a smile that seemed to say: 'I'll rustle along the luncheon if you just sit there and fan yourself.'

"In a corner over near a window there was a big mahogany desk that looked like business. On it was the photograph of a Chinese-American youth, a strapping tall fellow who looked every bit a soldier. He is Dr. Kin's soldier son, Alexander, 21 years old, who left college to enlist as a private, and is now with Pershing's Eighty-second Division.

"A book and a magazine lay side by side on that desk. The book was Rabindranath Tagore's 'Nationalism.' The magazine was 'The Bean Bag.' I took up the magazine. Here are a few things I learned:

"Three million acres have been cultivated to soy beans in the South, principally in North Carolina; man could come nearer living well on soy beans alone than on any other food: it is the nearest substitute to meat there is; containing starch, sugar, fat, cellulose, albuminoids, mineral salts; a new harvester has been invented that threshes the beans on the vines, over 100 American manufacturers are using soy bean oil for soap, paint, varnish, enamel, salad oil; soy beans are listed in the food market of the District of Columbia; the soy. or soja, is the first and oldest of the 150 branches of the bean family; Manchuria claims the honor of its nativity; the Manchurian railroad recently opened a branch and an improvement station for distribution of the Ssupingkai special." Continued.

423. Winkler, Gustav. 1918. Die Sojabohne: Aus einem Vortrage... gehalten in der Hauptversammlung der Gartenbau-Gesellschaft Frankfurt a.M. am 17. April 1914. Zweite Auflage [The soybean: From a lecture... presented at the main meeting of the Gardening Society of Frankfurt am Main, on 17 April 1914. 2nd ed.]. Mainkur bei Frankfurt am Main, Germany: Published by the author. ii + 28 p. Illust. 22 cm. [4 ref. Ger]

• ***Summary:*** On the cover: "Die Sojabohne der Mandschurei [The soybean of Manchuria]. Much of this lecture (as stated on the title page) was based the following English-language article, translated into German by Werner Winkler (Gustav's son) in 1913: Shaw, Norman. 1911. "The soya bean of Manchuria." *Shanghai, Statistical Department, Inspectorate General of Customs. China Imperial Maritime Customs. II. Special Series* No. 31. 32 p.

Contents: A 2-page insert at the front. Photos show: (1) The author (with a large white beard and moustache) with a many-branched soybean plant, stripped of its leaves, mounted on a 2 x 3 foot wooden board, from his beanfield (*Winklers Bohnenfeld*) at Mainkur. This one plant grew from May 10 to Oct. 15, 6 months, producing 242 pods containing 503 completely mature soybeans. This line was acclimatized for 6 years and cultivated in the soil for 5 years. (2) The author standing and holding (with the roots facing upward) one soybean plant in each hand. In his right hand is an acclimatized soybean which produced 58 beans in 100 days. In his left hand is a plant grown from Chinese seeds of 1912-13 which produced 224 flowers and no seeds in 100 days. (3) A many-branched soybean plant, stripped of its leaves, from Winkler's beanfield, affixed to a board. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1917 until Oct. 1, five months. 105 pods produced about 250 completely mature soybeans. From seeds that were not yet acclimatized grown on cultivated soil. (4) A similar looking plant from Winkler's beanfield. Grown from Chinese seeds harvested in 1911/12. It grew from 15 May 1918 until Oct. 15, five months. 160 pods produced about 350 soybeans. The seeds were not yet completely ripe because of bad, raw weather in 1918.

Foreword to the 2nd edition. Introduction. Diagram in the shape of a rhombus / diamond, showing how the various colored soybeans change from one color into another (adapted from Shaw 1911, p. 2). Description of the diagram: Discusses: (1) Ball, Carleton R. 1907. "Soy bean varieties." *USDA Bureau of Plant Industry, Bulletin* No. 98. 30 p. + 5 plates. May 27. (2) Hosie, Alexander. 1910. *Manchuria: Its People, Resources, and Recent History.* London: Methuen & Co. xii + 293 p. Hosie describes 3 types of soybeans: Yellow, with 3 subvarieites. Green, with 2 subvarieites. Black, with 3 subvarieites.

The rest of the contents is fairly similar to that of the

1st edition (1914), but the details within many sections are greatly expanded. On the rear cover is a photo of two soybean plants attached to a board, one month after planting the seed, Summer 1917; 15 May to 15 June. In the Supplement (p. 26-28), the author summarizes the results of his 8 years of soybean cultivation in Frankfurt; he concludes that it can be grown with good results in southern Germany. Frankfurt am Main is about midway between the northern and southern tips of Germany. Address: Mainkur bei Frankfurt am Main, Germany.

424. *Schweizerische Milchzeitung* (*Schaffhausen, Switzerland*). 1918. Soja-Milch [Soymilk]. 44(93):1. Nov. 22. Friday. [Ger]
• ***Summary:*** The soybean is imported in large quantities to Europe for industrial uses, for example in southern France, Algeria, and the USA. The plant originated in China. In the *British Medical Journal* of April 1918 [April 13, p. 430] we find a recipe for the preparation of soya milk. The recipe is summarized and the properties of soymilk are described. A milky liquid with a beany smell is obtained. The smell disappears upon boiling. Children like this milk, especially mixed with a little tea or coffee.

When fresh, this "soybean milk" has a slightly acid reaction, is microscopically homogeneous, and in its physical properties, resembles cow's milk. Lactic fermentation bacilli are active in it. It contains 3.13% casein and 9.89% fat. As the fat is rather oily, churning is impossible. When soymilk is heated, a skin [yuba] forms on its surface. A cheese [tofu] can also be made from soymilk. Soymilk and its derivatives are rich in phosphates, which would be good for nourishing infants and children. In normal times, soymilk should be very inexpensive. The residue from making soymilk [okara], which is still rich in nutrients, could be used in making cakes.

425. Castet, M. 1918. Utilisation du soja [Utilization of soybeans]. *Revue Horticole de l'Algerie* 22(10-12):160-61. Oct/Dec. Meeting of 20 Oct. 1918. [2 ref. Fre]
• ***Summary:*** The author (a woman, Mlle. Castet) is especially interested in the use of soymilk (*le lait de Soja*) for infant feeding. The soybean grows very well in Algeria and easily gives abundant harvests. In a small household, soya can furnish milk and very nourishing pastries at a low price. Properly prepared and cooked, it has an acceptable taste. Sweetened appropriately, infants also accept it well. One can mask its less agreeable flavor with two drops of essence of cut hay.

By reason of their extremely low price, one can pardon soymilk and tofu (*fromage de Soja*) if their flavor is not quite as good as their dairy counterparts.

According to the author, soymilk can entirely replace cow's milk. She believes that its use in place of cow's milk would reduce infant mortality.

Okara (*la drèche, drêche* = dregs or residue) can be used to make a sweet paste or cookies. Add half its weight of sugar plus just enough water to cover, then cook for at least one hour to give it an attractive brown color, with the taste and appearance of almond paste. It can be consumed as is or used to make stuffed dates. "One can even push the technique further. Mix with this jam one egg yolk, 2 egg whites (beaten until fluffy), and 3-4 gm of bitter almonds (crushed). Spoon onto a cookie sheet and bake for 4-6 minutes. Remove the cookies before they cool, lest they stick to the sheet."

Mlle. Castet also made a cheese (tofu) from soymilk, using magnesium chloride as a coagulant. Address: Secrétaire de la Société d'Horticulture d'Alger, Algeria.

426. Morse, W.J. 1918. The soy-bean industry in the United States (Continued–Document part II). *Yearbook of the U.S. Department of Agriculture* p. 101-11. For the year 1917. See p. 106-10. Contains many photographs by Frank N. Meyer.
• ***Summary:*** Continued from p. 106. "Soy beans for human food: In Asiatic countries, especially China and Japan, the soy bean and the various food products made from it are so largely consumed that it is second only to rice in importance as a food crop. The soy bean is eaten only to a very small extent like other beans, but in China and Japan it is elaborated into a great variety of products, all having a high percentage of protein and making a well-balanced diet when eaten in connection with the staple food, rice. Some of these products are said to be eaten at every meal and by rich and poor alike. Of these numerous preparations, only one, 'shoyu,' or 'soy sauce,' has been introduced to any extent in other countries. It is quite possible that some of these products would appeal to the American taste and with proper exploitation become established on the American market.

"Although the soy beans as an article of food has attracted attention from time to time in the United States, thus far it has been used but little except as a special food for invalids. The beans contain only a trace of starch and are highly recommended as a food for persons requiring a diet of low starch content. During the past year, however, much interest has been manifested in the possibilities of the soy bean as a staple food.

"Many schools of cookery and domestic science throughout the country have conducted experiments rather successfully, utilizing the dried beans in the manner of the navy bean. As a result, the dried beans can now be purchased in the markets in nearly all of the large cities. The variety and palatability of the forms in which the bean can be served make it a very desirable article of food, and it may be expected to grow in favor as it becomes better known (p. 107)."

"Dried beans:... During the season of 1916 about 100,000 bushels of American-grown soy beans were packed as baked beans by several canning companies in

the Central and Eastern States." Properly roasted, the dried beans "make a good coffee substitute. Those fond of cereal beverages pronounce it equal to many of the preparations on the market. In China, the beans are soaked in water and roasted, the product being eaten after the manner of roasted peanuts. This method of preparing the beans is improved by soaking the beans for about twelve hours in a 10 per cent salt solution, boiling slowly for about 30 minutes, and then roasting to a light-brown color. The yellow-seeded and green-seeded varieties are preferable, as they make a product of better appearance.

"Green beans: When soy beans are three-fourths or more grown, the seed makes a most palatable and nutritious green vegetable. As such it may be used much as is the green pea or the Lima bean. The pods are somewhat tough and not desirable to eat. The green beans are rather difficult to shell, but after cooking in the pods for about five minutes, they shell out very easily."

"Soy-bean milk:" If dried soy beans are soaked, crushed, and boiled "a milky emulsion is obtained which is very similar in appearance and properties to cow's milk. This liquid, separated out by means of a very fine sieve or through a cloth filter, is the soy-bean or 'vegetable' milk used so extensively in China." "Soy-bean milk has a rather strong characteristic taste and odor which may be masked by the addition of a small quantity of coumarin or vanillin. This 'vegetable milk' can be used in numerous preparations, such as breads and cakes, in creaming vegetables, in milk chocolate, and in custards. If allowed to remain in a warm place the milk becomes sour, like animal milk, and in that form may be employed just like sour milk or buttermilk...

"After separating the milk from the solid material, the residue [okara] is still very rich in nutritive substances. It can be dried and used for cattle feed or possibly made into a meal or flour for human consumption."

"Soy-bean cheese: "The addition of magnesium or calcium salts (about a 1 per cent solution) to soy-bean milk when hot precipitates some of the proteid substances, forming a grayish white curd which settles out, leaving a yellowish watery liquid. This curd, after being drained and pressed, represents the tofu, or bean curd, which is so extensively eaten and forms the basis of numerous fermented, smoked, and dried cheeses in China and Japan (Plates III and IV). Tofu is made fresh daily and is a staple article of diet of oriental peoples. In many cities of the United States having a large Asiatic population, fresh bean curd generally may be found in the Chinese markets. Although the fresh curd, or tofu, is tasteless, it is a highly nutritious food and no doubt could be elaborated by the American housewife into a variety of palatable dishes.

"Soy sauce: Soy or shoyu sauce is a dark brown liquid prepared from a mixture of cooked and ground soy beans, roasted and pulverized wheat (barley is sometimes used), salt and water. This mass is inoculated with a culture known as rice ferment (*Aspergillus oryzae*) and left in casks to ferment from six months to a year and sometimes longer (Plate V)... This product may well serve as the basis of sauces of the Worcestershire type... The manufacture of soy sauce is conducted on a large scale in China and Japan, and to some extent in India. The yearly production of Japan is said to amount to nearly 2,000,000 barrels. The brewing of this sauce has also become a well established industry in Hawaii. Although there are no factories in the United States, considerable quantities of the sauce are imported annually, and it can be obtained at Chinese stores in most of our cities."

"Soy-Bean sprouts: Several species of beans are sprouted and used as a green vegetable by the Chinese (Plate VI). Soy beans are used to a very considerable extent for this purpose, as these sprouts are larger and firmer than those of most other legumes. Bean sprouts can be used as a home winter vegetable, for the dried beans are sprouted easily in a short time under proper conditions of heat and moisture. It is quite possible that sprouted soy beans utilized in various vegetable dishes would appeal to the American taste."

Note 1. This is the earliest English-language document seen (Jan. 2013) that uses the term "sprouted soy beans" (or "sprouted soy bean") to refer to soy sprouts.

A table (p. 111) shows the "Quantity and value of soy beans, soy-bean cake, and soy-bean oil imported into the United States, 1910-1917, inclusive.

Photos on unnumbered pages show: (1) A typical soy bean plant. (2) A field of the Biloxi soy bean grown at Biloxi, Mississippi. (3) Pods and seeds of 7 common varieties of soy beans.

(4) "Large blocks of freshly made bean curd, 'tofu' [on a round wooden table], ready to be cut up into squares and sold to the housewife."*

(5) "Large bamboo tray of various kinds of soy-bean cheese of the drier type" [pressed tofu sheets].*

(6) "A dark room of even temperature where wooden trays, full of bean curd [tofu] are piled. This is another method of preparing soy-bean cheese" [fermented tofu].*

(7) "Large earthen jars full of squares of bean curd, which are covered with spiced brine and soy sauce. After several months' curing a bean cheese [fermented tofu] is formed, which can be kept for many years."*

(8) A "courtyard full of covered pots of fermented soy beans and brine from which soy sauce is made."*

(9) The basket on the left contains "sprouted soy beans, which are sold and used as a green vegetable" [in China]* * = Photographed by Frank N. Meyer, Agricultural Explorer, USDA.

Note 2. This is the earliest published document seen (Jan. 2001) that contains photos of soyfoods by Frank. N. Meyer. Most of the photos appear to have been taken in China.

Note 3. This is the earliest document seen (Jan. 2013) in

which William Morse describes "soy-bean sprouts" or "soy-bean cheese" (tofu).

Note 4. This is the earliest English-language document seen (Oct. 2011) that uses the term "soy-bean cheese" to refer to fermented tofu.

Note 5. This is the earliest English-language document seen (May 2005) that uses the term "masked" (or any other form of that verb) in connection with the undesirable taste or odor of soyfoods (soy-bean milk) or soy beans.

Note 6. This is the earliest document seen (June 2013) that gives statistics for the amount of whole soybeans used as food in the United States, or that gives a figure (about 100,000 bushels) for the amount of soybeans canned in the USA in 1916–the first time they are known to have been canned. Address: Scientific Asst. in Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

427. Shih, Chi Yien. 1918. Beans and bean products. Shanghai, China: Soochow University Biology Dept. 13 p. 24 cm. [Eng]

• ***Summary:*** The author's name in pinyin is probably Shi Jiyan. At the head of each section, the name of each product or type of bean is written in Chinese characters. Contents: Introduction by N. Gist Gee of the Dept. of Biology, Soochow Univ., China.

Note 1. Soochow, also called Su-chou (formerly Wuhsien) is a city in southern Kiangsu (pinyin: Jiangsu) province, in eastern China, on the Grand Canal. Introduction and names of soy beans: Classical Chinese names, colloquial Chinese names, Latin names, and English name (Soja bean). Soy beans. The food products of soy beans. Bean curd (Cc). Tou fu koen. Po yeh. Yu tou fu [fried tofu]. Ju fu [fermented tofu]. Tsao ju fu [fried fermented tofu]. Ch'ing hsien ju fu. Tou chiang or bean sauce. Chiang yu. Bean ferment or tou huang. Bean Sprouts. Bean relish or tou shih [fermented black soybeans]. Bean oil.

Note 2. This is the earliest English-language document seen (April 2013) that contains the term *You tou fu* (regardless of hyphenation).

Beans (Four varieties of *Phaseolus mungo* var. *radiatus:* chidou = dark-red [azuki] bean, baichidou = white dark-red bean, lüchidou = green red bean, and lüdou = green [mung] bean): The food products from the green [mung] beans (lüdou): Bean sprouts, green bean congee or lu tou chou, green bean soup or lu tou tang, green bean pudding or lu tou kao and lu tou sha. The food products from the red [azuki] bean (quite similar to those made from the green [mung] bean): Congee, rice, pudding, tou sha.

Hyacinth beans (*Dolichos lablab;* five Chinese varieties / names: biandou, baibiandou, qingbiandou, zibiandou, longzhao biandou). Asparagus beans [cowpeas] (*Vigna catiang;* four Chinese varieties / names: jiangdou, panxiang jiangdou, manli jiangdou, baimi jiangdou). The food products from Pien Tou and Chiang Tou. Medicine. Flowers and seeds of the Pai Pien Tou, the broad bean, windsor bean, or horse bean (*Vicia faba*)*;* In China it has two names: (1) Ts'an Tou or silkworm bean, because it is harvested at the time the silkworm is making its cocoon; (2) Han Tou or cold bean, because it grows through the winter. The food products from Ts'an tou (broad bean): Bean shoot (tou miao), Ch'ing tou (as a vegetable), Ja tou (broad bean sprouts), Shien fan and fan bee (made from broad beans and mung beans), Tou sha. The section on the names of beans (p. 1) we will give the English name, Latin name, the classical Chinese names / colloquial Chinese names, and an English translation in parentheses, as follows: (1) Soja bean, *Glycine hispida:* heidou / heidou (black [soy] bean), huangdou / huangdou (yellow bean), yangyandou / yangyandou (sheep eye bean), maliaodou / maliaodou (horse material / feed bean),–/ guguo qingdou (bone wrap green bean),–/ jiajia sandou (pod pod three bean), xiangsidou (mutually think bean) / xiaqngzhidou (fragrant branch bean),–/ bayue baidou (8th month white bean). Soja bean: *Dolichos cultratus* quedou (magpie bean) / equedou (chirp magpie bean). Soja bean: *Phaseolus vulgaris* baidou (white bean) / shui bai dou (water white bean),–/ shidou (fennel bean) (Note 3. shiluo means "fennel"),–/ guashudou (melon ripe bean),–/ maquedou (sparrow bean),–/ niuta biandou (cow tread flat bean),–/ yadou (sprout bean),–/ shijia xiangdou (ten family fragrant bean),–/ xifeng qingdou (west wind green bean),–/ shizi hedou (persimmon pit bean),–/ denglongdou (lantern bean).

Note 4. The large title "Soy Beans" at the top of this table, the right column which says that the English name of each variety is "Soja bean," and the next 8 pages which are only about soy beans, strongly indicate that all the colloquial names in this table refer to different varieties of soy beans. Moreover, all these colloquial names appear again on page 3 in a table on planting and harvest times of different varieties of [soy] beans. The bottom half of the colloquial names are probably from different parts of China, since Dr. H.T. Huang (a soybean expert) has never heard many of these colloquial names before. The most puzzling question is: What are *Dolichos cultratus* and *Phaseolus vulgaris* doing at the bottom of the "Latin name" column? *Dolichos cultratus* is not listed on either of the two comprehensive taxonomy databases (GRIN and ILDIS, which include all past Latin / scientific names). *Phaseolus vulgaris* refers to the common bean, such as the kidney bean, pinto bean, navy bean, frijole, etc.

2. Soy beans. "They were introduced into France during the reign of Ch'ien Lung about 1740 A.D. by a French Consul; into England in 1790, into Australia in 1875, into Germany 1881, and 1888 into America. They were known here from ancient times and were mentioned in the oldest books Pên Ts'ao Kong Mu, which were written by the Emperor Shen-nung in the year 2838 B.C., and the later Chinese Classics."

Note 5. This is the earliest English-language document seen (Aug. 2002) that treats Shen Nung as a real, historical figure, or that says the first written record of the soybean appears in a book written by him. The information about that book is wildly inaccurate. The *Bencao gangmu* (The great pharmacopoeia), perhaps China's most famous materia medica, was written by Li Shizhen (+1596). The above information, which is all wrong, has been cited again and again, down to the present day (2002), in connection with the supposed origin of the soybean.

"Even during the ancient times they were considered by the people to be the most important of the cultivated leguminous plants." Note 6. This is the earliest document seen (Aug. 2002) which states, incorrectly, that the date of Emperor Shen-nung's book is 2838 B.C.

"The methods of cultivation are as follows: In general all of the soja beans are planted in rows along the banks of canals and the boundaries of the fields, which separate the fields of one family from those of another, except those which are called oil beans or Eighth month white bean and Water white bean. These last are planted in large fields. The oil beans are planted early in June." The method of cultivation, harvest, and threshing is then described in detail. A table gives the time of planting and harvest for 18 varieties of Chinese soybeans, grouped into 6 types by planting and harvest dates: (1) Plant in latter part of April, harvest in latter part of Sept.: *Heidou* (black [soy] bean), huangdou (yellow bean), *maliaodou* (horse material / feed bean), *guguo qingdou* (bone wrap green bean), *jiajia sandou* (pod pod three bean), *xiangzhidou* (fragrant branch bean). (2) Plant in early part of June, harvest in middle part of Sept.: *bayue baidou* (8th month white bean), *shuibaidou* (water white bean), *maquedou* (sparrow bean). (3) Plant in early part of July, harvest in early part of Oct.: *equedou* (chirp magpie bean). *niuta biandou* (cow tread flat bean), *shijia xiandou* (ten family fragrant bean), *xifeng qingdou* (west wind green bean), *shizi hedou* (persimmon pit bean), *denglongdou* (lantern bean). (4) Plant in early part of April, harvest in early part of July: *guashudou* (melon ripe bean). (5) Plant in early part of April, harvest in latter part of July: *shidou* (fennel bean). (6) Plant in early part of April, harvest in latter part of June: *yadou* (sprout bean).

The rest of the work concerns the food products of the beans, including a detailed description of how each is made.

Note 7. This document contains the earliest date seen for soybeans in Australia or Oceania (1875). It is not clear whether or not these soybeans were cultivated in Australia; they may well have been. The source of these soybeans is unknown, as is the author's source of information concerning that early introduction, 43 years before Shih wrote this booklet. He is the first to give such an early date for the introduction of soybeans to Australia. Yet the date does not seem unreasonably early since there were 17,000 Chinese in Australia by 1855 (see Australian Department of Immigration and Ethnic Affairs. 1985. "A Land of Immigrants"). Address: Biology Dep., Soochow Univ., China.

428. *Virginia Department of Agriculture and Immigration, Bulletin.* 1918. Soy bean useful crop. May be utilized in greater number of ways than almost any other agricultural product. No. 126. p. 174-76.

• ***Summary:*** "In addition to its availability as a food, soybean oil has found important uses in the markets of the world for making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, and lubricants. It is also used in the Orient for lighting and in the manufacture of printing ink. In Japan the soy bean forms one of the most important articles of food in use. It is one of the principle ingredients in the manufacture shoyu (soy sauce), miso (bean cheese), tofu (bean curd), and natto (steamed beans). The beans are eaten also as a vegetable and in soups; sometimes they are picked green, boiled, and served cold with soy sauce, and sometimes as a salad. A 'vegetable milk' is also produced from the soy bean, forming the basis for the manufacture of the different kinds of vegetable cheese. This milk is used fresh, and a form of condensed milk is manufactured from it. All of these foodstuffs are used daily in Japanese homes, and for the poorer classes are the principle source of protein."

"An artificial milk like that manufactured in the Orient has been produced in small quantities in the United States, and recently a factory has been equipped to make this product." Photos show: (1) Soy beans as a forage crop, arranged in stacks. (2) Lime spreader at work. Address: Virginia.

429. Eddington, Jane. 1919. The Tribune Cook Book: Soy beans as human food. *Chicago Daily Tribune.* Jan. 12. p. B4.

• ***Summary:*** Miss Eddington first got interested in the use of "soy bean flour" in the human diet about 5 years ago when she "first received samples of this flour for a medical manufactory." During these five years "soy bean flour has come into wide use in hospitals and homes. From being used in the United states to renew worn out soil and then for hog feed, the soy bean has come to be used largely as a food for those who have worn out kidneys, the diabetics."

"Soy bean cookery, especially the whole bean cookery, must be good, or the variety [of] vegetable meat contained in it is ruined, becoming as indigestible as white of egg cooked to a crisp." The key is to cook the whole bean at a low temperature for a long time. "Baked soy beans must be cooked at least eight hours."

"In Washington [DC], the government experts used 30 per cent soy bean flour with 70 per cent of wheat flour and called their product 'a high powered bread.'" She then gives four wartime recipes for "Soy bean muffins." Some call for "soy bean meal." Note: This "meal" is probably soy bean flour.

"Used as a meat substitute:... The tofu, a sort of cheese which is fried in deep fat and used as a meat substitute, was exploited by the United States department of agriculture last year, along with other of the soy bean products..." She then cites (incorrectly): Morse, W.J. 1918. "The soy-bean industry in the United States." *Yearbook of the U.S. Department of Agriculture* p. 101-11. For the year 1917. Then, from the section titled "Soy beans for human food," she includes the recipes for "Soy-bean milk" and "Soy-bean cheese," and the description of soy sauce. "Soy or shoyu sauce is a dark brown liquid prepared from a mixture of cooked and ground soy beans, roasted and pulverized wheat or barley, salt, and water..."

430. *Bulletin Mensuel des Renseignements Agricoles et des Maladies des Plantes* (*Rome*). 1919. "Lait de soya" ["Soymilk" (Abstract)]. 10(2):252-53. No. 251. Feb. [1 ref. Fre]
• ***Summary:*** A French-language summary of the following German-language article: *Schweizerische Milchzeitung* (Schaffhausen, Switzerland). 1918. "Soja-Milch [Soymilk"]. 44(93):1. Nov. 22. Friday.

431. Erslev, Knud. 1919. Process for the manufacture of artificial milk. *U.S. Patent* 1,297,668. March 18. 3 p. Application filed 3 Jan.
• ***Summary:*** This process involves four basic steps: (1) "Soya bean flour" is treated with a fat solvent so as to completely remove the fat content. The preferred solvent is benzin, benzene, or benzol, which may be distilled off and removed. The inventor has found that the unpleasant flavors in artificial milks "are largely produced by the presence of products dissolved in the fat, which products themselves, such as esters, aldehydes, and ketones, and not the fats, possess disagreeable odors." (2) The residue from the fat extraction is extracted with alcohol, and the alcohol distilled off for re-use. This dissolves and removes lecithin, sugars, and bitter principles. (3) The residue which has not been dissolved in either the fat solvent or alcohol is treated with a weak alkaline solution, whereby protein is dissolved. (4) The alcohol extract from step (2) is purified to remove bitter substances from it, then this purified alcohol extract is added to the protein solution from step (3), and a suitable amount of fatty material is added and emulsified in.

Note: This is the earliest English-language document seen (Oct. 2001) that uses the term "soya bean flour." Address: 268 Groesbeekscheweg, Nijmegen, Netherlands; Citizen of Denmark.

432. *Le Mutilé de l'Algerie.* 1919. "Ce qu'il faut savoir:" Utilisation du soja [Let it be known: Utilization of soya]. 4(82):7. March 30.
• ***Summary:*** A French-language extract from the following French-language document: Castet, M. 1918. Utilisation du soja [Utilization of soybeans]. *Revue Horticole de l'Algerie* 22(10-12):160-61. Oct/Dec. Meeting of 20 Oct. 1918.

433. Delaye, A. 1919. Contribution à l'étude sur "l'utilisation du soja" au point de vue de l'alimentation de l'homme [Contribution to the study of utilization of soybeans for human food and nutrition]. *Revue Horticole de l'Algerie* 23(2-3):197-202. Feb/March. [2 ref. Fre]
• ***Summary:*** "The communication made by Mlle. Castet, at the time of your session of 20 Oct. 1918, interested us so much that we have tried, in turn, to study how one can use the soybean in a simple and economic manner, while making it lose its somewhat disagreeable taste.

"M. Castet, our sympathetic Secretary General, has desired to put at our disposal a supply of soybean seeds that we can use for experimentation... The soymilk that we have obtained, mixed with coffee, tea, or chocolate, is not much different from animal milk. If you didn't know in advance, you wouldn't notice any difference. Lactescent soy flour, it seems to us, has a brilliant future... The lactescent soy flour, although relatively simple to make, will never become widely used by the general population, if I may say so, unless it can be mass produced. In order for housewives to make the flour by themselves, they would need some special equipment. Furthermore, housewives are too busy to take the time to make it. So, to be accessible to the general public, it is essential that soy flour be sold in all grocery stores. From there, packaged in either boxes or sacks, it will end up on the kitchen shelves. The package will effectively and advantageously display a cow, or a goat, or a conscientious dairy man." Tables show compositional comparisons between soybeans and various foods. Address: Societe d'Horticulture, 11, rue de Metz, Alger (Algiers), Algeria.

434. Holland, J.H. 1919. Food and fodder plants. *Kew Bulletin of Miscellaneous Information* Nos. 1&2. p. 1-84. April 16. See p. 11-12. [5 ref]
• ***Summary:*** Great Britain imported large quantities of soy oil before World War I to make up for the shortage of cottonseed oil needed to manufacture soaps: 875,526 hundredweight from Manchuria, 816,032 hundredweight from China, and 43,209 hundredweight from Manchuria. Note: A hundredweight is 112 pounds weight.

"Considerable interest has been taken in the cultivation in England, but results of experiments made at Cambridge, Midland Agricultural College, South Eastern Agric. College, Wye, &c., go to show that no variety so far has been found that can be relied on to produce seed here.

"In Japan and China they [soy beans] are largely known in the preparation of the sauce known commercially as 'Soy,' and they make there a preparation used as a substitute for milk, and from this a food product call 'Tofu,' which in turn forms the basis of the bean cheeses of Japan. The meal [flour] in this country is used in the manufacture of biscuits

and in making a bread for special use in diabetes; but the principal use here is for the extraction of the oil of which the beans contain about 18 per cent., suitable for soap-making and in general as a substitute for cotton seed oil, the residue being a valuable cattle feed.

Also discusses the adzuki bean (*Phaseolus angularis*, Wight). "This bean appears to have been coming into the market recently in quantity. Trade samples have been submitted to Kew for name as 'Dainagon Azuki Beans.'" They are important human food in Japan, Korea, China, and Manchuria, cultivated for the purpose.

435. Nashville Agricultural Normal Institute, Food Department. 1919. Re: Soy bean and peanut products. Letter to Mr. George Washington Carver, Tuskegee Normal and Agricultural Institute, Tuskegee, Alabama, April 29. 1 p. Typed, without signature on letterhead. [1 ref]

• ***Summary:*** "Yours of April 10 received. We have sent you two cans of our Soy bean product. We also can soy beans in three ways, plain, with tomato, and with nut meat.

"We do not know as anything we have would do to exhibit except our soy bean flour, and that you say you make yourself. We have never seen a sample of the milk though we have tried to make it many times. We would be much pleased to receive a little sample of you. Do you think you can make a success of producing milk from the soy bean? I hope the soy bean food reaches you O.K." Initials Dp or Sp.

Handwritten note on bottom of letter: "Is the wood stain you made from the soy bean of much use? Would be pleased to hear how you are succeeding with these experiments.

436. Lepine, R. 1919. Le soja et le lait de soja [The soybean and soymilk]. *Revue Scientifique* 57:373-74. June 28. [1 ref. Fre]

• ***Summary:*** Most of the information in this article is summarized from two earlier articles: (1) Dr. Louis Trabut, Director of the Botanical Service for the Government of Algeria, which appeared in the April 1918 in *Algerie, Service Botanique, Informations Agricoles. Bulletin* (No. 55, 16 p.). (2) Mlle. Castet. 1918. Utilisation du soja [Utilization of soybeans]. *Revue Horticole de l'Algerie* 22(10-12):160-61. Oct/Dec. Session of 20 Oct. 1918. "D'après Mlle Castet le lait de soja, pour toutes les préparations culinaires, ainsi que pour les entremets, peut remplacer entièrement le lait de vache. On a supposé que s'il était employé dans l'alimentation du premier âge il diminuerait la mortalité infantile"

There is also a brief reference to: Delaye, A. 1919. Contribution à l'étude sur "l'utilisation du soja" au point de vue de l'alimentation de l'homme [Contribution to the study of utilization of soybeans for human food and nutrition]. *Revue Horticole de l'Algerie* 23(2/3):197-202. Feb/March (1919).

In France, one pioneering soybean grower was Mr. Gustave Dollfus, near Mulhouse, but he was unable to continue. Most soybeans were cultivated for forage. To give good yields of forage they demand a warm climate and irrigation, which is only available in the south of France (*le midi de la France*) and, above all, in Algeria.

We are ignoring entirely the nature of the protein substances that it [soymilk] contains. A priori, it is doubtful that, for the development of infants and children, these proteins are as valuable as casein, which is of such great importance in nutrition. But it is likely that soymilk will render a great service in raising veal calves, which are reared with a pap of the [full-fat] flour; for it would add some fat and we now know, according to a recent article by Mr. Maignon in *l'Academie des Sciences*, that fats plays a role in the synthesis of albuminoids.

437. Acosta Henríquez, Juan. 1919. Habichuelas soyas [Soybeans]. *Revista de Agricultura de Puerto Rico* 3(1):18-29. June. [Spa]

• ***Summary:*** Contents: History. Varieties grown in Puerto Rico and their characteristics. Soils. Sowing. Harvest. Production and yield per acre. Seed storage. Uses. Silage. Green forage. Hay. Green manure. Uses of the seed (for humans and animals). Assimilation (by humans and animals) and digestibility. Soya as a domestic food (incl. soymilk and tofu). Soy flour (*harina de soya*). General considerations. Enemies of the soybean.

"The soybean (*La habichuela soya*) is a new crop in Puerto Rico. It was introduced from the United States and though, in some towns on the island it has been sold occasionally as a domestic food, it has not been cultivated for that purpose. The federal agricultural experiment station of Mayagüez [Mayaguez] is the only site where experiments have been conducted with this bean (*grano*). Its field of experimentation has been expanded to almost all the towns of Puerto Rico, where one would have been able to obtain very satisfactory results if it were not for the carelessness of the farmers on whose land the trials were conducted; for after seeing that their plants had grown a little, the farmers stopped tending them [assuming that the plants would grow by themselves]. On the grounds of the station at Mayagüez, we were able to carry out various experiments concerning the cultivation and utilization of this crop, and all gave favorable

results."

At the Mayagüez station, the author conducted soybean trials for 18 months, and he is sure that the soybean can be cultivated in and adapted to Puerto Rico. This is especially important today when yields of native beans are decreasingly rapidly. In 1918 at Mayagüez, the author planted the following soybean varieties: Mammoth Yellow, Ito San, Wilson's Five, Tokyo, Haberlandt, Manchu, Chiquita, Virginia, and Early Green. With these introductions an average production of 1.128 tons of dry hay per acre were obtained.

"The soybean has not been used to a great extent as a food in people's homes in Puerto Rico. Experiments have been conducted in this regard and the results have been satisfactory." The author believes that in Puerto Rico, the soybean has not been used as it should be for food. He does not believe that Puerto Ricans will use the soybean as it is used in Japan, with the exception of tofu (*queso de soya*). "This cheese could be made in Puerto Rico with very good results." He then describes how to make soymilk and tofu, and says that the tofu can be sold either fresh or refrigerated. "The pods [*las vainas;* he probably means green vegetable soybeans] can be used in salads before they harden. They should be washed and the fibers on the peel of the pod should be removed. The pods get lightly or briefly boiled, as is done with tender beans, and are served with oil and vinegar, resulting in a magnificent dish." Note: Habichuela means "French-bean or kidney bean." Tables contain data on production and composition of soybeans.

Note: This is probably the earliest Spanish-language document seen (June 2009) that mentions green vegetable soybeans, which it describes as shown above. Address: Subinspector de Agricultura, Puerto Rico.

438. Palen, L.S. 1919. The romance of the soya bean. *Asia and the Americas* 19(1):68-74. July. Illust.

• ***Summary:*** The author, who begins by acknowledging his indebtedness to Dr. Yamei Kin, Dr. John Harvey Kellogg, and Mr. W.J. Morse for much of the material in this article, gives an overview of the soya bean worldwide. The article contains excellent photos (many by Adachi): (1) Stacks of soya bean cake in open storage on Dairen wharves, South Manchuria. (2) Horses plowing soybean fields in North Manchuria. (3) Modern machinery [a huge steam-powered tractor] used in bean cultivation in remote parts of Manchuria where foreign interests are involved. A Western man and woman ride horses nearby. Caption: "To the Manchurian farmer, with his laborious methods of hand cutting and hand winnowing, the introduction of modern Western farming methods would spell many-fold prosperity." Note: This is the earliest document seen (Feb. 2003) that shows a photo of a tractor in connection with soybeans. (4) Stacks of soybeans piled high in sacks in Manchuria as far as the eye can see. (5) Soybeans stored in huge cylindrical, 20-foot-high osier bins, each covered with a conical top.

Soy oil is purified and flavored with an admixture of olive oil for use as a salad oil. It also forms the basis of some of our butter and lard substitutes. "What Mr. Li Yu-ying accomplished in Paris in the establishment of a Laboratory of Research and of a factory for the production of all the products derived from the soya has been the forerunner of activity on the part of certain independent Chinese companies in America and of government and private investigations."

"In general the use of whole soya beans has not been attended with much success because of the ever present flavor of the oil content and because, with the ordinary method of cooking, they remain hard and unpalatable; but it has been found that cooking at a temperature somewhat above the boiling point, say from 220 to 230 degrees, breaks up the cellulose structure and develops a richness of flavor that is not obtainable with the lower temperature."

"By far the most extensive use of the soya is in the products manufactured from it. And it is here that Dr. Yamei Kin, the talented Chinese physician, is making her chief studies under the direction of the Pure Foods Division of the Department of Agriculture, with the purpose of spreading a knowledge of the soya among Americans. For convenience of consideration the products studied may be divided into sauces, curds, cheeses and milk.

"Of the sauces the liquid form is already familiar, although unrecognized, perhaps, by a large percentage of Occidentals through the work of early English traders in bringing back the base of the now famous Lea and Perrins Worcestershire Sauce. This original Chinese *shi-yu* was highly spiced and became a well recognized adjunct to many an English meal. Following the example of Lea and Perrins, others have put out sauces with the same base without, however, attaining the same success, because the makers did not understand that there are many kinds of soya sauce. While they are all made by the same ferments and in the same general way, they differ very greatly in quality according to the locality and to the manufacturer, just as wine, though made from the identical kind of grape and by the same process of fermentation, may be a very different article from different hands. It takes several months to make this liquid form of sauce, while the best kind requires a year or more to attain the finest flavor and mellowness. The hot condiment added by Lea and Perrins is not favored by the Chinese, since according to their taste it detracts from a wide use of the soya sauce."

Tofu (spelled to-fu) is discussed in detail. "There are records to show that it has been used since at least nine hundred years B.C. *To-fu* making is a staple industry in every little community. Usually it is done at night so that the fresh curd will be ready for the morning demand in the market, or for peddling around the streets. It provides, for the fraction of a cent, the indispensable equivalent of meat and affords

very often the explanation of how the Chinese laborer does so much work on what is purely vegetable diet, popularly supposed not to contain much protein. *To-fu* is made in many different forms and the bean stalls occupy quite as large and prominent places in the city market as the fish and meat stalls...

"Cheeses are also made from the growth of cheese-making moulds on *tofu.* The Chinese resident in America regularly import a certain highly flavored red bean cheese for their own use...

"Perhaps the greatest contribution of the soya to the life of the Occident will be in its form of milk. Back in the golden era of peace there had been established in London a soya bean milk factory which was prepared to place its product regularly on the market, and there were said to be plans consummated for the erection of two others at Manchester and Liverpool; but of what the development has been we have no definite information. In Shanghai, Peking and Dalny Chinese companies are supplying hospitals and individuals with an 8 or 10 ounce bottle of concentrated milk per day at a cost of $1.00 Mex per month.

"In its competition with the cow the legume has in its favor the following facts: Soya milk can be produced with less contamination; it is tuberculosis-free; its caseins break down much more readily than the caseins of cows' milk and do not form curds in the stomach in the same degree...

"By those who advocate and urge a vegetarian diet, a very strong bill can be drawn in favor of this oriental substitute. In these days when war has thrown new light on many of our life problems, it will be easier to secure acceptance for their contention that the world must for both economic and physiological reasons adopt the biological diet. It has been calculated that, roughly speaking, it takes 100 pounds of foodstuffs to produce 3 pounds of beef and that a given acreage of land can support five times the population if the necessary protein can be derived directly from vegetable sources rather than going through the roundabout way of an animal form, imposing upon the body the burdens incident to taking in the toxines [toxins] resultant from the catabolism of the cells of the animal, and from possible putrefaction. In China the Buddhist priests and people who enter the various temperance societies all depend on varieties of *to-fu."*

439. Yamamoto, Yoshitaro. 1919. Process of deodorizing and decoloring bean-flour. *U.S. Patent* 1,314,298. Aug. 26. 1 p. Application filed 21 May 1919.

• ***Summary:*** "This invention relates to a process of preparing deodorized and decolorized bean flour from raw bean, or deoiled bean and consists in steeping in a weak solution of an organic acid bean coarsely broken and deprived of its bran, until it has swelled and lost all of its offensive smell, and color; then removing all the traces of the acid by carefully washing the material with water, and then drying and grinding it. The object of this invention is to obtain bean flour suitable for use as material for making sweetmeats, as a substitute of powdered milk, or for preparing bath powder."

Note: This is the earliest English-language document seen (Sept. 2010) that contains the word "deoiled" (spelled as one word) in connection with soybeans.

In detail: Steep the bean powder in a solution of 1-2 liters of vinegar mixed with 100 liters of water, heat the mixture to a temperature not exceeding 60ºC, remove the powder from said solution and wash it with water, then steep the powder in a solution of 140-200 gm of bicarbonate of soda mixed with 100 liters of water. Remove the powder again, wash it in water, then dry it at a low temperature. This process will not cause "condensation of the albumin, matters which give out the offensive smell and color of the bean, are decomposed and removed, such matters being changed into soluble substances. Thus the product obtained by my process is almost pure white in color, and retains it albuminous components unaltered, that is, in the condition they exist in raw bean. Thus the bean flour produced by my process can be used in place of wheat flour or rice flour in making sweetmeats, as a substitute of powdered milk for drinking purpose and as food stuff for other purposes. It can be also used as material for preparing bath powder, and also as body of soap." Address: No. 5 Zitchome, Taikaidori, Hyogo city, Kobe, Japan.

440. Bowers, William G. 1919. Some studies on the nutritive value of the soy bean in the human diet. *North Dakota Agricultural Experiment Station, Special Bulletin, Food Department* 5(13):278-328. Aug. Reprint of his 1919 PhD thesis, Ohio State Univ. 28 cm. [65 ref]

• ***Summary:*** Contents: Part I: Introductory. Extent of production. Human food preparation made from the soy bean. Varieties and chemical composition. Character of the carbohydrates of the soy bean and its bearing on nutrition. Character of the fats of the soy bean and its bearing on nutrition. Character of the protein and its bearing on nutrition. Vitamines of the soy bean. Minerals of the soy bean. The soy bean compared to some other legumes used as human food as to fuel value and organic nutrients. Digestibility of soy bean products.

Part II: Experimental part. The character of the materials used in the experiments. Digestibility of soy cake meal baked into bread. Digestibility of soy cake meal mush. A study of the nutritive value of the nitrogen free contents of the soy bean. Malt digestion. One per cent HCl [hydrochloric acid] extract (incl. pentosans, galactans, true cellulose). Milling of the soy bean: Composition of parts (incl. "the bran"), digestibility of the bran, the nitrogen-free extract, crude fiber, physical effects of a diet solely of a mush made from the bran, the calcium oxide and phosphorus pentoxide content of the soy bran and soy meal. Toxic and disagreeable or unpalatable substances of the soy bean: Some investigations

as to the possible poisons, location and elimination of the disagreeable and unpalatable substances (20 experiments, incl. soy and navy bean bran, benzine extracted soy and navy bean meal, alcohol extracted soy and navy meal, a steam distillation for the purpose of separating objectionable flavor). Discussion of results. Summary.

Introductory: Only within the last 35 years "has the soy bean been considered with much favor as a food for stock. Only within the last ten or fifteen years has it met with any favor at all as a food for man" (p. 279). "Soy milk and soy milk products are being made in the United States now" (p. 280). "Roasted beans. Soy beans may be roasted in an oven or ordinary corn popper. They are heated until the beans are burst like popcorn. The beans thus roasted may be softened by immersing in a syrup while they are hot. This is said to make a wholesome candy. The roasted beans may be powdered and used as a salad dressing or employed as a substitute for coffee" (p. 281). "The fresh green beans, those that have been dried without being allowed to ripen thoroly [sic, thoroughly], or those that have ripened on the vine after the vine has been pulled show slight amounts of starch" (p. 282).

"Experimental part (p. 287): "In our experimental work we propose to inquire into the digestibility of soy cake meal. We shall then determine the digestibility of the different carbohydrates as found in a representative variety of the soy bean. After passing some of the beans thru a milling process we shall study the composition and digestibility of the meal and bran and determine their relative amounts of calcium and phosphorus, and locate any possible poisons or objectionable substances that my be present in either of these. This will make it possible, then, to determine whether or not it would be profitable to carry on the milling process and eliminate certain products, or whether by the use of certain extractives we can get rid of the objectionable constituents."

Recalling the fact that "navy bean bran is so indigestible and is responsible for fermentation and discomforting gas in the digestive system, we were led to the effort to separate the bran and the meal of the soy bean and make determinations of each separately... we found the bran to constitute 8% of the whole bean." The germ was 1½% and the remainder was cotyledon. "The bran consisted of very large flakes. We had to grind it thru a burr mill three times before it would pass thru a twenty mesh sieve" (p. 301-02). The bran can be easily separated from the soy bean by milling. It is composed of about 37% crude fiber and 43% nitrogen free extract. "Digestibility experiments on the bran showed that the nitrogen free extract, including the hemicelluloses and waxes, is about 84% digestible, which is much less than that of the whole bean. (p. 323).

"In order to see what would be the physical effects of a day's diet on the bran alone, we made three meals of 30 grams each for one day. Next day we were a little uncomfortable on account of a slight amount of gas in the bowels. We were a little weak and very hungry but not sick. The next day the stool was voluminous but not so very soft. The diet had neither a laxative nor a constipating effect that could be noticed" (p. 304).

"In most of the Japanese foods made from the soy bean the disagreeable flavor is avoided by the nature of the preparation made. These, of the most part, involve some sort of fermentation which changes the flavor entirely. The Domestic Science Department of the Ohio State University [under the leadership of Dr. J.F. Lyman, with help on milling from Dr. Park of the Farm Crops Dept.], has carried on considerable experimentation making different preparations, combinations and extractions, as well as making use of different methods of cooking soy bean preparations, to avoid the disagreeable flavor."

The calcium oxide content of the bran was found to be 0.8% and the phosphorus pentoxide content 0.27%. No salicylic acid was found in the bran, and no hydrogen cyanide or cyanates in the samples tested. There was no trace of tannin in the bran and only a slight trace of alkaloids.

"As far as flavor is concerned there is no point gained in removing the bran from either the soy bean or the navy bean. The beany flavor and some of the disagreeable taste can be easily removed from the soy bean by steam distillation, but the disagreeable flavor in the oil cannot be removed in this way."

Nineteen tables (all but one without captions) show compositional percentages of soy beans, and a summary of results. An illustration (line drawing; p. 297) shows the apparatus for extracting meal with 95% alcohol. Three bar charts (p. 316-18) gives a summary of experimental results.

Note 1. Although this document was reprinted as a Special Bulletin by the Food Department of the North Dakota Agricultural Experiment Station, it has nothing to do with North Dakota per se, and makes no mention of soybeans being used or grown in North Dakota.

Note 2. This is the earliest English-language document seen (June 2013) that mentions soy bran, which it calls "soy bran." It is also the earliest document seen concerning the etymology of soy bran.

441. *Journal des Praticiens: Revue Generale de Clinique & de Therapeutique.* 1919. Le lait de soja [Soymilk]. 33(38):607-08. Sept. 20. [1 ref. Fre]

• ***Summary:*** This article in the "Food Hygiene" section notes that the soybean [*la soja*] is a legume whose seeds are very similar to those of haricot beans or beans, but the contain more protein and fat, and less carbohydrates. For this reason, they have been recommended in diabetic diets. Soy bread has had little success. Presently, soymilk is widely used (see articles in *Revue Horticole de l'Algerie* by Mlle. Castet, Oct/Dec. 1918, and by Delaye, March 1919).

In 1914, a ton of soybeans from Manchuria sold for 202 French francs in London [England]. Since 150-160 gm of

soybean are sufficient to make a liter of milk, the cost of the raw materials is only about 3 centimes. The labor could not be very expensive because the process is very simple. Thus, even with increasing freight rates, the actual cost of a liter of vegetable milk (*lait végétal*) is probably not more than about 20 centimes.

A brief description of the process soymilk making process is given. The flavor is very acceptable. Suitably sweetened, it is also well accepted by infants.

Mr. Delaye says that he has succeeded in removing the bad taste from soymilk, but he does not describe his process. According to Mlle. Castet, in all culinary preparations, as well as in side dishes or sweets, soymilk can entirely replace cow's milk. We suppose that its use in the feeding of young infants would diminish their mortality rate, but this supposition has not yet been supported by facts.

Mlle. Castet makes a cheese [tofu] with soymilk, using magnesium chloride as a coagulant. The taste is not bad, but rather tasteless. It should be sweetened. In the future, one can imagine an industry making various foods from soymilk curds.

In the preparation of soymilk, that which remains in the filter [okara] is not without value. Mlle. Castet adds sweetener plus a little water and cooks it for an hour or less until it has the appearance and taste of almond pâte. It can be consumed as is or used in making pastry, such as almond pâte.

442. Carver, G.W. 1919. Re: Milk from peanuts. Letter to Robert Russa Moton, Principal [Tuskegee Institute, Tuskegee, Alabama], Sept. 22. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "I am sure you will be pleased to know that I have today made a delicious, and wholesome milk from peanuts. It looks exactly like rich cows' milk and has a fine... flavor."

Note: Linda O. McMurry (1981, p. 170-71, 175) states that in this letter Carver announces a "discovery that ultimately shaped the course of his career... The creation of the Peanut Man began with the discovery of peanut milk." In 1918 Carver seemed well on his way to becoming the "Sweet Potato Man." Later, though he did not desert this work, the end of World War I soon brought an end to the interest in sweet potato flour. About a week after Carver wrote the letter to Moton mentioned above, "Walter M. Grubbs of the Peanut Products Corporation in Birmingham, Alabama, heard of the discovery and wrote Carver for details. Carver assured him that the milk tasted as good as cow's milk and had been successfully used as a substitute in baking and in making dairy products such as cheese. He also declared, 'I think I am conservative in my statement when I say that it is without a doubt, the most wonderful product that I have yet been able to work out, and I see within it, unlimited possibilities.' Grubbs came to Tuskegee to investigate and departed dazzled by both Carver and his many peanut products."

Location: Library of Congress, Washington, DC. Microfilm of The George Washington Carver Papers in the Tuskegee Institute Archives, Roll 6 #0321. Address: Director, Dep. of Research & Experiment Station [Tuskegee, Alabama].

443. Carver, G.W. 1919. Re: Milk from peanuts. Letter to Mr. Walter M. Grubbs, Peanut Product Corporation, Birmingham, Alabama, Oct. 1. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** "It is true that our Research Laboratory has succeeded in producing a milk from Peanuts, eminently commercially practical. I am not ready however, to release it, as the discovery is less than a week old and it has a number of possibilities that I am perfecting; at present I have three grades. First, the Normal milk, Second, a very rich product which I choose to call Cream; Third, a Butter milk; they are all three wonderfully interesting products and every way that I have tried them out, they have proven a success.

"I have used the sweet milk for making both Corn-bread and Biscuits with perfect success; have used the sour milk with baking powder for biscuits with equally as much success. The Butter milk is delicious for drinking. I am making yeast bread with it today, hope to make ice cream very soon; The cream works very nicely in coffee, changes the color similar to the cream from cow's milk and those who tried it out with me, pronounce it excellent; in fact, I am trying it out upon a great many people here who are really fastidious. I do this in order to get whatever objections they may have to it, so as they may be corrected before it is released."

"I think I am conservative in my statement when I say that it is without a doubt, the most wonderful product that I have yet been able to work out, and I see within it, unlimited possibilities. It curds much like cow's milk and the curds make a delicious cheese [tofu]. I hope to have it perfected sufficiently to let it go out before a great while.

"P.S. [handwritten] I have just tried it out in rolls made with just the peanut milk instead of water. Yeast was used in the usual way. The rolls were simply delicious and taste like real milk rolls only more nutty in flavor. Experienced bread makers say the rolls are delicious."

Location: Library of Congress, Washington, DC. Microfilm of The George Washington Carver Papers in the Tuskegee Institute Archives, Roll 6 #0328. Address: Director, Dep. of Research & Experiment Station [Tuskegee, Alabama].

444. Le Goff, Jean. 1919. Le soja: Un aliment précieux pour diabétiques [The soybean: A valuable food for diabetics]. *Gazette des Hopitaux* 92:1120-21. Nov. 18-20. [3 ref. Fre]
• ***Summary:*** "In two preceding articles in this journal (22 May 1910 and 7 March 1911) I have called attention to the

use of soya in diabetic diets, I have demonstrated that it is to cultivate this plant in France, and I am hopeful that some day there will be interest in cultivating the soybean as a garden vegetable." In the United States the soybean is being introduced to many states under the direction of Mr. W.J. Morse, who has also written various bulletins dedicated to the study of the soybean, its cultivation and usage.

From the viewpoint of food, the soybean has been neglected up until the present. However I noticed in the *New York Herald* (May 1916) the name of this seed among the substances that the Germans have fed to our poor prisoners of war. And these soybeans came from France!

"Here, in effect, is what one reads in the *Journal de Genève* on Thursday, 10 August 1916, page 6, 1st edition. "Export of soybeans." Berne (Switzerland): "The *Nouvelle Gazette de Zurich*, in its issue no. 1238, has published the following note: 'We have said that Mr. G. Liechti, in Zurich, is the importer from France of 2,000 railway cars (*wagons*) of soybeans. At a later date, these soybeans were re-exported to Germany. He submitted to us the file of this case in which the press took such great interest.'" Note: These soybeans were probably not grown in France (or even Europe), but rather imported to France from East Asia.

"We would like to know what the role of our Minister of Blockade (*Ministère du Blocus*) has been in this affair, which I brought to their attention.

"Food uses of the soybean.–The soybean can be used in either the dry or fresh state. To date, it has been used only in the dry state in Europe: (1) As a flour, with which one can make biscuits, pastries, and bread. (2) As an edible oil. (3) As a vegetable milk with which one can make a cheese [tofu], that can be consumed fresh, dry, smoked, or fermented. (4) A coffee substitute, after roasting.

"In the fresh state, the soybean is rarely used because agriculture does not take enough interest in this plant, which not only fertilizes the soil by fixation of atmospheric nitrogen, but also furnishes forage and an edible seed of the first order. This is the vegetable of choice for those with diabetes mellitus." Soybeans harvested fresh in France are very easy to cook–quite unlike dry soybeans. A table shows the chemical composition of 3 samples of dry soybeans.

Two photos by Dr. Le Goff show: (1) A mature soybean plant with pods, harvested in the suburbs of Paris; it bears 38 pods containing 90 soybean seeds. (2) A portion of the roots of a soybean plant with nodules. Address: Dr.

445. Cromwell, Richard O. 1919. Fusarium blight of the soy bean and the relation of various factors to infection. *Nebraska Agricultural Experiment Station, Research Bulletin* No. 14. 43 p. Nov. Based on his PhD thesis, Univ. of Nebraska. [32 ref]

• ***Summary:*** The blight of soy beans is due to *Fusarium tracheiphilum.* The first report of this soy bean disease appeared in a publication by the author in 1917. "The disease is characterized by a chlorosis and shedding of the leaves or leaflets, followed by the death of the plants, and is herein called 'blight.' Soy bean blight has been observed in several localities within North Carolina on soils infested with cowpea wilt..." The physical structure of soils under natural conditions is not the limiting factor in the infection of the disease, but acidity under certain conditions has some influence. The nematode (*Heterodera radicicola*) also has some influence.

The section titled "Economic importance of the soy bean" (p. 6-7) states: "Its culture in England was begun in 1790. The plant was introduced into the United States from Japan in 1860. Since that time its cultivation as a soil-improving and a forage crop has been confined for the most part to the Southern States. North Carolina is probably foremost among these States in the production of soy beans. The yield in 1909 was only 13,313 bushels (29, p. 632), and in 1915 was estimated as approximately 1,000,000 bushels. Within the last three or four years, and especially since the war began, this crop has become increasingly important because of the large variety of products manufactured from the oil and meal and because of its introduction in the United States as a human food.

"The following is a list of the most important products obtained from soy beans or in which soy beans enter: Soy bean milk, vegetable cheese, meal or flour, macaroni preparation, soups, pork and beans, meat substitutes, toilet powder, fertilizer, and cattle feed from the meal, and high explosives, soaps, linoleum, rubber substitutes, margarine, Japanese sauce, paints, varnishes, water-proof cloth, salad oil, lubricants, and lard substitutes from the oil."

The section titled "Other soy bean diseases" (p. 7) mentions nine, including Heterodera, and "Chlorosis and crinkling (cause?)."

The section titled "History, occurrence and importance of the disease" (p. 8) states that in 1900 Orton conducted tests for disease caused by *Fusarium* on soy beans at Edisto Island and at Monetta, South Carolina (see Orton 1902, p. 16-19). Eight varieties of soy beans [planted on 29 May 1901 in Monetta] were tried on ten plats. "The varieties tested were Tokio, Buckshot, Yosho, Ito San, Manhattan, Guelph, and Amherst [Footnote: The names in use for these varieties in 1890 were respectively as follows: Best Green, Early Black, Yoshoka [sic, Yoshioka], Rokugatsu, Gosha, Black Round, Green Medium, and Bakaziro]. Orton reported that at Edisto Island the soy bean made a heavy growth, 3 or 4 feet high, and was free from the wilt disease. It may be said that a very considerable proportion of the several varieties of cowpeas grown in adjacent plots succumbed to wilt. The results of these tests accord with the observations of others who have had opportunity to observe these crops when they were grown on soil known to be infested with cowpeas wilt."

The section titled "Field experiments to determine the susceptibility of varieties" (p. 38-40) states that the following

soybean varieties were planted in May 1916 in Red Springs, North Carolina: Black Eyebrow, Brown, Haberlandt, Mammoth Yellow (which suffers greatly from *Fusarium* blight), Medium Yellow, Pekin, Tar Heel Black. and Virginia. Black Eyebrow seems to show some evidence of resistance.

A larger number of varieties were tested in this field in 1917, including the following not tested in 1916: Arlington, Auburn, Austin, Barchet, Chiquita, Early Dwarf Green, Guelph, Jet, Manchu, Peking (spelled differently this time), Tokio, and Wilson Black. Again, Black Eyebrow showed resistance. "The Brown variety, altho as badly infected by the nematode and *Fusarium* as any of the other varieties, deserves special mention because of its tolerance to these parasites." Address: Extension Plant Pathologist, Iowa State College. Formerly Asst. Plant Pathologist, North Carolina Agric. Exp. Station.

446. Gasca, Enrico. 1919. Il latte vegetale [Vegetable milk]. *Igiene e Vita* (*Rome*) No. 11. [Ita]*
• ***Summary:*** Note: This is the earliest Italian-language document seen (Aug. 2013) that uses the term *latte vegetale* to refer to soymilk.

447. **Product Name:** Milqo (Soy Milk).
Manufacturer's Name: Milqo Ltd. Later renamed Milquo Ltd., then Vi-Tone, then Milk-Ko.
Manufacturer's Address: Milqo Ltd., Hamilton, ONT, Canada.
Date of Introduction: 1919.
New Product–Documentation: W.L. Burlison and O.L. Whalin. 1932. *Journal of the American Society of Agronomy* Aug. p. 594-609. "The production and utilization of soybeans and soybean products in the United States." See p. 608. In a table under "Canadian Products" "Milqo (soy milk)" is listed.

H.W. Lohse. 1936. *Canadian Chemistry and Metallurgy.* July. p. 224-25. "The soya bean as a food product and industrial raw material." The author, who is from Milqo Ltd., Hamilton, Ontario, Canada, states in this paper presented at the Canadian Chemical Convention: "Soya bean milk has been manufactured here in Canada by Milqo Limited in Hamilton since 1919. This firm erected one of the first, if not the first, plants for the purpose of this manufacture on a large scale in the Western world."

American Soy Bean Association. 1938. "16th annual meeting." This leaflet lists the stores from which the soy products were purchased, incl. Milqo Limited, Vi-Tone Company, Hamilton, Ontario, Canada.

Soybean Digest. 1948. "Grits and flakes... from the world of soy: Milquo Ltd. is now Vi-Tone." Jan. p. 34. "Milquo Limited has changed its firm name to Vi-Tone Products Limited, 198 Gage Ave. S., Hamilton, Ontario. Ray H. Bissell is president."

Soybean Blue Book. 1954. p. 102. Milk-Ko Products in Hamilton is probably the same company that was previously named Milqo Ltd.

Note: This is the earliest known commercial soy product made in Canada, or in the province of Ontario.

448. Calvino, Mario. 1919. La soya [The soybean]. *Informe de la Estacion Experimental Agronomica* (*Santiago de las Vegas, Cuba*). p. 98-103. For the years 1917-1918. [1 ref. Spa]
• ***Summary:*** This report, which describes the first soybean experiments in Cuba, begins by discussing the composition of the seed, and its various uses in China, Japan, and Europe (including for manufacture of soaps and as a drying oil in paints, and as foods such as whole dry soybeans, soy coffee, roasted soybeans [soynuts] {"*Se comen también tostados...*"}). In China they are sprouted in darkness and the white sprouts, up to 3 cm long, make an excellent green vegetable."

Note. This is the earliest Spanish-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *sus gérmenes blancos.* From soybeans the Chinese also make a special soy cheese (*un queso especial*), a type of milk (*una especie de leche*), and other drinks. The author then states: "We thought it would be useful to test varieties of soya suited for hot/tropical countries, and we were able to obtain two types of Japanese soybeans, those that gave satisfactory results without having been inoculated.

"Since these soybean types did not find suitable bacteria for the purpose of being inoculated naturally in our terrain, I asked the Mulford house (*casa de Mulford*) for a special bacterial strain for soy (Soya) and proceeded with the artificial inoculation of the seed. The result has been magnificent, as one can see in the accompanying photographs.

"Now we have inoculated land, with which we have been able to ensure the most success for our crop. The harvest [yield] during this first year in Cuba was 2,000 kg/ha of seed. We have also found that it is best to cultivate soya in rows 60 cm apart, with the seeds planted 10 cm apart in each row. This is very dense planting, but it is better to thin the plants than to transplant in others to get the desired plant density. Transplanting is often unsuccessful, and if a crop is not planted evenly the first time, it is difficult to make it even later by transplanting.

"I have had a chemical analysis done of the soybean seeds from our crop. The report prepared by the Department of Chemistry shows that they contain 10.4% water, 41.95% protein, 17.5% oil, 2.45% carbohydrates, 2.5% fiber, and 5.2% ash. The analyst was F. Dominguez." An analysis is also given of assimilable or digestive elements in the soybean from a book by R. Gouin titled *Alimentation rationelle des animaux domestique* [*Rational feeding of domestic animals*]. Three full-page photos show soybean plants: (1) Root nodules on a soybean plant grown in Cuba

without the use of inoculant (p. 99). (2) Two soybean plants grown at the agronomic station that contain many pods (p. 101). (3) Four soybean plants with roots; two were inoculated and bear nodules (p. 103).

Note 1. This is the earliest Spanish-language document seen that refers to soynuts. Note 2. This experiment station is under the Secretary of Agriculture, Commerce and Labor (*Secretaria de Agricultura, Comercio y Trabajo*). This 515-page report is published in Havana by Alvarez López y Cie. Address: Director, Estacion Experimental Agronomica, Doctor en Ciencias Agricolas de la Universidad de Pisa [Italy].

449. Koenig, Franz Joseph. 1919. Chemie der menschlichen Nahrungs- und Genussmittel. 4 Aufl. Nachtrag zu Band I. A. Zusammensetzung der tierischen Nahrungs- und Genussmittel [The chemistry of human foods and food adjuncts (stimulants / enjoyables) 4th ed. Supplement to Vol. I. A. Composition of animal foods and food adjuncts]. Berlin: Verlag von Julius Springer. 594 p. See p. 286-87, 346, 528. [6 ref. Ger]

• ***Summary:*** On pages 286-87 is a section on "Sunflowerseeds, soybean cake and soybean meal (*Sojakuchen und–mehl*) as fodder for milk cows," by Nils Hansson. A table shows the weight of the feed and the resulting milk, and the fat content of that milk. Soybeans (*Sojabohnen*) are also mentioned in two places on p. 346 as a raw material for soymilk–which is described in German as a "fluid resembling cow's milk" or a "soybean emulsion" (*Sojabohnenemulsion*) (Footnote: *Die Sojabohnenmilch, Sojamilch, Sojaglobulin*).

A table titled "Plant cheeses (*Pflanzenkaese*)" gives the composition of tofu, kori-tofu (frozen tofu), Hamananatto, three types of soybean cheese (*Sojabohnenkaese;* from the year 1912, one type prepared in a laboratory), Chinese tofu, and Daua-Daua (Dawa-Dawa) cheese made from the seeds of *Parkia africana.* The source of all data is given, and the lengthy footnotes accompanying each entry in this table take up more space than the table itself.

Note: This is the 2nd earliest German-language document seen (Dec. 2011) that mentions fermented black soybeans, which it calls *Hamananatto.* Address: Germany.

450. Mattei, G.E. 1919. La soja ed i suoi prodotti [The soybean and its products]. *Bollettino di Studi ed Informazioni del Regio Giardino Coloniale di Palermo* 5(1/2):1-34. [40 ref. Ita]

• ***Summary:*** This article contains one of the best histories seen to date of the soybean in Italy, from 1760 to 1813. Contents: Brief history of the soybean. History of its taxonomic classification. Botanical description of the wild and domestic soybean. Varieties. Introduction of the soybean to Europe (especially France and Italy). The question of the root nodule bacteria. Cultural requirements. Importance / value of the production. Utilization of the seeds. Soy flour (*farina di soja*). Soymilk (*latte di soja*). Soy cheese [tofu] (*formaggio di soja*). Soy oil (*olio di soja*). Soy cakes (*panelli di soja*). Other Japanese preparations: Miso, shoyu, koji. Opportunities for soybean cultivation in Italy. Results of cultural trials at the Colonial Garden (*Giardino Coloniale*) in Italy.

"Introduction of the soybean into Europe: The soybean (*La Soja*) was long confined to East Asia, and it is only towards the 17th century that it appears in the Indian Archipelago; in fact, if it had existed in the Pacific islands at the time of Cook's voyage, Forster surely would have reported it. Its introduction to the East Indies is even more recent. Roxburgh mentions its cultivation in the Botanical Gardens of Calcutta from seeds acquired from the Moluccas, in 1798. On the other hand, as Alphonse de Candolle observes, if its cultivation were ages-old, it would have spread long ago toward the West to Syria and Egypt, which did not occur.

"Its introduction to France is said to date back to 1739, when certain missionaries sent soybean seeds, from China, to the *Jardin des Plantes* in Paris: the uncertainty however arises as to whether, even before this time, it was cultivated in Europe, since, as Saccardo points out, it appears that essays (*saggi*) on the plant exist in the *Herbarium* of Bartolomeo Martini of Verona, Italy, written (*composto*) in 1701.

"In any event, concerning France, the soybean is reported as being grown extensively in about 1821 at Champ-Rond near Etampes; it seems, however, that subsequently its cultivation was nearly lost; in fact, Lachaume, in the *Revue Horticole* of 1857 [pages 568-70. Nov. 16], reports it as a new introduction, thanks to the French Consul in Shanghai, and he describes and illustrates it.

"As for Italy, Pinolini [1905] dates the soybean to 1848 [sic, 1840]. It is possible that its cultivation as an agricultural plant began to spread from that date, but the existence of the soybean in Italy antedates this date by at least a century. Saccardo says in fact: 'cultivated since the mid-18th century, and at times extensively, as in the Treviso region.'

"With the existence, as I have stated, of essays on the soybean in the *Herbarium* of Bartolomeo Martini of Verona, an herbarium written in 1701, one might suspect that from that time the soybean was being cultivated in the Verona region; but who could have brought the seeds? And if this were the case, why do we not find any reports of it in somewhat later authors? Or was the above-mentioned essay brought directly from the Orient. It should be noted that Kaempfer's voyage to Japan dates to 1690, and we have the first accurate reports on the soybean in 1712 with Kaempfer's own publication. Should we perhaps believe that some study, brought back by Kaempfer, was given to Martini? He might have obtained it from Zannichelli who, as

Targioni-Tozzetti relates, in the life of Micheli, carried on a correspondence with Martini himself? Assuredly Kaempfer had to regard a plant which is used for so many purposes in Japan as important and it is possible he brought back essays about it, and perhaps even seeds.

"In any event, the Jardin des Plantes in Paris, after 1739, must have distributed seeds to various botanical institutions, including Italian. In fact, from the old *Catalogs* (*Cataloghi*) of the first Italian botanical gardens and from the pertinent *Index seminum*, we see that in the second half of the 18th century, the soybean is being cultivated almost everywhere: in 1760 Allioni mentions its cultivation in the Botanical Gardens of Turin; in 1780 Abbot (*l'Abate*) Farsetti introduced it to his Santa Maria di Sala garden near Venice; in 1785 Scopoli mentions it in Pavia; in 1787 Guatteri records it in Parma; in 1790, with the Botanical Gardens barely established, Tineo was cultivating it in Palermo, as results [show] from the Catalogue published in precisely that year; in 1793 Zuccagni refers to it in Florence; in 1798 Durazzo had introduced it into his garden Dello Zerbino near Genoa; in 1801 Tilli mentions it in Pisa; in 1805 Graefer refers to it in Caserta; in 1807 Arduino introduced it to the Agricultural Gardens (*Orto Agrario*) of Padua; in 1811 Fabriani refers to it in Modena; in 1813 Tenora points it out in Naples, and the same may be said for other more recent reports. From this we see that, at the end of the 18th century, the soybean was already cultivated throughout Italy, not for agricultural but for scientific purposes, that is, in Botanical Gardens.

"Perhaps this information escaped those, like Pinolini, who did research on the soybean as an agricultural plant because, in all works dealing with plants cultivated at that time, the soybean is found under the name of *Dolichos soja*, the generic name *Soja*, of Moench or Savi, not yet having been adopted."

In 1918 a soybean cultural trial was conducted at the Colonial Garden, Palermo, on a plot of 350 square meters; smaller experiments had been conducted in previous years. A variety was chosen which had almost spherical seed and was greenish yellow in color. The seeds were planted on March 29, in furrows at a spacing of 30 x 40 cm.; they germinated regularly about 10 days later. The plants were hoed twice to reduce weeds and irrigated eight times from the end of May until the end of August. Flowering began in early July and the seed was harvested on Nov. 15. The entire vegetative period was, therefore, 7½ months. The plants reached an average height of 90 cm. Their growth was luxuriant and there was a normal development of nodules on the roots. From this plot of 350 square meters, 51 kg of clean seed was harvested; this corresponds to a yield of about 1,450 kg/ha, which is considered quite satisfactory and could be increased by manuring. The beans, when cooked in different ways, were found to have an agreeable taste.

Talk with Ted Hymowitz, soybean geneticist, Univ. of Illinois. 2003. Aug. 18. Caution! It is not clear whether the early dates for soybean in Italy in this article are based on herbarium specimens or living plants. With herbarium specimens, it is easy to make errors.

Note 1. This document contains the earliest solid dates and the second earliest overall dates seen for soybeans in Italy, or the cultivation of soybeans in Italy (1760). The source of these soybeans is unknown. Yet note that the earliest possible date that the soybean was cultivated in France was about 1740. Perhaps there was some connection between the earliest possible soybean cultivation in France and in Italy.

Note 2. This is the earliest Italian-language document seen (April 2013) that uses the term *formaggio di soja* to refer to tofu.

Note 3. This article was reprinted in the Nov. 1991 issue of *Il Giornale della Soia* (p. 11-16). Address: Royal Botanical Garden (R. [Regio] Orto Botanico), Palermo, Italy.

451. Smith, Joseph Russell. 1919. The world's food resources. New York, NY: Henry Holt and Company. 634 p. See pages 326-27, 360-65. [1 ref]

• ***Summary:*** Contains a brief overview of the soybean, soybean production, and soybeans as a food product, with several long excerpts from Dr. J.H. Kellogg, and the *USDA Year Book of Agriculture* (about food uses, including shoyu or soy sauce).

A photo shows "Soy bean curds and cheeses in a Japanese factory," in large earthenware containers (p. 362). Note: This photo of "curds and cheeses," taken by Frank N. Meyer, shows the production of fermented tofu, probably in a Chinese factory (See: {1} Morse 1918. "The Soy-bean Industry in the United States." Plate IV, fig. 2; {2} Piper & Morse. 1923. *The Soybean.* p. 242).

Concerning use of food resources, in the USA and Canada, the chief goal of agriculture is not to feed humans but to feed animals. This was true even in the food crisis of 1918 [at the end of World War I]. About 5,191 million bushels of grain are now grown in the USA; in descending order of importance (in million bushels) they are corn (2,863), oats (1,422), wheat (643), barley (195), rye (54), and buckwheat (14). Of this total of 5,191 million, the American people eat less than 550 million (14.1%). Adding the 340 million bu exported, the total amount used for human food was 900 million bu (17.3%). "The rest, 4,300 million, went to our four-footed brethren, who outnumber us and whose food requirements, because of their greater size, are several times our own.

"In addition to the grain, they get all of the 85,360,000 tons of hay grown on 54,618,500 acres. (More than ten per cent of the half billion acres under cultivation in the United States). They also roam over millions of acres eating all the grass. It is therefore plain that more than four-fifths [80%] of the produce of American agriculture, even in 1918 [a war

year], went to feed beasts." Address: Prof. of Geography, Columbia Univ., New York.

452. Le Goff, Jean. 1920. Un aliment précieux pour diabétiques: le soja [A valuable food for diabetics: Soya]. *Repertoire de Pharmacie* 32(1):1-4. Jan. 10. Series 3. 76th year. (Chem. Abst. 14:1169). [Fre]

• ***Summary:*** A call for the cultivation of the soy beans in France on the ground that they can be the source of valuable food products. Soybeans are said to be especially valuable as a food for diabetics, since they are is composed almost entirely of nitrogenous and fatty materials and contain practically no carbohydrates.

Food uses of soya: In the past, it has been objected to as a food because the dried beans are difficult to cook. The fresh beans, however, are said to be as easily cooked as peas and to have a flavor somewhat resembling that of chestnuts. The soybean can be used to make: (1) Flour, from which biscuits, pastries, and bread can be made. (2) Edible oil. (3) Vegetable milk (*lait végétal*), from which one can make a cheese [tofu] that can be eaten either fresh or dry, smoked or fermented. (4) A coffee substitute, after roasting.

A table compares the nutritional composition of soybeans grown in China, Hungary or France; there is no significant difference in their chemical compositions. Address: M.D., licencié ès sciences.

453. Parry, Charles A. 1920. Travel sketches, LXXXIII–Bean that made Manchuria famous: A factory at Shimizu–The bean of many qualities. *Japan Advertiser* (*Tokyo*). Jan. 25. p. 7. [Eng]

• ***Summary:*** Contents: Introduction. Sweet and nasty. "Not now." The tea port. History of a bean. Substitutes. Big business. Japanese place names. On 26 Nov. 1919 the author traveled by train from Tokyo to the port city of Shimizu, on Suruga Bay, in Shizuoka prefecture (about 90 miles southwest of Tokyo). "Shimizu is one of the 36 treaty ports, and it was opened along with now fewer than 26 others, in 1899. The name means 'clear water'... My chief object in coming to Shimizu is to visit the Suzuki Company's Bean Oil Factory, for which I have obtained permission by courtesy of the Japan Tourist Bureau. This consists of several large buildings, erected three years ago, including a central office and two mills which being built in a castellated Gothic style, make a picturesque adjunct to the scenery as they rise by the calm waters of Shimizu Bay. The mills deal at present with two only of the many products of the wonderful manchurian [sic] or soy bean, called in Japanese daizu (glycerine [sic, Glycine] hispida) the crushed bean and the oil." The two mills are capable of treating 300 tons of beans per day. The process is secret. "I am informed that factories for the extraction of this oil exist only in Japan and Manchuria; but the Suzuki Co. has a branch office in New York, and the business is rapidly extending."

"The oil is used for frying, for lubricating, for water-proofing clothes, for medicine, as a butter substitute, and in the manufacture of soap, candles, guncotton, and artificial rubber; though it can hardly yet be said to be on the market." For culinary purposes it is not as good as the ordinarily used goma (sesame) oil, being much lighter and requiring the use of a deep saucepan. Yet it costs only about 62% as much as sesame oil; the latter costs ¥1.60 per sho (1.58 quarts).

"At present its chief use is for making soap, for which it is taken at a less refined stage, of a dark brown color while the finished product is light yellow. The oil is at present little used in Japan because little known; its retail sale seems to be limited to the neighborhood of the factories. Of these there are three, the two others being at Yokohama and Kobe, both established only last year.

"One large shed is devoted to storing the crushed beans (*kasu*) after the oil has been extracted, large piles of which lie about... The chief use of this at present is for cattle-food; but it is now to be manufactured into flour, useful for mixing in various proportions with wheat flour."

"The daizu [soy] bean has long been known in Japanese cookery in the form of 'kiriako' [sic, kinako] ('yellow powder') to make which the entire bean is slightly roasted and pulverized; then used for mixing with flour to make light cakes, for giving savor to boiled rice, etc. The prices are not yet determined, the cost of manufacture not being known; but it will be cheaper than flour, as well as more nutritious, and will help to relieve the scarcity of rice.

"Substitutes: Other products of the bean are: tofu, the white bean-curd, used universally in Japan and, until recently, almost absurdly cheap; also used in the forms of age-dofu (fried in cottonseed oil), yake-dofu (baked) [yaki-dofu (grilled)], and the curious gori-dofu [kori-dofu], 'frozen tofu,' also called koya-dofu (from koya-san), tofu sprinkled with hot water, frozen, dried, and cut into small cakes; miso, the cheap condiment made of daizu beans fermented with yeast and barley; and soy, Japan's only sauce. A later addition to the list has been to-nyu, or tofu-milk [sic, "bean milk], a very passable substitute for cow's milk at half the price; and still more recently tofu-butter. The whole bean, parched and boiled, is an excellent coffee-substitute, yielding when parched just to the right degree, much of the aroma of that fascinating drink without any of its deleterious effects."

Note 1. This is the earliest English-language document seen (Aug. 2013) that uses the word "to-nyu" or the term "tofu-milk" to refer to soymilk; the Japanese word is *tônyû*.

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "gori-dofu" or the term "koya-dofu" to refer to dried-frozen tofu.

"The present demand for been cake in Japan is met by the three factories of the Suzuki Co. that at Shimizu supplying central Japan, Yokohama Northern and Kobe Southern.

"There are several varieties of the bean known as white,

yellow green and black, the first two being the most used. The plant is as yet little grown in Korea and Japan.

"Big Business: The Shimizu factory, which is the largest of the three, employs about 300 workpeople on day and night shifts. This new bean-industry is, however, only the latest among many activities of the Suzuki Co. which ranks among the great industrial concerns of the world, the third largest in Japan, standing next to the Mitsui and the Mitsubishi, and employing a total of over 3,000 clerks and 100,000 workpeople. It deals also in rice, wheat flour, sugar, sake-brewing, coal, timber, metals, camphor, wool, cloth and manure besides numerous small lines. It has three dockyards, at Harima, Toba and another; a coal-mine in Kyushu; copper mines at Hibi (Okayamaken) Hiroshima (Yamaguchiken) and Dairi (Fukuoka ken) also mines of zinc and iron; while its steel works (*seikojo*) at Kobe are the largest in Japan."

"Shimizu is well situated for growth being midway between the ports of Yokohama and Yokkaichi and serving a prosperous hinterland. Its chief exports are tea and oranges and its imports coal and timber." Address: Japan.

454. *Good Health* (*Battle Creek, Michigan*). 1920. The soy bean. 55(2):71-73. Feb.
• ***Summary:*** Contents: Introduction. Soy-bean milk. Soy-bean cheese. Soy sauce. Soy-bean sprouts." Photos show: (1) A typical soy bean plant with leaves and pods. (2) A large basket full of "sprouted soy beans, which are sold and used as a green vegetable" [in China].* (3) "Large blocks of freshly made bean curd, 'Tofu' [on a round wooden table], ready to be cut up into squares and sold to the housewife."*

Note 1. This article consists mainly of long quotations from the following article: Morse, W.J. 1918. "The soy-bean industry in the United States." *Yearbook of the U.S. Department of Agriculture* p. 101-11. For the year 1917. * = Photographed by Frank N. Meyer, USDA Plant Explorer.

Note 2. The cover of this issue reads: "Edited by John Harvey Kellogg, MD, LLD. Devoted to race betterment and biologic living."

455. Lancaster Mechanical Products, Inc. 1920. Soya beans, coconuts, copra, cohune, cocobabassu, cebo, tapioca, tagua (Ad). *Bean-Bag* (*The*) (*St. Louis, Missouri*) 2(9):47. Feb.
• ***Summary:*** "If interested in growing, collecting, husking, de-podding, steamifying, cracking, decorticating, drying, curing, macerating and in adopting the most advanced methods, processes, plants and machinery in these important edible oil-producing, deodorizing, clarifying, refining pure Foods and kindred industries, consult or address. James H. Lancaster, President."

"Also builders of placer gold, platinum, and diamond washers, dredges, hoisters, pea hullers and splitters, soya-bean and rice hullers and super-sterilizers; also for utilizing the by-products of all species of oil nuts.

"'Soylac' cream and milk for bakers, ice cream and all edible uses.

"Soups: Soy-Rice; Soy-Pea; Soy-Coconut; Soy-Tomato; Soy-Tapioca; Soy-Potato (flour); Synthetic milk, canned or in bulk."

"Cables: Lanjames, New York. Established 1880; Incorporated 1918." Address: 37 Liberty St., New York [City], U.S.A. Phone: John 3531.

456. Moses, Albert Barnes. 1920. Process of making a substitute for milk. *U.S. Patent* 1,332,562. March 2. 2 p. Application filed 19 May 1919.
• ***Summary:*** Soya-beans are washed and the outer skin or coating is removed. The beans are dried then ground to a flour or meal, which is heated until it becomes very slightly brown in color. The flour is added to 8 times its weight of water which has been heated to 120ºF [49ºC]. It is kept at this temperature for about an hour, whereupon the temperature is gradually increased to 160ºF [71ºC], whereupon it is mixed for 30 minutes. The liquid is then filtered and heated to about 200ºF [93ºC] for a short time "for the purpose of precipitating such portion of the albumins as are subject to fractional precipitation thereby." During this last heating some filtercel or fuller's earth is added to remove any dark colors, or the dark colors may be removed by filtering the heated mixture through charcoal. "The solids contained in the mixture are calculated in the usual manner and vegetable fats and sugar are added in proportions to correspond to that of average cow's milk..." Flavor may then be added, and "the flavor added may be regulated either by the addition of *Lactis bacillus* or other cultures..." Address: Seattle, Washington.

457. Adolph, W.H.; Kiang, P.C. 1920. The nutritive value of soy bean products. *National Medical J. of China* (*Shanghai*) 6(1):40-49. March. [15 ref. Eng]
• ***Summary:*** "One of the problems of science has been the search for a perfect food. Though eggs and milk are presently considered to be "perfect foods," the authors believe that the soy bean should also be considered. "The recent world shortage of food, and the demand for foods which are high in nutritive value has turned the attention of dietitians to the possibilities of the soy bean." It is a distinctly well-balanced food.

"During the last few years, the soy bean has found application in the West in the infant dietary, frequently with an admixture of some cereal for additional carbohydrate (Ruhräh 1915), and in summer diarrhea (Sinclair 1916). It is one of the recognized diabetic foods. One of the most satisfactory forms of artificial milk is made from soy beans. The bread used by the French army in the recent war was made essentially from soy bean flour."

"Soy bean products in China: History–The use of the soy bean in China dates back to the beginning of China's agricultural age under the emperor Shen Nung. It

is mentioned in the *Ben Tsao Gang Mu* [*Bencao gangmu*] written by Shen Nung in the year 2838 B.C."

Note 1. This is the second earliest English-language seen (Aug. 2002) that treats Shen Nung as a real, historical figure, or that says the first written record of the soybean appears in a book written by him. The *Bencao Gangmu* (The great pharmacopoeia) was actually written by Li Shizhen in +1596.

"Tradition says that the manufacture of soy bean curd [tofu] originated in China in 164 B.C. during the reign of Han Wen Di, by a man named Liu An, the duke of Hwai Nan [Huai Nan]. The colloquial name for soy bean curd is *Do Fu*, and the classical name, *Li Chi*, probably meaning 'the morning prayer.' Its exact derivation, however, could not be traced. It is interesting to note that in China, at the present day the bean curd is made in the early hours of morning, and sold at daybreak."

"Liu An was a great friend of the Buddhist monks, and it is quite probable that he invented this bean curd in order to provide a change or a delicacy to break the monotony of the monastic ration. As a matter of fact, the bean curd is a real delicacy if carefully made and well cooked. Chinese who are connoisseurs on the subject assert that when so prepared it has the taste of pig's brain. The foreigners eating Chinese food often eat carefully prepared bean curd thinking it pork. With sugar it produces a dish like custard. Prepared with salt it resembles scrambled eggs."

"Application–The Chinese people make practically no use of dairy products, and the bulk of the people consume only very meager amounts of meat. Yet in spite of this they have lived for centuries on what appears to be a remarkably well-balanced diet by use of the soy bean."

"A number of interesting examples are found in China of the use of bean products as an agent for growth. One of us has observed in Anking that dealers in birds employ bean curd as the sole food for infant birds. The birds are robbed away from their nests immediately after they are hatched, and are then fed bean curd to tide over the infantile period till able to feed themselves. Possibly more interesting is the case of the true Buddhist monk who from birth is consecrated to the priesthood, and is carried through the period of childhood growth on a rather heavy diet of bean curd. The apparently normal growth of these monks would seem to be paralleled by the experiments of Osborne and Mendel (1917) on the promotion of growth in rats by both the water-soluble and fat-soluble vitamines contained in the soy bean. The country monastic diet is noted for its high content of soy bean products."

"The Chinese coolie... in spite of the scanty intake of meat and the constant exposure to overwhelming sources of infection, still does possess a wonderful resistance. The diet of the average coolie contains a surprisingly large amount of beans and bean products."

"A common saying in some parts of China terms *bean milk the poor man's milk*, and *bean curd the poor man's meat*... It is commonly stated that a meat diet is characteristic of the most aggressive peoples of the world. Has the protein of the soy bean replaced meat in the Orient?

"Bean milk is another bean product which is in composition not far different from cow's milk. In many places in China bean milk is a food drink. It is usually drunk sweetened with sugar. Western countries employ a number of patented methods for removing the 'beany taste' objectionable from the point of view of the Western consumer."

"It would be almost impossible to make a complete list of all the products manufactured from the soy bean in China. The best known and most important are the bean milk, bean curd, bean sauce (soy), and bean oil. In addition to this are the different forms of bean curd preparations, bean sprouts, and a large variety of sauces and condiments into which the soy bean enters as one of the constituents."

Details are then given on bean milk and bean curd. In making bean milk, the "bean residue [okara] which does not pass through the sieve is used as feed for hogs. On coagulation of this solution the soy bean curd (tofu), often called Chinese cheese, separates. As far as is known to the authors there are at present four agents employed in China to effect this coagulation. These are: (1) *lu*, the residue from the crystallization of salt, (2) gypsum; (3) *swan giang*, the soured bean milk whey remaining from the previous coagulation of bean curd; and (4) vinegar."

Table 1 gives the average chemical composition of the yellow soybean [*huangdou*] common throughout Shantung. Table 2 gives the chemical composition of two samples of soy bean curd purchased on the streets of Tsinan and made with *lu* [nigari] as a coagulating agent: The composition of the first sample is: protein 10.22%, fat 3.66%, water 80.90%, ash 1.09%, nitrogen-free extract 4.13%. This composition is compared with that of cottage cheese. Table 3 compares analyses of the ash of soy bean curd with that of soy bean. When it is made by coagulating soybean milk with bittern (from sea salt) the curd is rich in all the inorganic essentials (especially calcium, sodium, and chlorine) missing from the soy bean itself. The authors suggest that some of the racial characteristics of the Japanese people can be traced to their dependence largely on vegetable protein.

Table 4 gives analyses of 2 samples each of [soy] bean milk, cow's milk, bean milk whey, and bean residue [okara]. The chemical composition of the first sample of bean milk is: protein 4.22%, fat 1.87%, ash 0.40%.

Note 2. This is the second earliest document seen (Jan. 2002) that mentions Liu An of Huai Nan in connection with tofu.

Note 3. This is the earliest English-language document seen (April 2013) which states that *Li Chi* was an early or classical name of tofu.

\ Note 4. This is the earliest English-language document

seen (April 2013) that uses the term "poor man's meat" to refer to tofu. Address: Lab. of Chemistry, Shantung Christian Univ., Tsinan, China.

458. Valderrama, Santiago F. 1920. Notas sobre el cultivo de la soja: Ampliadas con las experiencias de los años 1914 al 1919 [Notes on the culture of soybeans: Enlarged with experiments of the years 1914 to 1919]. Cordoba, Spain: Printed by M. de Sola. 26 p. April. 16 cm. [Spa]
• ***Summary:*** This rare, valuable, and very interesting booklet was sent to Soyfoods Center on 15 June 1995 by Manuel Ruiz Luque, a collector of antiquarian books, from Montilla (Córdoba), Spain.

Contents: Introduction (description of the plant and brief history). Cultivation of soybeans. Manures and fertilizers. Preparation of the soil. Time of planting. Spacing of the plants. Quantity of seeds and depth of planting. Work. Yield. Photo of a soybean plant (yellow seeds) grown at Montilla (Cordoba) by Don Santiago F. Valderrama and harvested in 1916 (p. 15). Nutritional analysis of the seeds of this plant (conducted Aug. 1916 at Granada by Mariano Moreno). Soy products: Soymilk (*leche de Soja*), various types of tofu (*queso de Soja*). Soybeans and products cultivated in Montilla and exhibited in May 1918 at Cordoba: 16 types of seeds (7 yellow-seeded, 4 black, 3 green, 1 variegated, and 1 red), 6 green soybean plants (from yellow, green, or black seeds), 1 dry soybean plant, and 11 soy products. Summary.

The soy products exhibited in 1918 at Cordoba are: 1. Soy oil obtained from 5 kg of seeds. 2. Soy flour (full-fat). 3. Soy flour (defatted). 4. Soy bran (finely ground; *Moyuelo de Soya*). 5. Soy bread (made with full-fat soy flour). 6. Soy bread (made with defatted soy flour). 7. Soy extract (*Extracto de Soja;* "This product can be substituted with advantage for all food extracts"). 8. Legumine (*Legumina*) extracted from soya; "Similar to the casein of milk and with equal applications." 9. Soymilk. "Of great nutritional power. This product, fermented, yields an exquisite cheese." 10. Urease. "A chemical reagent of great application, extracted from soya." 11. Soybeans pods (*Cáscara de la Soja*).

On page 49 he continues. "In Spain, the first attempts at soybean cultivation were made by the Count of San Bernardo, who cultivated soybeans on his estates at Almillo (in Écija [a city in southwest Spain, 48 miles east-northeast of Seville]) at the beginning of this century. But the person who has given a truly admirable impetus to this cultivation is Col. Santiago F. Valderrama who, during the last decade, as well as obtaining marvelous plants, some of which we will show in a photo (page 70, fig. 1), also introduced his own varieties, of which we will speak later (p. 85). He estimates a really favorable yield, which cannot be obtained except in favorable regions having warm climates, where cotton, sugar cane, date palms, and bananas grow luxuriantly. In fact, he gets a yield of 2,500 kg/ha, which we can't wait to have here in Italy."

An illustration shows a soy bean plant (frontispiece, facing the title page).

Note 1. This is the earliest document seen (Feb. 2001) concerning the cultivation of soybeans in Spain.

Note 2. This is the earliest Spanish-language document seen that mentions soy bran, which it calls *Moyuelo de Soja.* Address: Montilla, Spain.

459. Cobb, C.W. 1920. Increasing interest in soy beans. *National Stockman and Farmer* 44(6):200. May 8.
• ***Summary:*** "Little did I think the article I wrote a short time ago for *The Stockman* would cause the flow of letters that I have been receiving, with all manner of inquiries. To answer them separately would take an expert typist, so I will try to answer here... All want to know where they can get Medium Green soy bean seed. They can get them from seed companies which advertise in Stockman, or possibly a few from their experiment station... Those living in Crawford county, Pennsylvania, I would advise to plant the Wilson or Ito San as next best, to those further south in this state I would plant Wilson and either Ohio 916 or Mammoth..."

The writer then describes in detail how he plants, cultivates, cuts or mows, and stores soy beans–for hay or threshed beans. "Put the soys in with commercial fertilizer and there won't be many weeds to contend with."

"If cut by machine too many are lost by tramping. If cut by binder more are threshed out than I care to lose. One man with sharp scythe will cut a lot of them in a day, then drive along rows and pitch them on, no need of raking. For hay roll the ground after planting..." "I have never had less than 25 bushels per acre and from that to better than 60 bushels."

"The soy is higher in protein than wheat middlings. There is a process by which they can be made into a substance resembling cow's milk that would be hard to tell the difference from cow's milk so far as taste is concerned." Address: Erie County, Pennsylvania.

460. *Liberty Bell.* 1920. Cow's milk from peanuts, work of colored genius. May. p. 2. *

461. *Popular Mechanics.* 1920. Close counterpart of milk made from peanuts. 33(5):691. May.
• ***Summary:*** "The common peanut is the source of a new substitute for milk, which so closely resembles its prototype that it turns sour and curdles, produces buttermilk when churned, and may be made into cheese. The flavor, in which the nut characteristic persists, is declared to be practically its only point of variance from cow's milk. The new lacteal product originated in the laboratory of a southern university... The cost of production is said to be less than the market price of dairy milk."

462. Schloss, Oscar M. 1920. Allergy in infants and children. *American J. of Diseases of Children* 19(6):433-54. June. [19

ref]
• ***Summary:*** The author observed 53 infants under 16 months of age who suffered from eczema. "Thirty-six of the patients reacted to cow's milk, and as this was the basis of their food, it was considered that the milk was, perhaps, responsible for the eczema. In artificially fed infants this is difficult to prove, as it is almost impossible to keep up their nutrition on foods free from milk protein. That the milk protein may be the cause of the eczema was demonstrated in six patients. These patients, all of whom had eczema, were given a mixture consisting of protein free milk (lactose and mineral salts), washed butter and soy bean protein. The amounts of fat, sugar and protein were approximately the same as they had been receiving. In all cases the eczema improved markedly in twenty-four hours and practically disappeared in three days. This mixture, however, caused diarrhea and vomiting in four of the patients and for this reason further observations were not made. The experience of Blackfan (1916) with infantile eczema is practically identical."

Note 1. This is the earliest document seen (May 2008) concerning work with soyfoods at Cornell University (Ithaca, New York).

Note 2. Rowe (1933) says of this article: "Schloss, in 1920, suggested the use of soy-bean flour in an improvised formula for the control of milk sensitization." Address: Dep. of Pediatrics, Cornell Univ. Medical College, Ithaca, New York.

463. *Scientific American Monthly.* 1920. Food economy. 1:560. June.
• ***Summary:*** Dr. C.O. Johns of the USDA Bureau of Chemistry has found that the quality of protein in soy beans and mung beans (unlike most common beans) is unusually high because of their high content of cystine. "If the press cake from the soy bean oil presses is used with peanut flour and white flour to make a loaf of bread it is claimed that such a loaf is a complete ration and will be found more easily assimilated than meat and equally nutritious and sustaining...

"Of late an increasing acreage has been devoted to raising soy beans, particularly in the South where the boll weevil makes the cultivation of diversified crops a necessity...

"The variety of materials made from the soy bean and its products in the Orient is remarkable. It forms the basis for an artificial milk. It is fermented into a drink. It affords an artificial cheese and the casein recovered from it has a variety of application. It will be seen, therefore, that nature has been particularly good to the Orient and naturally provided it with a particularly useful variety of bean."

464. *Matieres Grasses* (*Les*) (*Paris*). 1920. A propos des graines de Soja [Concerning soybean seeds]. 12(148):5614-15. Aug. 15. [16 ref. Fre]
• ***Summary:*** A two-page summary of information on soybeans from 16 sources, most of them in French. Soybeans are widely used in Manchuria and Japan. Soybean seeds from Cambodia and lower Laos are superior to those from Manchuria. A table gives the composition of three soybeans from Laos, Tonkin, and Manchuria. Soybeans in Indo-China and their use during World War I in England and France. Vegetable milk made by Li Yu-ying in France. A table gives the composition of three soybeans from Yun-Nan, Tonkin (Lang-Son), and Tonkin (Delta). Mr. Fr. de Roux recommends that soybean be more widely used in France and its colonies. Summarizes soybean research in Connecticut and New Jersey, and soybean production and yields in Ohio. More than 500 soybean varieties have been tested in the USA; the yellow varieties generally work best for human foods, oil and flour, while the brown and black are used for animal feeds. In 1917 cotton seed mills also used soybeans grown locally or in Manchuria. Milk made from soybeans is similar to animal milk and can be used to make cheeses. Soybean oil is used in the USA and England for making paints, but of greatest interest is its use in margarine and other food uses. In Japan, a society was founded with capitalization of 100,000 yen to extract soy protein for use as a substitute for celluloid. Conclusion: "In view of these many uses, it seems interesting to us to pursue in our colonies some cultural trials with this interesting legume. Could it perhaps be developed in certain temperate regions? É.D.W."

465. Carver, George W. 1920. Peanut milk. *American Food Journal* 15(8):25. Aug.
• ***Summary:*** Properly made, peanut milk is one of the most perfect and stable emulsions. "When it sours, the clabber or curd is about the same in quantity and physical appearance as that of cow's milk." "The curd can be converted into many fancy types of cheese, such as the pimento, nut sage, tutti fruiti, chocolate fillers, cream bonbons, etc., etc." The chemical composition of both peanuts and peanut milk are given. Note: This is the earliest English-language document seen (June 2002) with the term "peanut milk" in the title. Address: PhD, Dep. of Research and Experiment Station, Tuskegee Inst., Tuskegee, Alabama.

466. Kellogg, John Harvey. 1920. The almond. *Good Health* (*Battle Creek, Michigan*) 55(8):466-70. Aug.
• ***Summary:*** Contents: Introduction. Composition. Rich in food lime [calcium]. Rich in iron. An extraordinary food. Science prizes the high value of the almond [digestibility experiments]. Why nuts sometimes disagree [they are concentrated and should be used as a staple food which is well masticated, not as a dessert]. The origin of nut butters. Nut proteins equal to meat proteins [proteins are broken up into about 18 amino acids]. Meat eating involves enormous economic waste. The great food commission declared meat not necessary. Almonds are pure and safe which meat is not. A ready-to-eat food.

"The origin of nut butters: To overcome the objection that some people are unable to masticate nuts properly on account of defective teeth and to insure the proper assimilation even if not properly chewed, the writer about thirty years ago [i.e., in about 1890] conceived the idea of converting the nuts by crushing and grinding, into a paste–in other words, chewing the nuts by machinery. The peanut was first utilized in this way and rapidly won its way to public favor. Now, many scores of carloads of that nut are eaten under the name of peanut butter.

"Almonds were next used, and were found to make a delicious nut paste, or butter, which by the addition of water and a little salt, became a most delicious cream. In the form of almond cream or milk, nothing could be conceived in the way of nourishment which the body can more easily appropriate and more fully utilize" (p. 469-70).

"The Almond Grower's Association of California, with the co-operation of the U.S. Agriculture Department, in encouraging the growth of the almond is doing a work which will entitle it to an honored place in the economic history of this country; for the time is certainly coming, and it cannot be far in the future, when the animal industry will languish for lack of space for pasturage, and flesh foods for this as well as other reasons will fill a less conspicuous place in the dietary of the average man than at present" (p. 470).

"The great food commission... The Inter-Allied Scientific Food Commission which met during the war was without doubt the most authoritative body on the subject of food and nutrition that was ever brought together." The names of the members of the commission, each a distinguished specialist on human nutrition, are given. There were generally two members from each of the following countries: France, Italy, Great Britain, United States (Profs. Lusk and Chittenden), and Belgium. "The question of a minimum meat ration was discussed by the commission, but it was decided to be unnecessary to fix a minimum meat ration 'in view of the fact that no absolute physiological need exists for meat, since the proteins of meat can be replaced by other proteins, such as those contained in milk, cheese and eggs, as well as those of vegetable origin' (beans, nuts, and especially almonds).

"Quite in line with this official action was a recent editorial in the *Journal of the American Medical Association*, perhaps the highest medical authority in the world, which states that 'man's health and strength are not dependent on the assumed superior virtues of animal flesh as a dietary constituent.'

"Within the year 1918 there were slaughtered in the United States a hundred million beeves, sheep, pigs and goats, one whole beast for every man, woman and child in the United States. Of this vast multitude of animals, the Federal inspectors examined nearly two-thirds (60,000,000) and found one and a half per cent so badly diseased that the whole or part of the carcass was condemned. In other words, nearly a million (900,000) carcasses were found seriously diseased" (p. 471).

"Almond butter with the addition of a little water is converted into a delicious cream, which, with the addition of more water, becomes a delicately flavored milk closely resembling the milk of the cow in appearance, and with the addition of sugar the resemblance to milk, especially mother's milk, becomes still more complete. Such a preparation is in fact almost a perfect substitute for milk.

"The almond is thus not only capable of taking the place of meat in the dietary but may also serve as a substitute for milk." Address: M.D.

467. Rindl, M. 1920. Vegetable fats and oils. IV-V. Semi-drying oils. Soy bean. *South African J. of Industry* 3(6):518-31. June; 3(8):742-49. Aug. [29 ref]

• ***Summary:*** These are 2 installments of a series of articles on vegetable fats and oils, forming a Report to the Advisory Board of Industry and Science on Vegetable Oils, Fats, and Waxes. Soybeans are considered among the semi-drying oils. Contents of Part I: Introduction. Early [soybean] experiments in South Africa. Botanical characters. Varieties. Germination. Inoculation. Technique of inoculation. Soy beans as a rotation crop for maize. Comparison of soy beans and cowpeas. Storage of seed. The soy bean as human food. Vitamines. Soy-bean [food] preparations: Soy-bean milk, soy-bean curd [tofu], the soy bean as a vegetable (baked, boiled, roasted, green beans [green vegetable soybeans], soy-bean pulp (kara)). Soy-bean meal [soy flour and its uses]. Fermented soy-bean products: Fermented boiled beans (natto), ripened vegetable cheese (miso), the Chinese paste chiang, soy-bean sauce (shoyu).

Contents of Part II: Oil content of seed produced in South Africa. Quality of oil from South African beans. Extraction of oils. Nature and composition of soy-bean oil, and methods of treatment. Uses of the oil. Soy beans as forage. Enemies of the soy bean. Method of shipment from the East.

"The first systematic trials [with soy beans] were initiated about 1903 at Skinner's Court, on the Springbok Flats, and at the Natal Experiment Farms, Cedara, Weenen, and Winkle Spruit. These latter were continued until the season 1910-1911 when the field trials referred to above [by the Transvaal and Natal Departments of Agriculture] were carried out by the Department of Agriculture in conjunction with Messrs. Lever Bros. and a large number of farmers" (p. 519).

The best yields during the 1910-11 season at the three Natal Experiment Farms were: At Cedara: Haberlandt 2,000 lb/acre. Winkle Spruit: Mammoth Yellow 1,191 lb/acre. Weenen: Mammoth Yellow 1,400 lb/acre.

"Method of shipment from the East. The beans are shipped in bags, vessels are well dunnaged, and a large number of wooden pipe ventilators are placed in the ships'

holds to keep the cargo from getting heated. The beans, on a long voyage from Eastern Asia to Europe, being liable to sweat, are sometimes dried before shipment."

Tables show experimental yields and chemical compositions of soy beans from different countries and soy-related products. A diagram (outline-form) shows the various ways in which plants and seeds of soy beans are utilized.

Note: This is the earliest English-language document seen (April 2013) that uses the term "soy-bean curd" to refer to tofu. Address: Ing. D., Prof. of Chemistry, Grey University College, Bloemfontein [Orange Free State, South Africa].

468. Carver, George W. 1920. Peanut milk. *Good Health* (*Battle Creek, Michigan*) 55(10):589-91. Oct. [1 ref]
• ***Summary:*** This is a reprint of an article by the same author with the same title published in Aug. 1920 in *American Food Journal* 15(8):25. Address: Head, Dep. of Research and Experiment Station, Tuskegee Inst., Tuskegee, Alabama.

469. Thevenot, Gaston D. 1920. Process of manufacturing milk and cream substitutes. *U.S. Patent* 1,359,633. Nov. 23. 2 p. Application filed 24 Jan. 1919.
• ***Summary:*** To manufacture a liquid food, closely resembling cow's milk, soya beans are soaked in water, then boiled until they are thoroughly cooked and the coloring matter removed. The cooked beans are separated from the water and crushed to a fine pulp, which is mixed with sterilized and slightly alkaline water. "But if its desired to increase the albuminous content for a given quantity of pulp, a mixture of ground pulp and water may be digested with proteolytic enzym [enzyme], such as pepsin, or papain, in the presence of a sufficient amount of sodium chlorid [chloride; table salt], which acts as an activating medium on the enzyms." The liquid portion is removed and emulsified with fats, oils, and sugar.

Note: This is the earliest document seen (April 2003) that mentions the use of commercial or purified enzymes for processing soybeans. Address: Milwaukee, Wisconsin.

470. Adolph, W.H.; Wu, C.M. 1920. Additional notes on soy bean products. *National Medical J. of China* (*Shanghai*) 6(4):231-33. Dec. [2 ref. Eng]
• ***Summary:*** Tables give the following nutritional analyses of soy bean products purchased in the streets of Tsinan: Dry soy bean curd (salted or unsalted). Soy bean sprouts. Soy bean curd (86.4% water or 83.0% water; some is coagulated with gypsum (pinyin: *shígao*) and some with *lu* (nigari); in Shantung, soft tofu made with gypsum is called "southern tofu."). Ash of soy bean curd. Soy bean cake ("the press cake remaining after the expression of soy bean oil." Employed as a fertilizer and cattle feed, it contains 5.3 to 5.8% moisture, 39.1 to 39.8% protein, and 10.7 to 10.9% fat). Address: Lab. of Chemistry, Shantung Christian Univ.

471. **Product Name:** [Soyamamilk (Normal, or for Diabetics), Soyamamilk for Baking].
Foreign Name: Trink-Soyamamilch (normal, oder fuer Diabetiker), Soyamamilch fuer Backzwecke.
Manufacturer's Name: Soyama-Werke.
Manufacturer's Address: Frankfurt am Main, Germany.
Date of Introduction: 1920.
New Product–Documentation: Noorden and Salomon. 1920. *Handbuch der Ernährungslehre.* p. 311-12. The section titled "Vegetable Milk and Cream" (p. 311-14) notes that the authors have had extended experience with soybean milk and soy flour made by Frankfurter Soyama-Werken in various forms. For each product the composition of protein, fat, carbohydrates, ash, and calories is given. These 3 products contain 3.29–3.77% protein and 3.36–4.40% fat.

Horvath 1927. *The Soybean As Human Food.* p. 67-68. "In Germany the Soyama factory (in Frankfurt) manufactures soybean fresh milk (mostly from soybeans), soybean normal cream, and also condensed bean milk and cream. Soyama bean milk looks like cow's milk, contains the same constituents, even in larger amount and in a state of finer dispersion. Only the taste is different. According to Fuerstenberg [1917], Soyama milk can be qualified as a special, very valuable dietetic nutrient. The high lecithin content of this preparation adds to its value, too." Horvath then gives a nutritional analysis of each of the 3 types of soymilk and 3 types of soy cream, based on Noorden and Salomon (1920). Soyama production started during World War I. It was still being produced in the late 1920s.

472. **Product Name:** [Soyamacream (Normal, or for Diabetics), Soyamacream (Extra Rich in Fat for Diabetics)].
Foreign Name: Soyamarahm (normal, oder fuer Diabetiker), Soyamarahm (extra fettreich besonders fuer Diabetiker).
Manufacturer's Name: Soyama-Werke.
Manufacturer's Address: Frankfurt am Main, Germany.
Date of Introduction: 1920.
New Product–Documentation: Noorden and Salomon. 1920. *Handbuch der Ernährungslehre.* p. 311-12. The section titled "Vegetable Milk and Cream" (p. 311-14) notes that the authors have had extended experience with soybean milk and soy flour made by Frankfurter Soyama-Werken in various forms. For each product the composition of protein, fat, carbohydrates, ash, and calories is given. The first 2 soy cream products contain 2.93–2.95% protein and 11.50 fat. The third extra-rich cream contains 2.5% protein, 3-0.0% fat, and 1% carbohydrates.

Horvath 1927. *The Soybean As Human Food.* p. 67-68. Gives a nutritional analysis of each of the 3 types of soymilk and 3 types of soy cream, based on Noorden and Salomon (1920). Soyama production started during World War I. It was still being produced in the late 1920s.

473. Calvino, Mario. 1920. La soya [The soybean]. *Informe de la Estacion Experimental Agronomica* (*Santiago de las Vegas, Cuba*). Part 15. p. 179-92. For the years 1918-19 and 1919-20. [2 ref. Spa]

• ***Summary:*** Lists and describes briefly nine soybean varieties received from the office of new plant introduction of the U.S. Department of Agriculture ("A magnificent collection of varieties.") and four varieties already owned by the Station in Cuba. They were first planted in March 1919 (a second lot of four of these varieties were planted at this time–Wilson Five, Peking, Black Eyebrow, and Amarilla Nakasawa) and again in August 1919. The varieties and their yields (in kg/ha) in descending order of yield for the first planting are as follows: Pekin [Peking] (1435.9 + 790 / -). Early Brown (1153.9 / -). Biloxi (1153.9 / -). Virginia (923 / -). Unknown (976.6 / -). Black Eyebrow (1153.9 + 1140 / -). Wilson 5 [Wilson-Five] (920.5 + 1230 / 277.7). Arlington (820.5 / -). Soya S.P.I. 40125 (615.3 / -). Barket [Barchet] (513.0 / -).

The four varieties already owned by the station and their yields during these first two plantings were: (1) Amarilla Nakasawa / Nacasawa (from Mr. Nakasawa of Japan; 897.4 + 1100 / 1375). (2) Gigante (imported from the USA; 551 / -). (3) Negra. "This is not a variety name. Rather this seed came mixed with other seeds. We noted some of these plants in our fields and we propagated them." Note: This is said to have been the first Cuban soybean selection. (4) Hahto, from the USDA. "This is the most interesting soybean variety for Cuba for use as either green seeds (*grano verde;* green vegetable soybeans) or whole dry seeds (1000.0 / -).

For each variety the following information is given. Color of seed, date of start of germination in petri dishes (14 March 1919) and laboratory temperature, percentage germination, number of days to germination in lab, date of germination, date of harvest in fields (9 June 1919), yield, observations. There is a special section on the Hahto variety; sown on 10 June 1919, it yielded 1,000 g/ha. A table (p. 190) shows the nutritional composition of 12 the 13 varieties (all but Negra). Hahto had the highest protein content (39.12% protein, 11.90% water, and 17.36% fat), whereas S.P.I. 40125 had the highest oil content (28.91% protein, 10.60% water, 19.60% oil). A second such table (p. 191) shows assimilable nutrients of all 13 varieties.

The article concludes: "According to Dr. E. Babe, Chief of the Dept. of Chemistry at Santiago de las Vegas, in China and Japan the soybean is used to prepare very nutritious foods including a special bread for diabetics and a milk that is widely appreciated." Note: Dr. Babe, who never went to Asia, is said to have acquired this information from the literature on soybeans.

Photos show: (1) A field of variety trials in 1919. (2) 11 soybean varieties, with 10 samples of seeds from each variety. (3) A field of mature Biloxi soybeans. (4) An uprooted Biloxi soybean plant. (5) The Hahto soybean: Pods, green seeds, and dry seeds. (6) An uprooted Hahto soybean plant with many pods.

Note: This is the earliest Spanish-language document seen (June 2009) that uses the term *grano verde* to refer to green vegetable soybeans. Address: Delegate of the Secretary of Agriculture, Commerce, and Labor, and Acting Director, Cuba.

474. Caspari, Charles, Jr. 1920. A treatise on pharmacy for students and pharmacists. 6th ed., thoroughly revised by E.F. Kelly. Philadelphia and New York: Lea & Febiger. 954 p. Illust. Index. 24 cm.

• ***Summary:*** In Chapter 18, titled "Emulsions" is a table titled "The official emulsions." The first of four recognized by the Pharmacoepia (U.S.P.), is Emulsum Amygdalæ or Emulsion of Almond, "Made by triturating sweet almond, acacia, and sugar with water." The "Special remarks" on this (p. 281-82) state: "Emulsion of almond is also known as *milk of almond*, and should always be made fresh when wanted."

Also discusses: Fluidextractum Cannabis, also known as Fluidextract of Hemp (p. 375). Almond oil, expressed from sweet almonds (p. 770-71). Linseed oil (p. 774). Sesame oil (p. 775-76; also known as benne oil or teel oil).

Charles Caspari, Jr. lived 1850-1917. Address: 1. Late Prof. of Pharmacy; 2. Dean and Prof. of Pharmacy, Baltimore. Both: Dep. of Pharmacy, Univ. of Maryland.

475. Kellogg, John Harvey. 1920. The health question box, or a thousand and one health questions answered. 2nd ed. Battle Creek, Michigan: Modern Medicine Publishing Co. 907 p. Illust. Index. 21 cm. 1st ed. was 1917.

• ***Summary:*** "Foreword: For more than forty years, the writer of this volume has each week stood before an audience of invalids at the Battle Creek Sanitarium to open a popular question box. During a longer period the writer has supplied each month to the monthly journal *Good Health* several columns of answers to correspondents." More than a thousand of these have been selected, with their answers, for this volume.

The following questions concern the soy bean (p. 350-53, 886; also 125, 200, 347, 349): In what respect is the soy bean superior to the navy bean and other varieties? What is soy bean curd or cheese (to-fu), and how is it made? What is the food value of the soy bean? What is the composition of the soy bean, especially in relation to the amount of carbohydrate it contains?

Concerning peanuts (p. 348-49): Is the protein of the peanut equal to that of meat or eggs? Which is the more digestible, roasted or raw peanuts? Why is it necessary to cook peanuts to prepare them for digestion?

"In North China and various other countries where the peanut flourishes, it has long held a prominent place in the national dietary; but in this country its great value has been so little appreciated that it has been scarcely recognized as a

food, having been eaten as a dainty or luxury.

"Although, since the writer–some twenty-five years ago [i.e., ca. 1895]–introduced the crushed nuts, or peanut butter, into the bill of fare of the Battle-Creek Sanitarium, the use of peanuts in this form has rapidly extended and it has found its way to many thousands of tables."

One discovery has "placed the peanut upon a high pedestal among foodstuffs... It is the fact that the protein of the peanut belongs to a special class very rare among the products of the vegetable kingdom, known to the chemist as 'complete protein.' The complete protein is one which contains all the elements needed for making any of the many different kinds of tissue found in the human body. Very naturally these proteins are found in eggs, milk and meat, but they are not found in cereals or vegetables." The almond and soy bean also contain complete proteins.

Concerning the natural diet of man (p. 96-109, 124-25): What was the diet of prehistoric man? Ans: Fruits and nuts. What is the natural diet of man? Ans: Fruits, soft grains, nuts, tender shoots and juicy roots. Man is not carnivorous. What was the Brook Farm experiment? What is the simple life? What is biologic living? Ans: Living in accord with the "great biologic laws... which rule our physical being." What is Fletcherism? Ans: Thorough mastication. When eggs and meat are discarded what vegetable foods should take their place? Ans: No substitutes are needed. "Protose, Nuttolene and other vegetable meats are rich in protein. The newly introduced soy bean is more than a substitute for meat. It is rich in lime and vitamins which meat lacks. Its protein is 'complete.'" Have human beings a natural appetite for flesh? Do scientific authorities admit that animal flesh is a necessary part of the human dietary? Ans: "All modern physiologists admit that flesh food is not an essential part..." Is a meatless diet capable of maintaining the body in a state of vigorous health? Is there any authority for the elimination of flesh foods from the dietary? Does a flesh diet injure the kidneys? Is it not true that laborers universally require a large amount of meat.

Concerning roughage, bran, and constipation (p. 197-99). Diabetic foods (p. 199-201, incl. soy bean and soy bean curd). Dietary oils and butter (p. 338-41, incl. nut oils, peanut oil, olive oil, malted nuts). Concerning tree nuts (p. 341-47, 354-59): What is the food value of nuts? Ans: The "most highly concentrated of all natural foods." Tropical fats–Where do the natives of the tropics get their fat? Nuts for nursing mothers–Is there any food which will increase the flow of her milk? Ans: Nut milks, Malted Nuts. How did the Jordan almond get its name? Ans: This choicest of all almonds came originally from Malaga in southern Spain. Almond milk–Is it possible to prepare a substitute for milk from vegetables? Ans: Yes. "The writer has made large use of almond milk for thirty years [i.e., since about 1890]. It is more easily prepared from almond butter." "Almost equally good milk preparations may be made from the soy bean and the peanut." Are nuts good food? Yes, incl. peanut butter. Nuts make good "meat substitutes."

On the last page is a list of 18 health books by Dr. Kellogg, all published by the Modern Medicine Publishing Co. Address: M.D., Battle Creek, Michigan.

476. Noorden, Carl von; Salomon, Hugo. 1920. Handbuch der Ernaehrungslehre. Erster Band. Allgemeine Diaetetik [Handbook of nutritional education. Vol. I. General dietetics]. Berlin: Verlag von Julius Springer. xxxiii+ 1237 p. [100+* ref. Ger]

• ***Summary:*** The section titled "Vegetable Milk and Cream" (p. 311-14) notes that the authors have had extended experience with soybean milk and soy flour made by Frankfurter Soyama-Werken in various forms. For each product the percentage protein, fat, carbohydrates, ash, and calories per 100 gm is given, based on analyses of Dr. G. Popp in Frankfurt: Soyama Flour (*Soyamamehl;* 42% protein, 18% fat), Soyama Milk (*Trink-Soyamamilch* [normal], 3.77%, 3.36%), Soyama Milk for Diabetics [low in carbohydrates] (*Trink-Soyamamilch* [*fuer Diabetiker*], 3.77%, 3.40%), Soyama Milk for Baking (3.29%, 4.40%), Soyama Cream (Soyamarahm [normal], 2.93%, 11.50%), Soyama Cream for Diabetic (*Soyamarahm* [*fuer Diabetiker*], 2.95%, 11.50%), Soyama Cream [extra rich in fat, especially for diabetics] (*Soyamarahm,* 2.50%, 30.0%). The soybean is of special importance in diabetic diets because of its low carbohydrate content, which can be reduced even more by a special process.

When Soyama Cream is mixed with coffee, tea, or chocolate, once can scarcely tell whether or not one is using cow's milk. Pages 312-13 summarize the findings of Fischer on the ease with which plant- or vegetable milks are digested.

The section on variety breads (p. 427) notes that soybean flour is now warmly recommended in such recipes.

A section titled "Soybeans" (p. 542-43) notes that edible soy products are made by Aguma-Werken F. Thoerl in Harburg, Vaterland brand soy flour is made by E. Friedrichsen in Berlin, and an excellent soy flour is made by Soyama-Werken in Frankfurt am Main. In Japan and China countless preparations made from soybeans are on the market. Especially prized is the cheese named tofu (To-fu). Soy sauce is also known worldwide. Soy coffee (p. 694) is of much less economic importance than imitation coffees made from cereal grains or malt. Page 714 mentions tests using soybean flour to make cocoa or chocolate. Page 800 discusses soya seasonings such as shoyu fermented with koji, and miso.

Pages 887-903 discuss vegetarian cures for diseases, and ten specific diseases for which they are well suited. Some groups of German vegetarians are endeavoring to return to a more "natural way of life," and some of these eat a raw-food diet. Pages 898-99 give the protein content

and calories per 100 gm of soy flour and soymilk, plus a discussion of soymilk. Page 979 gives the composition of two brands of soymilk and one of soy cream. Also contains early information on using baking soda for cooking whole soybeans. Noorden lived 1858-1944. Address: 1. Geheimer Medizinalrat und Prof., Frankfurt-am-Main, Germany; 2. Prof., Vienna, Austria.

477. Ubbelohde, Leo. 1920. I. Oele und Fette aus Pflanzen. B. Schwachtrocknende Oele [I. Oils and fats from plants. B. Semi-drying oils]. In: Leo Ubbelohde & F. Goldschmidt, eds. 1920. Handbuch der Chemie und Technologie der Oele und Fette: Chemie, Analyse, Gewinnung und Verarbeitung der Oele, Wachse und Harze. II. Band [Handbook of the Chemistry and Technology of Oils and Fats: Chemistry, Analysis, Extraction, and Processing of Oils, Fats, Waxes, and Resins. Vol. 2]. Leipzig, Germany: Verlag von S. Hirzel. p. 137-322. See p. 282-93. Illust. Index. 25 cm. [Ger]
• ***Summary:*** No. 182, "Soybean oil (*Sojabohnenöl*)," has the following contents: Names: *Huile de Soja. Soja bean oil. Chinese bean oil. Olio di Soia.* Introduction: Botanical, varieties, culture, composition of the beans (2 tables), lecithin content, urease. Various preparations from soybeans: European (Sarton powder / Sartonpulver made by Bayer & Co.; Soyap made by Firma Zinnert), Asian (flour, bread, milk, cheese, canned / tinned foods, soya sauce {*Sojasauce*} and the so-called soya-quark {*Sojaquark*} [tofu, containing 72.1 to 73.0% water], natto), diabetic bread, soy sauce. Production of soybean oil. Properties of soybean oil. Use of soybean oil. Soybean cake (*Sojabohnenkuchen, Sojakuchen*). Commerce and trade.

Also discusses: Sesame oil (p. 196-206). Address: 1. Prof. Dr., Karlsruhe [Germany].

478. U.S. Tariff Commission. 1920. Summary of tariff information, 1920; prepared for the use of the Committee on Ways and Means, House of Representatives. Washington, DC: Government Printing Office. 1004 p. See p. 320-22, 779-80, 990. [7 ref]
• ***Summary:*** Contains a description of the soybean, its uses, production, and quantities imported, and the tariff regulations applicable to the various soy products.

Paragraph 200, page 321: "The provision in this paragraph for 'bean stick [dried yuba sticks] or bean cake, miso, and similar products,' covers a Japanese food product made from ground soja (soya) beans and water, known as frozen tofu or koya-dofu, and fried tofu or hoshi aburage, the frozen tofu or koya-dofu being in the shape of small, porous, yellow cakes about one-half inch thick, from 1½ to 2 inches square, and the fried tofu or hoshi aburage being in thin cakes one-quarter inch thick and 2½ to 5 inches in diameter, which have been fried in some kind of oil or grease. Even if not bean cake it is dutiable as a product similar to bean cake, bean stick, and miso. (G.A. 8045, T.D. 37079, of 1917, following Abstract 29577, T.D. 32780, of 1912.) *'Amasake,'* made from rice yeast (30 per cent) and boiled rice (70 per cent), used as a drink among the Japanese, was likewise classified as a 'similar product,' apparently as similar to miso. (Abstract 31147, of 1913).

Oil cake produced from the soya bean is free of duty as oil cake provided for in paragraph 560. (Abstract 23794, T.D. 30828, of 1910)."

Paragraph 201, p. 321-22: In the Act of 1909, sauces of all kinds were subject to a 40% ad valorem duty; this decreased to 25% in the Act of 1913. Thick sauces include dressings and condiments such as chutney. "Thin *Chinese soy* made by mixing cooked soy beans with wheat flour, salt, and water and exposing to the sun for about three months, used to flavor and color soups, fish, and meats, about 80 per cent being used in the kitchen and about 20 per cent on the table, is dutiable as a sauce hereunder and not as a nonenumerated manufactured article under paragraph 385. (9 Ct. Cust. Appls., -; T.D. 37976, of 1919.) *Japanese shoyu* is also classified as a sauce under this paragraph. (T.D. 37574, of 1916; Abstract 43496, of 1919.)"

Paragraph 606, p. 779-80. A duty is first levied on soya beans in the Act of 1913.

"Description and uses.–*Soya beans* used in oil mills, the important consumers, are chiefly imported. Soya-bean cake, or meal, a by-product of oil manufacture, is a valuable cattle feed and enters extensively into international trade. (See pars. 560 and 561.) In China and Japan the beans, cake, and oil are elaborated into a large number of food products, such as milk, cheese, flour, bean cake, and soya sauce... Except by resident Asiatics there is only a limited use of soya beans for food purposes.

"Production.–Soya-bean culture has recently developed rapidly... Imports of *soya beans,* too small to be listed separately prior to 1914, rose from about 2,000,000 pounds in 1914 to about 32,000,000 pounds in 1918; during the same period imports of soya bean *oil* rose from 16,000,000 to nearly 337,000,000 pounds.

"Soya beans cooked and salted, but not enough to so change them as to prevent their identification as soya beans, and packed in tins, jars, bottles, or similar packages, do not thereby lose their status as soya beans and are free of duty under this paragraph rather than dutiable under paragraph 199. (6 Ct. Cust. Appls., 415, of 1915.) *Soya beans* in stone jars and hermetically sealed tins, invoiced as *bean sauce,* were likewise classified, and not dutiable as prepared beans under paragraph 199, nor as sauce under paragraph 201. (G.A. 8217, T.D. 37860, of 1918.) *Beans* and *bean sauce* prepared or preserved in tins, jars, bottles, or similar packages, were also held free of duty under this paragraph, analysis of the samples showing them to be soya beans, either natural or prepared. (Abstract 41021, of 1917.)... A *black bean* known to the Japanese as *Kuromame,* was held not to be free of duty under this paragraph, the evidence

being insufficient to prove that the merchandise was soya beans. (Abstract 42852 of 1919)." Address: Washington, DC.

479. Domaschintzky, Julius. 1921. Improvements in and relating to synthetic milk. *British Patent* 157,351. 2 p. Application filed Jan. 10. Granted 10 April 1922. [Eng]
• ***Summary:*** The unbroken beans, peeled or unpeeled, are extracted with a solution of acids or salts having an acid reaction. Mild oxidizing agents may be added. The beans are then washed and treated with a solution of carbonates, or salts having an alkaline reaction, so that on crushing and extracting the beans in the usual manner with weakly alkaline water the proteins are dissolved, freed to a great extent from undesirable flavoring and coloring constituents. Address: 1 Marokkassergasse, Vienna, Austria.

480. Carver, George W. 1921. Re: Statement on uses for peanuts and sweet potatoes, and thoughts on the future of meat substitutes. *Tariff Information. Hearings before the Committee on Ways and Means, House of Representatives on Schedule G, Agricultural Products and Provisions.* Jan. 21. p. 1543-51.
• ***Summary:*** Carver has developed 107 products from sweet potatoes. He has just begun similar work on peanuts, and he expects to create even more products from them. He shows a high quality pomade or face cream made from peanuts, a fine ink made with peanut oil, peanut flakes than can be easily dissolved in hot water to make peanut milk, and some peanut relish.

Next he discusses meat substitutes: "And then here is a bottle of mock oysters. The peanut curds can be made into mock meat dishes so thoroughly that it is impossible to tell them from meat, and it is going to be very satisfactory in that direction. We are going to use less and less meat just as soon as science touches these various vegetable products, and teaches us how to use them. I remember years and years ago when the automobile first was being introduced how the people laughed and how they jeered and how they talked of the horses, about the impossibility of running them off the streets. I have been here two days, and I have not seen a single horse on your streets. They are automobiles. And now the same thing is true, or much the same thing is true about our vegetable products with reference to the meat business." Address: United Peanut Assoc. of America, Tuskegee, Alabama.

481. Adkins, Dorothy Margaret. 1921. The soya-bean problem. *Science Progress* (*London*) 15(59):445-51. Jan. [9 ref]
• ***Summary:*** This is a popular article. Contents: Introduction. Practical applications of the bean: Food uses include Tofu, or bean cheese (Japanese), Miso similar to chiang (Chinese), Shoyu (Japanese) and chiang-yu (Chinese), Natto (Japanese), whole dry soya-beans, soya-beans canned as a green vegetable (see description below), vegetable milk, soya-beans roasted, ground and used as a coffee substitute in Switzerland and the USA, soya flour, soya in diabetic diets and macaroni. Utilisation of soya-bean oil: In Italy, China, Manchuria. Utilisation of soya-bean cake and meal: As fertilizer in China and Japan, for feeding stock. Food value of the bean. The cultivation of the soya bean: China, Japan, United States, Australia (New South Wales), South Africa, West Indies, British East Africa, West Africa, Burmah [Burma], England.

"In Japan beans are germinated until the sprouts are about five inches long, and eaten with vinegar; beans, germinated and treated with brine, have also been noted in Spain." Note: It is not stated clearly that these beans in Japan or Spain are soya beans.

"Soya-beans may be cooked and used in the same way as haricot-beans, and may also be picked when young and treated like green peas, in which condition they may be canned."

"In South Africa success has been achieved in growing the plant; in 1910 the outlook was so hopeful that a project for constructing oil mills was suggested. Unfortunately the bean was not taken up by farmers, who preferred to cultivate maize, as it was an easier crop to produce. Thus no extensive culture of the bean was attempted, and the subject was dropped.

"In other parts of the Empire, for example the West Indies, British East Africa and West Africa, trials of soya-beans have proved successful, but in no district have promising early experiments been followed by tests on a larger scale."

"In certain parts of India, for example Burmah, soya-beans are grown on a large scale and are consumed by the natives."

Note: "Lower Burma is a historical region, referring to the part of Burma annexed by the British Empire after the Second Anglo-Burmese War, which took place in 1852... Lower Burma was centered at Rangoon, and composed of all of the coast of modern Burma, and also the lower basin of the Irrawaddy River, including Prome. The area was also known as British Burma" (Source: Wikipedia, Oct. 2010). Address: Royal Holloway College, London.

482. *Bulletin de la Societe d'Acclimatation.* 1921. Extraits des procès-verbaux des séances de la Societe: Botanique [Extracts from verbal proceedings of meetings of the Society: Botanical (Mr. Rouest)]. 68:138-39. Meeting of Feb. 7. [Fre]
• ***Summary:*** "Mr. L. Rouest, director of the experimental farms for new crops named Lacygrazailles à Carcassonne (Aude) [in south central France] requests that the Society obtain for him varieties of soya and of wheat native to Manchuria for their acclimatization and study in France.

Note 1. Hervé Berbille of France, an expert on the life

of Léon Rouest, says (e-mail of 14 Nov. 2011) "La ferme des Néocultures des Barthes," is located in Villardonnel (a village), closed to Carcassonne (the main city of the département de l'Aude); and "Lucie-Grazaille," which seems to be a neighborhood of Carcassonne (a kind of hillside to be precise). I guess L. Rouest worked at the farm of Néocultures and lived in Carcassonne, at Lucie-Grazailles. Note that "L'Aude" is the eponymous river of the department of l'Aude. According to *Le Génie rural.* Pyc-Édition, 1914, it seems that L. Rouest started to work at La ferme des Néocultures des Barthes, Villardonnel, in 1914. (exact month unknown to date).

"For some years, Mr. Rouest has cultivated American varieties of soya which have acclimatized themselves well in France's wine and corn region(s)... With these varieties, he has created numerous hybrids which are even better adapted than their ancestors.

"He has obtained very early varieties, which can be cultivated like the haricot bean. The goal is not to replace the haricot, but to furnish agriculture with a plant with both forage and industrial uses. The soymilk industry would be very useful in the feeding of veal calves and piglets, says Mr. Rouest. Using soybeans cultivated in France, one could also make casein and numerous food products with a high protein content." Note 2. This is the earliest document seen (Aug. 2013) concerning the use of soymilk as a calf milk replacer. It is only an idea or proposal, however.

"Mr. Rouest recalls that the Society for Acclimatization was the first to propagate soybeans in France.

"The president adds that soybean cake is remarkable for the feeding of carp. Very interesting experiments have been made in America and Hungary on use of soya as forage. Formerly, our colleagues Messrs. Paillieux and Bois have published very complete studies on this legume.

"Mr. Chevalier gives very curious details on the soybean plantations cultivated in the French Congo [*les plantations de Soja faites au Congo*]. They only succeeded on land where soil from the country of origin of the plants had been spread. In this soil there are bacteria which favor the development of the soybean." Note 2. This is the earliest document seen (Aug. 2009) concerning soybeans in the French Congo (Congo Republic), or the cultivation of soybeans in the French Congo. This document contains the earliest date seen for soybeans in the French Congo (Congo Republic), or the cultivation of soybeans in the French Congo (1921). The source of these soybeans is unknown. However, we have been unable to find the document by Mr. Chevalier to which Mr. Rouest is referring.

Mr. Charles Rivière presented a fruit of *Lodoicea Seychellarum.* Mr. Chevalier had traveled in Buitenzorg (Bogor), in Peradeniya (Ceylon), and in Malaysia.

483. Forrest, Wilbur. 1921. Ford breaks silence; Denies seeking loan. New policy aims to shift industry to country towns; Horse and cow will disappear, he says; Science to furnish milk and beef. *New York Tribune.* Feb. 9. p. 1, 4.
• ***Summary:*** In this exclusive interview, Ford broke the silence of nearly a year and talked freely of general affairs. Last year Ford sold 1,250,000 cars. There is unemployment worldwide and the company has been closed for a while to sell off excess stocks. The Ford Motor Co. wants to move a large part of its manufacturing away from cities, which "have come to be unnatural. They cause unnatural unrest in men's minds." Ford wants to make major use of the water power of small streams throughout the country for making car and tractor parts. Farmers can work at these rural industries when they are not farming.

Ford predicts that horses will be replaced by automobiles and tractors. The horse is a "twelve hundred-pound 'hay motor' of one horse power." The milk and meat from cows will be replaced by man-made products. Ford notes: "It is a simple matter to take the same cereals that the cows eat and make them into a milk which is superior to the natural article and much cleaner. The cow is the crudest machine in the world. Our laboratories have already demonstrated that cow's milk can be done away with and the concentration of the elements of milk can be manufactured into scientific food by machines far cleaner than cows and not subject to tuberculosis." [Note: This article was written 10 years before Ford discovered soybeans and soymilk!]

But what about the beef that the cow also provides? "Meat is not essential. A scientific food, such as I have described, will not only take the place of milk, but meat."

A nice photo shows Henry Ford, with an insightful character sketch.

484. Carver, G.W. 1921. Prof. G.W. Carver's lecture–Farmer's Conference. 19+ p. See p. 18. Feb. 16.
• ***Summary:*** "Here is a bottle of worcestershire sauce and it is made of Peanuts. The original worcestershire is made from the soy bean but I find this is just as nice as the soy bean and therefore will be attractive in that particular. Here is a bottle of Peanut coffee...

"Here is a bottle of tofue [tofu]. It is a Chinese preparation made from the soy bean and I find that the peanut makes it just as nice as the soy bean. The Peanut milks have just about the same quality of curds as cow's milk. Here is a bottle of Curds and all that is necessary is to freshen them up and you can make any of the various cheeses, or koumiss."

Note 1. The above lends support to the theory that Carver may have been influenced in his peanut research by his knowledge of existing processes for making products from soybeans. Note 2. This lecture was presented at the Voorhees Normal and Industrial School, Denmark, South Carolina. Address: [Tuskegee, Alabama].

485. Meekins, Lynn W. 1921. Favorable outlook for American trade in Manchuria. *Commerce Reports* [*USA*]

(*Daily Consular and Trade Reports, Bureau of Foreign and Domestic Commerce, Department of Commerce*) 24(41):983-93. Feb. 18. See p. 989-91.

• ***Summary:*** "The South Manchuria Railway Co., the largest purchaser of American products, proposes to spend more than $200,000,000 gold upon improvements and extensions of its enterprises within the next five years... In spite of Japan's special advantages in Manchuria there is an excellent opportunity for the marketing of many lines of American goods,..." Manchuria is made up of three provinces having an area of some 365,000 square miles.

"American trade with Dairen–Dairen versus Vladivostok: The share of the United States in the trade of Dairen is much larger than that shown by the Maritime Customs statistics, owing to the extensive shipments of goods to and from the United States credited to Japan as the country of immediate destination and origin. The direct trade between Dairen and the United States exceeded $38,000,000 in 1919, of which imports [to Dairen] comprised two thirds and exports one third."

"As between Dairen and Vladivostok, at present a greater risk is involved in using the Vladivostok route. Costs of handling cargo at that port are higher than at Dairen; there is no market at Vladivostok itself for produce shipped there, wharves and warehouses are inadequate, and shipping services are irregular. Until these conditions are improved Dairen will probably continue to handle most of the exports of Manchurian products, as well as the imports of American goods for sale in Manchuria.

"If Vladivostok were made a free port and provided with facilities which Dairen now enjoys, full advantage could be taken of it as a real open door to Manchuria. Vladivostok, rather that Dairen, offers the more promising outlook to American firms seeking non-Japanese business in Manchuria and eastern Siberia."

"It is estimated that 2,500,000 tons of soya beans are produced annually in the three Provinces of Manchuria. The wheat and millet crops generally approximate 1,000,000 tons each. The Japanese firm of Suzuki & Co. has sold 100,000 tons of Manchurian wheat to the United Kingdom and 50,000 tons to Italy during the last few months."

"The products of the soya bean include bean curd [tofu], flour, milk, cheese, soy sauce, oil, and cake. The Chinese are concerned chiefly with the food products mentioned and the Japanese use large quantities of the cake for stock feed and fertilizer. The United States is the principal purchaser of the oil, a substitute for cottonseed and linseed oil employed in the manufacture of soap and paint and also as a lubricant."

"How bean trade is conducted: In Tiehling and Sunkiatai (Fengtien) and Kwanchengtze (Kirin) there are about 300 Chinese wholesale bean companies whose capital averages from $100,000 to $200,000 Mukden currency. Four Chinese banks–the Bank of China, the Bank of Communications, the Government Bank of the Three Eastern Provinces, and the Hsing Yeh Bank of Mukden–negotiate loans upon the joint guarantee of two of these companies without security; other Chinese banks require in some cases that the beans be pledged. Such loans are for three months or six months, sometimes one year, and the rate of interest has been less that 10 per cent. The Japanese banks lending money to bean dealers are the Yokohama Specie Bank and the Bank of Chosen [Korea], the former issuing Newchwang notes and the latter gold notes. It is estimated that between 60 and 70 per cent of the loans made by the Japanese banks is to Chinese and between 30 and 40 per cent to Japanese companies.

"The bean business may be said to commence in September, when buyers visit the producing districts and pay from 10 to 20 per cent of the stipulated price in advance. To the towns mentioned above, from 1,000 to 2,000 cartloads of beans are brought daily from November to January. The average price during the past two years has been $2 Mukden currency per 27 catties (36 pounds), exclusive of the production tax and the cost of transportation to Dairen and Newchwang. Mukden currency–that is, small coin dollars–exchanges for Mexican dollars at an average value of $1.40 to $1. At the present rate they are equivalent to about 40 cents in United States currency.

"Owing to the lack of good roads in Manchuria the beans must be carried to the market centers during the winter months, when the fields and streams are frozen. By March the crop has been collected and stored and exports become most active.

"Through the system of mixed storage, the South Manchuria Railway Co. has effected a great improvement in the handling of beans. When brought to the railway stations the beans are examined and graded according to quality and size. A certificate issued to the depositor entitles him to draw from the mixed-storage depot at Dairen or Newchwang an equivalent amount of beans of the same quality and size. The bags used in packing are also examined, and when the grade of bags deposited and that of the bags delivered is different the loss or gain thereon is adjusted by paying to or collecting from the depositor the difference in value. The new system saves the railway the trouble of transporting and storing each consignor's cargo separately. It also saves the shipper from the risks attending delay in transportation and from searching for his goods after they have arrived at their destination.

"Production of oil: The 60 bean mills at Dairen produce daily nearly 400 tons of oil and 3,700 tons of cake. Newchwang and Harbin are next in importance as oil-mill centers. The most widely used method of production is the expression system, by which one picul (133.33 pounds) of beans yields about 12 pounds of oil and 122 pounds of cake (in two equal pieces of 61 pounds each). By the chemical extraction system one picul of beans yields an average of 17 pounds of oil and 116 pounds of meal. The specific gravity of the oil is from .922 to .930.

"Sapan-wood, hemp seed, sesamum, and bean oil are being used by the Manchuria Paint Factory in Dairen, organized in February, 1920, with a capital of 1,000,000 yen, to manufacture paints for the South Manchuria Railway Co. and for various markets. The daily output is about 7,000 pounds, or 250 tins containing 28 pounds each. The colors produced include white, 'iron rust' red, and brown.

"The Japanese initiated the export trade in soya beans from Manchuria and developed the business to its present proportions. These middlemen, conversant with oriental ways, studied occidental needs and learned enough about western business methods to deal successfully with American and European firms. their strong position is due to their control of railways, their banking connections, their oil mills, and, in general, their special organization in South Manchuria for handling the business. Eventually it may be possible by exporting beans and oil through Vladivostok for Chinese sellers and American buyers to deal directly with each other. Meanwhile the most effective methods to be employed involve the development of selling and buying organizations able to cope with the situation now existing."

"About two thirds of the population of Manchuria is in the Province of Fengtien, which composes, in general, South Manchuria." Address: Trade Commissioner, Peking.

486. *Agricultural News* (*Barbados*). 1921. The soya-bean problem. 20(492):73. March 5. [4 ref]
• ***Summary:*** Begins by summarizing articles from three other publications on the importance of having root nodule bacteria in the soil if the soybean plants are to bear root nodules and give a good yield of soybeans. Concludes by summarizing the many uses of the soybean, especially in Japan and China, including vegetable milk, oil, meal, and non-food industrial uses, as in the manufacture of linoleum, explosives, water-proof goods, rubber substitutes, and printing inks. "If vegetable milk is kept for several days, it turns sour, and can be used as butter milk. One firm in England is engaged in the production of a vegetable condensed milk, which is prepared from soya beans." Address: Barbados, West Indies.

487. Morse, W.J. 1921. La industria del "soy bean" en los Estados Unidos [The soybean industry in the United States]. *Revista de Agricultura, Comercio y Trabajo* (*Cuba*) 4(3):521-24. March. [1 ref. Spa]
• ***Summary:*** This is a translation of Morse 1918, from the USDA *Yearbook of Agriculture* (1917). Contents: Early history of the soy-bean industry. The soy bean in the United States. Cultural requirements. Varieties. Soya as forage. Soya for oil. Soy-bean meal (*Harina de "Soya"*). Soy beans for human food: Dried beans (*frijoles de soya secos*), green vegetable soybeans (*frijoles de soya verde*), soy-bean milk (*leche de frijol de soya*), soy-bean cheese (*queso de frijol de soya*), soy sauce (*salsa de soya*), soy-bean sprouts (*brotes de frijol de soya*). Possibilities of the soy-bean industry in the United States.

A table shows the quantity and value of soybeans (*Frijoles de soya*), soybean cakes (*Tortas de soya*), and soybean oil (*Aceite de soya*) imported by the United States from 1910 to 1917, inclusive.

Note 1. This is the earliest Spanish-language document seen (June 2009) that uses the term *frijoles de soya verde* to refer to green vegetable soybeans.

Note 2. This is the earliest Spanish-language document seen (April 2012) that uses the term *salsa de soya* to refer to soy sauce.

Note 3. This is the earliest Spanish-language document seen (Jan. 2013) that uses the term *brotes de frijol de soya* to refer to soy sprouts. Address: USDA, Washington, DC.

488. *Dairyman* (*The*) (*London*). 1921. Substitute for cow's milk: Canadians to manufacture vegetable milk. 43:345. April 2.
• ***Summary:*** "A score of prominent business men in Hamilton, [Ontario], Canada, have begun the erection of a large plant that will endeavour to manufacture a vegetable milk which they think can be sold in competition with cow's milk.

"Mr. James Frid, a well-known contractor, who is actively interested in the new plant, pointed out to the Toronto *Globe* recently that regardless of what scientists and chemists may say, the world has long been using vegetable milks in preference to animal milks. In China no animal or cow's milk is used at all. The natives there, Mr. Frid said, take the soya bean and make all their milk from it. The company he is associated with propose to do the same thing. It will import soya beans from China for the time being, but expects that the bean will be grown in Canada at no distant date, for the reason that it has great fertiliser virtues. If planted alternately with wheat, the latter crop shows an increased yield of from eight to ten bushels to the acre because of the fertilising qualities returned to the soil by the soya bean, thus rendering the keeping of live stock for fertilising purposes unnecessary. A normal yield of soya beans ranges from 20 to 25 bushels to the acre.

"Mr. Frid said that the company's product has been given the most rigorous tests, by chefs, bakers, makers of ice cream, confectioners, makers of malted milk and cocoa, with the result that in every instance the milk produced from the milk produced from the soya bean has been declared far superior to cow's milk in all properties, such as vitamines, fatty solids, casein, albumen, carbohydrates, sugar, and salts, with the same percentage of water as cow's milk.

"Laboratory demonstration: The chemist of the company recently visited the Ontario Agricultural College at Guelph and there met the chief chemist of that institution, who was inclined to doubt the claims of the Hamilton chemist that a substitute for cow's milk had been found. The Guelph chemist courteously stated that for twenty years, science and

chemistry had laboured to find a successful substitute for cow's milk, but of all the seventeen recognised formulas not one of them had come up to the standard of cow's milk, after being given every fair test.

"The Hamilton chemist insisted that he had a formula that was a success, whereat he was invited to the laboratory to give a demonstration. He went there and made milk from the soya bean and requested the Guelph chemist to put the milk to the hardest possible test. The latter did so, and finally admitted, Mr. Frid stated, that the substitute in question was superior to cow's milk.

"Machinery and other equipment are on order now, and the new company, to be known as the Soy Products, Ltd., will begin operations by next June. Officials say the tentative period is passed; they are satisfied that their product will be much superior to and can be sold cheaper than cow's milk.

"The above is not 'spoof': nor is it new. The process, so far as it is disclosed above, does not differ from that worked by Solae, Ltd., in this country. Unless it has much more push behind it than Solae: had, Mr. Frid's ideal of a cowless world will not be realised in our time."

Note: The fill title of this periodical in 1921 was *The Dairyman, and the Cowkeeper & Dairyman's Journal,* published by Grampian Press, London.

489. *St. Louis Globe-Democrat* (*Missouri*). 1921. Amazing food uses for the lowly peanut. April 3. p. 3. Sunday magazine section.

• ***Summary:*** The subtitle reads: "At a recent session of the Ways and Means Committee of the House of Representatives, Geo. W. Carver, a professor of the Tuskegee Institute, astounded both the members and spectators with visible proof that he can manufacture one hundred and forty-five different foods and useful articles, including milk and cream, from peanuts. This milk not only looks like cow's milk, but even tastes better and purer."

"'My very latest work in investigation is in reference to the production of peanut milk. Like Mr. Ford I believe that the cow is the crudest milk machine in the world and may easily be abolished for the synthetic cow, which gives clean, sweet and wholesome peanut milk.

"'In the milk, the cream rises exactly the same way as in cow's milk. In many ways peanut milk is even better than cow's milk, for no chemicals are used-nothing but pure water. The milk produced from the peanut is a vegetable milk, uncontaminated with harmful bacteria.

"'The peanut milk I have developed looks like cow's milk and is, if anything, more nourishing and more pleasant to the palate. It consists of a perfect emulsion of oils, fats, proteids, and carbohydrates. If you did not know one was cow's milk and the other peanut milk, the eye would never detect the difference. Peanut milk can be used for cooking just the same as cow's milk, while the rich cream may be used on fruit, in coffee, and for breakfast cereals.

"'of course, you want to know how many peanuts it will take to make a pint of milk. Here is a 3½ ounce glass. When filled with shelled peanuts it will make a pint of very, very rich milk, that is, milk that is many times richer than cow's milk, about what they call cream in most city dairies.

"'Here is a bottle of synthetic buttermilk made from peanuts. In this buttermilk, the whey rises exactly as it does in the cow's milk, and tastes very much like real fresh buttermilk. What's more, it is very nutritious, having a mild, pleasing acid taste.

"'Here is a bottle of full peanut cream. It can be used in coffee, chocolate, cereals, fruit, and in other ways, the same as cow's product.

"'Here is some peanut milk made especially for ice cream. Not long since I made a quart, gave it to a neighbor, and invited myself over to help eat it. It is not modest to say so, but I am honest when I say it was the finest I had ever tasted.

"'Here is an evaporated synthetic milk, much on the order of the regular commercial evaporated cow's milk, and acting when used in the same way. An interesting thing about this and the other peanut milks is that you can use nay acid with them, and they don't curdle as cow's milk does.

"'The cow is a portable milk manufacturer who grinds her food, moistens it, heats it to a proper temperature and then filters it, and the result is milk,' continued the chemist. 'A machine or the simple utensils used here, under the direction of a man, can do the same thing that the cow does. It is the same food or the elements of the same food as cow's milk and contains all the vitamines and nutritive quantities now that it has been proved that most excellent milk can be made from peanuts. The skill and ability of the human being can perfect a machine far more economical and infinitely more convenient for milk making than the cow. Man can do more than the cow. He can produce a synthetic milk at his own convenience and protect its quality and purity. He can make milk which lacks the animal taint and the danger of disease germs.

"'It takes the cow twenty-four hours to make milk. I can make from peanuts better, cleaner and more healthful milk in five minutes. The cow simply takes out of the food she eats what is soluble. Which is the cleaner process, that of grinding, moistening, heating and filtering in a machine or pan, or passing cereals, vegetables or the vegetable matter a cow eats through her stomach?'"

Dr. Carver then demonstrated how to make peanut coffee. For the best flavor, the peanuts must be roasted, allowed to cool, then roasted again; only then does it develop the coffee flavor. An illustrations shows Carver turning the crank on a hand mill whose hopper is filled with peanuts. Out of it come boxes and bottles of many common products, such as dyes, sauce, coffee, breakfast food, cheese, cream, milk, oil, face cream, and flavorings.

490. Muggia, Alberto; Gasca, Enrico. 1921. Il latte vegetale di soia nell'alimentazione e nella terapia delle malattie gastro-enteriche dei bambini [Soymilk for feeding and treating infants with gastro-enteric illnesses]. *Gazzetta degli Ospedali e delle Cliniche* 42(30):356-58. April 14. [10 ref. Ita; eng]

• ***Summary:*** Discusses soybean milk in feeding and in the treatment of gastro-enteritic illnesses in infants. "A suspension of soy-bean flour can be prepared which is stable, and which has a nutritive value closely approaching to that of cow milk. Comparative analyses are given. To prepare a liter of 'vegetable milk,' 150-160 gm of the beans are steeped in tepid water for 12-24 hours, which causes considerable swelling. They are then carefully crushed, l liter of water is added, little by little, and the whole then boiled 15 minutes, and filtered through sterilized gauze, forming a white emulsion. If the taste is not agreeable it can be improved by the addition of a small amount of real milk. The suspension coagulates under much the same conditions as real milk, and similar precautions in its handling must be observed. Figures are given showing marked improvement and gain in weight of infants in whose diet the suspension was substituted wholly or in part for true milk. This was especially noticeable in gastrointestinal disorders, or where human or cow milk was not well tolerated. 'What is most important from our point of view, is that the soy-bean milk, in the cases observed by us, shows itself to be more easily tolerated than the milk of animals, and sometimes more easily than human milk. The experiments will be continued on a larger scale and under more exact biochemical control, and we believe that we shall be able to show that in many affections of the digestive system of infants where there is evidence of intolerance toward animal milk, we shall be able to substitute the soy-bean milk wholly or partially, not only without inconvenience, but with improvement in the local condition of the digestive organs, and improved general conditions of the child.' The use of soy-bean flour in preparing food for diabetics, industrial uses of the oil, and of the 'vegetable casein' (*la caseina di soja*) are also suggested. References to the literature are given."

Note 1. This is the earliest Italian-language document seen (Aug. 2003) that uses the term *caseina di soja* to refer to isolated soy protein.

Note 2. This is the earliest Italian-language document seen (Aug. 2013) that uses the term *latte vegetale di soja* or the term *latte de soia* to refer to soymilk. As of Aug. 2013 *latte di soia* is the modern Italian term for soymilk. However, the term *latte di soia* appears only once in this article; the term *latte di soja* is used more than 10 times. Address: 1. Prof., Docente Clinica Pediatrica Università di Torino; 2. Dott., Direttore Generale del Dispensario per lattanti di Torino. Both: Torino, Italy.

491. Brook, Harry Ellington. 1921. Care of the body. *Los Angeles Times.* May 29. p. VIII18.

• ***Summary:*** The first section, titled "Milk substitutes," argues that cow's milk is not suited for human infants (who should use mother's milk) or adults (for many reasons, including tuberculosis germs). "Recognizing the limitations of milk as a food, many have endeavored to introduce some form of synthetic or artificial milk. In France, for many years, the soya bean has been used for this purpose, in feeding infants. It is not well adapted thereto, because, like the peanut, it contains starch, and infants cannot digest starch."

Dr. Elmer Lee of New York, recently developed a new synthetic milk made from oats and peanut meal. However these foods also have a high starch content. The best milk substitutes would be made from nuts, which contain no starch. The peanut is not a true nut. "The almond is the best nut to use for this purpose, blanched, ground into cream, but not heated, and mixed with distilled water." An infant deprived of its mother's milk will thrive much better on this nut milk, mixed with a little raw fruit juice, than on the milk of a cow, "while for adults it is greatly superior to milk."

The section titled "Removal" states: "The Carque Pure Food Company has moved from Magnolia avenue to 2618 West Seventh street, two blocks west of Westlake Park." Address: N.D. [Los Angeles, California].

492. Larue, Pierre. 1921. La fabrication du lait végetal au Canada [Production of vegetable milk {soymilk} in Canada]. *Vie Agricole et Rurale* (*La*) (*Paris*) 19(28):33. July. [Fre]

• ***Summary:*** "In certain countries, vegetable milk has long been used in preference to animal milk. In China, for example, the milk of cows and other animals is never consumed. The people use only soybeans for the preparation of their milk. And this is exactly what some people in Canada propose to do. For the time being, they will import their soybean seeds from China, but they hope that, in the future, soya will be cultivated in Canada. Grown in a rotation on alternate years with wheat, soya will increase wheat yields by 5-7 quintals/hectare. The normal yield of soya in 13-17 quintals/ha. Note: 1 quintal = 100 kg.

Soymilk (*Le lait de fèves de soja*) has been submitted to the most rigorous tests by chefs, bakers, pastry makers, makes of frozen desserts, etc., and they have unanimously recognized that this product (when containing an equal proportion of water) would be superior to cow's milk when considered from every point of view: vitamins, lipids, casein, albumin, carbohydrates, sugar and salts.

"The soymilk will be significantly less expensive than cow's milk."

493. Carver, Geo. W. 1921. Many products can be made from peanut and sweet potato. *American Food Journal* 16(8):20. Aug.

• ***Summary:*** Carver now has 150 tested recipes for the

peanut. "First let us examine the peanut as food for man. We find on our list peanut brittle, peanut fudge, peanut cream candy, peanut oil, which constitutes one of the choicest of cooking oils, peanut butter, peanut flour, peanut cake, peanut crackerjack, peanut caramels, peanut butter scotch, peanut kisses and peanut breakfast food.

"Under the head of general usefulness, we find peanut hulls, ground, a powder much prized for the scouring and finishing of tin plate, peanut skins for dyes, peanut wood stains, peanut axle grease, peanut oil soap, peanut quinine, peanut linoleum, peanut butter chili, peanut lard compounds, peanut margarin [margarine], and finally peanut germs, a by-product from various manufacturing processes which makes one of the most desirable pigeon feeds now on the market.

"Value of peanut milk. We next come to one of the most important peanut products–peanut milk... It is one of the most perfect and stable emulsions that I have seen when properly made." A table compares its composition with that of cow's milk. "When it sours the clabber or curd is about the same in quantity and physical appearance as that of cow's milk. The possibilities of this milk are practically unlimited, but it might be well to mention a few: Cooking purposes, sweet and sour milk, buttermilk, cream for coffee, cream for ice cream, evaporated milk, fancy fruit punch, Worcestershire sauce, peanut coffee, instant coffee, clear white oil, tofu–a highly flavored peanut sauce.

"And among the more astonishing products resulting from the peanut are mock oysters, made from the curds, and a very satisfactory substitute for real oysters; face pomade, ink, a fine blue black ink being derived from the vines, and finally a vinegar." Address: Dep. of Research and Experiment Station, Tuskegee Inst., Alabama.

494. Weed, A.R. 1921. Soy beans a standard Illinois crop: Many varieties studied at Illinois "soy bean day." *Orange Judd Farmer* 69(32):795. Sept. 15.

• ***Summary:*** Farmers learned that the soy bean has many uses. "The 'soy bean cranks' (we might mention in passing that they are rather proud of that name now) gathered at South Farm of the University of Illinois to look over the work that is being done with soy beans on the experimental plots." They learned that different varieties are best in different states, and "soy bean tourists" studied how soybeans are grown on 400 acres and used in the rotation on the Meharry farm.

"For lunch, everyone enjoyed them [soybeans] baked and parched. Likewise everyone was asked to help themselves to soy bean butter and soy bean cream."

Note: This is the earliest English-language document seen (Dec. 2012) that contains the term "soy bean butter." However, it is not clear whether this term refers to soynut butter (like peanut butter, made from roasted soybeans–probably so), or soy margarine, or soy bean butter (a product resembling soy margarine that is not hydrogenated).

A small photo shows two horses pulling a plow–probably in a field of or for soybeans. Address: Illinois.

495. *San Francisco Business* (*San Francisco Chamber of Commerce*). 1921. Factory to be built here for rice milk products. Sept. 23. p. 20.

• ***Summary:*** The factory will be built by the Vita Rice Products Co. "Too many everyday foods have been robbed of their vitamines in the process of manufacture. Care has been taken to avoid this fault in the preparation of Vita Rice Milk."

Note: This is the earliest English-language document seen (Aug. 2013) with the term "rice milk" in the title.

496. Berczeller, Laszlo. 1921. "Manna" food. Products of the soya bean. Bread, flour, and milk. *Times* (*London*). Sept. 28. p. 11-12.

• ***Summary:*** Contents: Preface. Introduction. Animal experiments. An ideal food. "Manna" milk. Children's food.

"We give below a statement which Dr. László Berczeller, a young Hungarian who was assistant to the late Professor Franz Tangl, has made to our Vienna Correspondent on the new foodstuffs which are being made from the soya bean. Dr. Berczeller is working in a laboratory specially placed at his disposal by the Austrian Minister of Public Health, and his studies are being watched with lively interest by the British Minister and the American High Commissioner in Vienna.

"It was in 1913, in Berlin [Germany], that I first turned my attention to the soya as a food. I was the guest of the Japanese Club and a Japanese professor showed me soya food and told me that a milk was made from the bean in Japan... Professor Riegler, also in Hungary, had invented a synthetic milk made from the gluten of wheat. I saw these products were not satisfactory as they only had qualities in the sense of the old theory of calories and protein value of foods."

Note: This is the earliest English-language document seen (Sept. 2011) that contains the term "soya food" or the term "soya as food."

"We have fed white rats on beans, peas, and lentils, and we have found that animals fed on beans live shortest and those on lentils longest." When animals are allowed to follow their instinct, and choose between "the several kinds of legumina... they eat most lentils, less peas, and least beans."

"It is well known that in the time of the Greeks men still used, of cereals, chiefly barley. Barley was followed by rye, especially in the Middle Ages, and both barley and rye were supplanted by wheat, as in England, as is the case today on the Continent."

"An ideal food–We now endeavored to apply this knowledge to the soya bean with a view to the food shortage problem. In the chemical sense, the soya is an ideal food.

It contains 40 percent albumen and 20 percent fat, and at the same time can be obtained very cheaply. In Japan and China the soya is worked up into a number of very valuable foodstuffs by small industrialists. These foodstuffs do not meet European taste. Probably the Mongolian race has accustomed itself to this food. The European foodstuffs industry has made repeated efforts to produce out of the soya a good and palatable food, but every attempt has failed, because the biological factor has been ignored. We could show that most of the processes used for this purpose and for which patents were also taken out, such as for extraction and roasting, only lead to one result; the rats fed with this food have a much shorter life than even those fed with the raw soya.

"We have been successful in creating three foods: bread, flour and milk, in which these principles were taken into account. These foods have been tested not only in the laboratory, but also on man; man, because one does not even yet know to what extent of certainty one may conclude from animal experiments to human beings."

"The new 'Manna' bread which has been produced by Mr. Robert Graham and myself–Mr. Graham's technical and scientific experience in bread making rendered it alone possible to work out this problem–is the solution of the old standard bread controversy. We do not use the bran, which is already disintegrated by the milling process. We use better proteids than those contained in the bran and we introduce a great quantity of fat into the bread. The bread is cheaper than any other at present on the market."

"Manna flour contains 40 per cent proteid and 20 percent fat. In the raw state it has a sweet and pleasant taste. It can be used for soups and cooking vegetables."

"'Manna' Milk–If we give animals the choice between the best milk powder and manna flour, their instinct leads them to eat largely of the later; and if we feed them on eggs or meat and manna flour in a similar colloidal state, they consume more manna flour and less eggs or meat. We deduce therefrom that human beings will find it pays them better to use manna flour. Manna milk is in its proteid, carbohydride, and fat contents, and in its colour, very similar to cow's milk. It has an almond-like taste. Used with tea, cocoa, or puddings, ice creams and pastry, one cannot detect any difference from fresh milk. It is now being manufactured and its cost in Vienna will be six times less than fresh milk. It is merely a question of scientific research and manna milk will be biologically perfect also."

"It is indisputable that the food of the white race is very costly, especially when one compares it with the food which the yellow race is accustomed to. We observe the evil consequences of this difference above all in the United States. It is therefore a matter of the highest political importance that the West should learn the lesson of cheaper living as taught them by the East in the adaptation of the soya bean as an article of food."

"For fighting the Russian famine the aforementioned foodstuffs commend themselves for widely different reasons." Address: Vienna, Austria.

497. *Times* (*London*). 1921. "Manna" for the hungry. Sept. 28. p. 11, col. 3.

• ***Summary:*** "A few months before the war attention was drawn in these columns to the wonderful food-producing properties of the soya bean. Since its first importation to Europe from the Far East, in 1906, these properties have been closely studied by western chemists, and during the last few years the researches of Dr. László Berczeller, a young Hungarian scientist working in Vienna, have been especially useful in extending the possibility of their further development... Dr. Berczeller is particularly interested in its adaptability as the basis of human food. In this respect its virtues are even more remarkable than as a fodder. Soy bean has been used to produce not only milk, butter and cheese, but flour and what is known as 'manna' bread. One part of the manna flour has the same nutritive value as two parts of meat and one third part of wheat flour. Manna milk, he says, is in its proteid, carbohydride, and fat contents and in its colour very similar to cows milk, over which... it has this advantage–that it is free from all suspicion of being contaminated by milk-borne diseases. It is now being manufactured in Vienna at on sixth of the cost of fresh milk. Dr. Berczeller's whole account, reads almost like a fairy tale but it is a fairy tale with a moral. Dr. Berczeller believes that... these manna foodstuffs are admirably adapted for fighting the horrors of the Russian famine. The cheapness and quickness with which they can be produced in Vienna, the facility of their transport, and the fact that, when they are produced in the form of rusks, they need no cooking, combine to give them a special value possessed by no other food that can be imported into the famine regions. If these plans of his are carried out, he looks forward to the time when the soya bean will be permanently cultivated in the Ukraine, to the great advantage of the future provisioning of the whole of Europe."

Note: Writing in the *The Illustrated London News* (8 Oct. 1921, p. 476), J.L. North, Curator of the Royal Botanic Society of London, and a pioneer in growing soybeans in England, notes that in this article of Sept. 28 about "Manna flour, Manna bread, and milk substances from the Soya bean... there is no reference to the fact that all these 'Manna' or Soya bean products were first made in England before the war. Samples of the flour and biscuits are to be seen in the cases of the London Institute of Hygiene, and Manna milk has been for years–and, no doubt, still is–sold here under the name of 'Solac' at a price considerably lower than that charged for milk by dairymen. "

498. Moderwell, Hiram K. 1921. Milk, flour, bread from a bean, new "manna" found in Vienna: Inventor claims it will

do for starving Europe what was done for the Children of Israel in Biblical times. *Toronto Daily Star* (*Canada*). Sept. 29. p. 13.

• ***Summary:*** London, Sept. 29. This is basically a rewritten version of the following article: *Times* (London). 1921. "'Manna' for the hungry." Sept. 28. p. 11, col. 3.

Reports from Vienna, Austria, describe experiments [by Laszlo Berczeller and colleagues] in which flour, bread and milk are made from the soya bean. "Soya milk costs only one-sixth as much as cow's milk and soya bread is 40 per cent. cheaper than wheat bread." The soya bean, which will be extensively cultivated in eastern and southeastern Europe, is "the only real solution to the problem of reconstruction" of Europe after World War I. Address: Special cable to The Toronto Star and the Chicago Daily News.

499. North, J.L. 1921. To solve the cost-of-living problem? A magic bean. *Illustrated London News* (*The*). Oct. 8. p. 476-77. [1 ref]

• ***Summary:*** "The leading article and letter in the *Times* of Sept. 28 from its Vienna correspondent about Manna flour, manna bread, and milk substances made from the Soya bean, are likely to do good if they help us to realise how much we are losing by our neglect of this, the most valuable–for the uses to which it can be put–of all legumes.

"In the letter giving the details of the researches of Dr. László Berczeller of Vienna, there is no reference to the fact that these 'Manna' or Soya bean products were first made in England before the war. Samples of the flour and biscuits are to be seen in the cases of the London Institute of Hygiene, and Manna milk has been for years–and, no doubt, still is–sold here under the name of 'Solac' at a price considerably lower than that charged for milk by dairymen. The appearance and rapid rise into importance of the Soya bean is one of the most remarkable commercial events of modern times."

"In 1790 the [soy] bean was brought to Europe when its cultivation was first attempted by Young [Arthur Young, lived 1741-1820 in England], the father of British Agriculture, though without success. In 1878 an Austrian professor, Haberlandt, tried it, but failed [Note 1. Haberlandt did not fail; he successfully cultivated soybeans in Austria as early as 1875, and many times thereafter.] When the bean came here in 1908 there was an immediate rush to grow it both in Europe and America. Experiments were started by our Board of Agriculture, the Royal Agricultural Society, and many semi-public bodies. The early experiments failed completely, for the reason that they were made with seed whose climatic origin was unknown, as well as the orthodox Chinese methods of growing it. Later, this was remedied..."

By 1918 Europeans were aware of 500 different soybean varieties that were growing experimentally at Arlington, Virginia.

"My interest in the Soya bean began in 1913 with a visit from an agent of a German cultivator at the office of the Royal Botanical Society at Regent's Park. He was, he said, trying to form a syndicate to grow what he called an acclimatised Soya bean, brought from China in 1910, and already in cultivation in Germany. He refused seeds for testing, but sent from Hamburg a plant which had been carefully cleared of the seed, though the *empty* pods, nearly sixty in number, were left. The syndicate never materialised, and I thought no more of the matter, until later on, whilst examining the dried plant, I noticed a tiny pod, scarcely half an inch long, which contained a seed no bigger than a pin's head. Going over the plant I found other pods which evidently had been thought too insignificant to be of use, and from these I obtained thirteen seeds. These were sown in 1914 and resulted in thirteen plants, which produced four hundred and forty seeds. From thirty-three plants in 1915 one thousand seeds resulted, and in 1916 no less than twelve thousand. Many experiments as to the value of different methods of growing them were made in several countries, and with no less than twenty-one different foreign varieties. One thing came clear throughout the tests, and that was that the original variety started with was by far the best. It says a good deal for German astuteness that they should have gone to Manchuria and, from hundreds of varieties, chosen the one best for them and for us."

The future of the Soya bean in England is uncertain. "Natural selection helps the plants that mature earliest produce most seed; those that mature late die out. It is noticeable that the plants experimented with in England fruit earlier now than they did at first, and this is a very hopeful sign. Another satisfactory fact is that there is no lessening in the number of pods produced, but rather a gain. This year there are plants with three times the number of pods shown in a photograph of the best German-grown specimen of 1912."

In China and Japan the Soya bean "enters into the composition of most dishes, and in one form or another, as Soy sauce, bean paste, bean cheese, bean curd, bean milk, bean wafers, bean cakes and confectionery, is used everywhere. For a hundred years Soy sauce has been imported–the principal ingredient in the well-known Worcester [Worcestershire] sauce."

Apart from its value as a food, it is used in the manufacture of glycerine, explosives, enamels, varnish, varnish, waterproofs, linoleum, paints, soaps, celluloid, printing inks, and as a lubricant."

Photos (all but #1 by Frank N. Meyer of the USDA) show: (1) A typical pod from a soya bean plant grown by Mr. J.L. North at Chiswick, England, in 1921. (2) Two large, thin "blocks of tofu (bean curd)" on a round, wooden table. "Soya bean cheese for human food... Ready to be cut up into squares for sale to the public. Tofu, or Soya bean curd, is made by adding magnesium or calcium salts (about a 1 per cent. solution) to hot Soya bean milk; the product is drained

and pressed. (3) "Varieties of soya bean cheese on a bamboo tray. Tofu, or Soya bean curd, forms the basis of many fermented, smoked, and dried cheeses in China and Japan." (4) "Soya bean cheese [fermented tofu] in preparation: A pile of wooden trays full of bean curd in a dark room of even temperature." (5) "Used by the Chinese as a green vegetable: A basketful of sprouted soya beans." (6) Soy bean plant with leaves, many pods and roots, grown at Chiswick.

Note 2. This is the earliest document seen (March 2002) written by Mr. J.L. North, the pioneer in cultivating soybeans in England.

Note 3. This is the earliest English-language document seen (April 2013) that uses the term "soya bean cheese" or the term "soya bean curd" to refer to tofu.

Note 4. This is the earliest English-language document seen (July 2007) that uses the term "magic bean" or that uses the word "magic" as an adjective to refer to the soybean.

Note 5. This is the earliest English-language document seen (Jan. 2013) that uses the term "sprouted soya beans" to refer to soy sprouts.

Note 6. Concerning Arthur Young. He was the author of many books on agriculture, which were very influential in their day. He was an important advocate for the progressive agricultural practices of his time, advocating such innovations as the seed drill, improved crop rotations, the use of marl as fertilizer, and the enclosure of open fields. In 1767 he undertook the management of a farm in Essex. He conducted various experiments and published the results in *A Course of Experimental Agriculture* (1770). In 1784 he began the publication of the *Annals of Agriculture*, a periodical which was continued for 45 volumes and had many contributors. Young traveled to France during 1787-89 and in 1792 published an important book about his travels and observations there. The soybean was first grown in Paris, France, perhaps as early as 1740, definitely by 1779. So he may have learned about soybean from fellow agriculturalists in Paris while on this trip. Address: Curator of the Royal Botanic Society of London.

500. Nakayasu, Kyoichi. 1921. Gyûnyû-chû no tônyû no kani kanshiki ni tsuite [On the simple detection of soymilk in cow's milk]. *Yakugaku Zasshi* (*J. of the Pharmaceutical Society of Japan*) No. 476. p. 880-87. Oct. 26. (Chem. Abst. 16:1469). [Jap]
• ***Summary:*** On adding 4-5 drops of 28% potassium hydroxide solution to 10 cc of milk, a yellow color develops if soybean protein is present; 5% of the protein can be detected. To render the test more definite, the albumins may be precipitated from the milk by acetic acid, filtered off, and treated in a dish with 2-3 drops of the alkali. A light yellow color indicates the presence of soybean protein; the protein from pure milk gives a yellow color only on heating.

501. Brook, Harry Ellington. 1921. Care of the body. *Los Angeles Times.* Oct. 30. p. VIII-18. Sunday magazine.
• ***Summary:*** The section titled "The soya bean" states: "English and Hungarian agricultural chemists have collaborated in the production of a soya bean for which great things are promised. We are told that it is to take the place of bread, butter, flour and milk. Nonsense.

"The soya bean is largely used by the Chinese. The white cheeses you can see at Chinese stores are made of soya bean curd [sic, they *are* soya bean curd, or tofu].

"In France, a liquid made from the soya bean has been used as a milk substitute. It is not good for that purpose because, like all beans, it is largely starch.

"The soya bean is a valuable food, but it is inferior to peanuts. They contain much fat, which beans lack."

Note 1. Tofu was apparently sold at Chinese stores in Los Angeles by 1921. Note 2. The writer doesn't realize that soya beans, unlike common beans, contain very little starch. Address: N.D. [Naturopathic Doctor].

502. Queen, W.M. 1921. Friend cow has new rival in rice: Marvelous rich milk can be made from kernel on commercial basis. Discovery promises to mark new chapter in history of dietetics: Opens up enlarged field of consumption. *Rice Journal* (*The*) (*Beaumont, Texas*) 10(24):19, 25. Oct.
• ***Summary:*** "In the rice plant the sun's heat performs the work directly and in a most perfect manner, requiring more time than the cow to complete the process of making its milk."

"It is known that rice at first grows like any ordinary grain, but later puts forth its milk veins, which have been called water roots, above the surface of the ground. These draw a milk from the elements in the water... A milk containing 7 per cent. fat has been produced. It is 100 per cent. rice. The writer has tasted this milk, 55 hours after its production, when it had become a buttermilk, and can vouch for the fact that it is refreshing, invigorating and stimulating.'" J.H. Stassen and Mr. S.

"In the near future a factory will be started in San Francisco or Oakland, which serving as a base for operations on the Pacific Coast, will be the nucleus of a world-wide industry of colossal magnitude."

"Too many everyday foods have been robbed of their vitamines in the process of manufacture. Care has been taken to avoid this fault in the preparation of Vita Rice Milk."

Note: For a long summary of this article, see *Literary Digest* (17 Dec. 1921, p. 23).

• ***Summary:*** Bitter principles could be removed by soaking beans in vinegar or dilute acetic acid.

504. *Bean-Bag* (*The*) (*Lansing, Michigan*). 1921. An

interesting feature of a fair held at Elizabeth City, North Carolina,... 4(6):45. Nov.
• ***Summary:*** "... early in October was an exhibit of the various products of the soy bean, whose production is rapidly increasing in North Carolina as well as in most other southern states. Twenty-five manufacturers supplied products," including "a substitute for butter, imitation milk, table syrup, flour, soap, linoleum, glycerine and paint–all made from soy beans."

505. *Trans-Pacific*. 1921. Making bread from Manchuria's beans. 5(5):43-44. Nov.
• ***Summary:*** "In a recent speech in London Mr. Winston Churchill insisted that 'it is a matter of the highest political importance that the West should learn the lesson of cheaper standards of living which is taught them by the peoples of the East in the adoption of the soya bean as an article of food.' He then went on to say that in a recent statement to the Times' Vienna correspondent by Dr. Berczeller, a young Hungarian, the latter professed to have succeeded in making both flour and milk from the soya bean, and that the bread made from soya bean flour is both palatable and easily digested and can be placed on the market at a price below that of any other kind."

Note: This is the earliest document seen that mention's Winston Churchill's speech about the soya bean. Address: Tokyo.

506. Blunck, Gustav. 1921. Pflanzenmilch [Plant milk]. *Chemiker-Zeitung* 45(144):1166. Dec. 1. [3 ref. Ger]
• ***Summary:*** The author notes that margarine was born in 1871, out of the necessities of the time, and the margarine industry grew rapidly during World War I until today in Germany margarine is more widely used than butter. The same problem has now arisen with respect to milk, and how to make a substitute from plants. The main drawbacks with existing soymilks are the strange flavor and the lack of vitamins. The author developed a soymilk using a fermentation with "aroma building" bacteria, and involving treatment with certain proteolytic enzymes. This improved the soymilk flavor, making it "completely similar" to that of cow's milk in flavor and digestibility, as well as in its ability to make kefir, yogurt, etc. And it stays fresh longer since it is free of a germ/sprout [*Keim*]. So in a short time we should have a plant milk to go with our plant butter, and an improvement in our nutritional situation, since the shortage of milk and its high price makes it almost a luxury item. Address: Chemiker, Eberswalde.

507. *Literary Digest.* 1921. "Milk" from rice. Dec. 17. p. 23. [1 ref]
• ***Summary:*** "Rice can be liquefied into the form of milk, we are told by W.M. Queen, writing in the *Rice Journal* (Beaumont, Texas [Oct. 1921, p. 19, 25])... 'It is known that rice at first grows like any ordinary grain, but later puts forth its milk veins, which have been called water roots, above the surface of the ground. These draw a milk from the elements in the water... A milk containing 7 per cent. fat has been produced. It is 100 per cent. rice. The writer has tasted this milk, 55 hours after its production, when it had become a buttermilk, and can vouch for the fact that it is refreshing, invigorating and stimulating.'" J.H. Stassen and Mr. S. Christensen are producing the new product from rice. After World War I, Stassen "went to Texas, where he brought the experiments with rice as a base for ice-cream he had started in Iowa, to a more perfect stage of development. His products were already being made experimentally in the form of an emulsion and also in a frozen state as a substitute for ice-cream and sherbet.

"'At this point Mr. Stassen brought his discovery to California,'" where he met Mr. Christensen (one of California's leading rice growers), "'whose researches covering a long period of years were so supplemented by Mr. Stassen's invention that between them they have opened a new field for the development of rice with possibilities hitherto undreamed. In the near future a factory will be started in San Francisco or Oakland, which serving as a base for operations on the Pacific Coast, will be the nucleus of a world-wide industry of colossal magnitude.'"

508. **Product Name:** Vita Rice Milk.
Manufacturer's Name: Vita Rice Products Co.
Manufacturer's Address: 407 Flatiron Building, San Francisco, California.
Date of Introduction: 1921. December.
Ingredients: Incl. rice.
New Product–Documentation: Ad (half page, black-and-white) in *The Rice Journal* (Beaumont, Texas). 1921. Dec. p. 12. "Vita Rice Milk: The new discovery which brings rice into its own." "The main reason for the superiority of Rice over all other forms of food is its ready digestibility; it being assimilated in one hour, while the other cereals, legumes, and most vegetables, require from three to five hours. Unfortunately for the Human Race, Rice, as sold in stores (in the World Market today) has been robbed of its vitals (Life-giving Food Value). Vita Rice Milk brings rice into its own, rich in all Vitals, retaining all life giving and life sustaining fats."

Note 1. This is the earliest rice milk seen worldwide. It is not clear whether or not the rice was fermented, like amazake.

Note 2. This is the earliest English-language document seen (Feb. 2005) that uses the term "rice milk" to refer to a commercial product.

509. Kellogg, John Harvey. 1921. The new dietetics: What to eat and how. A guide to scientific feeding in health and disease. Battle Creek, Michigan: The Modern Medicine

Publishing Co. 933 p. Illust. Index. 24 cm.

• ***Summary:*** This is the first edition of this important book; subsequent editions were published in 1923 and 1927. Contents: Foods: Food Principles. The digestive process: The liver, mastication, hunger. Metabolism: The energy of food–the calory [calorie]. The physiology of eating: The protein ration, fats, carbohydrates–starches and sugars, food salts, vitamins, cellulose, the acids of foods. Wholesome foods: Cereals (incl. wheat bran), vegetables, green vegetables, root vegetables, vegetable or garden fruits (incl. tomato, cucumber, eggplant, watermelon, muskmelon, squash, vegetable marrow, pumpkin, chayote), legumes (incl. the adsuki [azuki] bean, the Hahto bean, the soy bean, composition of the soy bean, soy bean milk, to fu [tofu], soy sauce, soy bean sprouts), fruits, nuts (incl. the ground nut, the peanut, peanut butter, flour from the peanut, peanut milk, malted nuts). Animal foods. Condiments. Tea and coffee (They are poisonous drugs, in 1921 the U.S. per capita consumption increased to 12 lb/year, chronic caffein [caffeine] poisoning, coffee raises blood pressure, tea, coffee and uric acid, coffee cripples the liver, other coffee poisons, some poisonous effects of tea and coffee, soda fountain drinks containing caffein, coffee substitutes {most consist of cereals plus molasses, roasted until part of the starch and sugar are caramelized; the roasting process makes them unwholesome}), tobacco. Ptomains–Poisoned foods. Water drinking. Medical dietetics: Introduction, scientific tests of the nutritive functions, regimens and dietaries, diet in disorders of the digestive organs, diet in disorders of nutrition, diet in joint diseases (rheumatism, arthritis, gout), diet in disease of the heart and blood vessels–Cardio-vascular-renal diseases, diet in disorders of the nervous system, diet in disorders of the urinary organs, diet in diseases of women, diet in management of fevers, diet in chronic infectious diseases, diet in diseases of the skin, diet in surgical cases, diet in diseases of the eye, ear, nose, and throat, infant feeding, the rice regimen. The world's foods: Making the bill of fare.

A table (p. 138) titled "Vegetable fats" lists "The principal sources of edible vegetable fats..." including: Cocoanut meats 36%, corn 5%, hemp seed 32%, palm nut 72%, peanut 52%, sesame seed 51%, soy bean 20%

A table (p. 166-67) lists the 7 main food salts [minerals] found in various foods, including soy beans, gluten (pure, 40%, or 20%), and peanuts.

Table XII (p. 170-71) lists foods rich in iron. Columns (a) shows the grains of iron in one ounce, and column (b) shows the number of ounces required to supply one day's ration of iron. Includes (in descending order of iron content): Savora (yeast extract), Gluten–pure, gluten–40%, egg yolk, dried lentils, wheat bran, soy beans, Protose, Brose (oatmeal, corn meal, bran), Nuttolene, Graham Flour, tenderloin meat, Graham bread, Zante currants.

Table XIV (p. 182) lists foods rich in lime [calcium] in descending order of lime content, with the same two columns as table XII. Includes: Cheese, yogurt cheese, mustard greens, linseed meal, turnip tops, soy beans.

Page 183 discusses "The acids and bases of foods–The reaction balance. As pointed out by Bunge many years ago, and as further shown by an extensive research conducted by Sherman of Columbia University, foodstuffs differ in relation to their acid and basic contents... The waste products of the body are predominantly acid, consequently it is desirable that the foodstuffs should be predominantly basic... The predominance of acids gives rise to a condition known as acidosis (p. 719), and care must be taken to protect the body from injuries which result from this condition... Meats of all sorts, especially the lean meats, tend to acidify the tissue fluids to a marked degree. Eggs tend in the same direction, though less strongly than do meats."

In the chapter titled "Diet in disorders of the digestive organs," pages 654-55 discuss soy flour, yeast extract (Savita, Marmite–which is a very useful source of iron and vitamins), Malted Nuts, 20% gluten meal, and the "Gluten-feeding method."

In the section on diabetes, page 703 gives a recipe for gluten bread. Gluten is also mentioned on p. 718. The section titled "Diet for acidosis" (p. 719) begins: "The blood and tissue fluids are slightly alkaline in reaction. This slight degree of alkalinity is essential to the maintenance of health. When, through disordered metabolism, the body becomes charged with an excess of acids, so that the alkalinity of the blood and tissues is diminished, the result is a condition known as acidosis. Among the symptoms due to acidosis may be mentioned nervousness, mental depression, mental confusion, drowsiness, convulsions, and coma. Air hunger with shortness of breath is one of the early symptoms of acidosis. This condition is most pronounced in advanced cases of diabetes and is encouraged by a meat diet, particularly by the use of an excess of fats. Fasting persons always show a condition of acidosis after fasting for a day or two. Professor Fischer believes that this preponderance of acids, or chronic acidosis, is the exciting cause of Bright's disease."

The section on diet and heart disease notes (p. 738-39): The "great frequency with which arteriosclerosis is encountered in modern times is the result of the increase in flesh eating which in recent years has been very marked in all civilized countries." It "has become the universal custom among practical physicians to exclude meats, meat extracts, and broths of all sorts from the diet of patients suffering from arteriosclerosis, as the most efficient means of checking the degeneration of the arteries..." Foods containing uric acid, plus coffee and tea, should be discarded. Bran, agar, paraffin oil, and an enema should be used freely. Address: M.D., LL.D., F.A.C.S., Superintendent of the Battle Creek Sanitarium, Battle Creek, Michigan.

510. Kellogg, John Harvey. 1921. Flour from the peanut. Peanut milk (Document part). In: J.H. Kellogg. 1921. The New Dietetics: What to Eat and How... Battle Creek, Michigan: The Modern Medicine Publishing Co. 950 p. See p. 359. 24 cm.

• ***Summary:*** These two sections appear in the chapter titled "Nuts." "Flour from the peanut: It has been found that by special treatment of the press-cake obtained after the extraction of the oil from the peanut an excellent flour, containing only five per cent oil, may be made. The flour contains a high percentage of an excellent protein."

"Peanut milk: The protein of the peanut is quite soluble in hot water, and the fat being in a finely divided state, it is easy to prepare from peanut butter a very palatable cream or milk by the simple addition of hot water." Address: Battle Creek, Michigan.

511. Kellogg, John Harvey. 1921. Malted Nuts (Document part). In: J.H. Kellogg. 1921. The New Dietetics: What to Eat and How... Battle Creek, Michigan: The Modern Medicine Publishing Co. 950 p. See p. 359-60. 24 cm.

• ***Summary:*** This section appears in the chapter titled "Nuts" (p. 359). "Nearly thirty years (1892-93) the writer, in seeking to supply the needs of invalids unable to eat cow's milk, conceived the idea of combining malt-digested cereals with nuts to prepare a substitute. The result reached after many experimental efforts was the product known as 'Malted Nuts,' which much resembles malted milk in appearance, while having a delicate and very agreeable nutty flavor. This product has been produced in considerable quantities and has come to be somewhat widely used. The following is the analysis as made by Atwater, as published by the U.S. Department of Agriculture:" Water 2.6%, protein 23.7%, fat 27.6%, carbohydrate (malt sugar and dextrin) 43.9%, and ash 2.2%. Calories per ounce: 140.

"It was soon discovered that 'Malted Nuts' had certain characteristic properties which rendered it of special value as a nutrient. One of these is its richness in food iron of which it contains double the amount found in ordinary beefsteak. Another... is its influence upon the milk secretion in nursing mothers. This discovery was first made by a mother who by its use was able to double her milk production and to nurse the child of a neighbor in addition to her own. Later, Dr. Hoobler, of Detroit, superintendent of a lying-in hospital, independently undertook an extended series of experiments, the interesting results of which, largely attained by the use of malted nuts, were reported in the *Journal of the American Medical Association* for August 17, 1917. The purpose of the research was to determine the influence of diet upon the milk production of nursing mothers... Studies were made of the effects of meat, eggs, cow's milk, a strictly vegetable dietary (fruits, grains and vegetables) and nuts.

"The influence of the diet was judged by the following points: 1. The amount of milk produced [by the nursing mother]. 2. The food value of the milk. 3. The effect upon the mother in loss or gain of weight.

"It was found that a diet consisting largely of nuts (fifty per cent), was far superior to any other dietary and in every particular. The amount of milk was larger than the average (14.8%), the food value was greater (30%), and the mother did better. It was noted that the mothers 'took the diet directly and in fact enjoyed it.'"

"'Malted Nuts' has been demonstrated practically the best substitute for milk which has thus far been found. It is relished by bottle-fed infants and 'agrees' when cow's milk is not tolerated."

Note: We are not told what kind of nuts were used to make Malted Nuts. But other sources (Schwarz 1970, p. 121) explain that this nondairy product was made principally from peanuts and almonds, and resembled malted milk. Address: Battle Creek, Michigan.

512. Kellogg, John Harvey. 1921. The soy bean. Composition of the soy bean (Document part). In: J.H. Kellogg. 1921. The New Dietetics: What to Eat and How... Battle Creek, Michigan: The Modern Medicine Publishing Co. 950 p. See p. 299-302. 24 cm.

• ***Summary:*** In the chapter on "Legumes," the section titled "The Soy Bean" (p. 315-21) has the following contents: Introduction and history (incl. a long extract from a publication by W.J. Morse (1918), and discussion of soy beans and diabetic diets). Composition of the soy bean (according to Bailey and Street 1915). Soy bean milk. To fu (tofu). Soy sauce. Soy bean sprouts. Composition of soy bean sprouts compared with mung bean sprouts.

The section begins: "The soy bean has been used in China since 2838 B.C. It was introduced into France in 1740, England 1790, and this country not until a century later. This bean requires a long season and does best in the Southern states on this account. It is quite hardy, however, and some varieties have been found which mature as far north as Canada.

"The soy is the best of all beans. It differs decidedly from other beans in its composition. It contains 40% protein, practically no starch, and nearly 20 per cent fat, giving it characteristics approaching those of the peanut more closely than those of ordinary beans.

"More than one thousand varieties have now been tested by the U.S. Department of Agriculture. Twenty varieties are at the present time being handled by growers and seedsmen in this country. The green and yellow varieties are best adapted for food. The black and brown are chiefly for forage.

"In China, the soy bean is very little used in the manner in which beans are used in this country. Instead, according to W.J. Morse [1918], of the U.S. Department of Agriculture, 'the beans are soaked in water and roasted, the product being eaten after the manner of roasted peanuts.'" Dr. Kellogg then quotes two passages from Morse; one about roasted

soybeans, and the other about soy beans which, when three-fourths or more grown, can be used as "a most palatable and nutritious green vegetable."

"This bean not only contains a large amount of protein, more than is found in the same weight of beef, but its protein is of a particularly fine quality. Heretofore, the casein of milk has enjoyed a unique reputation as a protein of finest quality, but now 'the protein of the soy bean appears to be as valuable as the casein of milk.' In view of the shortage of milk, which is likely to increase, it is gratifying to know that a protein has been discovered equally valuable as casein, and one which may be produced in unlimited quantities.

"For promotion of growth, it is not only necessary for the food to contain 'complete' protein in proper amount, but it must also contain a sufficiency of the two vitamins, designated as fat-soluble A and water-soluble B. Osborne and Mendel demonstrated that the soy bean contains an adequate supply of both fat-soluble and of 'water-soluble vitamins,' in which respect it is superior to all seeds heretofore examined, with the possible exception of flaxseed and millet.

"The soy bean is destined to become one of the great food staples, not only of this country but of the world. It is capable not only of supplying the essentials for growth and maintenance, but may also act as a complement to other imperfect foods, such as corn for example, in combination with which it has shown most excellent experimental results.

Composition of the soybean: A table shows the composition of the soy bean, compiled from various sources. "The above analysis clearly shows the soy bean to be a most remarkable food product. Its composition is in some respects more like that of a nut than that of other legumes. In this respect it very much resembles the peanut. Its protein content, nearly 40 per cent, is higher than that of any other foodstuff. Even lean meat affords but half as much. Its high percentage of fat gives it a very high food value and makes it a rich source of oil for various industrial purposes as well as for food.

"The soy fills the place of meat as well as milk in the dietary of many millions of sturdy Orientals. Since the composition of the soy has been understood, it has been much used as a food for diabetics. It is evident from the above [table] that it contains little which can be objectionable in diabetes. The small amount of dextrin and sugar may be easily removed, when necessary, by parboiling.

"Experiments by Holmes [1920], of the office of Home Economics, U.S. Department of Agriculture, have shown that the well cooked soy bean (cooked for two hours under steam pressure) is very easily digestible, and is an exceptionally wholesome article of food, superior to most other legumes.

"The soy bean may not become really popular until the pressure cooker comes into general use, which may be some time. In the meantime, while the patent pressure cooker is coming, any resourceful housewife may improvise a perfectly good and satisfactory pressure cooker from inexpensive materials close at hand. Get a stone jug or jar that can be hermetically sealed. The little stone jars in which apple butter is sometimes sold are well adapted to the purpose. After soaking the beans over night put [them] in the jug with a little salt and enough water to cover, seal up tight and secure the cover well, remembering that the pressure will be from within. Set the jug in a saturated solution of common salt, place over a smart fire and boil for one to two hours. The salt solution boils at a temperature of 220ºF. and so the beans are exposed to a higher temperature than in ordinary boiling... Cooking at the higher temperature not only softens the cellulose and so renders the foodstuffs tender, but greatly improves the flavor.

Note: This is the earliest document seen (Sept. 1996) that uses the term "pressure cooker" in connection with soy beans. Address: Battle Creek, Michigan.

513. Kellogg, John Harvey. 1921. Soy bean milk (Document part). In: J.H. Kellogg. 1921. The New Dietetics: What to Eat and How... Battle Creek, Michigan: The Modern Medicine Publishing Co. 950 p. See p. 302-03. 24 cm.

• ***Summary:*** "In Japan infants are sometimes nourished artificially on milk prepared from the soy bean by methods for a long time kept secret. Soy milk is now well known and quite extensively in use in France and England, and likely soon to be introduced into this country. The writer has prepared, experimentally, a quite palatable milk from the soy bean, and has for twenty-five years made use of milk prepared from the almond and other nuts.

"The beans may be prepared either by grinding to a fine flour or by soaking over night and crushing to a pulp between rollers. The dry meal is most convenient. Add to the dry meal sufficient water to a little more than saturate. Allow to soak for two hours. Add five times the quantity of boiling water. Boil for ten minutes, stirring. Filter through a fine cloth. The milky liquid thus obtained has properties very closely resembling cow's milk. It is rich in protein and fats. The fat is well emulsified and easily digestible, and the protein very closely resembles that of milk, being what is known to chemists as a complete protein which may replace the casein of milk as food. The soy milk is rather deficient in salts, both lime and iron. It contains vitamins but less than milk, and it contains no carbohydrates. To be used as milk it should be sweetened by the addition of 2 per cent of cane sugar or 4 per cent of milk sugar. To suit most palates a little salt should be added also. The flavor is different from that of cow's milk, but it is wholesome and not unpalatable and may to a considerable extent take the place of cow's milk by persons who are sensitized to milk or when milk is not available. A similar preparation may be made from peanuts.

"Soy bean milk, according to Adolf and Kiang, has the following percentage composition: Protein 4.22, fat 1.87, salts 0.40, water 93.51.

"The composition of the milk will vary, of course, with

the amount of water used in its preparation. It will be noted that soy milk contains no sugar and is very poor in salts, containing only half the amount of salts found in cow's milk. All these may be easily added, however, and so soy milk is a possible resource for lacteal food in case of scarcity of the bovine product; but it seems to the writer doubtful that soy milk will ever be able to compete with cow's milk as a nutrient for human beings, and especially the feeding of infants." Address: Battle Creek, Michigan.

514. Kellogg, John Harvey. 1921. Animal foods (Document part). In: J.H. Kellogg. 1921. The New Dietetics: What to Eat and How... Battle Creek, Michigan: The Modern Medicine Publishing Co. 950 p. See p. 363-435. 24 cm.
• ***Summary:*** Dr. Kellogg confines to this one chapter all of his discussion of meat, poultry, fish, eggs, and milk. Contents: Introduction: Special characteristics of animal foods. Meats: The iron of meats, the lime [calcium] content of animal foods, beef, mutton, goat, venison, pork, fowls, fish, "sea foods," oysters, meat extractives, the poisons of meat, viscera highly objectionable. "high" meats, putrefaction products in meat, the bacteria of meat, acidosis from a flesh diet, effect of flesh eating on animals, parasites of meat, flesh meat not essential, meat unnecessary, raw beef not antiscorbutic, special contraindications of flesh foods. Eggs: Introduction, egg yolk, egg white, the cooking of eggs, influence of hen's food on eggs, eggs and biliousness, the food iron of eggs, the lime content of eggs, egg substitutes, preserved eggs, bad eggs, candling of eggs, egg poisoning, when eggs should not be eaten. Milk: Introduction, table showing composition of cow's milk and milk products, why milk sours while meat putrefies, the special value of milk proteins, milk rich in vitamins, influence of food of cow upon milk, milk rich in salts, dried milk, cream, butter (rich in vitamins), butter color, cheese, skimmed milk, canned milk, buttermilk, whey, modified milk, the iron content of milk, the lime [calcium] content of milk and cheese, "yogurt cheese" (fermented using pure cultures of the *bacillus acidophilus*), whey, milk must be clean, sour milk, bitter milk, slimy and colored milk, bacteria on milk bottles, infections due to unclean milk, infected milk a cause of tuberculosis, injurious effects of sterilizing or pasteurizing milk, buddized milk (sterilized with peroxide of hydrogen), certified milk (and specifications established by the American Association of Medical Milk Commissions), a person may be sensitized to milk, medical uses of milk, how to eat milk (it must be chewed to mix it with saliva, not just swallowed; never eat it with meat), milk a cheap food, table showing composition of milk of various animals (human milk is the lowest in total protein {2.01%} and reindeer milk is the highest {10.90%}), table showing the composition of certain infant foods.

Photos show: (1) The appearance of eggs when candled (4 types). (2) The Battle Creek Sanitarium dairy barn (very clean, with cows standing in two long rows), (3) Beefsteak preserved in buttermilk for 15 years.

Note: Dr. Kellogg advocated a vegetarian diet. He opposed the consumption of meat, fowls (poultry), fish, or sea foods. Eggs are good food if they are fresh and properly cooked to make them digestible–at a low temperature (150-160ºF) until they are "soft boiled." Milk is an excellent food (good source of protein, calcium, and vitamins; and inexpensive) if it is fresh and clean (ideally certified), and comes from cows which have been fed upon fresh grass or other green food (which supplies vitamins). Unsanitary milk may contain disease-producing organisms such as those of typhoid fever, tuberculosis, and diphtheria. Butter is the most important of all animal fats because it is rich in vitamins. Fresh, unripened cheese (especially cottage cheese) and yogurt cheese are good foods. Fresh, clean milk is better than clean eggs. Address: Battle Creek, Michigan.

515. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk. Agricultural and industrial applications]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]
• ***Summary:*** Contents: Preface, by Louis Forest. Introduction–What is soya? 1. History of the dissemination of soya: In 1712 the naturalist Kaempfer introduced soya, introduction of soya to France and Europe, soya is cultivated in Austria in 1875 by Prof. Haberlandt, soya is the object of many trials in France from 1876 to 1881, the study and acclimatization of soya becomes widespread, the causes of setbacks in the cultivation of soya.

2. Cultivation of soya: Botanical characteristics of soya, the varieties of soya, Chinese varieties and soya in China, Japanese varieties and soya in Japan, American varieties and soya in America (varieties: Mammoth, Hollybrook, Ito San, Guelph, Haberlandt, Medium Yellow, Wilson, Peking, Tokio, Mandchu [Manchu], Black Eyebrow, Barchet), soya in Europe–France and Italy, seven varieties of soya tested in France, soya in the experimental farms for new crops (*les Fermes Expérimentales de Néoculture;* Many varieties from the USA were tested, including Manchu, Wilson Five, Haberlandt, Tokio, Virginia, Hato [Hahto], Early Medium Green), the cultural and geographical appearance of soya, its production worldwide, planting soybeans, heat units (*degré thermique*) and the germination of soya, the importance of spacing between plants, number of seeds per hectare, soya during its vegetative stage, the vegetation of soya compared with that of the haricot at high altitudes, rolling the seeds and types of crop maintenance, growth of the plant, acclimatization, the enemies of soya.

3. Composition of the soybean plant. 4. Soya forage: Green soya forage, soya hay, soya as a plant for soil improvement. 5. Harvesting soybean seeds: Maturity of the seed, harvesting soya, the food value and composition of

soya seeds. 6. Soya as an oil plant: Richness in oil, defatted soybean cake, imports and exports of soya cake from 1915 to 1919 (Imports to: Sweden, Canada, Korea, Japan, Formosa. Exports from: England, China, Korea), production of soya cake from 1915 to 1919 (Denmark, Great Britain and Ireland, Netherlands, Sweden, USA, Japan, Formosa, Korea, Java and Madura).

7. Soymilk: Its manufacture (in 1910-1913 Li Yu-ying installed a factory named "La Caséo-Sojaïne" at Vallées {Asnière-Seine} near Paris. Rouest visited this factory and saw them make soymilk, which was filtered using a filter-press resembling those used in sugar refineries), its properties and composition, composition compared to other types of milk, powdered soymilk, soymilk in the nursing and feeding of animals, soymilk related to tuberculosis in animals and in humans, soymilk would allow the milk and butter from animals to be reserved exclusively for human foods and could be used for raising many piglets, manufacture of non-dairy milk in Canada (a factory is now under construction). 8. Soya in Industry: Soymilk and soy casein, Sojalithe (like Galalithe).

9. Soya in human nutrition: Soy flour and its applications (incl. Li Yu-ying's usine de la Caséo-Sojaïne, and bread made of soya and wheat), soya compared to dry legumes (such as lentils, haricots, peas, beans), soya used as a legume (whole soybeans), the food value of soy sprouts, preserves and confections made from soya, soya chocolate and coffee, the amount of nutrients produced by soya and other crops from a unit of land, a meal of soya served in France (prepared and served some years ago by Li Yu-ying's soyfoods plant La Caséo-Sojaïne for the major print media, the medical press, the National Society for Acclimatization, etc.; it consisted of 2 soups {one with 'soya meat' and one with soymilk}, 2 entrees {an omelet with smoked soya ham, and fritters stuffed with soy meat}, soy [actually mung bean, *lüdou*] sprouts in a salad and sauteed, 3 desserts {soya cake, biscuits, and confection}, and soy coffee; a recipe for each is given; soya meat is smoked tofu).

10. Use of soya in East Asia: Tofu (*fromage végétal*), soy-based condiments (such as natto {Ping ming Natto and Tokio-Natto}, miso, Chinese miso or tao-tjiung [doujiang], and shoyu {Soyou or Schozou}), making soy sauce in Kwantung, China (from Groff).

11. The opinions of several authors concerning soya (from the French medical and hygienic press): Introduction–E. Maurel. Soya and soy bread in diabetic diets–Dr. Dujardin-Beaumetz, Dr. Bloch, Dr. J. Le Goff, L. Beille, M. Gautier. Soya used as a bean–M. Gautier. Soy sauce used in place of meat extracts. The state of cheese. The popularization of soya in Europe–A. Paillieux.

Conclusions: The influence of cultural technology on variation. Appendix: Advice to experimenters on the acclimatization of soya in France. Other methods of obtaining early-maturing soybeans.

The author concludes (p. 140): We must make every effort to acclimatize soya in France. We must develop the will and learn from past mistakes. Most soybean varieties now available in France are too late. We must get varieties from Manchuria, whose climate is similar to that of southeastern France, and from the northeastern USA. It is urgent that, in the near future, we start a Soybean Experiment Station to take responsibility for this work. The setbacks since 1830 can be overcome by present science and genetics. The first step is to introduce better varieties.

On the last page is a full-page advertisement for various seeds sold by Mr. Rouest, including 30 varieties of soybeans (*Soja hispida*)*;* the names of the individual varieties are not given.

Illustrations show: (1) A soy bean plant with many pods (title page). (2) Flowers and pods of the soy bean plant (p. 29). (3) Soy pods and beans (p. 30). (4) A soy bean plant drawn by a Chinese artist (p. 32, from Li Yu-ying). (5) Pods of the Hato [Hahto] variety of soy bean (p. 51). (6) Germinating soy bean seeds (p. 54, from Li Yu-ying). (7) Soy bean roots with nodules (from a photo by Dr. Le Goff; p. 73). (8) Soy bean pods, opened to show 3 beans in each (p. 82).

Tables show: (1) Production of soybeans by color in China in 1916 and 1917 (p. 35, in quintals, from the International Yearbook of Rome, Vol. 1, 1919): In 1917: Yellow 4,069,822. Other 953,012. Green 181,190. White 71,234. Black 40,066. Total: 5,315,324.

(2) Percentage composition of various oilseed cakes (p. 95, from Kellner). (3) Imports and exports of soybean cake, by country, from 1915 to 1919 (in quintals, p. 96). Imports are given for Sweden, Canada, Korea (from 1916), Japan, and Formosa [Taiwan]. Exports are given for England (6 quintals in 1915), China (including Manchuria, by far the biggest exporter, from 1916), and Korea (from 1916).

(4) Production of soybean cakes, by country, from 1915 to 1919 (p. 97, in quintals, based on statistics from the International Bureau of Agriculture, Rome, 1919). In descending order of production in 1915 (in quintals): Japan 5,439,337. Korea 3,209,238. Great Britain and Ireland: 1,513,059. Denmark 921,782. Java and Madura 503,025. Note that China is not listed. Netherlands 144,523. Formosa [Taiwan] 62,131. Sweden 1,733. USA 0, but 501,822 in 1916.

Note: When Alsace was occupied by the Germans during World War I, the Rouest family moved from Alsace to Paris. Mr. Rouest brought soybeans from Africa and adapted them to France. He paid for the publication of this book. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

516. Rouest, Leon. 1921. Le soja et son lait végétal: Applications agricoles et industrielles [The soybean and its vegetable milk. Agricultural and industrial applications].

Carcassone (Aude), France: Lucie-Grazaille. 157 p. Illust. No index. 25 cm. [42 ref. Fre]

• ***Summary:*** This is a summary of interesting points throughout this book. The main early use of soy in Europe was more therapeutic than nutritional (p. 3); it was used mainly in diabetic diets.

Nothing remains of the early trials conducted 20 years ago in France and Austria. The reasons for the crop's failure were lack of understanding of the laws of acclimatization and genetics, and the fact that soya (*soja*) was introduced as a new food legume, when actually it can only be utilized as a forage plant and industrially (for oil, cakes, and casein). Later, when the plant has been adapted, when it is understood that soya is not being propagated to competed with other dry legumes, that it is not being cultivated to extract from the seeds a vegetable milk for people, but simply as a forage plant–and the most remarkable one that exists (p. 3).

The English are trying to acclimatize soya to their colonies, especially those in southern Africa. In 1908 some 200,000 tonnes (metric tons) of soybeans were exported from China [including Manchuria] to Europe, followed by 500,000 tonnes in 1909. One can extract from soybean seeds a vegetable milk (*lait végétal*) which has the same value as animal milk for use in raising young animals. Its seeds and forage are also fine for raising farm animals and for industrial products. The author thanks all those who have helped him to acclimatize the soybean to France and to create new varieties of soya in France (p. 4).

Introduction of the soybean to France and to Europe (p. 6-7): A good but brief review of the literature on this subject. In 1739 Buffon was made director of the Jardin des Plants in Paris. Shortly thereafter, Christian missionaries in China sent him specimens of seeds and plants. The soybean must have been among them. The soybean has very probably been cultivated at the Museum since 1779, certainly in 1779 and later from 1834 to 1880. In 1855 Baron de Montigny was charged by the Society for Acclimatization to distribute five varieties of soya sent from China by Mr. Montigny; these were from northern China. The plants first bore seeds in France in 1854; their acclimatization is assured. In 1857 Mr. Lachaume transmitted to the Society for Acclimatization details of the success he obtained at Vitry-sur-Seine with soy culture. The seeds were planted in 1856. In 1858 a report to the Society for Acclimatization indicated that the acclimatization of the soybean was complete. In 1859 Mr. de Vilmorin reported on cultural trials sent from China by Mr. Perny. The varieties matured too late. The same year Dr. Turrel harvested soybeans at Toulon. In 1862 the Society for Acclimatization received seeds from Mr. Guillemin; the yellow soybean was said to be used for making tofu. Following the events of 1870, the cultivation of the soybean in France was apparently discontinued. Note 1. The brief war of 1870 between France and Bismark's Germany ended in France's defeat and the ceding to Germany of Alsace-Lorraine.

In the long section on Prof. Haberlandt's work with soya, starting with his cultivation of it there in 1875, is a quotation from him: "I don't know, in this history of cultivation, any example of a plant which has, in so few years and to such a high degree, excited such general interest" (p. 8).

From 1876 to 1881, the soybean was the object of numerous trials in France by the Society of Horticulture at Etampes (Seine-et-Oise). During this same period, one Dr. H. failed with varieties sent from Japan but succeeded in cultivating a yellow soybean sent from China, and used the latter to make his own tofu (*fromage végétal*) for use at home. In 1880 Messrs. Vilmorin-Andrieux introduced in their catalog a species cultivated in Austria-Hungary (p. 17-18).

In 1878, Japan, China, and the Indies (*les Indes*) presented all the varieties of Soya at the Universal Exposition, and their seeds filled more than 20 boxes. In 1880 the National Society for Acclimatization was able to distribute soy in France and tests were conducted in 24 regions; they were largely successful, especially in central and southern France (p. 19-22).

Tests were then abandoned from this time until about 1888, when the soybean started to grow in the southern states of the USA. That same year Messrs. Lecerf and Dujardin-Beaumetz first had the idea of using soy bread in diabetic diets (p. 22).

Causes of setbacks in soybean culture (p. 24-27): First, the varieties used matured too late and were not acclimatized in a progressive manner. We must choose varieties from northern China and adapt them to the south of France (*le Midi*) [which is on the same latitude as Toronto, central Wisconsin, or southern Minnesota]. From these, we must develop hybrids, and gradually move them northward.

The soybean has been ostracized in France. Major commercial, financial, and social interests have viewed with terror the production of an inexpensive food and have retreated into the egotistical "Malthusian agriculture." This is the truth! (p. 26).

Soy cheese is even feared by the cheese industry in France. They ask if they should abandon their excellent cheeses in order to adopt a vegetal cheese (*fromage végétal*).

A long quotation from the *Chinese Imperial Encyclopedia of Agriculture* (p. 34) gives the various colors of soybeans, including black, white, grey, and even some speckled / mottled with blue. The black ones can be used for medicine. And they are used as an ingredient in the condiment called fermented black soybeans (*Chi* [*douchi*]), made of soybeans, ginger, and salt.

In 1910-1913 a factory named "La Caséo-Sojaïne" was installed near Paris. I (Rouest) visited this factory in which were installed all the modern conveniences (*tout le confort moderne*), and presented the best guarantees of hygiene. The

milk was filtered using a filter press similar to those used in sugar factories (p. 99).

Note 2. Rouest has borrowed a great deal of material from earlier publications by Li Yu-ying, usually without acknowledgment and often arriving at very different conclusions, especially on the question of using soya to make human foods (Li) vs. foods and milk for animals (Rouest).

Rouest strongly recommends the use of soymilk to feed young domesticated animals. For us, soy will not replace green beans, milk or cheese. During World War I, the Germans were actively involved with the study of soymilk. A translation of an article from the *Schweizerische Milchzeitung* (Nov. 1918) tells how to make soymilk and tofu (p. 102). By using soymilk, there is no fear of transmitting tuberculosis. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

Le Soja et Son Lait Végétal [The Soybean and Its Vegetable Milk]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. See p. 22-24. [Fre]

• ***Summary:*** From 1880 to 1896 frequent communications were published in agricultural bulletins from the United States.

The soybean was studied in Russia by Nikitin.

In 1905, Li Yu Ying, councillor 1st class at the Ministry of Agriculture in China, had the idea of soymilk in Europe. In 1906 he created a laboratory in Paris. This laboratory grew into the factory Caséo-Sojaïne, which made all the products derived from the soybean (*produits dérivés du Soja*).

In 1910-11 presentations of soy products (*produits de Soja*) at the expositions at Brussels, Turin, and Dresden.

Mr. Lechartier conducted cultural trials in Bretagne and in the Haute-Vienne, and gave the results of his chemical analyses of the plant.

Dr. J. Le Goff, in the *Gazette des Hôpitaux*, called new attention of hygienic doctors to the use of soya in diabetic diets.

In 1913 it seems to have been imported into Germany for the following note was published in several Frankfurt journals:

An institute has been founded under the name of Soyama-Werke for the purpose of making soymilk (*lait artificiel de graines de Soja*) and other soy products. Soya furnishes to Bockenheim the most important quantity, if not all of the artificial product. Some 5,000 liters per day will be sold on the market in Frankfurt, when the factory is in full swing. The head of this enterprise is a deputy of the Reichstag. The Society Soyama-Werke also makes cream, butter, and cheese. Samples of soymilk have already been used by various bakers in Bockenheim.

This note indicates that in 1913 soybeans had not yet been cultivated in Germany. Dairy farmers were said to fear competition from soymilk. Thus, no doubt, they tried the same thing in Germany that was tried in France, for during the same period a factory, "La Caséo-Sojaïne," installed at Vallées near Asnières (Seine), conducted rather original publicity in favor of soy products. The soybeans processed in the Chinese factory were imported from China and it was realized in advance that the soyfoods, made from a plant absolutely unknown to the public, would not have its favor.

In 1910 Vilmorin had in its catalog Early Podolie soybeans [from Russia]; they had black seeds. But Early Podolie is still too late for the south of France (*midi*).

Dr. Le Goff published new medical articles about soy and tried cultivating it in the area around Paris. He introduced a rather early black-seeded variety (Tokio) that matured in this region.

Messrs. Boulanger and Dausse cultivated this variety at Etrechy (Seine-et-Oise, near Paris) in order to prepare conserves to be packed in boxes for diabetic diets.

Finally in 1918 Mr. Rouest, Director of the Experimental Farm of Neoculture, receive some soybean samples from the United States, via Messrs. Brioux and Semichon. He cultivated them, isolated the mutations, created hybrids, and tested the new varieties that had already been cultivated by Mr. Carles of Carbonnière / Carbonniere in the Tarn. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

Le Soja et Son Lait Végétal [The Soybean and Its Vegetable Milk]. Carcassone (Aude), France: Lucie-Grazaille. 157 p. See p. 103-06. [Fre]

• ***Summary:*** Soymilk can be used as a milk replacer, replacing the natural milk of mother calves, lambs, and pigs.

The raising and fattening of young bovines: Calves, when they are young, whether they are destined for reproduction, fattening, or raising, must drink natural milk, at least for about their first 15 days. Today everyone agrees on the purgative effects of the first milk (colostrum), serving to clear out the digestive tract of products which have encumbered it (meconium, a dark greenish mass that accumulates in the bowel during fetal life and is discharged shortly after birth) during its intra-uterine life. It is no big sacrifice to let the calf drink the natural [mother's] milk during the first week, since this milk cannot be used in the human diet, and one would do well to prolong this regimen for another week in order to permit the calf to gain strength and resistance.

Any [solid] food, however well prepared, cannot replace animal or vegetable milk at a young age. The composition of these milks is hard to imitate; the fats and casein are in emulsion in a large volume of water; likewise, the minerals

are in solution.

How could we proceed after the animal has been weaned? The calf should first be given defatted milk, soured, lukewarm with a little bran; other livestock raisers dilute the defatted milk with dish-water and increase the richness of the liquid by the addition of flour and bran. Fairly often, under these conditions, the calf digests this poorly and will not benefit from it as much as desired. This is the reason for it. The defatted milk, left on its own, sours and acidifies, to the degree that its environment is warm and humid. Thus it yields, through decomposition of lactose or milk sugar, lactic acid, which the animals don't like any more than we would like vinegar. In addition, brans and flours contain ferments [enzymes] and harmful germs that, having arrived in the stomach, find an environment favorable to their development. Thus they multiply in number such that the by-products they generate poison the organism [animal]. The young animal often contracts diarrhea and suffers for a long time; sometimes it even dies.

In this situation, when one does not know about soymilk, there is only one remedy, and that would be to give defatted milk, which is sweet and boiled, enriched with starch or meat powder or even flours from seeds that are very rich in protein (beans, broad beans, peas, or lentils). Here I can point out that one can replace these flours, which contain no more than 24-28% protein, with soya flour which contains 45-47%. By virtue of its high protein content, soy flour can be fed at the rate of 150 to 300 gm per day per head as a supplementary feed for calves from 1 to 3 months.

Thus, the feeding of young animals with the plant-based (*végétal*) milk of Soya permits the utilization of defatted animal milk for other purposes: human nutrition, extraction of the lactose for industry, etc. Since the animal milk, when centrifuged, would be a by-product, why not dry it dry it for making bread and biscuits, destined for the human diet.

Raising of young breeding cattle, beef cattle, poultry, piglets, birds, etc. on soymilk. The farmers who raise breeding cattle nourish them with pure milk, for a rather long time and rather copiously as is necessary to obtain elite animals; for all the others, which is the great majority, they measure out the milk to their animals with extreme parsimony / thrift, in the fear that any extra expense would not pay off. We resign ourselves to seeing the calves stagnate during their first month, with the hope of repairing the consequences of this miserable diet later, at a lower cost.

The vegetal Soja milk (*Le lait végétal de Soja*) will, from now on, reduce proportionally the cost of the milk diet such that the breeder will be assured of finding it to his advantage not to reduce the amount of time that this milk is given to the calves.

The prolonged and exclusive use of vegetal milk will be the first step, and the most important one, on the way towards the general improvement of our bovine races and of all our animal races.

The author then gives almost two pages of additional details supporting his basic argument. He notes that male calves, which are not being raised to be breeders or veal, should be killed and sold for their meat at the age of about 5 weeks; feeding them any longer is not cost effective–unless he feeds them defatted milk to which is added meat powder (which always gives red meat [unsuitable for veal]) or potato starch. The same basic concept can also be used for raising young pigs, poultry, other birds, horses, and sheep. Animal milk will then be reserved entirely humans, for use as milk, butter, cheese, and other dairy products. These products, which will be less expensive, could be purchased by people with lower incomes, and that will be the progress that will be made possible by the soybean.

A feed can also be prepared from molasses mixed with soy casein (*caséine de Soja*). In Germany such a feed is prepared with molasses and defatted milk; the casein extracted [from the defatted milk] using an acid and pressure, is mixed with [defatted] peanut press-cake, rice bran, crushed corn / maize, and palmetto flour. Molasses is added to the mass this obtained. It seems that a milk production facility in the center of Berlin, 400-500 quintals of this feed are produced each day. Here is a use for soybeans and their casein that could render a great service to dairy farms, if defatted milk were not used.

Soymilk could also cause the disappearance of so-called milk flours with names such as Lactine, Lactifer, Farine lactée, and Farine lactique. These products are normally not of a lactic nature; they always result from the association of nitrogenous flours and tertiary flours.

One such "lactic flour," which sold for 125 francs per 100 kg (before the war), according to Dr. Delacroix, professor of plant pathology at the National Agronomic Institute, is nothing but very finely ground field peas.

When the farmer cultivates soybeans themselves, whether he transforms them into milk or flour, these dairylike products, put on the market by ingenious industrialists, will be widely used to the great profit of agriculture.

Note: This is the earliest document seen (Aug. 2013) that discusses calf milk replacers in detail.

The next section discusses how soymilk can prevent tuberculosis in both animals and humans. Address: Directeur des Fermes Expérimentales de Néoculture, Carcassonne (Aude), France.

519. Chevalier, Aug. 1922. Rouest (L.)–*Le soja et son lait végétal, applications agricoles et industrielles* [Review of Rouest's book *The Soybean and its Vegetable Milk*]. *Revue de Botanique Appliquee & d'Agriculture Coloniale* 2(5):34-37. Jan. 30. [1 ref. Fre]

• ***Summary:*** Mr. Rouest (of Luxey, Landes) is director of the experimental farms in the southeast of France. He has collected many documents concerning the soybean published in France, the USA, Austria, etc. His book constitutes a

very complete study of soya, especially of its culture and utilization.

Mr. Rouest has conducted soybean trials at the experimental form of Barthes, at Villardonnel (Aude), in the southeast of France, since 1918, starting with varieties from America obtained via Messrs. Brioux and Semichon. He has also tested the new varieties cultivated by Mr. Carles, of Carbonnières, in the Tarn.

Sojalithe, made from soymilk, can replace celluloid. The reviewer concludes: "There is no reason that this crop, whose cultivation has recently expanded so greatly in North America, could not also be increasingly widely cultivated in France and her colonies."

520. Adolph, William Henry. 1922. How China uses the soy bean as food. *J. of Home Economics* 14(2):63-69. Feb. [11 ref. Eng]

• ***Summary:*** This article is quite similar to a 1920 article by Adolph and Kiang titled "The nutritive value of soy bean products," published in *The National Medical Journal of China* (6:40-49). It combines a review of the literature with the author's personal experience in China and a summary of some studies conducted in the Shantung Christian University laboratory on soy bean products. "The soy bean is probably the most universal article in the Chinese dietary. When the Chinese finds it necessary to distinguish between the soy bean and other varieties of bean, he refers to the soy bean as the *yellow* bean (*hwang dou*), and this is the name most common throughout the orient... The use of the soybean in China dates back to the beginning of China's agricultural age under the Emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu,* the ancient materia medica, written by Shen Nung himself in the year 2838 B.C."

"The soy bean as such is not very largely used as food in China, but it is the source of a number of products. It would be impossible to make a complete list of all these. The best known and the most important are the bean milk, bean curd, bean sauce (soy), bean sprouts, bean oil, and bean cake. The student of nutrition is particularly interested in the bean curd or 'bean cheese.'" There are four agents employed in China to make soy bean curd, often called Chinese cheese. "These are: (1) *lu,* the solid residue prepared by the evaporation of salt bittern; (2) gypsum; (3) *swan giang,* the soured bean milk whey remaining from the previous coagulation of bean curd; and (4) vinegar.

"In spite of the tremendous consumption of bean curd in China, the industry does not center in large factories, but myriads of small shops, as numerous as our own candy stores and fruit stands, make and supply the daily needs in bean curd for the millions throughout the Chinese republic. Every small town has at least one bean curd shop. Good bean curd must be manufactured fresh every day. The coagulated curd is white in color and resembles our cottage cheese. After coagulation it is pressed between cloths, cut up into squares or moulded into cakes about five inches in diameter and an inch thick, and sold to the Chinese housewife. A cake of the size indicated costs approximately $0.01 in U.S. currency. The cakes of bean curd may also be salted and dried, yielding a product which resembles our cream cheese.

"Tradition says that the manufacture of soy bean curd was originated in China in 164 B.C. during the reign of the Emperor Han Wen, by a man named Liu An, the duke of Hwai Nan. The common Chinese name for soy bean curd is *dou fu,* often romanized *tofu;* and the classical name is *li chi,* probably meaning 'the morning prayer.' It is interesting to note that in China at the present day the bean curd is made in the early hours of the morning, and sold at daybreak.

"Liu An was a great friend of the Buddhist monks, and it seems quite probable that he invented this bean curd in order to provide a change or delicacy to break the monotony of the monastic ration. As a matter of fact, bean curd is a real delicacy if carefully made and well cooked. Chinese who are connoisseurs on the subject assert that when so prepared it has the taste of pig's brain. Americans and Europeans eating Chinese food often eat carefully prepared bean curd thinking it is pork. With sugar it produces a dish like custard. Prepared with salt it resembles scrambled eggs.

"The Tsinan variety of bean curd is made exclusively with the use of *lu* as a coagulating agent. In the following table the analyses of bean curd are compared with that of common cottage cheese."

Table II gives an analysis of both fresh and dried soy bean curd, and compares them with cottage cheese. Table III gives an analysis of the ash of soy bean curd and soybeans.

Soy bean milk is discussed and Table IV gives its composition (4.22% protein, 1.87% fat), plus that of cow's milk (3.3% protein, 4.0% fat) and bean milk whey.

"Soy bean sprouts. Soy beans soaked in water and allowed to sprout are much relished as a vegetable by the Chinese. Very considerable quantities of soy bean are used in this way. The sprouts are usually cooked in oil, and produce a dish which appeals very strongly to the taste of Americans in China. It is strongly recommended for use as a vegetable on the American table." Table V shows that soy bean sprouts contain 5.7% protein and 0.8% fat.

"The soy bean cake is the press-cake which remains behind after the removal of the soy bean oil in the press mill. The orient has used soy bean cake for cattle feed and for fertilizer. It is of note that it contains a high percentage of nitrogen, but, economical though the Chinese have been, they do not seem to have attempted to convert it into a human food. Only recently has it been very seriously suggested that both in the occident and in the orient this rich nitrogenous material should be converted into some form of food for human consumption. During the north China famine of 1920-1921, the soy bean cake was actually used in the starvation diets to bolster up a failing food supply."

"Discussion: The Chinese people make practically no

use of dairy products, and the bulk of the people consume very meagre amounts of meat. Yet in spite of this they have lived for centuries on what appears to be a remarkable well-balanced diet by the use of the soy bean...

"A number of interesting examples are found in China of the use of bean curd as an agent for growth. One of the writer's Chinese colleagues, whose home is in Anking, has observed that dealers in birds employ bean curd as the sole food for infant birds. The birds are robbed away from their nests immediately after they are hatched, and are then fed bean curd to tide over the infantile period till able to feed themselves. Still more interesting is the case of the true Buddhist monk who from birth is consecrated to the priesthood, and is carried through the period of childhood growth on a rather heavy diet of bean curd... The country monastic diet is noted for its high content of soy bean products...

"The Chinese coolie... in spite of the scanty intake of meat and the constant exposure to overwhelming sources of infection, still does possess a wonderful resistance. The diet of the average coolie contains a surprisingly large amount of beans and bean products...

"A common saying in some parts of China terms 'bean milk the poor man's milk, the bean curd the poor man's meat.' This simply indicates the extent to which bean curd has been incorporated into the diet of the Chinese...

"Soy bean propagandists have been especially enthusiastic over the introduction of soy bean curd into America. Dr. Yamei Kin, a Chinese dietitian, has become particularly well-known as an exponent of bean curd on her visits to the United States."

Note 1. This is the earliest document seen (April 2013) that uses the terms "poor man's meat," or *li chi* or *dou fu* or "bean cheese" or "Chinese cheese" to refer to tofu. Use of the word "bean cheese" is confusing, since it could also refer to fermented tofu (also called "Chinese cheese" or "bean cake").

Note 2. This is the earliest document seen (Aug. 2003) that uses the term "poor man's milk" to refer to soymilk. Address: Assoc. Prof. of Chemistry, Shantung Christian Univ., China.

521. Sato, Y. 1922. Bean industry and its scientific study. *Light of Manchuria* No. 20. p. 1-33. April 1.
• ***Summary:*** Contents: Introduction. 1. Bean [soya bean] industry: Utilization of fat and bean oil, refining of bean oil (clarification of bean oil by precipitation, bleaching of bean oil {bleaching by clay, by carbon, by sun's rays, by heat, by chemicals}, refining by alkali, deodorizing), manufacture of derivatives (bean oil for paint manufacture, making of water proof from bean oil, substitute of India rubber from bean oil, substitute for hardened oil, lard and butter, manufacture of liquid fuel [petroleum] from bean oil). 2. Chemical industry using legumin: Industrial uses of bean cake, manufacture of plastic substance from legumin. 3. Beans as a food stuff: Introduction, bean milk (artificial milk; Melhuish 1915 British Patent, Goessel 1917 Dutch Patent, Japanese Patent no. 28,346), bean coffee and bean chocolate, food made from bean flour (bean powder or flour, roasted bean flour, and fat-free bean flour), hints on manufacture of food from nutritive point of view. Conclusion.

"What is now in the highest demand in Europe and the United States is not [soya] Beans themselves, but Bean Oil or various products made therefrom." "It may be said that the rapid development of the economic Manchuria has been accelerated by [soya] Beans. The future of the Manchurian industry may well be said to depend a good deal on Beans." Address: South Manchuria Railway Co., Agricultural Office.

522. Domaschintzky, Julius. 1922. Improvements in and relating to synthetic milk. *British Patent* 157,352. April 10. 2 p. Application filed 10 Jan. 1921. [Eng]
• ***Summary:*** About 0.07% of sodium nitrate (on the dry beans) is added to the alkaline washing liquid to decompose the amines present. Address: 1, Marokkassergasse, Vienna, Austria.

523. *Toronto Daily Star* (*Canada*). 1922. Milk from soya bean being made in Vienna [Austria]. April 19. p. 8.
• ***Summary:*** This is a summary for an article from Scientific American [sic]. "'Manna' milk from the soya bean is now being made in Vienna at one-sixth the cost of fresh cow's milk. In proteid, carbohydride [carbohydrate] and fat content, and in color, it closely resembles cow's milk, being, or course, free from milk-borne diseases. Butter and cheese [tofu] can also be made from the bean, and 'manna' flour, one part of which equals in nutritive value two parts of meat and one-third part of wheat flour. So, at least, Dr. Berczeller, a young Hungarian scientist tells us; he designates the soya bean as an ideal food containing 40 per cent albumen and 20 per cent fat."

Note 1. As of Aug. 2011, we have been unable, searching Google Books and the magazine itself, to find this article in *Scientific American.*

Note 2. This same article appeared in *The Labor Digest.* 1922. June p. 40 (Vol. 14, No. 3).

524. *Washington Post.* 1922. Bean that is a cow. April 28. p. 23.
• ***Summary:*** "The world's demand for soy beans is steadily increasing, and China's export of them bids fair soon to surpass in value that of its silk output. There are more than 1,000 varieties of soy beans, from which an experiment station at Kung-chu-ling, in southern Manchuria, has chosen one as the best of all. It is nearly spherical, yellow in color," and the size of a small pea. It yields 22% of its weight in oil when crushed. "The soy bean yields milk and butter (or products equivalent for table use), as well as a great variety

of other edibles, including a famous sauce [soy sauce]. Taken all in all, the soy bean is one our most versatile vegetables."

525. *Los Angeles Times.* 1922. "Manna" from soya bean. May 21. p. IV12.
• ***Summary:*** From Scientific American: "'Manna' milk from the soya bean is now being made in Vienna at one-sixth the cost of fresh milk. In proteid, carbohydride [carbohydrate] and fat content, and in color, it closely resembles cow's milk, being, or course, free from milk-borne diseases. Butter and cheese [tofu] can also be made from the bean, and 'manna' flour, one part of which equals in nutritive value two parts of meat and one-third part of wheat flour. • ***Summary:*** Gives a chemical analysis of soymilk and compares it with cow's milk. A sample of soy bean milk, yellowish-white in color and having a sickly sweet taste and a faintly acid reaction, gave the following results on analysis: 88.93% water, 11.07% dry matter, 3.06% fat, 8.01% non-fatty solids, 2.96% protein, 0.57% starch, 2.48% glucose, 0.63% mineral matter, 6.44 cc of 1 normal acid alkalinity of ash, 4000 germs per cc. The gross energy content was 54 calories (cow's milk 70 calories). Content of food- units was 27 (cow's milk 34). The price of the soy bean milk at the time of the investigation was the same as that of cow's milk. It cannot therefore be considered to be an economical substitute for cow's milk. Address: Chemical Dep., Hygienic Inst., Univ. of Freiburg.

• ***Summary:*** "Alcohol, coffee, cocoa, teas, tobacco, salt, pepper, etc., and sugar are all together poisons; so I was told when I was interested in dietetics after physical treatments had improved my conditions, but failed to heal me perfectly... I was a 'strict' vegetarian.

"Today my general attitude to these 'poisons' is this: In general they are, if used in a moderate way, far less harmful than over-eating,... They stimulate more or less at the expense of vitality and the efficiency of the nerves; but they don't produce nor do they leave any substantial waste in the body like meat, eggs, milk, fats and starchy foods." Address: Prof.

529. Kneipp Store. 1922. Health foods. Toilet articles (Ad). *Herald of Health and Naturopath* (*New York City*) 27(10):512-13. Oct.
• ***Summary:*** Under "Health foods: Breads and specialties. Diabetic foods and remedies (incl. Gluten bread). Laxative foods and remedies (incl. bran bread, crackers, wafers, and cookies). Cereal coffees (8 brands). Tea substitutes and health cocoas. Nut butters, honey and jellies (incl. Carqué's almond butter, Lust's peanut butter {roasted or unroasted}). Vegetable extracts, food additions and olive oil. Unfermented imported wines. Unsulphured, sundried fruits (incl. Black Mission Figs). Meat substitutes (Protose, Nuttose, Vegetable Meat or Roast, Vej-Meat or Vej-Roast, Watson's Nut Meat, Beans–Kidney, Soya, or Navy, Bromose–Nut or Fig, Mushrooms). Cereals (11 brands, incl. Carqué's Natural Whole Rice).

Note: The "Health Foods" half of this add appeared in the Sept. 1925 (p. 854) issue of this magazine. Address: 110 East 41st St., New York City.

530. Zlatarov, Asen; Trifonow, Iw. 1922. Die bulgarische Sojabohne [The Bulgarian soybean]. *Zeitschrift fuer Untersuchung der Nahrungs- und Genussmittel* 44(4):214-15. Oct. (Chem. Abst. 17:835). [1 ref. Ger]
• ***Summary:*** The mean analysis of 9 samples of black and yellow soy beans from different parts of Bulgaria is as follows: 10.91% water, 36.76% protein, 18.57% fat, 25.27% nitrogen-free extract, 3.94% crude fiber, and 4.75% ash. The fat content is high compared with other European soy beans. The papuda bean (*Phaseolus radiatus*) [azuki bean?], which is somewhat similar to the soy bean in appearance, and much cultivated in Macedonia, only contains half the quantity of protein and from 1/10 to 1/15 the quantity of fat. Two samples of artificial milk prepared from Bulgarian soy beans gave the following analyses: 90.53%/88.19% water, 5.3%/6.04% protein, 2.21%/2.94% fat, 1.18%/1.90% carbohydrates, and 0.78%/0.93% ash. Address: Chemical Institut, Univ. of Sofia.

532. Arnbrecht, Jacob. comp. 1922. Hygienic cook book: A collection of choice recipes carefully tested. Revised and enlarged. Battle Creek, Michigan: Shaw Printing Company. 416 p. Index. 21 cm. [10 ref]
• ***Summary:*** This is a Seventh-day Adventist vegetarian

cookbook (which includes dairy products and eggs), containing much basic information about nutrition and hygiene. A full-page table titled "Typical foodstuffs representative of each food nutrient" (p. 14) lists soy beans as a food that contains protein, but less than is found in eggs, meat, milk, or cheese. It also notes that soy beans are "Starchless." A half-page table titled "Classification of proteins" (p. 18) states that the proteins legumin and glycenin [sic, glycinin] are found in soy beans. The chapter titled "Entrees" contains a recipe for "Soy bean loaf" which includes 1½ cups soy bean puree and ½ cup peanut butter. This is the only soy recipe in the book. This same chapter contains many recipes using "substitutes for flesh meats" (such as Protose, Nuttolene), and other innovative ingredients (gluten meal, ground nut meats, vegetable butter, nut butter) made by Seventh-day Adventist companies. Recipe names include: Vegetable meat. Vegetarian beefsteak. Mock veal pie.

Cellulose (p. 26): It "has no nutritive value, but because it is not digested in the human body it forms the larger part of the ballast or bulk of our food which is so necessary to a normal intestinal movement. It stimulates peristalsis by acting as a gentle mechanical irritant." Those who have a tendency to "sluggish intestinal movement" may want to add bran to their food or consume a diet consisting of "a greater proportion of foods which contain a large amount of 'roughage' or ballast, such as green vegetables, fruits, and whole grain products."

Note: This is the second earliest Seventh-day Adventist cookbook seen (Oct. 2004) that contains a recipe using soybeans or soy ingredients.

Also discusses: Lecithin (p. 28; soy is not mentioned). Food combinations (good, fair, and bad; p. 44). Acid and alkali forming foods (p. 48). Natural diet of man. Shall we eat meat? Dangers of disease in meat. Was flesh first used before or after the flood? (p. 50-55). Diet for constipation: Lists of laxative foods to be recommended and avoided (p. 147-49). Sago is used in puddings (p. 237). Many desserts contain a great deal of sugar, plus eggs and milk; others use "vegetable gelatine" (p. 262). Pies use butter, peanut butter, granola, etc. Whole wheat bread/flour is different from Graham bread/flour (p. 293). Recipes for gluten bread, and Gluten biscuit or sticks (p. 301), and Gluten mush (p. 319). Chapter 32, titled "Nut preparations" (p. 375-77) contains a recipe for peanut butter using two processes, one of which calls for a Quaker City Mill. Recipes for Almond milk (p. 382). Peanut candy (p. 394).

533. Beythien, Adolf. 1922. Volksernaehrung und Ersatzmittel [Popular nutrition and substitute foods]. Leipzig: Chr. Herm. Tauchnitz Verlag. xvi + 562 p. See p. 298-99. Index. 24 cm. [Ger]

• ***Summary:*** This book strongly reflects the influence of World War I, when many *ersatz* or "substitute" foods had to be made in Germany. In the section on meat alternatives (*Fleischersatzmittel*) is a listing of such alternatives by brand (such as "War meat") with the ingredients in each. Soybeans and yeast are mentioned separately (p. 133) as an important source of protein in such products.

The section on artificial milk (*Kunstmilch*) notes (p. 217) that although almond milk or "vegetable milk" (*Vegetabilen Milch*) is the best known, other good milk alternatives can be made by finely grinding other oil-containing seeds such as soybeans, peanuts, and hazelnuts with water and a little sugar or other sweeteners. Soymilk patents by Goessel and by Melhuish are described briefly.

A section titled "The soybean" (p. 298-99) notes that this versatile legume is widely used in East Asia, and has long been valued in Europe like lupins and chestnuts as a healing food in times of food shortages. During the War, the defatted meal was used in Germany in baked goods such as Agumamehl and Burtamehl, which also contained added rice starch, 7.22% fat, 40.28% protein, and 5% ash.

The section on dry soups (p. 334) mentions *Soja-Suppe* and *Sojama-Suppe.* Note: Suppe means "Soup." In the section titled "Legumes," a table (p. 337, based on König) gives the composition of eight legumes, including soybeans.

Also discusses: Quark and quark cheese (p. 224-25). Margarine (p. 275-77). Lupins (p. 299-300, 334). Bambarra groundnuts (*Voandzeia subterranea;* p. 340).

The author, a professor and doctor, was born in 1867. Address: Director of of the Office of Chemical Investigations (*Chemischen Untersuchungsamtes*), City of Dresden [Germany].

534. Cooper, Lenna Frances. 1922. The new cookery. 8th ed., revised. Battle Creek, Michigan: The Modern Medicine Publishing Co. 449 p. Index. 23 cm.

Plain soups. 11. Meat substitutes and entrees. 12. Macaroni and Italian pastes. 13. Eggs. 14. Gravies and sauces. 15. Vegetables. 16. Salads and relishes. 17. Toasts. 18. Fruit Desserts. 19. Custards and cold desserts. 20. Frozen desserts. 21. Pastry and pies. 22. Cakes. 23. Cake fillings and frostings. 24. Hot puddings. 25. Sauces for puddings. 26. Canning and preserving. 27. Special dishes for invalids. 28. Balanced menus."

Soy is not mentioned in this Seventh-day Adventist vegetarian cookbook; soy flour was mentioned in 9th edition (1924).

This book is dedicated to the author's mother. Page 13 states: "The author wishes to express her indebtedness to Dr. and Mrs. John Harvey Kellogg, of the Battle Creek Sanitarium, who have inspired her with a love for the study of foods and their scientific preparation and who have since been constant sources of help and encouragement."

With each recipe is given the calories in the recipe and per serving from protein, fat, carbohydrate, and total. Interesting items: Cereal coffee, Kaffir tea, and Health Koko (p. 33). Yogurt buttermilk and Orange yogurt (p. 34-36). Sterilized bran (p. 44). Graham mush with dates, Gluten mush, and Creamed gluten mush (with 1 cup 20% Gluten Meal, p. 47). Granola fruit mush (p. 49-50). Graham bread (p. 54-55). Peanut butter sandwiches (p. 84-85). Protose sandwiches (p. 85). Cream of almond soup (p. 104-05). Noodle soup with Savora (p. 126-27). Chapter 11, titled "Meat substitutes and entrees" contains many interesting recipes, including some commercial products made by SDA companies: Roast Protose with dressing (p. 129). Protose fillet (p. 130). Nut fillet (with Protose and Nuttolene, p. 131). Fillet of nut meat (with Protose and Cereal Coffee, p. 131). Nut meat loaf (with Protose and Nuttolene, p. 143). Vegetarian ham (with Nuttolene, Protose, and Savora, p. 143). Nut patties. Nut chops (with peanut butter, p. 144-45). Peanut roast (p. 145-46). Jellied peach (with 1 cup sugar, p. 284). Spanish cream (with 3 cups hot milk, 3 eggs, and ½ cup sugar, p. 285). Hot Malted nuts (with ¼ cup dry Malted Nuts, p. 386). Hot Malted Milk (with 4 tablespoons Malted Milk, p. 386). Almond cream (p. 388). Meltose ice cream (with 1 cup Meltose, p. 389). Almond ice (with 6 tablespoons almond butter, p. 389). Frozen malted nuts (with 1½ cups Malted Nuts, p. 390). Gluten bread (with 3.75 cups 40% Gluten Flour, p. 390-91). Gluten puffs (with 1 cup 40% Gluten Flour, plus soda and hydrochloric acid p. 391). Note: In 1923 Lenna F. Cooper was secretary of the American Home Economics Association (see *Journal of Home Economics*, Oct. 1923, p. 588). Address: Director of the Battle Creek Sanitarium School of Home Economics, Head Dietitian of the Battle Creek Sanitarium [Battle Creek, Michigan].

535. Martindale, William Harrison; Westcott, W. Wynn. 1922. The extra pharmacopoeia of Martindale and Westcott. 17th ed. (Reprint) 2 vols. London: H.K. Lewis & Co., Ltd. See vol. I, p. 568, 597, 824; vol. II, p. 369, 414-15. Index. 17 cm. [14 ref]

• ***Summary:*** The Preface to volume I notes that the last edition was issued in Jan. 1915, shortly after the European war began. The war was caused by "Germany's long conceived desire to ruin and destroy the British Empire–her best friend commercially..." During the war, brilliant German chemists and chemical factories quickly changed over "to the manufacture of explosives and poison gases"–such as mustard gas.

In the long chapter titled "Materia Medica, Official and Non-Official, alphabetically arranged" is a section on "Nutrimenta" (p. 562-79) that describes foods which can be used as medicines. In the subsection on "Milk preparations" (p. 567-75) we read (p. 568): "Synthetic milk. *Syn.* *Solac (T.M. 346623) [Trade Mark, British registered]. Soya beans are ground to a coarse flour and stirred vigorously in an alkaline solution to extract the soluble proteins. The oil, which is nauseous to the taste, is carefully removed. Finally Arachis and Sesame Oils, Dextrin and the remaining salts of milk are added; after emulsifying, *B. Acid Lactic* is added. The average fat content is 3.5%.

"*Melco* is also made using Pea Nuts as the source of Albumin. The methods are subjects of patents by W.J. Melhuish, (*The Practitioner* {London}, Vol. 10, No. 115, p. 80; *Pharmaceutical Journal and Pharmacist* {London}, Vol. ii, 1916, p. 297; *British Medical Journal*, Vol. ii, 1915, p. 646; Vol. 1/18/430).

"D.F. Ritchie writes that he experimented in the matter some years ago and found that a milk can be made by grinding up Soya Beans with a small quantity of water, and then adding enough water to make an emulsion, but Soya Beans as such cause considerable gastric disturbance (*Pharmaceutical Journal and Pharmacist* {London}, Vol. ii, 1916, p. 244; See also F. Golby, *Pharmaceutical Journal and Pharmacist*, Vol. ii, 1916, p. 214).

The section titled "Oleum papaveris" (p. 597-98) is identical to that in the 1915 edition.

In the chapter titled "Supplementary list of drugs" is a long section (p. 824) on "Soya Bean.–*Glycine Hispida* (*Leguminosae*)." It is identical to that in the 1915 edition.

The next two sections (p. 824) state: "Synthetic Milk *q.v.* has been made from the bean.

"Sarton (T.M. 322562) is a preparation of the bean for use as a diabetic food.

The next section, titled "Soya Oil" (p. 824) is almost identical to that in the 1915 edition.

In Vol. II, the section titled "Lecithin" (p. 87-88) is very similar to that in the 1915 edition; soy is not mentioned. In the chapter on "Analytical memoranda," the section on estimation of urea in the blood (p. 369) notes that "Urease contained in Soya Bean is used. It converts urea quantitatively into Ammonium Carbonate, but has no effect on other nitrogen constituents. (The hydrolysis is complete in 15 minutes.)... Caprylic Alcohol is used in conjunction with the Soy Bean flour. See for further details, pp. 414, 415."

The section titled "Urease method of estimating urea" (p. 414-15) begins: "Mix 25 Cc. of the urine with a pinch of powdered Soy Bean flour (2 to 3 Gm.)... It must be remembered that the urease [in the soy bean flour] attacks [hydrolyzes] only *urea*, 1 molecule of urea producing 1 molecule of Ammonium Carbonate." Details are given. can be used.

William Martindale lived 1840-1902. Volume I also discusses: Gluten (p. 576-77–Synonym: Vegetable Albumin). Diabetic foods (p. 576-77, incl. starchless bread; soy is not mentioned). *Oleum sesami* / Sesame Oil (p. 603-04; also called Benné oil, gingelli oil, teel oil). *Arachis Hypogæa.* (p. 780; also called Pea Nut, Ground Nut Goober Nut, Manilla grain [Manila grain], Chinese Almond).

Volume II also discusses: Proprietary medicines (p. 562-81, incl. Carter's Little Liver Pills, Ovaltine, and Pinkham's (Mrs. Lydia E.) Vegetable Compound, Woodward's Gripe Water). Address: 1. Ph.D., F.C.S.; 2. M.B.Lond., D.P.H.

536. Rouest, Leon. 1922. La culture du soja [Cultivation of soya]. In: Congrès de la Production Coloniale, Marseille. 1922. *Mémoires et Rapports sur les Matières Grasses* [Memoirs and Reports on Oils and Fats. Vol. 1]. Marseille [Marseilles], France: Institut Coloniale. 476 p. See vol. 1, p. 344-57, 449-51. 28 cm. [100+ ref. Fre]

• ***Summary:*** This paper is largely taken from the chapter on soybean cultivation in Rouest's 1921 book titled *Le soja et son lait végétal: Applications agricoles et industrielles* [The soybean and its vegetable milk. Agricultural and industrial applications]. However the bibliography for the soy chapter (p. 449-51) is largely new.

Contents of soy chapter: Soybean varieties tested in France: Yellow soybean, Soja d'Etampes, very early soybean (black), Wilson Five, extra early from Podolia, very early brown (selected by Mr. Carles de Carbonnière and tested at Barthes in 1920). The soybean on the Experimental Farms for New Crops in France. Sowing soybeans. Heat units required for soybean germination (2500º to 3000º). Importance of plant spacing. Quantity of seed per hectare. The soybean during its vegetative growth. Comparison of the vegetation of the soybean and the haricot at high altitudes. Rolling the seeds (*Roulage des semis*) and crop maintenance. Growth of the plant. The state of being acclimatized. Enemies of the soybean.

Most soybean varieties grown on the Experimental Farms for New Crops come from America. In 1920 the first ones arrived at maturity. These American varieties include: Wilson Five, Haberlandt, Tokio, Virginia, Hato [Hahto], and Early Medium Green. The writer has applied the principles of genetics, as articulated by Hugo de Vries, Blaringhem, Bateson, etc., in working with these soybeans. Discusses the work of l'abbé Vieules with soybeans in le Tarn, at l'Institut Génétique de Nages; he grew soybeans at an altitude of 800 meters (p. 349, 353, 355). Dr. Valette grew Manchurian soybeans and harvested them at the end of September.

Contains a long bibliography of many crops, by crop (p. 403-468); the bibliography on Soja is on pages 449-51. Address: Director of the Experimental Farms for New Crops, France (*Directeur des Fermes Expérimentales de Néoculture de France*).

537. Oshima, Kokichi; Church, Margaret B. 1923. Industrial mold enzymes. *Industrial and Engineering Chemistry* 15(1):67-70. Jan. [13 ref]

• ***Summary:*** "A new method for quantitative estimation of protease is described in this paper. Many strains of the *Aspergillus flavus-oryzae* group, which were separated from tane-koji used in shoyu manufacture and related industries, showed individually the production of amylase and protease of widely different strengths... Even on soy-bean flour, which contains no starch, strong amylase is produced."

The molds were cultivated on various media, including "soy-bean milk agar." "Experiments here show that extracellular and intracellular enzymes are the same, and after a certain period of growth all enzymes are excreted."

On page 68 is a reproduction of an interesting label, written in both Japanese and English, on an envelope containing "commercial mold ferment." The English-language portion reads: "Pure Cultured Aspergillus Soja. Registered Trade Mark." Illustrations show conidiophores of Aspergillus.

Photos show: (1) A worker in or near a koji room with koji trays inoculating the ingredients for making soy sauce with the mold ferment, *Aspergillus flavus.* (2) A series of modern, brick-walled koji rooms with wooden doors. Address: 1. Hokkaido Imperial Univ., Sapporo, Japan; 2. Bureau of Chemistry, USDA, Washington, DC.

538. Hamburger's Grocery Store. 1923. Go to Hamburger's Grocery Store for Health Foods (Ad). *Los Angeles Times.* Feb. 7. p. II20.

• ***Summary:*** "We carry the most complete line to our knowledge on the West Coast. Established 1881. 'Some ha' meat who canna' eat'–then it is they seek the most appetizing, most nutritious health foods. Hamburger's has searched this country and abroad to bring the best to you. One entire department is given over to health foods alone..." Two lines of health foods are advertised: Eugene Christian Vitamin Foods (Vegex brand), and Battle Creek Sanitarium Health Foods. For the latter: "- new goods arriving daily. Laxa–a combination of sterilized wheat, bran and Ceylon agar. Calax, Paramels, Paralax, Lactose, Dextrine, Acidophilus Lactose, Dialtetic [sic, Diabetic] Bran, Cooked Bran, Soy Biscuit, Black Fig, White Fig and Prune Marmalade, Gluten Meals, Malted Nuts, Yogurt Tablets. Among the many meat substitutes are Protose, Nuttose and Nuttolene."

"Free delivery, convenient charge account and special phone service." Groceries delivered free twice a day.

Note: A similar but larger ad appeared in 11 April 1923 issue, p. II22. Here we read "Diabetic Bran, Soy Biscuits." Address: Fourth Floor [Broadway at Eighth, Los Angeles]. Phone: Broadway 3940.

539. Thevenot, Gaston D. 1923. Process of making vegetable milk [from soy beans]. *U.S. Patent* 1,444,812. Feb. 13. 3 p. Application filed 21 Feb. 1922.

• ***Summary:*** "It is well known that vegetable milk may be obtained from a number of legumes, but among these the soy bean is to be preferred because of the fact that it contains the nourishing properties found in cow's milk to a larger degree than other legumes at present available. The use of this bean,

however, is attended with some objections, the principal one being the taste. Another objection is the color...” To prepare vegetable milk from soy beans, soak the beans in water at a temperature not exceeding 50ºC for about 4 hours, draw off the water, then soak in cold water for 10-12 hours. Grind or mash the beans with the spargings of boiling water such that the whole mass is raised to approximately 70ºC, but not substantially higher. “The effect of this treatment is to practically eliminate the disagreeable beany taste already referred to.” After a few minutes, run the mass “into a filter press or centrifuge. The resulting filtrate is a milky substance containing many desirable constituents of ordinary milk although lacking in some of the ingredients. For instance, it is deficient in salt and sugar.” It may be bottled for future use, or evaporated to any desired consistency, or formed into a powder. Or salt, sugar, and sodium bicarbonate may be added–the latter to neutralize any acid. Address: New York City, New York.

540. Piper, Charles V.; Morse, William J. 1923. The soybean. New York, NY: McGraw-Hill Book Company, Inc. xv + 329 p. Feb. Illust. Index. 24 cm. Reprinted unrevised in 1943 by Peter Smith Publishers, New York. [563 ref]

• ***Summary:*** This is the first comprehensive book about the soybean written in English, and the most important book on soybeans and soyfoods written in its time. Contains an excellent review of the world literature on soybeans and soyfoods with a bibliography on soy that is larger than any published prior to that time (563 references), a good description of the present status of the soybean worldwide based on the authors’ extensive contacts, and a great deal of original information. It quickly became a key source for people and organizations working with soybeans and soyfoods in all countries, and a major factor in the expansion of the soybean in the western world. Because of its scope and influence, Soyfoods Center considers the year of its publication to mark the end of the “Early Years” of the soybean worldwide. It remained in print until about 1986.

Contents: Preface. 1. Introduction: Name of the plant, origin, literature, use by the Chinese and Japanese, present importance, future prospects in the U.S., recognition of the possibilities. 2. The commercial status of the soybean: Manchuria and China, Japan, Europe, U.S., other countries, summary of imports and exports of soybeans and soybean oil. 3. Botanical history of the soybean: History prior to Linnaeus’ “Species Plantarum” 1753, Linnaeus’ misunderstandings of the soybean, Prain’s elucidation, other and the correct botanical name.

4. Agricultural history of the soybean: Vernacular names of the soybean, China, Korea, and Japan, India and neighboring regions, Cochin China, Malayan region, early introduction into the United States, later U.S. introductions, the early introduced varieties (grown in the USA by 1898–Ito San, Mammoth, Buckshot, Guelph or Medium Green, Butterball, Kingston, Samarow, Eda, Ogemaw or Ogema), soybean in Europe, varieties grown in Europe and identification, Hawaiian Islands, Australia, Africa, Argentina (p. 50), Canada (“Soybeans are grown in very small quantities in Canada and then usually as a forage crop”), Philippines, Egypt, Cuba (p. 52), British Guiana, Mauritius (p. 53), present culture distribution. 5. Culture of the soybean: Climatic adaptations, soil preferences, water requirement, preparation of seed bed, time of planting, methods and rate of seeding, seeding for pasturage, depth of seeding, inoculation, fertilizer reactions, cultivation, soybeans in mixtures (with cowpeas, sorghums, Sudan grass, Johnson grass, millet, corn, or sunflowers and corn).

6. Harvesting and storage of soybeans: harvesting soybeans for hay, silage, for the seed, seed yields, proportion of straw to seed, storing seed, separation of cracked from whole soybean seed, viability of soybean seed, pedigreed, inspected, registered, and certified seed. 7. Composition of the soybean: Proportions of stems, leaves and pods, composition of plant and seed, nutritive and mineral constituents, forms of nitrogen in soybean nodules, factors affecting oil content of seed. 8. Utilization of the soybean: Diversity of uses (a chart, p. 129, shows 59 products that can be made from soybean seeds, and 6 more that can be made from soybean plants), soybeans for green manure, pasturage, soiling, ensilage, hay, straw.

9. Varieties: Japanese, Manchurian, botanical classifications, vital characteristics, descriptions of important varieties, key for identification, breeding and improvement, genetic behavior, oil content.

10. Structure of soybean seeds. 11. Soybean oil: Methods of extraction [Manchurian, and solvent], American oil mills, methods of shipping and marketing, prices, utilization in soap manufacture, food, paint manufacture, miscellaneous. 12. Soybean cake or meal: Feeding value, composition, use for feeding for dairy cows, cattle, swine, sheep, poultry, digestibility, injurious effects, fertilizer.

13. Soybean products for human food: Food value of the soybean, digestibility of the soybean and its products, mature or dry soybeans, immature or green soybeans (a “nutritious green vegetable”), soybean flour, digestibility of soybean flour, soybean bran (p. 225-26), soybean sprouts, soybean coffee, soybean or vegetable milk [soymilk] (preparation, composition, residue from the manufacture of vegetable milk [okara], utilization of soybean milk, condensed vegetable milk, vegetable milk powder, fermented vegetable milk), vegetable casein, tofu or soybean curd (names and brief history, method of manufacture, coagulating agents, manufacturing yields, digestibility, utilization of bean curd and manufactured products, bean curd brains or *tofu nao*, dry bean curd or *tofu khan*, thousand folds {*chien chang tofu*}, fried bean curd {*tza tofu*}, Fragrant dry bean curd {*hsiang khan*}, frozen tofu {*kori tofu*}, Chinese preparation, various dishes), natto, hamananatto [hamanatto], yuba, miso, shoyu

[soy sauce], confections. 14. Table dishes of soybeans and soybean products: mature or dry beans, flour, tofu, sprouts (86 recipes). 15. Enemies of the soybean: bacterial, mosaic, fungous [fungus], and nematode diseases, insects, rodents. This last chapter is a comprehensive review of the literature on soybean diseases and insects published before 1922.

The Preface begins: "The soybean, also known as soya or soja bean, has assumed great importance in recent years and offers far-reaching possibilities of the future, particularly in the United States. It is, therefore, desirable to bring together in a single volume the accumulated information concerning this crop...

"The aim has been to present the information so as to make it useful from both agricultural and commercial standpoints, not omitting, however, much that is mainly of historical or botanical interest..."

The introduction begins: "There is a wide and growing belief that the soybean is destined to become one of the leading farm crops in the United States."

Note 1. C.V. Piper lived 1867-1926. Note 2. This is the earliest English-language document seen (July 2003) that uses the term "soybean bran" to refer to soy bran.

Note 3. This is the earliest document seen (July 2003) in which Piper or Morse describe natto, Hamananatto [Hamanatto], yuba, or miso.

Note 4. This book was published by March 1923 (See *Ohio Farmer,* 10 March 1923, p. 313). Address: 1. Agrostologist; 2. Agronomist. Both: United States Dep. of Agriculture, Washington, DC.

541. O'Brien, Harry R. 1923. Soy-bean magic: It is shown in feedlots as well as in factories. *Country Gentleman* 88(13):4, 18. March 31.

• ***Summary:*** Describes the results obtained by feeding a soy-and-mineral ration in a pasture to hogs, cows, poultry and horses. The idea was conceived in 1920 by three faculty men at Purdue University (W.A. Ostrander–extension farm crops specialist, S.D. Conner–chemist, and C.M. Vestal–dep. of animal husbandry). "Soy bean products are being used commercially to make salted peanuts and peanut brittle, meat substitutes, cheap coffee, synthetic milk, margarine, axle grease and other lubricants, chocolate, sardine packing oil, lard substitutes, soap, linoleum, artificial suet, foundry casting-cores, printer's ink, vegetable cheese, toilet powder, fertilizer, high explosives, rubber substitutes, waterproof cloth, and salad oil. The Chinaman makes an oil to use in lamps as a kerosene substitute.

"The use of soy-bean products commercially is just in its infancy in this country, hitherto the two most important uses being paint and soap. Most of the oil used has been imported from the Orient... Since 1912, when oil was first produced commercially in the United States from home-grown soy beans, the oil has been produced by the flaxseed crushing mills. But within the past year a number of mills for crushing soys alone have been projected. I visited Peru, Indiana, last summer, where one was being erected, and Monticello, Illinois, where a company was being organized to erect one.

"The past year there has been a big demand for soys from the paint companies who cannot get enough flaxseed."

Prof. W.E. Hanger, extension farm crops specialist at Ohio State University, says: "It is quite possible that before long, instead of feeding many beans, the farmer will sell his bean crop and buy back the soy-bean oil meal to feed... Last year there were somewhere between 40,000 and 50,000 acres of soy beans grown in Ohio, where in 1920 only about 7,000 acres were grown... and the acreage will doubtless be largely increased this year."

Photos show: (1) A man standing in a thriving "thirty-acre field of soy beans on the farm of Noah Fouts, Camden, Indiana. For two years previous this field has been in soy beans and corn and pastured with lambs. The present crop indicates there is nothing wrong with the system." (2) A man driving a tractor "harvesting and hulling soys in one operation on the Homer Johnson farm in Sheridan, Indiana." Note: This looks like a primitive combine, which is pulled alongside the tractor. Address: Indiana.

542. Piper, Charles V.; Morse, William J. 1923. Vegetable casein (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 233-34.

• ***Summary:*** "Vegetable casein can be prepared from soybean milk by precipitating the legumin from the milk, purifying by several washings and precipitations and finally by drying. The soybean casein obtained in this manner is a yellowish powder closely resembling animal casein prepared in the same manner. It is the general opinion that vegetable casein has a coefficient of digestibility much less than that of animal casein. According to the investigations of Labbé (1911 ["Le soja et ses usages"]), however, vegetable albumin is quite as readily assimilated as animal albumin. While vegetable casein has some differences from animal casein, about the same differences exist between the caseins of different animals.

"According to Beltzer (1911 [*see Scientific American Supplement,* 19 Aug. 1911, p. 115]), the manufacture of vegetable casein from the soybean has become an established industry in Cochin China. The extraction of the casein for industrial purposes is obtained from the meal, after the extraction of the oil from the bean."

"The casein obtained from the soybean can be employed in the same ways as animal milk. This vegetable casein is utilized for food and for industrial purposes. The various uses of soybean casein are: Medium for paints, dressing for textiles, size [sizing] for paper, Galalith, waterproofing for textiles, etc. As a food it is used as 'Soy-casein,' a flour like Nestle's, with which sauces, bread, jam, milk, fermented milk, cheese, and concentrated biscuits may be made."

Note 1. See also the separate section in this book titled "Soybean flour" (p. 222-25).

Note 2. This is the earliest English-language document seen (Oct. 2008) that uses the term "soybean casein" or "Soy-casein" to refer to isolated soy protein products.

543. Piper, Charles V.; Morse, William J. 1923. Photographs and illustrations (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p.

• ***Summary:*** Photos show: (Fig. 1) Typical soybean plant (p. 1). (2) Plant of wild soybean (p. 2). (3) A fleet of junks engaged in carrying soybeans to Newchwang, Manchuria, from different points in the interior, taking away bean oil and bean cake to other places * (p. 6). (4) Soybeans in sacks brought to a bean center by horses in winter in Manchuria (p. 8). (5) Chinese bean cart loaded with beans in wicker containers in Manchuria (p. 8).

(6) Type of cart and method of hauling soybeans with a horse in Manchuria (p. 10). (7) Manchurian farmers hauling the bean crop to market in winter on sleds (p. 10). (8) Plants of a soybean variety from India (p. 38). (9) Plants of the wild soybean from Soochow, China, grown at the Arlington Experimental Farm, 1908 (p. 38). (Fig. 15) Soybeans grown on the edges of a rice field in southern China * (p. 58).

(16) A man in a field of the Peking variety of soybean grown in rows and cultivated (p. 61). (17) A broadcast field of soybeans showing how weeds have overrun the field (p. 61). (18) The ordinary grain drill furnishes a most convenient method of seeding in rows or broadcast (p. 63). (19) Soybeans and corn grown in alternate rows for pasturage; a man in a hat stands between the rows (p. 65). (20) The roots of a soybean plant, showing abundant development of nodules (p. 66).

(21) A man standing in a plat of soybeans without inoculation (in the foreground) and an adjacent plat which had been inoculated, in the background (p. 67). (22) A man seated on a cultivator pulled by two horses doing the last cultivation on a field of soybeans (p. 79). (23) Soybeans and sorghums grown in mixture for forage purposes (p. 80). (24) A field of soybean and Sudan grass grown in mixture for hay (p. 81). (25) A field of soybeans and corn grown in the same row for ensilage (p. 82).

(26) Soybean hay on frames. Under favorable weather conditions, hay can be successfully cured in this manner (p. 86). (27) A field of mature soybeans ready to cut for seed (p. 90). (28) Harvesting soybeans for seed with a bunching attachment on the mower (p. 90). (29) Self-rake reaper used in cutting soybeans for seed (p. 91). (30) Soybeans cut for seed with binder and soybeans placed in shocks for curing (p. 92).

(31) The ordinary gasoline threshing outfit which may be used in threshing soybeans (p. 92). (32) A special bean harvester used in gathering the soybean seed from the standing mature plants and also cleaning it (p. 94). (33) A special bean harvester by which the plants are cut, thrashed, and cleaned (p. 94). (34) A special soybean harvester used to gather soybean seeds from the standing mature plants, and which can be adjusted to level or ridged cultivation. On one side is written "The Little Giant Bean Harvester," manufactured by Hardy & Newsom, La Grange, North Carolina (p. 95). (35) Method of storing soybean seed awaiting shipment in Manchuria. The beans is sacks are stacked under Chinese mats (p. 98).

(37) Pasturing a corn and soybean mixture with sheep (p. 133). (38) Thrashing soybeans from the field and baling the straw (p. 141). (39) The larger plant is the Guelph or Medium Green which is very pubescent, while the smaller plant is a nearly smooth variety from Japan (p. 149). (40) Pods of soybeans showing the range in size and shape (natural size; p. 151).

(41) Seeds of the most important varieties of soybeans now grown in the United States showing the wide range in size and shape of seed. The name of each of the 20 varieties is given. A side view and a ventral view of each pair of seeds is given (p. 152). (42) Seeds of a black and white variety (Widower) from Korea. The white is due to the splitting of the outer later of the testa. A side view of six varieties is shown (p. 155). (43) A field of the Biloxi soybean, which requires a long season to mature (p. 163). (44) A man standing in a field of the Virginia variety of soybeans (p. 170). (45) Seeds of a natural soybean hybrid showing peculiar types of coloration (p. 175). (46) Pods of soybeans, hairy and smooth (p. 176). (47) A sterile soybean plant obtained from a natural hybrid (p. 176). (49) Seeds of an artificial soybean hybrid, showing peculiar types of coloration (p. 181). (56) An old style Chinese oil bean press, Manchuria (p. 195). (57) Coolies at Newchwang, Manchuria, carrying loads of soybeans from the junks to big stacks, where they are kept until the factory needs them for oil manufacture * (p. 196). (58) "Seeds and pods of the Hahto variety of soybeans, the seeds being especially valuable as a green vegetable" (p. 222). (59) Baskets of sprouted, small yellow soybeans and sprouted mung beans * (p. 226). (60) Men making soymilk, working with machinery with which the soybeans are ground and the milk strained. Note the 2 grinding stones and the cloth strainers suspended from the ceiling over the tub. The cabinet with rack for bottles is noted in the background (p. 228). (61) Motor stone mill for grinding soybeans in preparing tofu with brass water tank (A), funnel reservoir (B), stones (C), and brass guard (D) (p. 229). (62) Delivery coolies holding baskets full of bottles showing the way soybean milk is delivered by the factory in Changsha, China (p. 231). (76) A courtyard filled with large earthenware containers with cone-shaped wicker tops for ripening soy sauce mash [in Ichang (I-ch'ang or Yichang), Hupe / Hupeh / Hubei province, China]; a small, strong basket is placed into each, with its rim just above the surface of the mash. The soy sauce collects or accumulates

in each basket and is then dipped out, ready for consumption * (p. 251). (77) A man standing next to an iron cauldron in which soybeans are boiled for the manufacture of soy sauce (p. 252). (79) Fermenting room for yeast and soybeans in preparation of soy sauce (p. 253). (80) Rows of pots with cone-shaped wicker lids filled with soybean and wheat mixture for soy sauce * (p. 254). (81) A box press in which sacks of fermented soybeans are placed for pressing out the liquid forming soy sauce * (p. 254). (82) A man next to a kettle for boiling the soy sauce. After it is boiled, the sauce is ready to be placed in kegs at left side (p. 255). (83) Rows of soybean sauce in jars ready for shipment (p. 255). (84) Root of a soybean plant showing rootknot caused by the nematode (*Heterodera radicicola*) (p. 285).

Note: * means photo by Frank N. Meyer in China or Manchuria.

Illustrations (line drawings) show: (Fig. 48) Flower of the soybean enlarged. Front view. Side view. Parts of the corolla, standard, wing, one of the keel petals. Stamens. Pistil (p. 177). Figures 50-55, from Kondo (1913) are described at Kondo.

Maps show where the soybean is extensively and successfully grown in: (Fig. 10) The Orient (p. 51). (11) North and South America (p. 52). (12) Europe and Africa (p. 53). (13) A map of Manchuria shows the soybean districts and seed production of different localities (p. 56). (14) An outline map of the United States shows the areas with shading to which the soybean is especially adapted as to varieties and purposes (p. 57).

A diagram (Fig. 36, p. 129) shows the various ways in which the plants and seeds of soybeans are utilized. Level 2: The first two categories are seeds and plants.

Level 3: Under seeds: Food products, oil, and meal. Under plants: Hay, ensilage, soiling.

Level 4: Under food products: green beans and dry beans. Under oil: Glycerin, explosives, enamels, varnish, food products, waterproof goods, linoleum, paints, soap stock, celluloid, rubber substitute, printing inks, lighting [illumination], lubricating. Under meal: Human food, stock feed, fertilizer. Under forage: Hay, ensilage, soiling.

Level 5: Under green beans: Green vegetables, canned, salads. Under dried beans: Soy sauce, boiled beans [from whole dry soybeans], baked beans [whole], soups, coffee substitute, roasted beans, vegetable milk, breakfast foods. Under soap stock: Soft soaps, hard soaps. Under oil–food products: Butter substitute, lard substitutes, edible oils. salad oils. Under meal–human food: Breakfast foods, diabetic foods, flour, infant foods, macaroni, crackers, [soy] milk.

Level 6: Under dried beans–vegetable milk: Cheese, condensed milk, fresh milk, confections, casein. Under meal–human food–flour: Bread, cakes, muffins, biscuit.

Level 7: Under cheese: Fresh, dried, smoked, fermented.

544. Piper, Charles V.; Morse, William J. 1923. Soybean flour (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 222-25, 266-73.

• ***Summary:*** "Soybean flour, though not as yet a common commodity, has been used for many years in America and Europe in invalid dietetics. This flour which is made by grinding either the whole beans or the press cake remaining after the oil has been removed from the bean, is becoming an important article of food in America and European countries as it is of high food value and can be used as one of the ingredients of many palatable and nutritious dishes.

"Utilization and products.–"Extensive investigations have been conducted by the United States Department of Agriculture and Domestic Science Schools relative to the utilization of soybean flour. It has been found that this flour can be successfully used as a constituent for bread, muffins, biscuits, crackers, macaroni, and in pastry. In these various food products about one-fourth soy flour and three-fourths wheat flour have been found to be the proper proportion. In some of the pastry products, however, as much as one-half soy flour can be used. It will be found that in several dishes, as soybean mush, soy flour can be used entirely.

"In the United States soybean flour in on the market, being put up like ordinary cereal flours; also in special packages for invalids. In England, manufacturers have placed on the market a so-called 'soya flour' which is 25 per cent. soybean flour and 75 per cent. wheat flour. This soya flour is being used by bakers in making a soy bread which is very palatable and is extensively used by the English bakers. A similar flour is said to have been manufactured in Holland for 25 years. Soya biscuits and crackers are also manufactured from this flour and constitute articles of export from England.

"German millers have been experimenting to some extent with soy flour in making brown bread by mixing with rye flour... Soybean flour enters largely as a constituent in many of the so-called diabetic breads, biscuits, and crackers manufactured as food specialties. It also is utilized in the manufacture of breakfast foods and can be used in the preparation of vegetable milk and bean curd.

"Composition and value for invalids.–The soybean contains at the most but a slight trace of starch, and extensive experiments in American and Europe indicate that value of the bean and its products as the basis of foods for persons requiring a low starch diet."

A table (p. 224, from the USDA Bureau of Chemistry) compares the composition of two types of soybean flour (made from whole soybeans, or from soybean cake), wheat flour, corn meal, rye flour, Graham flour, and whole wheat flour. The two types of soybean flour contain by far the most protein (39.56% and 47.30% respectively), followed by Graham flour (12.60%) and whole wheat flour (12.00%). The two soybean flours also contain the least carbohydrates (26.63% and 33.85%).

Also summarizes research on: (1): The value of soybean flour for feeding infants and young children; (2) The nutritive value and digestibility of soybean flour.

Thirty-one recipes for soy flour are given on pages 266-73.

545. Piper, Charles V.; Morse, William J. 1923. Tables (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p.

• ***Summary:*** Tables: (1) Acreage, production and yield of soybean seeds in the United States. Gives statistics for each for 1918, 1919, and 1920 for 14 states, other, and total. The states are listed in descending order of soybean acreage in 1921, as follows: North Carolina, Virginia, Alabama, Illinois, Ohio, Kentucky, Missouri, Tennessee, Wisconsin, Indiana, Georgia, Pennsylvania, S. Carolina, Mississippi.

(2) Estimates of soybean production of Manchuria for various years (in million tons): 1906 = 0.6. 1907 = 0.6 to 0.9. 1908 = 1.150. 1909 = 1.150. 1910 = 1.4. 1913 = 1.2 1921 = 4.52.

(3) Cost of production of soybeans per acre in Manchuria, 1910. (4) Monthly capacity of steam oil mills at Newchwang, Manchuria, 1917. (5) Export of soybeans, bean cake, and bean oil from the principal ports of South Manchuria, 1909 to 1913, inclusive. (6) Five-year averages of acreage, production, and yield per acre of soybeans in Japan. (7) Amount and value of soybeans imported by Japan. (8) Importations of soybean cake and bean oil into Japan. (9) Quantity and value of exports of soybeans and soybean oil from Japan to foreign countries, 1913 and 1914. (10) Quantity and value of exports of miso (bean cheese) and shoyu sauce, 1903 to 1907, inclusive. (11) Quantity and value of imports of soybeans, bean cake, and bean oil by European countries, 1912 to 1914, inclusive. (12) Comparative prices per ton of cottonseed and soybeans in European markets, 1911 to 1914, inclusive. (13) Quantity and value of soybeans, soybean cake, and soybean oil imported into the United States, 1910 to 1920, inclusive. (14) Quantity of imports of soybeans in the world's trade, 1920-1919 inclusive. (15) Quantity of imports of soybean oil in the world's trade, 1910-1919 inclusive. (16) Quantity of exports of soybean oil in the world's trade, 1910-1919 inclusive. (17) Quantity of exports of soybeans in the world's trade 1910-1919 inclusive. (18) Acre yields of seed and hay of soybeans at different dates of planting at Arlington Farm, Virginia. (19) Yields of soybeans variously spaced. (20) Acre yields of soybean hay and seed when planted at different rates. (21) Germination of soybeans at different depths of planting at Arlington Farm, Virginia. (22) Influence of nodules on the composition of seed. Michigan Experiment Station. (23) Effect of various nitrogenous fertilizers on the yield of soybeans. Massachusetts Experiment Station. (24) Effects of different phosphatic fertilizers with and without lime. Rhode Island Experiment Station. (25) The influence of different potash salts on yields of soybeans. Massachusetts Experiment Station. (26) Effects of different kinds of lime on the yield of soybeans. Massachusetts Experiment Station. (27) Effect of fertilizers on soybeans. Delaware Experiment Station. (28) Composition of hay of Mammoth soybean at different stages of development. Arlington Farm, Virginia. (29) Comparison of the loss in moisture in 10-lb. samples of green forage of ten varieties of soybeans when air dried. Arlington Farm, Virginia. (30) Tons of soybean hay to the acre at different experiment stations in the United States. (31) Bushels of soybean seed to the acre at different experiment stations in the United States. (32) Relative yields of straw to seed in different varieties of soybeans. Ohio Experiment Station. (33) Viability of soybean seed. (34) Proportions of stems, leaves, and pods. (35) Nutritive constituents contained in each part of the soybean plant. After Lechartier. (36) Composition of the different parts of the soybean plant at different stages of growth, at Arlington Farm, Virginia. (37) Total weights of mineral materials in 1,000 kilos of dry forage. After Lechartier. (38) Mineral Materials in 1,000 kilos of dry forage. After Joulie. (39) Percentages of nitrogen, phosphoric acid and potash contained in different parts of the soybean plant at different stages of growth, at Arlington Farm, Virginia. (40) Composition of soybean seed compared with that of other legumes. (41) Composition of common American varieties of soybeans. (42) Percentage composition of the different parts of soybean seed. After Lechartier. (43) Percentage composition and comparison of the amino acids of the protein of the soybean and of cow's milk. (44) Percentage composition of the nitrogen-free extracts of the soybean. (45) Starch content of commercial varieties of soybeans in the United States. (46) Maximum, minimum, and average of the more important constants of soybean oil from 48 varieties, compared with those of other well-known oils. (47) Comparison of the more important constants of soybean oil by different observers. (48) Constants for soybean oil. (49) Composition of the ash of the soybean seed. After Pellet. (50) Mineral content of the soybean seed compared with those of cowpea, navy bean, and peanut. (51) Oil content of soybeans gathered at various stages of maturity. (52) Oil content of soybeans as affected by partial defoliation. (53) Oil content of soybeans as affected by partial removal of very young seed pods. (54) Oil content of soybeans of large and small size seed from the same plant. (55) Oil content of soybeans planted at intervals of two weeks in 1911, at Arlington Farm, Virginia. (56) Varietal differences in the oil content of soybeans grown at Arlington Experiment Farm, Virginia, in 1907, 1908 and 1910. (57) Oil content of soybeans grown under different environmental conditions. (58) Oil and protein content of soybean varieties grown under different environmental conditions. (59) Fertilizing constituents of soybeans contained in crop and roots on one acre. Connecticut (Storrs) Experiment Station. (60) Yields of

hay of different legumes and content of fertilizing ingredients. Michigan Experiment Station. (61) Fertilizing constituents of soybeans cut at different stages of growth. Arlington Farm, Virginia. (62) Data and results of soiling experiments with milch cows. Iowa Experiment Station. (63) Soybean soiling experiment with milch cows, Pennsylvania Experiment Station. (64) Analyses of soybean, soybean and corn, and corn silages. (65) Digestibilities of soybean and other silages. (66) Digestible nutrients in 100 lb. of air-dry substance. (67) Digestible nutrients in 100 lb. of soybean straw and in other roughages. (68) Fertilizing constituents of soybean straw compared with those of wheat, oats, barley, and rye. (69) Number of seeds per bushel and weight in grams of 100 seeds of the most important varieties. (70) Results of planting a single variety of soybean at different dates. Vienna, Austria, 1877. (71) Results of planting different varieties of soybeans at different dates at Knoxville, Tennessee. (72) Life period of soybean varieties grown at the Arlington Experimental Farm, Virginia, for eight seasons. (73) Life periods of American varieties of soybeans grown at Sabour, India, 1911 (from Woodhouse and Taylor, 1913). (74) Life period of soybean varieties planted at intervals of two weeks in 1911 at the Arlington Experimental Farm, Virginia. (75) Behavior of flower color in natural hybrids. (76) Behavior of pubescence colors in natural hybrids. (77) Behavior of amount and colors of pubescence in an artificial hybrid. (78) Behavior of the color of pods in natural hybrids. (79) Behavior of seed colors in natural hybrids. (80) Soybean crosses in the study of seed color. (81) Behavior of cotyledons in natural hybrid selections. (82) Behavior of cotyledons in soybean crosses. (83) Variations in the cooking qualities of seed of different varieties of soybeans. (84) Consumption of vegetable oils by the soap industry in the United States. (85) Consumption of vegetable oils in the production of lard substitutes and oleomargarine in the United States. (86) Composition of soybean cake, meal, and other important oil feeds. (87) Two 17-week comparisons of soybean meal with other supplements for fattening pigs. (88) Growth and nitrogen elimination of chicks fed varying amounts of meat scrap or soybean meal or both, in addition to a corn ration. (Indiana Experiment Station). (89) Comparison of the digestibility of soybean meal and other oil meals. (90) Digestion coefficients of soybean meal obtained with sheep. Massachusetts Experiment Station. (91) Fertilizing constituents of soybeans, soybean meal, and cottonseed meal. (92) Analyses and calories of soybeans compared with those of other legumes and foods. (93) Composition of soybean flour in comparison with wheat flour, corn meal, rye flour, graham flour, and whole wheat flour. (94) Composition of the sprouts from the soybean and mung bean. (95) Composition of soybean milk compared with cow's milk. (96) Yields of bean curd obtained from different varieties of soybeans. (97) Compositions of tofu and tofu products. (98) Nitrogenous substances in natto. (99) Composition of hamananatto. After Sawa. (100) Composition of yuba. (101) Composition of red and white miso. (102) Composition of shoyu or soy sauce. (103) Composition of soybeans of the same variety dried, soaked, and roasted.

546. Piper, Charles V.; Morse, William J. 1923. Soybean or vegetable milk (Document part). In: Piper and Morse. 1923. The Soybean. New York: McGraw-Hill. xv + 329 p. See p. 228-33.

• ***Summary:*** Contents: Introduction. Preparation of soybean milk. Composition of soybean milk. Residue from manufacture of vegetable milk [okara]. Utilization of vegetable milk. Condensed vegetable milk, Vegetable milk powder. Fermented vegetable milk.

The section titled "Residue from manufacture of vegetable milk" states: "After separating the milk from the solid material, the residue is still very rich in nutritive substances. According to Bloch (1907) and Li Yu Ying (1911-12) this material contains no trace of starch. Bloch (1907) gives the following composition of this vegetable milk residue: Water, 88.75, nitrogen, 0.248; ash, 0.36, fat, 0.04; and other substances, 10.85 per cent.

Note: This is the earliest English-language document seen (June 2013) that uses the term "vegetable milk residue" to refer to okara.

"Utilization of Soybean Milk: Vegetable milk has rather a strong characteristic taste and odor, somewhat suggesting malt. These may be masked by the addition of a small quantity of coumarin or vanillin. Vegetable milk may be used the same way as cow's milk. In China this milk is drunk by the Chinese in the early morning with some sugar added. It is also eaten as a thin broth with salted pickles. Vegetable milk is extensively used throughout China for infant feeding. In many of the cities and towns of China, factories are engaged solely in the manufacture of vegetable milk. This milk which is bottled is delivered (Fig. 62) each morning to regular customers.

"Investigations in America and Europe with vegetable

milk indicate that it may be successfully used in place of cow's milk in numerous preparations. The milk has

been used with good results in bread, cakes, in creaming vegetables, in custards, in chocolate or cocoa, and in milk chocolate. In special therapeutic cases, vegetable milk has been used successfully in place of animal milk and is said to rank closely to mother's milk in infant feeding. If allowed to remain in a warm place, the milk becomes sour, like animal milk, and in that form may be employed just as is sour milk or buttermilk. Various ferments may be also used to bring about this condition.

"The milk made from the soybean also serves as a check on the very prevalent summer diarrhea common to children. Sinclair (1916) experimented on babies, who had various ailments, and found that soybean milk brought improvement in the great majority of cases, curing diarrhea and intestinal disturbances. It was also found that the milk was easily digested and easily excreted."

547. Friedrichs, Wilhelm. 1923. Verfahren zur Gewinnung eines milchaehnlichen Auszuges aus Sojabohnen und aehnlichen Samen oder Samengemischen [Process for obtaining an extract resembling milk from soya beans and similar seeds or seed mixtures]. *German Patent* 374,746. April 27. Application filed 27 Jan. 27 1920. [Ger]

• ***Summary:*** Soybeans or the like are fractionally lixiviated with water; they are first extracted in bulk, whereby the bitter principles present are removed, and are then ground and extracted a second time, yielding a liquid possessing properties similar to those of milk. The first extraction is preferably carried out with hot water in order to coagulate the coagulable proteins before the second extraction is attempted.

Note 1. It is not clear how the bitter principles are removed from the soy slurry. Note 2. The albumins and globulins (soy proteins) are coagulated by heat. Address: Frankfurt am Main [Germany].

548. *Popular Science Monthly.* 1923. Peanuts: How scientist's 145 varieties helped lowly "goober" to rise. May. p. 68.

• ***Summary:*** "At last the lowly peanut has graduated from the circus tent. It has become, almost overnight, one of America's most important and most wholesome food products. It serves more than 100 needs of man. This spectacular rise of the humble 'goober' is due chiefly to the patient experiments of one man–George W. Carver, professor of agricultural science and husbandry at Tuskegee Institute. Professor Carver knows more about peanuts than any other man in the United States... For example, Professor Carver found that one ordinary tumblerful of shelled peanuts will produce a pint of rich, creamy milk that you can drink in your coffee or pour over your morning cereal."

Concerning peanut milk, Carver explains: "It is rich, creamy, and palatable, and it contains 3 times as much carbohydrates, three times as much protein and 12 times as much fat as cow's milk, and only one tenth as much water. It was never intended to be substituted for cow's milk. It is a distinct product in the dietary."

"Peanut milk is a perfect emulsion of the oils, fats, proteins, carbohydrates and some of the ash of the peanuts. Many different kinds of milk can be made by controlling the proportions of carbohydrates and proteins and scientifically diluting the product. Its keeping qualities are about the same as those of cow's milk. It makes splendid bread, rich in flavor, and is excellent for creaming vegetables. Since it is a purely vegetable drink, it forms body building nourishment for invalids or children."

An illustration shows "Prof. George Washington Carver in his laboratory making peanut milk."

A sidebar notes that 25 years ago the peanut was a "no account" in American agriculture. Today annual production of peanuts in the USA is about 53 million bushels, or about ½ bushel per person.

549. Soyama-Werke Dr. Englehardt & Company. 1923. Verfahren zur Herstellung von Pflanzenmilch [Process for the manufacture of plant milk]. *German Patent* 378,180. July 5. 2 p. Application filed 8 March 1921. [Ger]

• ***Summary:*** Germinated beans are employed in the usual way for preparing the artificial milk. Use of the sprouting process (*des Keimungsprozesses*) for making a milklike liquid from certain soybeans give excellent results. The yield of the extract is higher, and the flavor of the product is very much improved. First, the sprouted seeds (*Die gekeimten Samen*) are washed... The final extract is rich is carbohydrates and soluble protein, and white in color; since the process takes place in a dark room no chlorophyll is formed. It has a taste similar to that of cow's milk.

Example of the process used: 1 kg of soybeans are soaked in water and after complete swelling, they are placed in a dark room at about 15ºC for about 24 hours. The sprouting takes place while the seeds are well rinsed at regular intervals. After 3-4 days powerful cotyledon sprouts (*kräftige Blattkeime*) will have developed. The germinated beans (*Die gekeimten Bohnen*) are scalded / parboiled (*abgebrüht*) then wet-milled (to 1 kg of starting material, 4 liters of water are added, resulting in a milklike suspension). The insoluble residue (*Die unlöslichen Rückstände*) [okara] is separated out through filtration. The resulting milklike liquid can be used just like any plantmilk (*Pflanzenmilch*).

The patent claim: Process for the manufacture of a plantmilk from soybeans and similar oilseeds (*ölhaltigen Samen*) using sprouted soybeans (*gekeimte Sojabohnen*).

Note. This is the earliest German-language document seen (Jan. 2013) that uses the term *gekeimte Sojabohnen* to refer to soy sprouts. Address: Frankfurt am Main–West [Germany].

550. Loreti di Imola, Mario. 1923. Esperienze sul lattante del

latte di Soja hispida [Experiments with feeding unweaned infants with soymilk]. Thesis, Univ. of Bologna (Università di Bologna), Faculty of Medicine and Surgery (Facoltà di Medicina e Chirurgia). 56 p. July. 30 cm. [10 ref. Ita]
• ***Summary:*** Soymilk, which is properly prepared, is shown to be an advantageous substitute for cow's milk in feeding infants with symptoms of exudative diathesis and spasmophilia.

Note: Hervé Berbille, who discovered this thesis and kindly sent a copy to Soyinfo Center says (Sept. 2010): "I am almost sure this is the first study in Europe about the use of soybeans for infant nutrition." Address: Faculty of Medicine and Surgery (Facoltà di Medicina et Chirurgia), Univ. of Bologna, Italy.

551. *Good Health* (*Battle Creek, Michigan*). 1923. Food value of the soy bean. 58(8):15-16. Aug. Advertising section.
• ***Summary:*** D.W. of Louisiana asks in a letter, "What is the food value of the soy bean?" Answer: "The soy bean is rich in fat, containing twenty times as much as the navy bean. It is also rich in protein, of which it contains fifty per cent more than the same weight of meat. The protein of the soy bean closely resembles that of milk, being a 'complete' protein and capable of replacing the protein of eggs, meat or milk. This has been demonstrated by animal feeding experiments.

"A milk closely resembling cow's milk may be prepared from the soy bean, and also cheese... In China and Japan the soy is used only in the form of *to-fu,* or curd... The half-grown beans of certain varieties are delicious."

552. Kloss (Jethro) Health Food Co. 1923. Health foods (Ad). *Naturopath* (*New York City*) 28(9):488. Sept.
• ***Summary:*** "We manufacture an unusual line of Health Foods. Have thirty-four years of experience along the Naturopathic line. Our years of experience in Institutional feeding of the sick, as well as out of Institutions, watching the results obtained from feeding Natural Products, has enabled us to present something to the public that is of infinite value."

"We manufacture a line of foods that most perfectly takes the place of meat, milk, eggs and butter. There are no animal products used in the manufacture of our foods. We have used no animal products in our home for over eight years [i.e., since 1915], no meat for over 30 years [since 1893 or before].

"We are just completing a book, which will be off the press in September, on Natural Products of the earth,..."

"Send for the price list of our health foods and complete description of our new book." Address: Brooke, Virginia.

553. Slosson, Edwin E. 1923. Catching up with China. *Scientific Monthly* 17:283-85. Sept.
• ***Summary:*** The soy bean "was first introduced to America in 1804, but it was a hundred years before we could be induced to take it seriously... But in the last ten years it has rapidly come to the front as one of our major crops and is likely in the next ten years to go ahead of oats in acreage in some of our states... The latest bulletin of the Department of Agriculture lists fifty different uses for soy products, and doubtless Yankee ingenuity can and will add more when we get our minds to working on it.

"Even the Japanese have not exhausted their ingenuity in this field, long as they have been at it. A Japanese scientist named Sato has invented a new plastic which he has called, according to American precedent, 'Satolite.' It is made by precipitating the protein with sulphite, hardening it with formaldehyde, and molding it under heat and pressure into combs, buttons and whatever we make from hard rubber or celluloid or the casein of milk.

"The soy bean is rich in protein and fat, and lacking in starch; in that more like animal than like vegetable food. You can make a milk out of it by simply soaking the dried beans till soft, then crushing fine in a meat grinder, boiling in three times the volume of water for half an hour and straining through cloth. If you do not like the flavor you can add vanillin or something else. This vegetable milk sometimes agrees with children when cow's milk does not. It can also be used for cakes and custards.

"The soy milk may be made into curds and cheeses of various sorts which form a large part of the diet of orientals, but for which we have not yet acquired a taste. Soy meal has come into common use in America, not only as a cattle food, but also for bread and pastry mixed with three parts wheat flour.

"Soy sauce has long been familiar but quite unknown to us. We did not recognize it under its aristocratic English name and its added flavors. But when the high cost of living drove us to the chop sueys, we became acquainted with the cruet of brown salty sauce called 'shoyu,' and we found, as the Chinese had found thousands of years before, that a sprinkling of it would make tasty a large lot of rice and serve as substitute for meat, both in taste and nutriment. Soy sauce is of several sorts. If you want it strong take the Korean. If you want it sweet take the Japanese. It is made by fermentation and the flavor depends upon the way it is brewed and the length of time it is left to ripen. To suit the palate of a Korean connoisseur the jars must be exposed to the sunshine by day and covered by night for a period of thirty years. We Americans, when we get to making it, will undoubtedly speed up the process.

"So far the oil is the most in demand of the soy products. The beans contain from 18 to 20 percent. of a fine palatable oil, which we have imported at the rate of a hundred thousand tons in a year, but which we are now growing for ourselves. It can take the place of cottonseed oil in vegetable substitutes for lard and butter, and of linseed oil in paints. Formerly the oil went mostly to Germany and England, but the war made a shift in the currents of Pacific trade, and we

learned to appreciate its value. But we have a lot to learn yet before we catch up with the orientals in the utilization of this multifarious bean."

554. *Estestvoznanie i Geografia* (*Natural Sciences and Geography*). 1923. [Soya milk]. 8(1-2):62-63. Sept/Oct. [Bul]*
• ***Summary:*** This editor's note discusses a soya milk production plant in Hamilton, Canada. Address: Bulgaria.

555. Goldlust, Wilhelm Niklas. 1923. Verfahren zur Herstellung von Teigwaren aus Sojabohnenmehl [Process for the production of farinaceous foods from soybean flour]. *Austrian Patent* 94,839. Nov. 10. 1 p. Application filed 15 July 1922. [Ger]
• ***Summary:*** Describes how to make pasta from soya flour or meal (*Sojamehl*) alone or in mixtures with other flours. In preparing the pasta, one can use either animal or vegetable milk; the latter can be made from soya, peanuts, or almonds. Address: Vienna [Austria].

556. Carqué, Otto. 1923. Rational diet: An advanced treatise on the food question. Los Angeles, California: Times-Mirror Press. xvi + 540 p. Illust. 24 cm. [104* ref]
• ***Summary:*** The preface of this book begins: "The aim of this book is to disseminate a better knowledge of diet and its relation to health and disease, in plain non-technical language, understandable to all who seek more scientific information on this vitally important subject." The author advocates a vegetarian diet, with dairy products and eggs consumed in small amounts–if at all; their pros and cons are discussed on pages 324-340.

In the chapter on "Flesh Foods," pages 353-54 state: "Writing to his friend Firmus, who had abandoned the Pythagorean doctrine in order to eat meat, the philosopher Porphyry, living in the third century, said: 'I cannot believe that your change of diet is due to reasons of health, for you yourself have constantly affirmed that a vegetable diet is much more suitable than any other, not only to give perfect health, but even a philosophic and balanced judgment, as a long experience had taught you.'

"And Seneca, who, after studying the problem of nutrition for many years, had adopted vegetarianism, wrote: 'Struck by such arguments, I also have given up the use of flesh of animals, and at the end of a year my new habits have become not only easy to me, but most agreeable; and it even seems to me that my intellectual aptitudes have become more and more developed.'

"Isaac Newton adhered strictly to a vegetarian regimen while performing the prodigious intellectual work which made his name immortal. Among the modern philosophers and artists who have followed or advocated a rational vegetarian regimen may be mentioned: Shelley, Byron, Thoreau, Tolstoi [Tolstoy], Richard Wagner, Tagore, Maeterlinck, Alexander Pope, and George Bernard Shaw."

Chapter V, "Cereals, Legumes, and Miscellaneous Food Products," contains a section titled "Beans," which is largely devoted to soy beans (*Dolichos soya*) (p. 316-318). It discusses green vegetable soybeans ("Soy beans, when about three-fourths grown, make a most palatable and nutritious green vegetable, like the green pea or the lima bean."), soy flour, soy bean milk, bean cheese (tofu), and soy sauce.

Note: This is the earliest document seen (Nov. 2010) in which Otto Carqué mentions or discusses soybeans or soyfoods.

Concerning the wastefulness of the animal as a converter of feed to food, page 361 contains a long quotation from an article in the prestigious journal *Science* titled "The cost of roast pig," by Prof. Henry P. Armsby (1917).

In extensive tables of food composition, the composition of soy beans is given on page 504. The author lived 1867-1935. Address: Los Angeles, California.

557. Wong, T. 1923. [Soy-bean industries]. *Chung-hua Hua Hsueh Kung Yeh Hui Hui Chih* (*J. of the China Society of Chemical Industry*) 1:83-92. (Chem. Abst. 17:2514). [Chi]*
• ***Summary:*** "Methods of preparation and analyses are given for 9 products manufactured from soy bean, including oil, been curd, bean milk, etc...

"Soy-bean cake contains 42.1% protein and 9.6% oil. This might be used for the manufacture of artificial marble and similar products."

558. Bottari, Fulvio. 1923. La soja nella storia, nell'agricoltura e nelle applicazioni alimentari ed industriali [The soybean in history, in agriculture, and in food and industrial applications]. Torino & Genova, Italy: S. Lattes & Co. 243 p. Preface by Prof. Oreste Mattriolo (R. Università di Torino). With 34 illust. 22 cm. [25 ref. Ita]
• ***Summary:*** Contents: Preface. Reason for the work; its scope and limits. Part I: The origin and history of the soybean. Reason for this history, the origin of the soybean and its early dissemination, soya (including production statistics) in Oriental countries (China, Manchuria, Japan, Formosa, Korea, French Indochina), how the soybean was introduced to Europe, the cultivation of soya in France, Soya in England, Austria, Germany, Denmark, Holland, Russia, Sweden, Alsace-Lorraine (now in northeast France), Spain, Italy, America, Conclusion.

Part II: Cultivation of soya. Part III: Soya in the feeding and nutrition of humans and animals. 1. The analysis and physiology of metabolism as an element in the study of nutrition. 2. Soybean forage in the feeding of animals. 3. Soybeans (*il grano di soja*) and soy products in the feeding of humans and animals: Commercial and nutritional value and digestibility of the soybean, how to prepare and cook whole soybeans, soy broth, thick soups, salads, and meat dishes, soy purée (*puré di soja*), soybean cakes (*torté di*

soja), soybean sprouts (*germi di soja*), roasted soybeans (*grano di soja come frutta secca*), soy coffee (*caffé di soja*), soy chocolate (*cioccolata di soja*), soy confections (*confetture di soja*), special soy sweets and chocolates for diabetics and tuberculosis patients, the soybean as a feed for animals.

Note: This is the earliest Italian-language document seen (Nov. 2012) that mentions soy chocolate, which it calls *caffé di soja.*

4. Flour, pasta, and bread in feeding. 5. Soymilk (*il latte di soja*) and its use in the feeding of animals and humans. 6. Tofu (*il formaggio di soja*). 7. Soy oil and oil-cakes (*panelli*). 8. Condiments and sauces: Natto, miso, soy sauce (*le salse,* called *Schogon* [sic] in Japan, *Tsinag-Yeou* [sic] or *Tao-yu* in China, *Ketjap* in Java, and *Tuong* in Annam). 9. Enzymes (I fermenti, incl. urease). 10. Conclusions.

Part IV: Industrial applications of soya.

Part V: General conclusions.

The first test of the lactation of calves with soymilk was conducted in the winter of 1916-17 by the Bonafous Institute in Turin. The results were splendid, and have encouraged eminent pediatricians such as Dr. Casalini, Prof. Dr. Alberto Muggia (teacher of clinical pediatrics at the University of Turin), and Dr. Enrico Gasca (vice director general of infants at Turin) to extend their experiments (p. 6).

In Italy vegetable oil production has decreased steadily from 1870 to 1920. Attempts were made to grow sesame, peanuts, and rapeseed, and to import oils from abroad. During World War I, unrefined soy oil was introduced to the market in large quantities, but its unappealing taste disgusted consumers and for a while nothing more was heard of it. Then in 1921 it began to be introduced again, but this time it was refined at Italy's national oil works. The good results obtained encouraged the Italian oil milling company, Sairo, and other oil works to make great progress in soy oil production. Several thousand quintals (i.e., several hundred metric tons) of the best soy oil, sold under the name "refined oil from seeds," were introduced in the first half of 1922 by the national oil works of Genoa.

Returning to the early history of soya in Italy, we find that in 1848 some missionaries brought soybean seeds and a little soil to Italy from Japan. They waited for the cultivation for several years, then nothing else was said. In 1880 the Italian Ministry of Agriculture recommended the cultivation of soybeans as a fodder crop for the future, as was being done in the USA, but their suggestion received no attention. In 1918, according to Mattei, a test of soybean culture was done at the Colonial Garden of Palermo on a parcel of 300 square meters.

Since 1912, after seeds had been brought by foreign delegates to the International Exhibition at Turin in 1911, repeated experiments with soybean cultivation have been conducted at the Bonafous Agricultural Institute in Turin, with the goal of developing two well adapted varieties, one for fodder and one for seed. Their green variety is for fodder and their yellow one for seed.

From 1920 the directorship of the cultural work was given to the head professor at the Institute, Venanzio Manvilli, also professor of the Germano Sommeiller Technical Institute, professor the faculty of agriculture, University of Turin. They worked with seeds already selected from the institute and with those obtained from Prof. Don Ricaldone, and from Tientsin, China, directly. Others who have done important work with soya in Italy are Paolo Bottari (with soymilk at the Bonafous Institute), Tamanini Guido, Mossello and Bellia, Prof. Cav. Giov. Batt. Allaria, Dr. Mose Miccinelli

A table (p. 31) shows soybean and cotton hectarage and production in Korea from 1909 to 1917. Soybean hectarage increased from 277,776 ha to a record 487,134 ha. Soybean production grew from 1,991,126 quintals (1 quintal = 100 kg or 0.1 metric tons) to a record 3,816,498 quintals.

Page 35: "Prof. Rouest of Luxey (Landes) in France wrote us on 30 Nov. 1921. 'I have finished only the period of acclimatization of the soybean. It remains for me to propagate it a little everywhere. The experiments of 1921 were extended in all the Departments, being viewed from an industrial and commercial point of view. I must now study which variety adapts among those I am cultivating. Soy flour will not be able to be made until we have many thousands of hectares under cultivation, and then we will be able to think of other applications as well... Actually the firm Hendebert de Lion sells its flour, originating in China, at 10 French francs per kg, a prohibitive price.'"

Page 206: At the pediatric congress held in Milan in Sept. 1922, the question of lactation (feeding children) with vegetable milk was discussed in a favorable way, proposed by Prof. Muggia and sustained by the illustrious Prof. Berghius, Director of the Pediatric Clinic of the University of Padua, and by Prof. Francioni of Bologna. We can also add that experiments on lactation are proceeding in Italy at the pediatric clinics of Turin, Bologna, Padua, Genoa, and Florence, and also at the Infant's Dispensary in Turin.

Photos show: (0) An infant fed soymilk in Turin in 1921, together with a table showing its weight gain from 18 July 1921 until 14 Jan. 1922 (p. 7). (1) Three different varieties of soybean plants (p. 70). (2) 2 soybean plants up close (p. 71). (3) The leaves of 3 different varieties of soybean plants (p. 72). (4) Close-up of the stem and pods of a soybean plant (p. 73). (5) Beans and pods of soybeans (p. 74).

(6) Different stages of germinating soybean seeds (p. 75). (7) Close-up of soybean roots (p. 76). (8-9) Field of soybeans at the "Istituto Bonafous" (p. 106, 108, 113). (10-11) Field of soybeans grown with corn (p. 122, 123). (12) Cellular transverse section through a soybean (facing p. 152). (13-14) Soy flour and wheat flour, each in a sack and loose (p. 177). (15) Pasta made from soy (p. 181). (16-21) Bread made from soy (p. 183-89). (22-23) Soy bran and wheat

bran, each in a sack and loose (p. 191). (24) Two bottles of soymilk (p. 194). (25) Two bottles of soy oil (p. 214).

A diagram (p. 227) compares the chemical composition of animal casein and vegetable casein.

Note 1. Quite a bit of the historical and non-Italian information in this book comes from Léon Rouest's 1921 book *Le soja et son lait végétal: Applications agricoles et industrielles.*

Note 2. This is the earliest Italian-language document seen (Jan. 2012) that mentions natto, of which it says: "il *Natto* in Giappone che corrisponde al *Tao-Teche* della Cina."

Note 3. This is the earliest Italian-language document seen (Jan. 2013) that mentions soy sprouts, which it calls *germi di soja.* Address: Dr. of Economic and Commercial Science, Turin [Torino], Italy.

559. Choux, P. 1923. Revue générale de botanique, tropical and subtropical (1910-1919 (suite)). [Review of botanical works, tropical and subtropical (1910-1919) (conclusion)]. *Revue Generale de Botanique* 35:141-43. [24 ref. Fre]
• ***Summary:*** This is a brief and very limited review of the literature with 24 references–several of which contain errors. It begins:

In France, in effect, the attention seems to have been attracted by the medical uses of the soybean and by soyfood products (*les produits alimentaires à base de Soja*)*:* soymilk, soy cheese (*fromage de soja*), soy casein, flour and bread, manufactured at the factory of *Caséo-Sojaïne* [the soy casein factory = tofu factory] installed at Vallés (Seine).

Everyone knows that in China the soybean plays a very important role in the diet of several million people and forms the basis of an entire series of food products that have been brought to our attention by Messrs. Li Yu Ying and Grandvoinnet.

560. Juckenack, A. 1923. Was haben wir bei unserer Ernaehrung im Haushalt zu beachten? Zweite, umgearbeitete Auflage [What must we be aware of concerning the foods in our homes? 2nd rev. ed.]. *Volksernaehrung* (*Die*) (*Berlin*) No. 6. xi + 75 p. [Ger]
• ***Summary:*** Some 129 numbered questions / subjects are considered, including: No. 38. What is artificial milk? (*Kunstmilch*). One type is the so-called vegetable milk (*vegetabilische Milch*), a beverage made with help from the soybean.

No. 89. Does the soybean deserve special attention? It is a legume that is unusually rich in nutrients, containing about 32-40% protein and 14-20% fat. Therefore it carbohydrate content is low (32.0-36.5%). Soybean oil is good for food use and has long been used to make margarine. Defatted soybean meal is sometimes used for livestock feed, and sometimes for protein-rich foods. Also, vegetable milk or plantmilk (*Pflanzenmilch*) is made with help from the soybean. So-called soybean milk (*Sojabohnenmilch*) can be used in place of cow's milk in the home in preparations such as soups, baked goods, egg-cakes, and puddings; it can also be added to coffee. It should obviously not be used for infant feeding, however it is noteworthy refreshing drink.

Also discusses: No. 81. What is artificial edible fat? (*Kunstspeisefett*). It is a lard substitute, which can be made from various vegetable oils, including peanut oil and sesame oil.

No. 129. What is vegetarianism? Is it scientifically grounded? Address: Berlin-Charlottenburg, Germany.

561. Kellogg, John Harvey. 1923. The soy bean (Document part). In: J.H. Kellogg. 1923. The New Dietetics: A Guide to Scientific Feeding in Health and Disease. Revised ed. Battle Creek, Michigan: The Modern Medicine Publishing Co. 1021 p. See p. 315-21. 24 cm.
• ***Summary:*** This section is quite similar to that in the 1921 first edition of this book, but on different pages. Changes appear on the following pages: 316 (addition of a paragraph stating that the soy bean is a highly valuable food for persons suffering from diabetes), 318 (deletion of the statement that the writer "has for twenty-five years made use of milk prepared from the almond and other nuts."), 320-21 (addition of a table, supplied by William Morse of the USDA, giving the composition of soy beans sprouts and mung bean sprouts). Address: Battle Creek, Michigan.

562. Kellogg, John Harvey. 1923. Vegetable substitutes for meat (Document part). In: J.H. Kellogg. 1923. The Natural Diet of Man. Battle Creek, Michigan: The Modern Medicine Publishing Co. 385 p. See p. 334-36.
• ***Summary:*** "By the combination of nuts and cereals, a product very closely resembling meat may be prepared. The process for doing this was discovered by the writer many years ago in a series of experiments undertaken for the purpose by the request of Professor Dabney, then assistant professor in the Department of Agriculture. Recognizing that the increase of population would ultimately lead to an increase in the price of foodstuffs and particularly of meats, and possibly a scarcity of meats, Professor Dabney requested the writer to solve the problem by a production of a vegetable substitute for meat. The result of the experiment undertaken was Protose, a nut-cereal preparation, which to a considerable degree resembles meat in appearance, taste and odor, having a slight fibre like potted meat.

"Earlier experiments made by the writer led to the production of peanut butter, which has since developed into a great industry and has increased enormously the size and value of the peanut crop of the South. From a food standpoint, a pound of peanut butter is more than equal to the same amount of pork or meat of any sort.

"In Malted Nuts, another product of our experiments, is provided a product [probably peanut milk] resembling Malted Milk, which has been extensively used as a substitute

for milk by those unable to tolerate cow's milk.

"No doubt the future will develop a large number of vegetable products which will so fully supply the place of various meat products and dishes that all of these unwholesome products may be dropped from the bill of fare without being missed. As a matter of fact, it is now recognized by the most eminent authorities in dietetics that the flavor of meats is about the only reason or apology which can be offered for their use." Address: Director, School of Hygiene and Public Health, Johns Hopkins Univ., Baltimore, Maryland.

563. Kempski, Karl E. 1923. Die Sojabohne: Geschichte, Kultur und Verwendung unter besonderer Beruecksichtigung der Verhaeltnisse in Niederlaendisch-Indien [The soybean: History, culture and use, with special attention to the situation in the Netherlands-Indies]. Berlin: Paul Parey. 88 p. Illust. Index. 22 cm. [101 ref. Ger]

• ***Summary:*** Contents: Introduction. Some remarks on the soybean's early history. Overproduction of soybeans in Manchuria after the Russo-Japanese War–English oil mills make their first trials. Soybean production in Manchuria. Soybean production in Korea. Soybean production in Japan. Soybean production in America–Soybean meal and soybean milk are introduced. Soybean production has also expanded in Africa, British India, and the Philippines. The introduction of soybean cultivation to Europe. The many uses of the soybean in Europe. Uses of soy oil. Old and new methods of obtaining soy oil. Soybean production and use of soybeans in the Netherlands-Indies. Appendix: Descriptions of how the most important soybean products are manufactured: In Java (tao-hoe [tofu]), tempeh, ketjap [soy sauce], tao-tjiong [or tao-jiung, a term, and perhaps a product, between *doujiang* and *tao-tjo*, Indonesian-style miso], in China and Japan (soy sauce, miso, tofu, frozen tofu, natto, soymilk) (p. 62-68). Supplements: I: Soybeans in Manchuria. II; Hansamuehle [Hansa Muehle] in Hamburg, Germany. III: *The Soybean* by Piper and Morse.

Note the extensive, early bibliography. Unfortunately, it contains many errors.

This book is largely a review of the literature, but with some original information, especially on Indonesia and Germany. In 1923 Java imported 150,000 to 200,000 tons of soybeans and had a population of 35 million. The area of soybeans planted in Java (including Madura) increased from 157,600 ha in 1918 to 164,700 ha in 1922 (p. 32). In 1921, 67.3% of Java's soybean acreage was in Central Java, 20.7% was in East Java, and only 5.7% was in West Java. (p. 35). Large quantities of soybeans are imported to the Netherlands-Indies from Manchuria: 35,105 metric tons (tonnes) in 1920, rising to 95,742 tonnes in 1922. From these and local soybeans are made tempeh [spelled like this!], tofu (*tahoe; Bohnenkäse*), soy sauce (*Ketjap, Sojasauce*), etc. In Java, mostly black soybeans are grown. To make tofu yellow, it is cooked in an extract of the *Curcuma* root / rhizome. Sometimes it is also sun-dried or fried/roasted (*gebraten*). Tempeh is inoculated with a piece of tempeh from a previous fermentation, and often fried in coconut oil. Detailed descriptions are given of the production of soy sauce (*ketjap;* which is made from black soybeans) and Indonesian miso (*taucho; tao-tjiong*). The author (p. 64) states that ketjap and tao-tjiung are both inoculated using *Hibiscus tiliaceus* (hibiscus) leaves, called *waroe* in Java. Today Germany, like America, produces fresh and dried soymilk, fresh and dried soya cream, meat analogs, and soy sauce (p. 25).

This book contains 17 interesting, old photos. Descriptions of those reproduced from other periodicals are omitted. (1) A soybean field on the farm Kikai Nojo near Sempo-Station, Korea, owned and run by Mr. Moegling (p. 12). (2) A combine used for harvesting regular beans in California in 1918 (p. 19). (3) Many hydraulic presses in a modern American oil factory (p. 29). (4) The equipment used in steaming the soybeans before they are crushed in an American "steam mill" type oil mill (p. 31). (5) The interior of a British oilmill (p. 33). (6) The electrical generators in a modern oilmill (p. 34). (7) Soybeans being harvested manually at Madioen [Madiun, in East Java], Java (p. 48). (8) Harvested soybeans being dried on racks in a field in Java, and carried away by one worker (p. 48). (9) Workers dividing up the harvest in Java (p. 50). (10) Threshing soybeans with bamboo flails in the courtyard of a small farmer in Java (p. 51). (11) Selling soybeans in a small market in Central Java (p. 51).

Tables show: (1) Imports of soybeans to Germany from 1910 (43,500 tonnes) to 1912 (more than 125,200 tonnes) (p. 24). (2) Soybean acreage in Java (including Madoera) from 1918 (157,600 ha) to 1922 (164,700 ha) (p. 32). (3) A breakdown of soybean area in Java in 1921 (of 226,186 bouws) into West Java (12,980 bouws), Central Java (152,154 bouws), and East Java (61,082 bouws) (p. 35). Note: 1 bouw = 1.754 acres (Johnstone 1975). (4) Imports of Manchurian soybeans to Java (including Madoera) and other parts of the Dutch East Indies (mainly Sumatra) from 1920 to 1922 (p. 36). (5) Yields (average or range) of soybeans in various countries: Germany, Italy, British Indies, Manchuria (incl. China and Korea), Japan, America (up to 2,700 kg/ha), Java (p. 52). (6) Comparison of the nutritional composition of soybeans, peas, and regular beans (Phaseolus varieties) (p. 53). (7) Comparison of the nutritional composition of soya cheese (*Sojakäse*, tofu), beef, and lean pork (p. 53). (8) The prices of white and of black soybeans in Java during January and December 1922 and the same two months of 1923 (in Gulden) (p. 56). (9) Comparison of yields, price, costs, and profit for peanuts (*Katjang tanah*) and soybeans in Java (p. 57-58). (10) Nutritional composition of canned frozen tofu (based on E. Senft) (p. 68). (11) Exports of soybeans from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Sansing) in 1919, 1920, and 1921

(p. 70). (12) Exports and value of soybeans from all of China to four countries (Netherlands, Russia, Japan, Dutch East Indies) in 1919, 1920, and 1921 (p. 72). (13) Exports of soybean oil from five Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe], and Harbin) in 1919, 1920, and 1921 (p. 72). (14) Exports and value of soybean oil from all of China to five countries (England, Netherlands, Belgium, Japan, USA) in 1919, 1920, and 1921 (p. 72). (15) Exports of soybean meal from four Manchurian ports (Dairen, Antung, Newchwang, Suifenho [Suifenhe]) in 1919, 1920, and 1921 (p. 73). (16) Exports and value of soybean meal from all of China to three countries (Japan, Russia, USA) in 1919, 1920, and 1921 (p. 73). (17) Names of the five major railway lines in Manchuria (South Manchuria Railway, Chinese Eastern Railway, Peking Mukden Line, Kirin-Changchun Line, Saupingkai-Taonan Line) (p. 74). (18) Amounts (in tons) of soybeans, soybean cake, and soy oil (*Sojaöl*) shipped over the South Manchuria Railway, and the Chinese Eastern Railway in one year (p. 74). (19) Railway transport and production amounts of the mills (in tons) in Dairen and Newchwang of soybeans, soybean cake, and soy oil (*Sojaöl*) during the year 1921 (p. 74). Address: Agricultural Expert in Poerbasari te Pengalengan, Java.

564. Lewkowitsch, Julius. 1923. Butter substitutes–Margarine, "Oleomargarine" (Document part). In: J. Lewkowitsch. 1923. Chemical Technology and Analysis of Oils, Fats, and Waxes. Edited by George H. Warburton. 6th ed. Entirely rewritten and enlarged. Vol. III. New York, NY and London: Macmillan and Co., Ltd. viii + 508 p. See p. 31-54. [79 ref]

• ***Summary:*** An in-depth treatment of the subject. Margarine is called "Oleomargarine" in America, *Margarine* in French, *Margarine* or *Kunstbutter* in German, and *Burro di margarina* in Italian. Older English-language names suppressed by legislation are "butterine" and "Dutch butter." "Margarine consists either of a mixture of animal fats alone or of animal and vegetable oils and fats churned with cow's milk to a butter-like emulsion, and colored yellow (unless forbidden by law) with annatto, methylorange, etc. The cow's milk is sometimes replaced by an emulsion prepared from the kernels of almonds [almond milk] (see Li Yu Ying, Belgian patent 231,588) or from soya beans, so that it is possible to prepare a margarine from vegetable products exclusively" (p. 32). In the UK it is prepared exclusively from beef fat (called "oleomargarine" in the UK or "oleo oil" in the USA).

"Amongst the vegetable oils, cotton seed oil and cotton seed stearine, sesamé oil, arachis oil, and even soya bean oil take the most prominent place... Arachis oil (also olive oil) and sesamé oil are used to a greater extent in Europe than in the United States (p. 33).

"A general recipe for the manufacture of margarine containing oleomargarine as a preponderant basis is as follows:–Mix 65 parts of oleomargarine, 20 parts of vegetable oils, and 30 parts of milk. The yield is 100 parts of finished product, 15 parts of water being eliminated in the course of manufacture. The more milk used, the better will be the flavor of the margarine." "For still lower qualities maize oil is said to be used in the United States... as it is extremely difficult to remove or to mask the peculiar flavour of maize oil. Lard [pig fat] is not used so extensively in Europe as in the United States. In this country [England] oleomargarine is prepared exclusively from beef fat. Mutton fat, which imparts an unpleasant ("animal") flavour to the margarine, is, however, used in continental margarine factories. In Russia, sunflower oil is used in the manufacture of margarine... The use of soya bean oil has also been proposed" (Korentschewski and Zimmermann, *Chemiker Zeitung*, 1905, p. 777) for use in margarine (p. 37).

At the end of this section is one titled "Vegetable butters" (p. 55-58). These include "fats or mixtures of fats... which are exclusively of vegetable origin, and have at the ordinary temperature a consistence approaching that of butter or lard." They may be made from "cotton seed stearine," coconut oil, or palm kernel oil. They are sold, for example, in "countries where the inhabitants are forbidden by their religious tenets to consume beef fat or hog fat (India, Turkey). In commerce such vegetable butters are known as 'vegaline,' 'cottolene,' etc. The manufacturing processes for producing cotton seed stearine have been describe in the preceding chapter (Vol. II. Chap. XIV.)." Address: 71 Priory Rd., London, N.W., England.

565. Watson, Ernest. 1923. The principal articles of Chinese commerce (import and export) with a description of the origin, appearance, characteristics, and general properties of each commodity; an account of the methods of preparation or manufacture together with various tests, etc., by means of which the different products may be readily identified. Shanghai, China: Statistical Dept., Inspectorate General of Customs; sold by Kelly & Walsh [etc.]. xi + 630 p. Illust. 28 cm. The Maritime Customs. II. Special Series No. 38.

• ***Summary:*** Section II, titled "Oils, fats, and waxes" (p. 76-149) contains detailed definitions of the following: Bean oil (*Tou-yu* or *Oleum dolichos*) obtained from the soya bean of China, and the residual meal (*tou-ping-fên*) (p. 85-86). "In China bean oil is used as a food; for cooking purposes; for mixing with lacquer; in making varnish and printing ink; in soap making; and, to a slight extent, as an illuminant, although for this purpose it has been almost superseded by kerosene. It is also used in water proofing cloth and paper for making umbrellas and lanterns. In foreign countries, where the demand for the oil is practically unlimited, bean oil is used chiefly in the manufacture of soap and in preparing salad oils. On account of its drying properties bean oil is not very suitable for use as a lubricating oil.

"Bean oil appears in Chinese commerce packed in

wooden tubs, paper-lined baskets, or in earthenware jars, of no standard weight. It is exported in great quantities from many of the northern ports, particularly from Dairen and Newchwang, and, to a smaller extent, from Hankow and other Yangtze ports."

Section VI, titled "Miscellaneous products" contains a long subsection on "Beans, Soya" (Tou) (p. 320-21). "Soya beans, or 'soy beans'... are cultivated in enormous quantities in Central Manchuria... It is estimated that about 1,600,000 tons are produced annually in Manchuria alone... The beans are small,... the yield per acre being from 1,100 to 1,600 pounds [18.3 to 26.6 bushels]. Several varieties are grown in China and are commonly classified by the Chinese according to form, colour, size, use, and other characteristics. The best known of these varieties are (with Chinese characters for each term): -

(1) Yellow beans (*huang-tou*), subdivided into *pai-mei-tou* or 'white eye-brow bean,' so called from the whiteness of the prominent hilum; *chin-yüan-tou* or 'round golden bean'; and *hei-ch'i-tou.*

(2) Black beans (*wu-tou*), subdivided into (*ta-wu-tou*) or 'large black bean'; (*hsiao-wu-tou*) or 'small black bean'; and (*pien-wu-tou*) or 'flat black bean.'

(3) Green beans (*ch'ing-tou*), subdivided into two varieties, one of which has a green epidermis and green interior, the other a green epidermis and yellow interior.

Three subspecies [of soya beans], yielding very small beans, are known as: (*hsiao-pai-tou*) or 'small white bean'; (*hsiao-hung-tou*) or 'small red bean'; and (*hsiao-lü-tou*) or 'small green bean.'" Note 1. The writer may be mistaken in calling these last three subspecies of soya beans. They are probably white azuki beans, red azuki beans, and mung beans.

Soya beans "are valued chiefly as a source of bean oil, but are also extensively used as food, either whole or ground to flour in making beancurd, bean milk, bean sauce, or 'soy,' and salted relish (*ta-tou-shih*) [fermented black soybeans], which is used both as a food and as a medicine. The black beans, which are not much used as food because they are supposed to make the body too heavy, are used in medicine, to impart strength and vigour, as a carminative, and also as an antidote for vegetable poisons, such as aconite, croton oil, etc. The hulls of green [soy] beans are applied to smallpox ulcers and other sores; the bruised leaves of the plant are used in treating snakebite; the flowers are used in treating diseases of the eyes. Young bean sprouts (*tou-ya*) are used as a vegetable food." Details are given on the following products made from soya beans: "Beancurd (*tou-fu*), bean milk (*tou-fu-chiang*), bean sauce (see under 'soy'), and bean vermicelli (*Fen-ssu, Tou-fen-ssu, Hsi-t'iao-mien,* or *Kua-mien.*–A very famous vermicelli made in the Chefoo district, from beans most of which are originally imported from Manchuria).

Note 2. This is the earliest document seen (Nov. 2012) that contains the term *Tou-fen,* which probably refers to roasted whole soy flour.

Note 3. This is the earliest English-language document seen (Nov. 2011) that uses the term "salted relish" to refer to fermented black soybeans.

The section titled "Soy (*Chiang or Chiang-yu"*–with Chinese characters for each term) states: "Soy is a sauce made in China from the soya bean (*Soja hispida*). In preparing it, a quantity of beans are slowly boiled, an equal quantity of coarsely ground wheat or barley being added. The mixture, after being allowed to ferment for some time, is put into a jar with an equal amount of salt, a few aromatics, and three times as much boiling water as there were beans at first; the whole is then allowed to stand for several weeks exposed to the sun, after which the liquor, which constitutes the soy, is separated by pressing and straining the mass. The finished product is afterwards packed into jars or bottles ready for the market.

"Soy is thin, and, in colour, very dark brown or almost black; it becomes brighter and clearer on being kept, has an agreeable salty flavour, and produces a yellowish froth when even slightly shaken. It is much used by the Chinese as a sauce and condiment, as it creates an appetite and is supposed to counteract the injurious properties of contaminated food; it is also used in medicine as an application for burns, scalds, eczema, leprous sores, etc. Soy is often exported from China to foreign countries, where it is extensively used in the manufacture of many European sauces."

Also discusses: Groundnut oil (*Hua-shêng-yu*), also called peanut oil, earth-nut oil, and arachis oil (*Oleum arachis*) (p. 105-06). Hemp-seed oil (*Ma-yu or Ma-tzu-yu*) (p. 106).

Sesamum-seed oil (*Chih-ma-yu or Hsiang-yu; Oleum sesame*) also known as "gingelly oil," "teel oil," or "benne oil" (p. 133-35). Groundnuts (p. 421-22). Wheat gluten (*Mien-chin,* p. 574). A second edition was published in 1930. Address: Chief Appraiser, Chinese Maritime Customs.

566. White, Ellen G. 1923. Counsels on health, and instruction to medical missionary workers. Mountain View, California, Kansas City, Missouri [etc.]: Pacific Press Publishing Assoc. 696 p. 19 cm. *

567. Loew, Oscar. 1924. The soy bean, a superior crop. *Porto Rico Agricultural Experiment Station, Agricultural Extension Notes* No. 64. p. 1-2. Jan. 15.

• ***Summary:*** "The soy bean originated in Eastern Asia and has been introduced during the past 30 years into different countries of the world. It can be grown successfully even in a rather poor soil, in the absence of nitrogenous manure, provided the specific root-nodule bacteria are present. This plant is far superior to other leguminous crops, even those very rich in protein, as the lupin, which it equals in protein

and highly surpasses in fat content. In fact, the soy bean is richer in fat than all other leguminous crops and is, therefore, sometimes called the oil bean. The soy bean does not contain alkaloids and bitter tasting matters like the lupin..."

A table compares the nutritional composition of the pea, common bean, lupin, and soy bean. "From the analyses it would appear to be of great advantage for the people of Porto Rico to replace the common bean now serving as an essential part of the daily food, by the soy bean, it providing a higher percentage of protein and fat... Since the Soy bean needs prolonged boiling until it reaches a sufficient degree of softness, it is best soaked for a day in water to which some soda and common salt are added (about a teaspoonful of each to half a liter) followed by washing two to three times with fresh water and then boiling for an hour or so. The taste of this dish is very agreeable.

"In Japan the soy bean serves for several preparations, called 'tofu,' 'yuba' and 'miso,' which might be prepared in Porto Rico. Also, a dressing or condiment similar to the English Worcestershire sauce, is prepared from the seeds." The preparation of tofu is described. It is "generally fried like cakes and represents an excellent food."

"The milky liquid can also doubtless be used as a suitable nutrient, but it can never replace the mother's or cow's milk for children, since the lime content is exceedingly small and the protein differs widely from the casein of the milk.

"In our trials with soy beans at the Experiment Station, Mayaguez, the results at first were disappointing. This was found to be due to the fact that the soil was not inoculated with the proper bacteria for assimilating nitrogen for the roots. We now have inoculated soil, and before planting on ground new to this crop inoculating material should be secured from the Station for mixing with the seed at the time of planting. When the soil is once inoculated it will remain so for all succeeding crops."

Note: Who was Dr. Oscar Loew and how did he learn about soyfoods? From 1897 to 1906 he was a Professor of Agricultural Chemistry at the Imperial University of Tokyo, Japan, where he wrote articles about soy sauce, tofu, soymilk, and yuba. In 1911 he was in Munich, Germany, where he wrote an article about soymilk. When he speaks of "our trials with soy beans at the Experiment Station, Mayaguez," he seems to indicate that he was living at the Station in Porto Rico in about 1924. Address: Mayaguez, Porto Rico.

568. Slosson, Edwin E. 1924. Soy. *Scientific Monthly* 18:109, 111. Jan.

• ***Summary:*** "The recent rise in restaurant prices has sent economical Americans flocking to the chop sueys, where a savory and satisfying meal can still be obtained for a small sum. The Chinese, in their efforts to keep three hundred million people above the starvation point for three thousand years, have been forced to figure closely on food values... With us Americans meat has been the main part of the meal with vegetables on the side. With the Chinese this is reversed, and meat has in many cases been reduced to a condiment...

"The chief difficulty of a vegetarian diet is to get a sufficient amount and variety of proteins. Beans and peas are the richest in proteins, but they are not of the sort and proportion found in meats and needed for our muscle-making.

"But there is one exception and that is the soy-bean... The soy bean resembles animal foods in being rich in fat and protein and devoid of starch. What is more remarkable, the soy bean contains a dozen kinds of protein compounds that are the same as those found in milk. In fact a 'vegetable milk' can be made from soy beans and from this vegetable curds and cheese. These form a large part of the diet of Chinese and Japanese who abstain from animal food either because they are Buddhists or because they are poor. By milking the soy bean they can get ten times as much lacteal fluid per acre as if they pastured cows on the land. Italian physicians who used soy milk as infant food during the war report that it was better tolerated than cow's milk by some of the babies.

"The soy milk products have not yet come into use with us, but the American patron of the chop suey has acquired a taste for another product of the bean, the little glass cruet of brown sauce that seasons the rice. It looks and tastes like meat extract, such as we use in making beef tea, and is really much like it in composition and nutritive value. This shoyu or soy sauce is made by long fermentation and ripening of a mixture of beans and wheat in brine. The longer the process the better the product. Six months or a year may suffice for the masses, but to suit the taste of the Oriental connoisseur it must be sunned for five years or even thirty, the jars being patiently uncovered every day and covered every night or whenever it rains. Over two million barrels of soy sauce are made in Japan every year."

569. *Chinese Economic Monthly.* 1924. Manchurian beans. 1(9):12-19. June. [Eng]

• ***Summary:*** "The principal export of Manchuria, and indeed of the whole of China, is the soya bean, which in its raw and manufactured states amounts to over 75 per cent of the value of the total exports of the Three Eastern Provinces. It would be no exaggeration to say, therefore, that the entire industry in this territory is concentrated on [soya] beans, their production, manufacture and barter. It is mainly the bean that provides the buying power of Manchuria, and stimulates its economic progress. From a primitive agricultural region Manchuria has developed along industrial lines mainly as a result of its stupendous [soya] bean resources."

Manchuria is "almost the sole supplier of soya beans to world markets. All attempts to cultivate beans out of China

on any extensive scale have failed. 'Beans' is therefore always associated with Manchuria, and *vice versa*.

There are many soya bean varieties, but the yellow oliferous one (*huang-tou*) is the dominant variety; it is "subdivided into a number of kinds. The experimental field of the Manchurian Rural Economy Society cultivates no fewer than 200 varieties."

Chinese official statistics, which are usually low, estimate the area under soya beans in the whole of China [including Manchuria] at 12 million acres. Statistics from the Economic Bureau of the Chinese Eastern Railway, in the C.E.R. zone (Heilungkiang and a part of Kirin province), yellow soya beans are planted over an area of not less than 4.3 to 4.4 million acres, or 25% of the entire cultivated area, while in all 3 of the provinces of Manchuria the Bureau estimates that there are 8 million acres under cultivation. On average in Manchuria, 1 acre yields about ½ ton of soya beans. Thus, the total average production of soya beans in the whole of Manchuria may be estimated at more than 4 million tons, of which about 2.4 million tons (about 60%) are exported in raw and manufactured articles.

Owing to the density of the inner provinces of China, almost all the soya beans there are consumed locally. "Inner China looks not so much to the oil content of the bean as to the azotic stuffs [nitrogen] it contains. The export of soya beans and products from Inner China is very small and decreasing (5.5 million piculs in 1920 and 4.6 million piculs in 1922) while the exports from Manchuria continue to grow dramatically.

The world is now looking to the soya bean as one solution to its future food problems. Dr. Berczeller, a well-known Hungarian scientist, says: "It is a matter of the highest political importance that the West should learn the lesson of cheaper living as taught to them by the East in the adaptation of the soya bean as an article of food." After prolonged investigation, he claimed to have succeeded in creating from the yellow soya bean bread, milk, and flour, which were both inexpensive and palatable. Yet the taste of many soybean products (such as "bean flour" and "bean cheese") is unknown to Europeans.

"The extraction of oil from [soya] beans has as ancient an origin as the cultivation of the beans themselves. In the native Chinese mills it is still effected by means of the wedge press, the invention of which dates from the early days of the history of technics. The first steam bean-oil mill was opened toward the end of the last century at Yingkow [Yingkou]. At present such mills are counted in hundreds. Almost the entire bean oil export comes from steam mills. Several years ago the South Manchuria Railway Company erected a mill at Dairen for the extraction of oil with the aid of benzine. It is now under private management." Using the solvent method, 12% of the weight of the bean is extracted as oil, using the steam mill only 19%, and using the wedges presses less than 10%. Recently, due to perfected methods of refining, an oil named "Atzetko, made at Harbin by the Anglo-Chinese Company, has begun to be used in food by Europeans.

Before World War I, the price of soya beans was much lower than today. Today the main consumer of beancakes is Japan, were they are used as fertilizer on the rice fields. "However, there is one dark side of the picture" of soya beans in northern Manchuria. Manchurian bandits (*hunghutze*) are terrorizing and plundering the peasants.

Note 1. This is the earliest document seen (Nov. 2012) that uses the term "dark side" in connection with soya beans.

Tables show: (1) Soya bean cultivated area and production in the three provinces of Manchuria in 1923: Kirin province (center east): 1.6 million shan (1 shan = 1.8 acres) produced 1.5 million tons. Heilungkiang province (furthest north): 1.2 million shan produced 1.5 million tons. Fengtien province (later renamed Liaoning, furthest south): 1.2 million shan produced 1.5 million tons. Totals for Manchuria: 4 million shan (7,200,000 acres) and 3,700,000 tons.

Note 2. This is the earliest document seen (March 2001) that gives statistics on soybean production in East Asia. (2) Export of soya beans and soya bean products from China proper. Source: 1922 Chinese Maritime Customs report. For the 3 years 1920, 1921, and 1922, gives the weight in millions of piculs (1 picul = 133.33 lb) and value in Hk. Tls. [Haikwan Taels; a monetary unit] of each of the following: Yellow [soya] beans: Grain [beans / seed], beancakes, bean oil, total. Black [soya] beans. Green [soya] beans. White [soya] beans. Other kinds. Total exclusive of yellow beans. Gross total. In percentages relative to 1920. (3) Exports from Manchuria only: Exactly the same years and products as Table 2. Note 3. One Haikwan Tael in 1920 equaled 6 shillings 6½ pence or $1.24 in gold coin; in 1922 it equaled 3 shillings 9 pence or $0.83 in gold coin.

(4) Re-import of soya beans and products into China in 1922. Yellow beans–4.9 million piculs worth 17.6 million Hk. Tls. Beancakes–6.3 million piculs worth 16.6 million Hk. Tls. Oil [soya]–0.2 million piculs worth 1.7 million Hk. Tls. Other [soya] beans–2.1 million piculs worth 7.1 million Hk. Tls.

(5) Net export of yellow soya beans from China in millions of piculs each year from 1920 to 1922: To Japan, To Dutch Indies, To Turkey, Persia, Egypt, etc. To Europe. To other countries. Via Vladivostok. Total. Note 4. Soya beans exported via Vladivostok are mostly directed to Europe (about 3 million piculs), with about 2.5 million piculs to Japan.

Note 5. In Table 5, "Turkey, Persia, Egypt, etc." is treated as one unit or geographical area. In 1920 this area imported from China 0.4 million piculs of soybeans, followed by 0.7 million in 1921 and 0.3 million in 1922. Although we know the amount of soybeans imported to the area, we cannot say for sure to which specific countries the soybeans were imported in this area (Turkey and/or Persia).

Therefore, this may be the earliest document seen (Dec. 2007) concerning soybeans in Turkey. This document may contain the earliest date seen for soybeans in Turkey (1920-1922).

Note 6. This may be the earliest document seen (Dec. 2007) concerning soybeans in Persia (today's Iran). This document may contain the earliest date seen for soybeans in Persia (1920-1922).

Note 7. This is the earliest document seen (Dec. 2007) concerning soybeans in the Middle East / Near East (Persia, and/or Turkey–today's Iran). This document contains the earliest date seen for soybeans in the Middle East / Near East (Persia and Turkey) (1920-1922).

(6) Net export of [soya] beancakes from China in millions of piculs each year from 1920 to 1922: To Japan, To other countries, Via Vladivostok. Total. "Beancakes exported *via* Vladivostok are directed almost exclusively to Japan."

(7) Net export of [soya] bean oil from China in thousands of piculs each year from 1920 to 1922: To Japan, To Dutch Indies, To Turkey, Persia, Egypt, etc. To Europe. To United States of America. To other countries. Via Vladivostok. Total. A note states that Bean oil exported via Vladivostok is mostly directed to Europe and to countries of Asia Minor. All the other kinds of beans are distributed mostly in Japan, Korea, and along the coasts and islands of the Pacific Ocean.

(8) Chemical composition [as-is basis] of the three main soya bean varieties cultivated in North Manchuria: White Eyebrow (*pai mei*). Round Gold (*chin-yuan*). Dark Belly (*hei chi*). (9) Weight (in millions of poods) of soya beans and products carried on the Chinese Eastern Railway in 1920, 1921, 1922, and 1923. Also: Percentage of total carried. Weight of each exported to the South Manchurian Railway, and to the Ussuri Railway. Soya beans and their products are the principal cargo of the Chinese Eastern Railway; in 1923 they accounted for 49.0% of its total cargo, compared with only 24.6% in 1920.

570. Tang, Chi Yu. 1924. An economic study of Chinese agriculture. PhD thesis, Cornell University, Ithaca, New York. 514 p. June. See p. 420-23. [2+ ref]

• ***Summary:*** In Part V, Chief Agricultural Enterprises, chapter 24 is titled "Soy beans." It begins: "China leads the world in the production of soy beans. Statistics on acreage and production of soy beans in China proper are lacking. The soy beans acreage in Manchuria, however, was estimated at 7,200,000 acres, and production 3,700,000 tons" (see *Chinese Economic Bulletin* No. 156, p. 9 {16 Feb. 1924}). "During the period 1891-1904, exports of soy beans and soy bean products were almost entirely absorbed by Japanese markets. The Russo-Japanese war in 1904 and 1905 stimulated the production of soy beans in Manchuria, After the war, the surplus beans had to be disposed of in some markets, and for the first time trial shipments were made by Japanese firms to English mills in 1908... During the period 1909-1922, acreage and production of soy beans increased by leaps and bounds" [in the USA].

The chapter then lists five major reasons that soy beans have become so important in China: "1. Soy beans thrive in a variety of climatic conditions. They do well in dry seasons and at the same time do not reduce greatly in yield in a wet season. 2. Since they are a leguminous crop, soy beans are grown to maintain soil fertility... 3. Soy beans have a high food value in comparison with other foods. They are especially rich in protein... 4. Many by-products are made from soy beans, including bean oil cake, bean meal, bean flour, bean bran, bean sprouts, bean coffee, bean milk and bean curd. Because of the large range of by-products that have been made, the price of soy beans has become stabilized... 5. Further expansion of soy bean production possible when North Manchurian lands are brought under cultivation."

Table 45 (p. 422) shows China's exports of soy beans, bean cake, and bean oil for the years 1913, 1920, 1921, and 1922 in piculs (133.33 lb) and taels (a monetary unit). Each of the three increased during this period which included World War. I. In 1922 exports of bean cake were worth the most, followed by soy beans and bean oil. Soy bean exports grew from 7,419,511 piculs in 1913 to 12,462,350 piculs in 1922. [Soy] bean oil grew from 49,817 piculs in 1913 to 12,294,006 piculs in 1922.

Table 46 (p. 423) shows the weight and value of these three products exported to various countries. Beans are mostly exported to Russia, Japan, and the Dutch Indies (in that order). Bean cake is mostly exported to Japan (86% of the total) and Russia. Relatively little bean oil is exported: it goes mainly to the "Turkey, Persia, Egypt, etc." [grouped as one unit] (380,000 piculs), Russia (250,000 piculs), Great Britain (246,000 piculs), the Netherlands (201,000 piculs), and the United States (116,000 piculs).

Note: This is the earliest English-language document seen (June 2013) that uses the term "bean bran" to refer to soy bran. Address: Cornell Univ., Ithaca, New York.

571. May Co. (The). Formerly Hamburger's. 1924. Health first! (Ad). *Los Angeles Times.* Sept. 7. p. I25.

• ***Summary:*** "The May Co. headquarters for Battle Creek [Michigan] and other famous health foods! Yogurt Tablets, a Battle Creek product that makes very superior buttermilk. Vegex–a vitamin food in four different forms and sizes. Cubes, almonds, paste and fruit wafers. 10¢ to $11.50.

"Fruit and Nut Bromose–health chocolates and meltose sweets. Zo–Vitamin breakfast food (Battle Creek Food Co.) rich in food iron and other food salts.

"For a full list of Battle Creek and other health foods, also catalog of fine groceries, write for Bklet [Booklet] 67T." Address: Fourth Floor [Broadway at Eighth, Los Angeles].

572. Cullison, W.V. 1924. The soy bean and commerce. *Oil Miller* 20(3):17-18, 20-22. Nov. Reprinted from The Staley Journal.
• ***Summary:*** Contents: Introduction and history. Three methods of producing soybean oil: Old hydraulic method, extraction process using "light petroleum naptha" [naphtha], and by the Anderson Expeller mill (continuous process). Crude soy bean oil. Use of oil in hard soaps and paints. Soy bean meal: Soy bean flour as food. Food uses of soy beans in China and Japan: Soy bean or vegetable milk, tofu or soy bean curd, miso or soy bean paste, soy bean sauce (shoyu). Soy beans and the farmer: North Carolina led in acreage until 1923, when Illinois gained first place. Growing soy bean. history of the soybean, uses, methods of oil production, and uses for the oil and meal.

"The soy bean has been grown in the United States since 1804, under the names of Coffee bean, Japan pea, Soja, Soy, Soya and Stock pea. During the period of the Civil War the soy bean was used rather extensively in the southern States as a coffee substitute. For a considerable while seedmen sold certain varieties under the names Coffee Berry and Coffee Bean.

Note 1. This is the second earliest document seen (Nov. 2005) which states that soybeans were used as a coffee substitute during the Civil War in the United States.

The 2nd process for producing soy bean oil is the "Extraction Process wherein the ground seed is leached with light petroleum naptha, which dissolves the oil, leaving a meal containing less than 4 per cent oil. The naphtha extract is distilled, the naphtha recovered and used over again, and the soy bean oil obtained as a residue from this distillation."

"The demand and market for soy bean products, especially the oil, is here and now. Whether or not this demand will be filled by American grown beans, or by beans and oil imported from Manchuria depends upon the American farmer."

A map shows where soy beans are produced in the USA. A flow sheet shows the basic steps in making soy bean oil, meal, and other chief products. A photo shows a line of expellers, powered by overhead belts, as they "extract soy bean oil."

Note 2. This article says nothing about the A.E. Staley Manufacturing Company's work with soybeans. Address: Research Chemist, A.E. Staley Mfg. Co., Decatur, Illinois.

573. Loreti, Mario. 1924. Esperienze sulla alimentazione di lattanti affetti da manifestazioni di diatesi essudativa e spasmofilica con latte vegetale di soja hispida [Experiments with feeding unweaned infants, affected by symptoms of exudative diathesis and spasmophilia, with soymilk]. *Rivista di Clinica Pediatrica* 22(11):765-81. Nov. [20 ref. Ita; eng; fre; ger]
• ***Summary:*** Soymilk, which is properly prepared, is shown to be an advantageous substitute for cow's milk in feeding infants with symptoms of exudative diathesis and spasmophilia. Address: Asst., Institute of Clinical Pediatrics, Univ. of Bologna, Italy (Istituto di Clinica Pediatrica della R. Università di Bologna).

574. Slosson, Edwin E. 1924. Soy. *School Science & Mathematics* 24(8):855-56. Nov. Whole No. 208. [2 ref]
• ***Summary:*** This article is reprinted from *Scientific Monthly* (Jan. 1924, p. 109, 111).

575. Battle Creek Food Co. 1924-1933. Special tests. Battle Creek, Michigan. 115 p. Unpublished manuscript.
• ***Summary:*** This is a bound, lined laboratory notebook used for recording the results of experiments, which were then reported back to Dr. John Harvey Kellogg. Most of the experiments involved the vitamin content of plant foods. Pages 4-5 (dated 12 Dec. 1924) shows graphs of the weight of rats fed soy bean flour as the sole source of protein and vitamin B. H.S. Mitchell was the experimenter.

Page 7 (dated 9 Nov. 1928) is a test of soy bean flour which "had been subjected to a process for removing the bad flavor. Dr. Kellogg was "anxious to see whether the vitamins A and B have been removed." A test on rats showed that they grew equally well on regular soy bean flour and the processed soy bean flour.

Page 22 (dated 1929-30) describes an experiment which shows that soy milk and soy bean meal are equally good sources of vitamin B. Many tests were conducted on the vitamin content of Savita, Savita Bouillon Cubes, and Savita yeast, compared to Fleischmann's yeast. Address: Battle Creek, Michigan.

576. *Biblioteka Naroden Universitet* (*Library Popular University*). 1924. Soiata. Neinoto otglejdane i izpolzvane. • ***Summary:*** "Methods of preparation and analyses are given for 9 products manufactured from soy bean, including oil, been curd, bean milk, etc...

"Soy-bean cake contains 42.1% protein and 9.6% oil. This might be used for the manufacture of artificial marble and similar products."

578. Cooper, Lenna Frances. 1924. The new cookery. 9th ed., revised. Battle Creek, Michigan: The Modern Medicine

Publishing Co. 475 p. See p. 76-77. Index. 23 cm.
• ***Summary:*** The Preface (p. 12) states: "The author wishes to express her indebtedness to Dr. John Harvey Kellogg, of the Battle Creek Sanitarium, and to his wife, the late Mrs. Kellogg, both of whom have inspired her with a love for the study of foods and their scientific preparation and have been constant sources of help and encouragement.

In the chapter on "Unfermented breads," the recipe for "Soy cakes and waffles" (p. 76) calls for "2 cups Soy flour."

The section titled "Unusual foods referred to in this book" (p. 462-64) states that the following are made by the Battle Creek Food Company, Battle Creek, Michigan: Protose (a meat substitute made from cereal and nuts), Nuttolene (a pure nut product with the consistency of brick cheese), Savita (a pure vegetable meat flavoring), Meltose (malt honey), Meltose Sugar, Sanitarium Cooked Bran (an appetizing food that supplies the necessary roughage, stimulates intestinal activity, and is rich in vitamins), Vita-Wheat (rich in gluten, lime, iron, and Vitamin B–the anti-neuritic vitamin), Branola (breakfast food that is 2/3 bran and 1/3 wheat), Zo (a body-building, ready cooked cereal breakfast food), gluten flour (contains 44% of wheat gluten), Malted Nuts ("A delicious nut cream–Contains the same nourishing food values as human milk and is even richer in its tissue building elements. It has an appetizing flavor and can be used with excellent results by those with whom cow's milk is found to disagree. It is excellent for those who wish to gain weight"), Minute Brew (a cereal coffee), Kaffir Tea, B. Acidophilus Culture (Bacillus Acidophilus is the strongest known lactic acid producing organism), Vegetable Gelatine or Agar (Made "from Ceylon moss, a seaweed that grows off the coast of Japan." It is "a form of cellulose resembling bran in chemical composition but somewhat like animal gelatine in physical appearance").

Note 1. This is the third earliest Seventh-day Adventist cookbook seen (Oct. 2004) that contains a recipe using soybeans or soy ingredients.

Note 2. The first edition of this book was copyrighted in 1914, the 11th edition in 1929. There is no mention of soya in Mrs. E.E. Kellogg's *Science in the Kitchen* (revised ed., 1892. Battle Creek, Michigan: Health Publishing Co.), nor in H.S. Andrews' *Science of Food and Cookery* (1921. Pacific Press Publishing Co.), nor in George Cornforth's *Good Food* (1920. Review and Herald Publishing Assoc.). Address: Dean of Home Economics, Battle Creek College; formerly, Head Dietitian of the Battle Creek Sanitarium; and later, Supervising Dietitian, United States Army (1918-1919).

579. Laxa, Otakar. 1924. Syrarstvi: Popis vyroby a upravy syra jako potraviny [Cheese production: Production of cheese and its productivity as a food. 2nd ed., revised and enlarged]. Prague: Ceskolovenske Podniky Tiskarske a Vydavatelske. 539 p. See p. 522-24. Series: Zemedelska Knihovna, edited by Prof. Dr. Alois Velich. [Cze]
• ***Summary:*** In the section titled "Vegetable Cheeses" (p. 522-24), the author discusses tofu, natto, kori-tofu [dried frozen tofu], and miso. Address: Prof., Dr., Czechoslovakia.

580. Minami Manshû Tetsudô K.K. Kôgyô-bu. Nômu-ka. [South Manchuria Railway Co., Industrial Div. Bureau of Agriculture]. 1924. Daizu no kakô [Soybean processing]. Dairen, Manchuria: SMRC. 777 p. 30 cm. (Sangyo Shiryo 21). [250 ref. Jap]
• ***Summary:*** Name of company with diacritics is: Minami Manshû Tetsudô K.K. Kôgyô-bu. Nômu-ka. This important, major work was written by Yoshitane Satô. Contents: Photos (on unnumbered pages at the front of the book) show 16 scenes of soybean transportation, storage, and processing in Manchuria, as follows: (1) Mule drivers whipping mules trying to pull carts loaded with large sacks of soybeans over muddy roads. (2) Cylindrical osier storage bins for soybeans. (3) Row upon row of sacks of soybeans piled high in storage near docks. (4) Soy sauce being made in a courtyard; each earthenware jar is covered with a woven conical lid. (5) The inside of a huge and modern soy sauce plant. (6) Wooden kegs and glass bottles of Yamasa shoyu. (7) Soy sprouts (*daizu moyashi*) growing in round woven baskets. (8-11) Soy oil being pressed using vertical screw presses [as an alternative to hydraulic presses]–four views. (12) Boilers used in a soybean mill. (13) A wooden barrel of soybean oil being sealed. (14) Soy oil packaged in many small containers, each surrounded by a wicker basket. (15) Round soybean cakes stacked high on railway flatcars. (16) The inside of a modern soy oil factory.

Note 1. This is the earliest Japanese-language document seen (Jan. 2013) that uses the term *daizu moyashi* to refer to soy sprouts.

Contents: 1. Current status of soybean production and consumption: A. Production: Overview (p. 2), Japan (p. 4), Korea (p. 12), Manchuria (p. 16), China (except 3 eastern provinces, but including Eastern Inner Mongolia, p. 31), USA (p. 34), British colonies (p. 37), European countries (p. 40). B. Consumption: Japan (p. 41), Korea (p. 52), Manchuria (p. 57), China (p. 59), Dutch East Indies (Indonesia, p. 60), USA (p. 61), European countries (p. 63).

2. Characteristics of soybeans: A. From a physical sciences viewpoint (p. 67): Structure (overview, cotyledons, hypocotyl, seed coat), contents of each system (p. 70), appearance (p. 73; color, gloss, shape, size, hilum (*fusuma*) color, young plumule leaf color, ratio of seed to seed coat). B. From chemical viewpoint (p. 82): General composition, structure of each component (p. 109; protein, oil, carbohydrate, ash/minerals, vitamins). C. Appearance and relationship between oil and protein content (p. 126): Oil and protein color related to color, glossiness, shape, size, hilum color, young plumule leaf color. D. Evaluating soybean quality (p. 140): Overview, key points (sizes, shapes, colors, glossiness, hilum color, young plumule leaf color, ratio of

seed coat to seed, dryness of seed, volume, weight, smell, mixing of different varieties, ratio of imperfect seeds, amount of other types of seeds), collection of materials for testing, testing and evaluating commercial soybeans.

3. Soybean usage and processing (p. 175). A. One view of main usage of soybeans. B. Nutritional value of soybeans as food (p. 183): Nutritional value of soy protein. C. Processed soyfoods (p. 208): Soy sprouts (p. 208), natto (*itohiki nattô,* p. 212, Hamanatto, p. 224), types of tofu (regular tofu [*nama-dôfu,* p. 226], *kori-dofu* or *koya-dofu,* p. 240, aburaage, p. 245, tofu curds [*tofu nô,* p. 247], hard tofu [*tofu-kan,* p. 247], fragrant hard tofu [*kô-kan,* p. 248], *senchô tofu,* p. 249, fermented tofu [*nyûfu or funyû,* p. 249]), *tofu-p'i* or yuba (p. 256), soymilk and artificial cow's milk, p. 259, soybean flour raw, or roasted (kinako, p. 263), shoyu (p. 266; overview of miso and shoyu, Japanese traditional regular shoyu, p. 267, Japanese traditional special shoyu and tamari, p. 269, Chinese soy sauce, p. 272, recent shoyu research and development, p. 274), miso (p. 280; Japanese traditional regular miso, Japanese traditional special and processed miso, p. 282, Chinese miso, recent miso research and development, p, 285). D. Soybeans as feed or fodder (p. 287; green soybeans as feed, p. 290): Fresh forage, dried forage or hay. E. Soybeans as manure or fertilizer (*hiryô,* p. 297; in the Kaijô area of Manchuria, have been roasted and steamed, and mixed with compost, and used for green manure (*ryokuhi*) or soybean cake (*daizu kasu*). This method has also been used in the northeastern provinces (*Tohoku Chiho*) of Japan in rice fields). F. Soybeans as oilseeds (p. 302). G. Use of soybean protein in industrial products (p. 304).

4. The soy oil extraction industry (p. 305): A. Methods of removing the oil (origins, traditional methods, hydraulic pressing, extraction method, p. 340). B. Advantages and disadvantages of each method (p. 348). C. The soy oil industry in Manchuria (p. 357): History of development, important places for soy oil on the Manchurian Railway, economic condition of the Manchurian oil industry (p. 420), oil extraction in Japan (history, p. 437, commercial factories, p. 442, development of these factories, p. 451).

5. Soybean meal or cake and its composition (p. 464). A. The varieties of soybean meal or cake and the composition of each. B. Evaluation of quality (p. 473). C. Soybean meal or cake as a fodder (p. 478): Feeding value and digestibility, incorrectness of the theory that there are bad effects from feeding soybean meal or cake (p. 479). D. Soybean meal or cake as a fertilizer (p. 490). E. Soybean meal or cake as food (p. 504): Use as a raw material for shoyu production (p. 506), use to make soy flour (p. 509). F. Soybean meal or cake as a source of protein in industrial products.

6. Soy oil and its processing (p. 526). A. Characteristics of soy oil: Composition, physical characteristics (p. 535), chemical characteristics, testing and evaluating soy oil (p. 564), the quality of commercial soy oil products (p. 577). B. Refining soy oil (p. 587). C. The use and processing of soy oil (p. 631): Overview, refined soy oil as a food, substitute for salad oil, or for deep-frying oil, as an illuminant, as a cutting oil, lard substitute, margarine, in paints, soap, hardened oil, for waterproofing, substitute for petroleum oil, glycerin, fatty acids, stearine.

7. Exports and imports of soybeans, soybean meal or cake, and soy oil (p. 708). A. Manchuria. B. Manchurian exports. C. China. D. Japan. E. Korea. Appendix: Bibliography of soybeans (Japanese-, German, and English-language works; p. 748). List of photos.

Note 2. This is the earliest Japanese-language document seen (Oct. 2011) that mentions fermented tofu, which it calls *nyûfu* or *funyû.*

Note 3. This is the earliest Japanese-language document seen (Feb. 2012) that uses the term *itohiki nattô* to refer to natto. Address: Dairen, Manchuria.

• ***Summary:*** A 3-page Italian-language summary of the following Italian-language article: Loreti, Mario. 1924. "Esperienze sulla alimentazione di lattanti affetti da manifestazioni di diatesi essudativa e spasmofilica con latte vegetale di soja hispida" [Experiments with feeding unweaned infants, affected by symptoms of exudative diathesis and spasmophilia, with soymilk]. *Rivista di Clinica Pediatrica* 22(11):765-81. Nov.

582. Lovell, Philip M. 1925. Care of the body. *Los Angeles Times.* March 15. p. L24. Sunday magazine.
• ***Summary:*** When Commodore Perry visited Japan and created the "open door" in the mid-1800s, he found many interesting things. "For instance, dairy cows were unknown and milk from animals was something not used." When a mother died at childbirth, either a wet nurse was found or "ample substitutes for animal milk were found.

"The article below, reprinted from the *Vegetarian Magazine* [Chicago, Illinois], is especially interesting, not only because it presents a food infrequently used by the American public, but also because it presents a new outlook on the problem of feeding the delicate, keenly sensitized stomach of the tiny baby."

"'The American public, almost unawares, witnesses today the tedious process of the advent of a new food. Slowly and laboriously, as was the case with the tomato and potato, the soy bean is fighting its way into popular favor.

"'In sustaining 300,000,000 people for 3,000 years the Chinese have worked out a vegetable diet with the necessary constituents of a meat diet. The soy bean is the backbone. Lack of proteins handicaps a vegetarian diet. Beans and peas are richest in proteins, but not of the sort of proportion found in meats–and needed for muscle building.

"'But the soy bean, having no starch, contains 40 per

cent of protein and 20 per cent of oil, thus resembling animal foods; moreover, it contains a dozen kinds of proteins found in milk. Some babies thrive better on soy milk than on cow's milk."

"'Chinese make milk of soy beans, but our Americans are so occupied in making cream puffs, serum, and money that they have no time for making anything but animals to kill and eat."

"'Perhaps some day it [the USDA] will awaken to the fact that soy bean milk having nourished the Chinese centuries before the white man robbed the Indian of his heritage, can more profitably adopt the same product to save the nation. Sander Christensen has produced milk from rice and it was good milk, but has not yet successfully canned it. Americans want everything canned–religion, music, milk. If this inventive man would turn his attention to soy bean milk, we doubt not but we should soon be flowing in soy bean milk and gaining health thereby.'"

Note: This is the earliest English-language document seen (Feb. 2004) that uses the word "backbone" in connection with the soy bean. It says: "The soy bean is the backbone" of China's meatless diet. Address: N.D. [Naturopathic Doctor].

584. Millennial Food Co. 1925. Agents wanted (Ad). *Vegetarian Magazine and Fruitarian* 24(4):29. April.
• ***Summary:*** "All over America agents are wanted to establish Rice Milk Dairies. Rice milk has been taken up with keen interest and the demand is sharp, but we need live men to promote its further introduction. Chicago [Illinois] has a successful dairy, Palestine [in the Middle East], and the calls coming in to California from stations proves its popularity. For information address Millennial Food Co.,..." Address: 223 Minna St., San Francisco, California.

585. Millennial Food Co. 1925. Vegetable powder (Ad). *Vegetarian Magazine and Fruitarian* 24(4):30. April.
• ***Summary:*** "Rich in vegetable fats and containing all vitamines, natural and Balanced for Man. Used instead of milk and eggs in bread making, hot cakes and waffles, in soups and other cooking. Mix with eight times its weight of water.

"Shipped anywhere in the U.S., 4 pounds for $1.00 postpaid." Note: This is probably rice flour, which can be used to make rice milk. Address: 223 Minna St., San Francisco, California.

586. Thevenot, Gaston D. 1925. Process of making vegetable milk [from soy beans]. *U.S. Patent* 1,541,006. June 9. 4 p. Application filed 11 June 1923.
• ***Summary:*** This is a patent for soymilk made from soaked soybeans which are so finely ground that soymilk need not be filtered and the okara need not be discarded, but remains suspended or emulsified in the soymilk. It is based on a previous patent (No. 1,444,812) in which the okara was separated from the soymilk and discarded. Address: New York City, New York.

587. *Vegetarian Magazine and Fruitarian.* 1925. Rice milk all over the world. 24(7):23-24. July.
• ***Summary:*** "Palestine has already interested itself in our American rice milk, and now the French government has had representatives visiting the California rice milk plant with a view to making contracts for it. Also British representatives are interested and present outlook is that foreign countries will adopt rice milk..."

"Well, bakers are coming to see the value of both rice milk and Vegetable Powder now placed on the market by that wonder worker, Sander Christensen, who invented the rice milk, and has furnished the country with a superior brand of rice, called '1000.'"

"When we first learned of rice milk we knew it would revolutionize our present food conditions. Sander Christensen's name will stand out as a brilliant star among world progressives as having brought to it a value not before known in our history." Christiansen traces his origins to Denmark.

"Now the warm weather will begin and heat increase in July and August. Begin now to select a cooling diet and when the heated term arrives you can meet it with a cool smile."

Note 1. This is the second earliest English-language document seen (Aug. 2013) that uses the term "rice milk" to refer to a commercial product.

Note 2. This is the earliest English-language document seen (Feb. 2005) that contains the term "cooling diet" (or "cooling food"). Address: 223 Minna St., San Francisco, California.

588. Carqué, Otto. 1925. Natural foods: The safe way to health. Los Angeles, California: Carqué Pure Food Co., Inc. 359 p. Illust. Index. 20 cm.
• ***Summary:*** This book advocates a natural-food, vegetarian diet, but not necessarily a vegan diet.

Contents: Part I: Fundamental facts about food and health. 1. The old and new conceptions of the cause of disease. 2. Drug medication, vaccination, and serum therapy. 3. Nature's healing factors: Sunlight, fresh air, exercise, rest,

water, the importance of natural foods for life and health, why denatured foods (white flour, refined sugar, candies, etc) are injurious. 4. The constituents of food considered in the light of modern physiology and biology: Proteins, carbohydrates, fats and oils, cellulose, fruit acids are organic acids, organic salts, the alkaline or base-forming elements (iron, sodium, calcium, magnesium, potassium, manganese, and aluminum), the acid-forming elements (phosphorus, sulphur, silicon, chlorine, fluorine, iodine, bromine, arsenic), the vitamins.

5. Rational soil culture essential for the production of superior foods. 6. The conservation of vital force (stimulants, narcotics, elimination of waste, quality of foods, prolongation of life, alkaline and acid-forming foods). 7. Why the calorie theory is misleading. 8. Fruit, man's best friend (the fruit of the tree, sulphured and unsulphured fruits). 9. Nuts–Nature's most concentrated foods.

10. Vegetables–Nature's blood purifiers (Great hygienic value of green leaves, proper soil fertilization most essential to vegetable culture, loss of organic salts in cooking, classification of vegetables–5 classes). 11. Cereals and legumes (Cereals falsely called "The staff of life," whole grain products are the best, the great waste of food elements by modern milling processes, legumes–an important food). 12. Milk and dairy products (Milk not a perfect food for adults). 13. Meat–the least essential and most expensive of all foods (the vegetarian alternative).

Part II: Practical dietetics. 14. How to live well on less food. 15. The feeding of infants and children (lactation, almond milk, soy bean milk). 16. The rational preparation of foods. 17. Rational food combinations (importance of simplicity of eating, the mono-diet and its advantages). 18. Simple and well balanced menus for all seasons.

Appendix: Tables and statistics. A1. Analyses showing the amount of sodium, calcium and iron in foods. A2. Amount of food materials necessary to supply one ounce of protein. A3. Amount of calories contained in one pound and one ounce of 200 food products. A4. Average time required for gastric digestion of foods. A5. Annual consumption of sugar, soft drinks, salt, spices, coffee, tobacco, drugs, alcohol, etc., in the United States. A6. Regulations for the enforcement of the Food and Drug Act. Important information about chemical preservatives and artificial colors.

The Preface (and the book) begins: "Two powerful superstitions are impeding the welfare and progress of the human race. The one is the conviction that disease is an entity, a mysterious something that attacks us without warning from the outside, either in the form of germs or as inclemency of weather. The other–perhaps the more harmful of the two–is the belief that for each disease specific remedies must be found, such as drugs, serums, vaccines, glandular extracts, etc., and that, when we are afflicted, we have to submit to a specialist's treatment or even to the affected parts or organs."

The average individual tries "to shift the responsibility for his sins of omission or commission to some imaginary cause, rather than to hold himself accountable for the violation of nature's laws." There is "almost universal ignorance of the fact that disease is merely an effort on the part of nature or the universal life force to restore normal conditions in the organism. Our present system of commercialism has taken advantage of this situation by misleading people through clever advertising to persist in their errors in order to maintain the demand for drugs and serums, proprietary medicines,..."

Chapter 11, "Cereals and Legumes," briefly discusses many types of soyfoods–soy bean sprouts, milk, flour, tofu, soy sauce, and oil (p. 142). Page 196 discusses the use of soy bean milk and almond milk for feeding infants and children.

Chapter 16, titled "The Rational Preparation of Foods," contains a long and detailed section on soy beans (266-71), with subsections on boiled soy beans, soy bean milk, tofu, soy sauce, and soy bean sprouts. Home preparation of each is described. Miso, yuba, natto, and hamananatto are also mentioned (p. 268). Soy-related recipes include: Baked soy beans (p. 269). Soy bean loaf. Soy bean croquettes. Soy bean bread (p. 270).

The section titled "Home made cheese" begins: "Man can live well without milk and dairy products, if he makes judicious use of legumes and nuts in various forms, as has been explained in the preceeding chapters, but under the present system og agriculture and production of foodstuffs, many people have to make occasional use of milk products... As the commercial cheese are generally heavily salted, preference should be given to home made cheese... Cottage cheese made without salt is the most wholesome of the cheeses."

Chapter 9 (p. 119-24), about nuts, states: "The making of nut butters is not a difficult process. At present peanuts and almonds are chiefly used for this purpose... The blanching of peanuts and almonds is now done on a large scale by special machinery, and the blanched nuts can be procured in nearly all the larger cities." Break the blanched nuts into small pieces by running them through the Climax Grater or a food chopper. Put them into a moderately hot oven for a few minutes to make them dry and crisp, then run them through a tightly adjusted nut mill to create a "smooth, palatable nut butter." A large table (p. 122) compares the composition of various nuts and nut butters (almond butter, peanut butter) with meat, cheese, eggs, cow butter, and whole wheat bread. "The pecan contains the largest amount of fat, about 70%, closely followed by the hickory nut, brazil nut, filbert and pine nut, which all contain over 60% of fat. The pignolia imported from Spain ranks highest in the amount of protein, containing nearly 34%; the peanut comes next with 29.8%; the butter nut, almond. pistachio, all contain over 20% protein, excelling the best cuts of meat in that respect. The

almond does not contain any starch as is, therefore, the nut best suitable for infants, especially in the form of almond milk." Chufa contains 3.5% protein and 31.6% fat.

The section titled "Fruit and nut confections" (p. 212-15) discusses and has recipes for natural candies and confections.

The section titled "How the American people deplete their vitality by their favorite poisons: The tremendous waste of our material wealth" (p. 328-43) discusses (p. 338-43): The amount spent in 1924 on each of 15 "adulterated foods and drinks and of poisonous stimulants and narcotics" ($5,040 million) compared with the amount spent on foods and vegetables ($850 million, or 16.8% as much). Refined sugar. Coffee. Tobacco. Condiments, etc. Alcoholic beverages. Drugs. Regulations for the enforcement of the Food and Drug Act (due to untiring efforts of Dr. Harvey W. Wiley, former chief of the Bureau of Chemistry, USDA). Sodium benzoate and sulphur dioxide. Salt. Saltpeter. Boric acid and borax. Saccharine. Mineral and coal tar dyes. Laxity in enforcement of the Pure Food Law.

On pages 344-47 is information about the Carque Pure Food Company (incorporated 1912) and its founder and owner Otto Carque, including a brief biography of Otto, a list of leading Carque food products, and a full page photo of the company's new home at 729 Seward St., on 1 Oct. 1925 (2 story brick building).

The food products are arranged by groups: Fruits: Sun-dried and dehydrated, without bleaches or preservatives (Black mission figs, white Smyrna-type figs, prunes, dates, olives, raisins, apricots, peaches, pears). Nuts: Fresh, selected and unroasted (almonds, walnuts, Brazil nuts, pecans, pignolias, pistachios, peanuts). Confections: Of assorted fruits, nuts and honey, without sugar, salt, glucose or preservatives (delectables, fruit nuggets, Kandy-Andy). Stamina and laxative foods (Nut-Fruto, Prunola {prunes and olives}, fruit laxative). Nut butters: Ground from whole nuts, uncooked and unsalted (almond, nut cream, peanut). Cereals and products: Made from re-cleaned whole grain (wheat flour, yellow corn meal, brown rice, breakfast food, crackers). Miscellaneous (olive oil, strained honey, raw sugar, fig-cereal breakfast drink {instead of coffee}). Price list and descriptive circulars on request.

Note: This is the earliest English-language document (or book) seen (June 2004) with the term "Natural foods" in the title that also discusses soy. Address: Los Angeles, California.

589. Deming, Macey F. 1925. Soybeans for human food. *Proceedings of the American Soybean Association* 1:71-76. Sixth annual field meeting. Held 1-3 Sept. at Washington, DC.
Address: Tappan, New York.

590. Latham, F.P. 1925. The economic value of the soybean to southern agriculture. *Proceedings of the American Soybean Association* 1:63-65. Sixth annual field meeting. Held 1-3 Sept. at Washington, DC.
• ***Summary:*** "I remember very distinctly some fifteen years ago [in about 1910], one October afternoon, when a stranger came into my front yard, as I was in the midst of the unusual work that a farmer has to do to maintain his living. I asked the stranger what I might do for him. He said, 'Morse is my name and I am from Washington [DC]. I am making a soybean investigation and would be glad to go over the situation with you.'

"I took just about two minutes to find that I was right next to a man who had the information for which I had been thirsting for six or eight years, and it was my pleasure to be with him that whole afternoon, that night, and all the next day. And, gentlemen, that is the date of a period in my agricultural activities, a period that I look back to with great pleasure. I know it has been one of the most profitable and most pleasant periods, and I know that there has been no better time in all of my life than the time of my association with Mr. Morse.

"I come from a section of the country, that is a cotton country, that has been growing cotton for a century. I come from a section whose people have been losing in cotton, and during that time, the white plague [boll weevil] has worked on their sandy soils and erosion has made pock-marks all over the country of the south." "I believe this, as clearly as I believe I am before you now, that the boll weevil in the South is going to drive us to produce our own foodstuffs; and when the day comes that the South sits up to breakfast and a soybean cereal is served with rich, yellow, soybean cream; when the table is supplied with ham, eggs, bacon, all made from a soybean product and as a result of the humus the soybean puts into the soil; when our new meal and even our livestock comes from the soybean, then I believe that the greatest territory will lie between the Virginia line and the Rio Grande territory, and I believe that God is the only one who knows what our land will do under those conditions. I am particularly delighted to meet the faces that I have met here today, people who each have a mission with the going to be of inestimable value to the South, North, East and West, because there is no legume that will adapt itself into the whole United States as does the soybean. It will fit anywhere; you can start it in March or in August and it will make good in every kind of season and when everything else quits. It is one of the greatest plants ever introduced into our whole agriculture, and I want to say to you, gentlemen, that I have been wonderfully interested in what I have heard and learned here with you today." Address: Belhaven, North Carolina.

591. Meharry, Charles L. 1925. Second annual field meeting: Illinois–September 1, 1921. *Proceedings of the American Soybean Association* 1:42-46.

• ***Summary:*** "The Second Annual Field Meeting of the National Soybean Growers' Association was held on 1 Sept. at the University of Illinois and at the A.P. Meharry Farm near Tolono, Illinois, the University of Illinois Extension Service, the Champaign County Soybean Growers' Association cooperating in arranging and conducting the program. The Champaign County Soybean Association and the Champaign County Farm Bureau furnished transportation and lunch was served by the Crittenden Unit of the Champaign County Farm Bureau.

"More than 1,600 people representing 35 counties in Illinois, 9 counties in Indiana, 3 counties in Kentucky, one county each in Missouri, Ohio and Wisconsin and the United States Department of Agriculture assembled at the South Farm of the University of Illinois, where representatives of the Extension Department explained the various soybean experiments, and the use and place of soybeans in rotations for Corn Belt conditions. Field plot tests of varieties suitable for different uses, soil types and latitude were inspected and the characters and behavior of each variety discussed. A special feature of variety demonstration was a test of sixteen varieties secured from each of ten different states... Visitors were then shown the work of Dr. Woodworth and others who are developing new varieties through selection and breeding. Dr. Woodworth discussed quite fully the principles of breeding and their application to natural and artificial crossing."

"At 10:30 the visitors started in automobiles for the A.P. Meharry Farm near Tolono... After arrival at the farm, several hay varieties, Illinois 13-19 (Ilsoy), Virginia, Mongol (Mid-west [Midwest]) and others were inspected. Several large fields of the Manchu, A.K., and Mongol (Midwest) for seed production were viewed."

"At noon a cafeteria lunch was served in the grove. In addition to the regular lunch, the A.P. Meharry Farm served a number of soybean dishes, including baked soybeans, soybean coffee, soybean milk, and soy sauce. An exhibit of soybean products consisting of soybean oil, soybean oil meal and flour, various paints and varnishes, soaps and photographs of various operations in the soybean field was furnished by County Agent C.H. Oathout.

"After luncheon President Riegel called the meeting to order, and Professor J.C. Hackleman, Illinois Extension Specialist in Farm Crops, presided.

"Mr. Charles L. Meharry welcomed the visitors to the A.P. Meharry Farm and spoke briefly of the place and importance of soybeans on the Meharry Farms.

Mr. Henry J. Waters, former President of the Kansas State Agricultural College, addressed the growers on the economic distress of the times and the economic situation at the close of the World War.

Professor E.J. Kinney, of the Kentucky Experiment Station, told briefly of the soybean in Kentucky... For Kentucky conditions the Mammoth Yellow was recommended for forage and the Haberlandt for seed.

"Mr. Charles Caldwell, soybean grower of Kentucky, told briefly of ten years' experience with soybeans."

"Mr. Taylor Fouts, soybean grower of Indiana, stated that he had been growing soybeans for a great many years, and emphasized their value as a soil-building leguminous crop on poor soils, especially where clover fails. He suggested that while corn is King of the midwest crops, the soybean would be known as the Queen, when we realize the wonderful possibilities and many uses of the crop.

Note: This is the earliest English-language document seen (July 2007) that uses the word "Queen" to refer to the soybean.

"Mr. C.E. Carter, of the Missouri Experiment Station, reported on the soybean situation in Missouri... The Morse and Medium Yellow (Midwest) are regarded as the best seed varieties and Wilson and Virginia as the best forage sorts.

"Professor George M. Briggs, of the Wisconsin Experiment Station, praised the performance of soybeans in his state."

"Mr. W.J. Morse, of the United States Department of Agriculture, gave a general review of the soybean situation in the United States. He stated that the interest in soybeans has increased very rapidly during the past few years, not only in the Middle West, but also on the Pacific Coast, in New England and throughout the Northern and Southern States."

"Mr. O.L. Cunningham, Kentucky, reported that soybeans were so generally grown and favored in Fulton County that soybean demonstrations were not essential. Of the 20,000 acres of corn, at least 16,000 acres were said to be planted with soybeans. The Mammoth Yellow variety was grown with late corn and the Haberlandt with early corn for pasturage. In Fulton County the corn is cut off and the hogs allowed to pasture the soybeans.

"Mr. C.B. Newton, Ohio, reported on soybeans growing in Ohio."

"Mr. W.E. Riegel, manager of the A.P. Meharry Farm, in a brief talk, stated that there was a place for soybeans on every farm to produce whatever amount of feed could be fed upon the farm, and that farmers should produce their protein feed instead of buying tankage, cottonseed meal and other high-priced feeds. It was also thought that soybeans should be developed as a human food in the United States as already had been done in the Orient."

"Chairman Hackleman emphasized his belief that the farmer should think of the soybean crop as a feed, forage, and pasture crop, and as a legume to enrich the soil. He made the point very emphatically that farmers should not depend on growing the soybean crop for seed alone, and more converts are needed to soybeans for their value on the farm. When the farmers get this attitude towards the crop, the seed crop will take care of itself.

"A demonstration of threshing soybeans followed the program of speakers. Several loads of unhulled beans of

the 1920 crop were threshed to demonstrate that the proper adjustment of an ordinary grain separator is all that is necessary to successfully thresh beans. The growers were shown the necessary adjustments and attachments in the way of different sized pulleys which reduced the cylinder speed without reducing the speed of the remainder of the thresher.

"The growers and guests after a unanimous vote of thanks to the hosts of the A.P. Meharry Farms departed about sundown."

Four small photos (p. 41) show "The Second Annual Field Meeting of the Association at the A.P. Meharry Farm near Tolono, Illinois, September 1, 1921." (1) Men standing in a field with silos and barns in the background. (2) People and children standing around luncheon tables covered with white table cloths. (3) Many men seated on the ground under trees, wearing white dress shirts (some wearing straw hats) and listening to a speaker. (4) Men standing around talking under trees. Address: Acting secretary.

592. Thevenot, Gaston D. 1925. Method for the preparation of a vegetable milk. *U.S. Patent* 1,556,977. Oct. 13. 3 p. Application filed 8 Dec. 1923.
• ***Summary:*** When decuticled mashed soybean is digested with proteolytic enzymes, some of the flavor principles are removed. Address: New York City, NY.

593. Vi-Tone. 1925. Vi-Tone (A Canadian product) (Ad). *Toronto Daily Star* (*Canada*). Oct. 25. p. 10.
• ***Summary:*** A very small ad for Vi-Tone. "A delicious Malted Milk Chocolate-flavored drink. Serve it hot or cold. Rich in proteins and vitamines of the Soya Bean.

"Look for our special demonstration in the Parkdale and Riverdale Markets this week-end."

594. Firth, Violet Mary. 1925. The soya bean: An appeal to humanitarians. London: C.W. Daniel Co., Graham House, Tudor St., London E.C. 4, England. 55 p. Oct. Reviewed in Russian by N.I. Morosoff in Manchuria Monitor. 1930. No. 5. p. 104-05.
• ***Summary:*** Contents: Part I: An appeal to humanitarians. Introduction. 1. Practical application of idealism. 2. Economic considerations. 3. Milk is not a humane food. 4. The power of humane ideals in commerce. 5. The burden of the animal kingdom. 6. The freedom of the cattle.

Part II: The making of soya milk. 7. The cultivation of the soya bean. 8. Early experiments with soya milk. 9. Process of manufacture. 10. The soya meal [okara]. 11. The soya bean industry. 12. The soya bean in the kitchen. 13. Medical and dietetic aspects. 14. The soya bean in national emergencies.

The foreword begins: "The manufacture of a vegetable milk from the soya bean is a matter in which I was much interested during the war, and I think I may claim to be the first person, in this country at any rate, who succeeded in making a cheese [tofu?] from vegetable casein.

"Shortly after the war [World War I] the company that was making soya milk closed down, the milk was unobtainable, and I lost touch with the matter. During a recent visit to Letchworth, however, I found that the making of soya milk was again in full swing, and I was so impressed with the spirit of service and humane ideals in which the enterprise was being conducted that I suggested to the managing director of the company that if he would assist me with the necessary technical details, I would like to write a little book on the possibilities of the soya bean, and bring to the notice of humanitarians in general the work that has been going on so quietly in this little country town. All information was freely given to me...

"I must express to the Garden City Pure Food Co. my thanks for their assistance and my admiration for the spirit in which their work is being carried on." That company has neither commissioned, nor subsidized this book.

This book is "written in an endeavour to make those who are "earnest for animal welfare realise that the exploitation of our younger brothers can be prevented more effectually from the commercial aspect than by individual abstention from flesh-food..."

"Over a hundred thousand pounds has been spent in England alone in experiments in making milk from the soya bean... The original company closed down during the post-war trade depression, and the wonderful soya milk was unobtainable; the work on the soya bean has been taken up again by a body of people actuated by philanthropic and humanitarian motives, whose names are well known among workers for human and animal welfare.

"The dearly bought secrets of the soya bean must not again be lost to the world..."

Note: The author sometimes writes under the pseudonym of Dion Fortune. Address: Author [England].

595. **Product Name:** Vi-Tone. Renamed Soybean Malter Milk, and Chocolate Malter Milk by Sept. 1929 (Malt Chocolate Soymilk).
Manufacturer's Name: Vi-Tone Company (Renamed in Milk-Ko Products in 1954).
Manufacturer's Address: P.O. Box 356, Hamilton, Ontario, Canada.
Date of Introduction: 1925. October.
New Product–Documentation: Ad for Vi-Tone by Vi-Tone Company. 1925. *Toronto Daily Star* (Canada). Oct. 25. p. 10. "A delicious Malted Milk Chocolate-flavored drink. Serve it hot or cold. Rich in proteins and vitamines of the Soya Bean."

Ad for Vi-Tone by Vi-Tone Company. 1928. Proceedings of the American Soybean Assoc. p. 39. "Jack and Jill both love Vi-Ton" [sic, Vi-Tone]. The ad text mentions "Vi-Tone 3 times. "Vi-Tone is a scientific combination of the Soy Bean with malt extract and milk–rich in protein and

vitamin content–and deliciously flavored with chocolate." An illustration shows a can of "Vi-Tone," described as a "food tonic beverage."

F. Dimmock. 1929. Proceedings of the American Soybean Assoc. p. 47-50. See p. 47. "The Soybean in Canada." "As far as the speaker is aware, only one firm in Canada uses the soybean in a commercial way. The Vi-tone Co., of Hamilton, Ontario, uses annually about 5,000 bu in the manufacture of a patent food." The product name is not given. It may have been Soybean Malter Milk and/or Chocolate Malter Milk. Note also that Milqo / Milquo (Soy Milk) had been launched in Hamilton, Ontario, by 1919 (Source: H.W. Lohse. 1936. *Canadian Chemistry and Metallurgy.* July. p. 224-25).

Gray. 1936. All About the Soya Bean. p. 124. Note: Hamilton is directly south of Toronto, at the western tip of Lake Ontario. This may be the product referred to by Dimmock in 1929.

Leon Lothrope. 1932. *Nor'-West Farmer and Farm & Home* (Canada). Oct. p. 8. "Soya beans." A photo titled "Products that contain soya bean oil or meal" shows a can of "Vi-Tone" Malt Chocolate Flavor. The front panel reads: "Hot or cold. A tonic food beverage. An extraction of malt and milk–rich in protein and vitamins of the soya bean."

L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "Vi-Tone Company, Hamilton, Ontario, Canada: Soy bean malted milk, chocolate malted milk."

International Inst. of Agriculture. 1936. *Le Soja dans le Monde* [The Soybean in the World]. See: Manufacturers of edible soy products. p. 206. Malted soymilk and chocolate malted soymilk. Address: P.O. Box 358, Hamilton, Ont.

American Soy Bean Association. 1938. "16th annual meeting." This leaflet lists the stores from which the soy products were purchased, incl. Milqo Limited, Vi-Tone Company, Hamilton, Ontario, Canada.

Soybean Digest. 1948. "Grits and flakes... from the world of soy: Milquo Ltd. is now Vi-Tone." Jan. p. 34. "Milquo Limited has changed its firm name to Vi-Tone Products Limited, 198 Gage Ave. S., Hamilton, Ontario. Ray H. Bissell is president."

Note that according to the *Soybean Blue Book* (1948, p. 80) by that year "Vi-tone Products Ltd." was making a "tonic food beverage with soybean base." No brand name is given. According to *Soybean Blue Book* (1954, p. 102) this company either apparently changed its name at this time to Mil-Ko Products Ltd. or merged with Milqo Ltd. in Hamilton. Its address changed to P.O. Box 366. It continued to make "Tonic food beverages with soybean base." When Mil-Ko appeared, Vi-tone disappeared.

596. Morse, W.J. 1926. Re: Material for the B.P.I. exhibit for the Sesquicentennial Exposition. Letter (memorandum) to Dr. R.A. Oakley, USDA, Washington, DC, March 22. 1 p. Typed, with signature on letterhead.

• ***Summary:*** "Dear Dr. Oakley: With reference to the attached memorandum of March 11 from Dr. W.A. Taylor regarding the B.P.I. [Bureau of Plant Industry] exhibit for the Sesquicentennial Exposition, will say that we have here at the office the materials shown on the accompanying sheet labeled, 'Soybean Material for Exhibition Purposes.'

"In a recent letter from the Henry Bower Chemical Co., Philadelphia, I have been advised by Mr. Sydney Thayer, Jr., Assistant Secretary of this company, that they have been offered exhibition space at the above exposition, and it is stated that they have no chemicals that they could exhibit for public interest, but they have considered taking some small space to demonstrate the results of their work with soybean. It may interest you to know that this company has been conducting experimental work with soybeans for about one year now, especially as to the milk and flour products which can be made from the soybean. Mr. Thayer states that it occurred to him perhaps the Department of Agriculture would be represented with some sort of an exhibit, and that in our exhibit of soybeans we might include the products which they are interested in. It is further stated that if we were planning this soybean exhibit, they would be very glad to cooperate with us and furnish us any material that they may have to make the soybean exhibit a successful one. Yours very truly,..."

Location: National Archives, College Park, Maryland. Record group 54–Bureau of Plant Industry, Soils and Agricultural Engineering. Subgroup–Div. of Forage Crops and Diseases. Series–General Correspondence, 1905-29. Box 92–Morgan-Morse.

Sent to Soyinfo Center by Matthew Roth of Rutgers Univ., March 2012. Address: Agronomist, Forage-Crop Investigations, Bureau of Plant Industry, USDA, Washington, DC.

597. McAuliffe, J.C. 1926. The soya bean as a new world food crop. *Manufacturers Record* 89:100-01. April 1.

• ***Summary:*** An brief overview. "Dr. Horvath, of the Rockefeller Foundation, at work in Pekin, declares that the soya bean is the most complete vegetable food in the world–that it has all the elements of bread and butter, milk, eggs and meat combined into one bean.

Moreover, a milk made from the soya bean is "said to serve all the purposes of cow's milk, simply by the addition of a little sodium chloride..." Investigators says that soya bean milk can be produced at one-tenth the cost of cow's milk. It "is both chemically and actually of the same constituent quality, possessing the vitamines and at the same time eliminating all dangers of contamination in the way of

tuberculosis, typhoid fever and other dangerous diseases."

A large photo shows a large field of O-Too-Tan variety soya beans in South Carolina. Two men, wearing hats, are standing in the field; one is holding uprooted soya bean plants. Address: Augusta, Georgia.

598. Tso, Ernest. 1926. The value of egg yolk in supplementing diets deficient in calcium. *American J. of Physiology* 77(1):192-98. June. [12 ref]

• ***Summary:*** This study is designed to test the statement made by the famous nutritionist McCollum in his *Newer Knowledge of Nutrition* (1922, p. 171, 343) that "all diets without milk or leafy vegetables are deficient in calcium and therefore not suitable for human or animal nutrition."

In the author's first feeding study using soybean milk, he prepared a fairly concentrated soybean milk (containing 4% protein and 1.6% fat), supplemented it with 5% cane sugar and 0.1% sodium chloride. When this mixture was supplemented by 4% of egg yolk, rats reproduced normally, reproduced young and these in turn grew up normally.

In China, cow's milk is little used and most households cannot afford to buy it. However the cost of eggs and soymilk are very low. Tso concludes: "Egg yolk should be considered as efficient a protective food as milk. Whereas milk in relatively large quantities is the most available source of calcium for human nutrition, egg yolk in small amounts furnishes a vitamin like substance which enables the body to mobilize and utilize economically the apparently limited supply of calcium in the diet. Egg yolk is therefore invaluable in supplementing Chinese diets of young children in which milk or milk products take little or no part." Address: Dep. of Medicine, Peking Union Medical College, Peking, China.

599. Horvath, A.A. 1926. A new method for the determination of fat in soybean milk. *China Medical Journal* 40(7):631-33. July. [2 ref]

• ***Summary:*** "Soybean milk is extensively used throughout China by adults and for infant feeding. It has also been a very great success in the feeding of children in the United States.

The method, which is described, consists in autoclaving the soybean milk in an equal volume of a 20 per cent NaCl [sodium chloride] solution, followed by determination of the fat by the Babcock method.

A table shows the percentage of fat in 8 samples of soybean milk; 1-4 were prepared in the laboratory and 5-8 were purchased from various shops in Peking.

The percentage of fat in samples 1-4 ranges from 1.75% to 1.42% when calculated by the new method and from 1.65% to 1.35% when calculated by the older extraction method.

The percentage of fat in samples 5-8 ranges from 1.04% to 0.52% when calculated by the new method and from 1.12% to 0.58% when calculated by the older extraction method. The specific gravity of samples 5-8 ranges from 1.105 to 1.018.

"The data also show that the market soybean milk is poor in fat owing to the custom of the Chinese of removing up to 30 pelliculas [pellicles; sheets of yuba] rich in fat, which are sold separately at a high price."

Note: Yuba is described as an early step in the process of making soymilk. Address: Dep. of Medicine, Peking Union Medical College, China.

600. Zlatarov, Asen. 1926. Die Soja und ihre Verwertung als Nahrungsmittel [The soybean and its use as food]. *Fortschritte der Landwirtschaft* 1(7):543-47. Sept. 1. [8 ref. Ger]

• ***Summary:*** On this document, the writer's name is written "Prof. Dr. Assen Zlataroff."

In Bulgaria as elsewhere in Europe, people have started to plant lots of soybeans. The soybean can serve as a source of healthy and rich nutrition, but also as a new source of income. There is much recent interest in Hungary and Germany.

Tables show: (1) Thirteen nutritional analyses of soybeans planted in Bulgaria between 1917 and 1922. (2) Nutritional analyses of black beans (non-soy), black peas, white beans, white lentils. Garbanzo beans (Chick-peas / chickpeas / *Kichererbsen*). And soybeans (*Soja*). The soybean is low in purines. (3) Soy oil constants (yellow variety, ether extract), including specific weight, saponification number, Reichert-Meissel number, iodine number, Hennersche number. (4) Nutritional composition of Papuda beans in 4 districts of Bulgaria in 1920 and 1921. (5) Weight of distilled water absorbed by 100 gm (800 beans) of soybeans after seven lengths of time ranging from 15 minutes to 12 hours. (6) Nutritional composition of soymilk (*Sojamilch*). (7) Comparative nutritional composition of various mammalian milks: Human milk, cow's milk, buffalo milk, sheep's milk, goat's milk. (8) Nutritional composition of tofu (*Tevu-fou, Sojakäse,* based on previous analyses by Champion and Lhote, Prinsen, and König {both fresh and dry}). He notes that tofu resembles quark. (9) Nutritional composition of soy casein (*Kaseo-Sojain*).

The value of the soybean as food: In China and Japan the soybean is used in large quantities as food. These foods include soymilk, soya cheese (*Sojakäse*), soya casein (*Sojakasein*), soybean meal, natto, miso, shoyu (*Schoyou*), Tao-you, Indonesian-style soy sauce (*Ketjap*), Vietnamese-style miso (*Tuong*), *Kiju-tze*, soya coffee (*Sojakaffee*), soya salad (*Sojasalat*), etc.

The soybean as a vegetable (green vegetable soybeans).

He then describes briefly how to make various soybean food products (based on Li Yu-ying and Grandvoinnet) including soya flour (*Sojamehl*), soy dumplings (*Sojaklösse*), soymilk (*Sojamilch*, discovered by the Chinese philosopher

Whai Nain-Tze), tofu (*Sojamehl*, made by coagulation of soymilk; he calls it *Sojamilchquark, Sojakäse, Tevu-fou* and notes that in China it is called "The meat without bones"). As far as taste is concerned, the writer has tasted tofu and he finds that this fresh cheese tastes very nice and the type of cheese made from it (by Li Yu-ying) such as Roquefort, Gruyere, Holländer, etc. are in no way inferior to the renowned real cheeses. Making tofu could be a new industry, which would be a good source of income for the nations where the soybean thrives and conducive to the nutrition of the people. Fresh tofu has many uses in cookery. With eggs it makes a fine omelet, likewise cheese dumplings and sausages. All these products have a fine taste and are very nutritious. In 1921 Dr. Assen Zlatafoff (a nutritionist) and J. Trifoneff wrote (in Bulgarian) a brochure on the soybean, its cultivation, composition, and food value. Address: Sophia Medizinisch-chemisches Institut, Bulgaria.

601. Eaton (T.) Co., Limited. 1926. Eaton's family drug sale (Ad). *Toronto Daily Star* (*Canada*). Sept. 11. p. 34.
• ***Summary:*** Near the center of this full-page ad, under "Patents" [meaning patented products] we read: "Vi-Tone–29¢, 49¢."

Note: By Jan. 1927 this product was described in another Eaton's ad as: "Vi-Tone, a milk chocolate-soya bean beverage, ½, 1, 5-lb tins. Sale price–29¢, 49¢, $2.39." It is not clear whether or not the product contained soya beans in Sept. 1926. Address: College St., Toronto. Phone: ADelaide 4941 or 5001.

602. Horvath, A.A. 1926. The soybean as human food. *Chinese Economic Monthly* 3(9):392-400. Sept. [Eng]
• ***Summary:*** Contents: Introduction. 1. General ingredients [composition] of the various Manchurian beans. 2. Composition of some Japanese soybeans and of the common American varieties. 3. Value of the soybean as food.

Introduction: "The soybean is a plant of very early cultivation in China. Its use dates back to the beginning of China's agricultural age under the Emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu* [*Pen-ts'ao kang-mu*], the ancient materia medica, written by Shen Nung himself in the year 2838 B.C. The celebrated dictionary of Sui Sham describes the plant under the name of *tchouan.* In another ancient dictionary, the *Kouang-ia* [*Guangya*, 230 AD], dating from the time of the Han dynasty, the soybean is called *ta-teou* [*dadou*], or grand pea, and also *sou.* It seems very probable that the names soi, soy, soya, and soja are all derived from the ancient Chinese name *sou.*

Note 1. This brief history of the soybean in China (above) is largely borrowed from Piper and Morse. 1923. *The Soybean.* p. 36-37.

In numerous ancient books the philosopher Hamintze [Lord Liu An of Huai-nan], a prince of the Han dynasty, is given as the inventor of soybean curd. The soybean and the soybean curd (*tofu*) are mentioned in many of the ancient Chinese poems, as for example in the rhymes of the great poet Sou, of the 2nd century: 'The tender jade* gets perfumed by it in the kettle' and 'to boil the pea to milk and the seed to butter' (Li Yu-ying et Grandvoinnet)." (Footnote: *"The poet emphasizes the resemblance of the fresh *tofu* with jade.")

"In 1921 China produced 80 per cent of the world's soybean production, 70 per cent of the latter being harvested in Manchuria. The 1921 crop of soybean in Manchuria was approximately 4,500,000 tons. The total acreage of soybean in the three provinces was 8,000,000 acres, covering 25 per cent of the total cultivated area."

In the section titled "General ingredients of the various Manchurian beans," four long tables give the nutritional composition of some of the roughly 500 different varieties of Manchurian soybeans, including black soybeans. The Chinese names of the varieties are given. Most of the analyses were conducted by the South Manchuria Railway Co. Table 1 gives the names (all are Chinese names), composition (water, fats, and protein) of 26 Chinese soybean varieties. The averages are: Water 8.60%. Fatty substance 19.90%. Protein 42.84%.

Table II gives the composition of 15 soybeans grouped by color, including the Chinese name, place of production, water, protein, fat, carbohydrates, fibrous tissue, "ashy substance," and analyst (incl. Fengtien Experimental Farm, Mantetsu Experimental Farm, and Mantetsu Central Exp. Farm). "Generally speaking, yellow beans are richest in protein and fat, especially the latter, then comes green beans with black beans last.

In Table III the "Kung Chu Ling Experimental Station classified the different kinds of yellow soybeans produced in Manchuria by the colours of navel [hilum] and compared their chemical composition. No significant differences were found. Table IV shows the composition of mixed soybeans stored in Manchuria during 1919 and 1920. A Manchurian grading system is described based on five factors: Shape and size (15 points), weight of 1 *sho* (10 points), lustre (15 points), dryness (25 points), purity (cleanness) (30 points). Soybeans receiving a score of 90-100 points are graded as a Special Class, those with 80-90 points as First Class, and those with 70-80 points as Second Class (Nakao and Usami). This table shows the average composition to be: water 8.5%, fatty substance 18%, protein 40%, soluble non-nitrogenous substance and fibrous tissue 28%, ashy substance 5.5%. The higher grades contain more oil and protein.

In the section titled "Composition of some Japanese soybeans and of the common American varieties," table V (p. 397) gives the composition of four leading Hokkaido soybeans: Tsuru-no-Ko, Kanro, Yoshi-Oka, and Oh-Ya-Gi. The water content averages 16.47%, the protein content ranges from 39.34 to 36.86% (average 37.62%), and the fat content ranges from 19.08 to 17.86% (average 18.66%).

Table VI gives the composition of six leading American soybean varieties: Mammoth, Ito San, Haberlandt, Guelph, Midwest, and Kingston. The water content averages 7.74%, the protein content ranges from 36.59 to 32.99% (average 35.00%), and the fat content ranges from 22.72 to 18.96% (average 20.37). Note that the Hokkaido soybeans contain more than twice as much moisture, 7% more protein, and only 91.6% as much fat.

The section titled "The value of the soybean as food," states: "One of the certain evidences that the soybean is making god headway in the Occident is the fact that about 10 years ago [during World War I] the French army replaced a large portion of the meat powder in the army ration pottage by soybean products, and has used it in several forms as part of the regular ration. Germany and Austria also tried to compensate the poor protein diet of their army and population during the Great War by using soybean products."

"The soybean contains a double amount of the protein and of calories present in beefsteak. Therefore, in Peking, where the retail price for soybean in 1925 averaged 4 cents (Mex.) per one pound, half of a pound, costing 2 cents, may provide for an adult the necessary protein minimum, which otherwise would have to be purchased in the form of one pound of meat, costing at least 20 cents. According to Li Yu-ying, author of the well-known monograph (in French), 'Le Soya,' and now connected with the Kai Cheng Bean Products Company in Peking, the market prices for an equivalent of 100 calories in soybean were, in Paris in 1912, thirty times cheaper than for the same 100 calories in beef." In Germany, Ehrhorn (a well-known soybean food specialist, formerly of the Aguma factories in Harburg, Germany) calculates that 500,000 tons of soybean residue [meal and cake] are available every year. Soybean protein in Germany is now 25 times cheaper than beef protein. In China, where undernutrition is found on a large scale and famine is a common occurrence, soybean cake is used mainly as a fertiliser for rice fields and sugar plantations–rather than as a low cost source of protein. Numerous famine relief committees in China "have come to the conclusion that one key to the famine relief problem in China is to stop the waste of precious soybean cake for fertiliser." Note 2. This is the earliest English-language document seen (Nov. 2002) that uses the word "undernutrition."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China).

Note 3. This is the earliest document seen (May 2011) in which Dr. Horvath gives his title as "M.D.

Note 4. This is the earliest document seen (June 2013) that mentions the soybean variety Kanro. Address: M.D., Peking Union Medical College, China.

603. Salazar, Leopoldo G. 1926. The manufacture and chemical control of some soybean products under Los Baños conditions. *Philippine Agriculturist* 15(4):219-31. Sept. [12 ref]

• ***Summary:*** "The Chinese and Japanese manufacture a large variety of food products from the soybean, among which may be mentioned soy sauce or *toyo,* bean curd or *tokua,* soybean milk, flour, salad oils, and lard substitutes.

"Of these products, the sauce and curd are the most important. To the Americans the sauce is known as *soy sauce,* to the Japanese as *shoyu,* to the Chinese as *ch'au yau,* or drawing oil; to the Filipinos as *toyo.* The curd, cake, or cheese is known as *teou-fu* and *tao-hu* in China; *tofu* in Japan; and *tokua* in the Philippines. Soybean cheese is a misnomer as the product is obtained without any ripening process.

"The objects of this work were: (a) to determine the possibility of preparing toyo [soy sauce] and tokua [tofu] under Los Baños conditions; and (b) to determine the time at which the toyo contains the highest percentage of nitrogen. This work was performed in the laboratory of the Department of Agricultural Chemistry, University of the Philippines, Los Baños, Laguna, from April, 1924, to February, 1925."

A review of the literature shows that in the Philippines, only three prior investigations on this subject have been reported, those of Barrett (1911), Gibbs and Agcaoili (1912), and Gibbs, Agcaoili, and Shilling (1912). A photo shows the hand-turned stone mill and other tools used for making tokua, following the method used by the Chinese in Manila. The residue left after making tofu (okara) is called "sapal," and that left from soy sauce is called "tahuse."

"After 8 weeks of fermentation, the toyo was found to be ready for the first drawing. Analyses showed that the toyo prepared in the laboratory compared favorably in composition, odor, and flavor with the superior grade product of the market."

Note 1. This is the earliest document seen (April 2013) that uses the word "tokua" to refer to tofu.

Note 2. This is the earliest English-language document seen (June 2013) that uses the word "sapal" to refer to okara.

Note 3. This is the earliest English-language document seen (March 2007) that uses the word "tahuse" to refer to the residue left after making soy sauce. Address: College of Agriculture, No. 231, the Philippines.

604. Wastl, Helene. 1926. Das Sojamehl als Nahrungsmittel [Soy flour as a foodstuff]. *Wiener Medizinische Wochenschrift* 76(41):1209-10, 1213-14. Oct. 9. Reprinted in: L. Berczeller. 1928. Publications on Berczeller's Soy Flour. Vol. I. [4 ref. Ger]

• ***Summary:*** In 1870 a large migration of Chinese into Manchuria began, and from this time the soybean started to become the main crop of Manchuria, which is today the most important place for growing soybeans in the world.

The soybean became known in Europe largely through the efforts of Prof. Haberlandt following the Vienna World

Exposition of 1873. Large agronomic trials were undertaken, not only in Austria-Hungary but also in Russia. Trials were conducted successfully in most areas where corn/maize thrives. Nevertheless, the crop did not expand, since there were no suitable conditions for the utilization of soya or even market opportunities for the new crop. But with the development of improved extraction processes for obtaining vegetable oils, since 1908 the soybean has become widely used in Europe (and especially in England) as an oilseed, and imports have grown very rapidly. This growth was so sudden that in the trade report of Gehe & Co. for 1911 it was described as "something that has happened only once in the history of world trade. The imports of this heretofore neglected commodity rose to fabulous heights, and in a very short time it conquered the world market."

The author then discusses the nutritional composition of the soybean and briefly reviews the history of research on its nutritional value, including the work of Osborne and Mendel–which was confirmed by L. Berczeller. "The high biological value of soya protein is also shown by the fact that in East Asia, soya largely replaces animal protein in human diets. The use of the soybean for human nutrition depends (despite its outstanding chemical composition) on how it its technically processed. For centuries, ongoing experiments have been conducted on how best to make soybeans into tasty, nutritious foods." The soybean was used as a vegetable, made into milk, subjected to fermentation processes, used to make a type of cheese [tofu], and even a coffee substitute. Above all, people tried to mill it into a flour or to cook it like European legumes, and these recommendations were repeated uncritically in book after book until the advent of World War I, when they were examined on a large scale over a long time. In 1915 Lüthje [Luethje] wrote that the soybean could not be cooked and used like typical European legumes. People who tried to make soy flour during the war found that, because of the oil in the soybean, the flour quickly became rancid, causing consumers to complain about its bitter taste. So processors tried to make soy flour from defatted soybeans, but this caused a loss in nutritional value. However L. Berczeller, using a process of fractional distillation, succeeded in making whole soy flour which, despite its high fat content, did not become rancid. On a dry-weight basis this soy flour contains 45.50% crude protein and 2.38% fat. A table (p. 1213) shows that it is a less expensive source of calories than any other food. Using prices from June 1926 1,000 calories from whole soy flour cost only 0.19 shillings compared with 0.78 shillings for milk, 0.80 for butter, 1.07 for pork, 1.75 for an egg, and 2.64 for lean beef. The great practical significance of this lies in the use of soy flour in bread in place of all or part of the milk, eggs, and fat.

"Through the use of soya flour it is therefore possible, even for people with a low income, to secure a similar consumption of protein and fat, as is otherwise accessible to only a very small part of the population. Soya makes this possible in East Asia already today for hundreds of millions of people." Address: Physiologischen Institut der Wiener Universtaet (Vienna), Austria.

605. Hain Health Foods. 1926. Formal opening of Hain Health Foods. Oct. 18, 8 A.M. (Ad). *Los Angeles Times*. Oct. 18. p. K26.

• ***Summary:*** This is an ad for the opening of the 1st Hain retail health food store in Los Angeles. "Something new in health foods. From the grower direct to you enables us to sell high grade, fine quality products at lower prices. Our foods are 100% pure and in accordance with health standards. Our policy is quality first–service–courtesy."

Contains a long list of products sold at the store, with weights and prices, divided into the following categories: Flour (incl. 5 whole grain flours, Hain Health Meal, and Soy bean flour, 80¢ for 5 lbs). Breakfast cereals (6, incl. Hain Health Bran). Legumes (lentils, split peas, green peas, garbanza beans). Legume flours (6). Hain Health Mayonnaise (made with lemon juice and honey). Selected dried fruits (dates, figs, prunes). Hain pure mountain honey. Italian pure olive oil. Hain nut butters (almond butter, nut cream butter, peanut butter). Shelled nuts. Raisins–fancy.

Phone orders delivered. Mail order service. "Will gladly mail catalogue: Ask us for one."

Note: This is the earliest document seen (Jan. 2013) concerning Hain. Note that the company sold soy bean flour from day one. Address: 329 W. 3rd St. (near Hill St.), Los Angeles, California. Phone: MUtual 1703.

606. Horvath, A.A. 1926. The soybean as human food. *Chinese Economic Monthly* 3(11):513-18. Nov. [Eng]

• ***Summary:*** Contents: Soybean oil for food: Refined soybean oil, crude soybean oil. Refined soybean oil: As substitute for salad or frying oil, as substitute for hardened oil or lard (hydrogenation), in oleomargarine and vegetable butters.

Until quite recently, the line between edible oils and industrial oils has been quite clear. "Originally soybean oil was used as an edible oil by the Chinese, but its strange smell has repelled Japanese and Western palates (Sato)." "The advance of science in recent times has quickened the development of methods of refining, deodorizing, decolouring, and hydrogenating oils. As a result, the partition that used to divide food oils from industrial oils has collapsed. Whale oil and fish oil, as well as soybean oil, are now in use in Europe and America as a regular constituent of edible oils and fats."

"The aggregate production of the bean mills in Manchuria is in the region of 200,000 tons of bean oil and over 50 million pieces of bean cake. All the bean mills in Manchuria, excepting the Suzuki Bean Mill, Dairen, which is worked on the so-called extraction system, are worked by the expression system." The process of pressing, however, leaves

about 45% of the soybean oil remaining unused in the bean cakes, each of which weighs 61 lb. In Europe, and especially in England, the solvent method is used. In the 'Hanseatische Muhlwerke' [Muehlenwerke], Hamburg, Germany, pressing and extraction methods are combined. Extracted soybean oil generally for ½ to 1 cent per pound less than the expressed oil.

Soybeans contain the highly valuable fat-soluble vitamin. "In 1925 Hornemann showed that if the oil is taken from the beans by pressure, all the fat-soluble vitamin remains in the cake and the oil is free from it... But in case the extraction method is used, the soybean oil contains, according to Hornemann, all the fat-soluble vitamin... Moderate hydrogenation of soybean oil does not destroy the fat-soluble vitamin. Rancidity destroys it.

"Fresh soybean oil has a sweet smell, but, when the impurity is contained in a large quantity, it will emit a disagreeable odour. As time goes by, the change will grow more pronounced... In the case of the temperature being high, the same change occurs more quickly, and the colour of the oil becomes darker, the oil itself tasting also less palatable." Filtered oil is more resistant to undesirable influences. "At the present time the Harbin market includes only the filtered oil produced by the Anglo-Chinese Company. All the other oils are merely such as have settled."

Soybean oil as a substitute for salad or frying oil. "The improved methods of deodorizing and bleaching soybean oil have tended to remove a former prejudice against its use as a table oil. Several firms in Europe and America are packing soybean oil for sale to the retail trade, and it is claimed that a satisfactory market has been found (Piper and Morse)... The Nisshin Oil Mills Company, Ltd., at Yokohama and Dairen, purchased some modern oil refining machines from the U.S.A. in 1921 and a refined bean oil (salad oil) is being made which is claimed by the Japanese to be better in quality than the European or American make, by means of improved scientific methods and special skill... It is said that about 20 tons of the refined bean oil (superior salad oil) is manufactured every day at Dairen. In 1923 the refining of special soybean oil was also successfully begun in Harbin by the Anglo-Chinese Eastern Trading Company, Ltd., which had installed special equipment. The resulting product, known as 'Acetco,' is sold to the local preserve factory, is exported to Transbaikal [Transbaikalia or Zabaikal; a former Russian government located east of Lake Baikal–which is in southern Siberia], which is adjacent to Manchuria, and gradually appears to be conquering the local market as a substitute for the more expensive vegetable oils and animal fats. Acetco salad oil has been used at the Peking Union Medical College Hospital for a year and has been found in quality to be equal to Wesson oil, being at the same time much cheaper" (costing only 60% as much).

Frying oil is widely used in Japan to make "Tempura." "Fried *tofu* especially is made everywhere. Sesame-oil or refined rape-oil was formerly used in Japan for frying purposes but a few years ago the demand for bean-oil began to increase as a substitute for the above mentioned oil. (Footnote: In China refined soybean oil partly replaces the very expensive sesame oil in the diet)." "It is partly because the soybean oil manufactured in Japan cannot compete with that made in Manchuria for purpose of export and, consequently, the Japanese are obliged to extend the market at home."

Concerning lard substitutes: "The commercial lard substitutes consist chiefly of a mixture of lard or 'lard stearine' with 'beef stearine', cotton seed stearine and some vegetable oil... In the United States half of the total amount of all vegetable oils produced in that country is used as substitute for lard. Cotton-seed oil stands first in this respect... In hydrogenation, deodorization is practically complete. Therefore, the product made from cotton-seed oil has no intrinsic superiority over that made from soybean oil. The hydrogenation of soybean oil has tended to remove a former prejudice against its use for the kitchen. In 1918 the consumption of soybean lard substitutes in the United States amounted to over 56 million pounds."

"In oleomargarine and vegetable butters: The industry of butter substitutes owes its origin to experiments made by Mege-Mouries which were worked out to a manufacturing process in Paris in 1870. This industry duly spread to Italy, England, Holland, and other countries in Europe... Cow's milk is sometimes replaced by an emulsion prepared from the kernels of almonds or from soybeans, so that it is possible to prepare a margarine from vegetable products exclusively (Lewkowitsch)."

Note 1. This is one of the most important, original, and creative publications on soyfoods written in English before World War II. It is especially unique and valuable for the information it presents about soyfoods in Europe.

Note 2. This is the earliest document seen (March 2002) that refers to shortenings made with soy oil as "soybean lard substitutes."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China).

Note 3. In Jan. 1927 this journal merged with and became the *Chinese Economic Journal*. Address: M.D., Peking Union Medical College, China.

607. Kellogg, John Harvey. 1926. Nuts as a substitute for cow's milk. *Good Health* (*Battle Creek, Michigan*) 61(11):5-7. Nov.

• ***Summary:*** This paper, read at a meeting of the American Nut Growers' Association on 16 Sept. 1926 in Lancaster, Pennsylvania, begins by discussing nine serious drawbacks with cow's milk as a staple for adults. Dr. Kellogg first discovered that "milk disagrees very seriously with certain persons more than forty years ago." So he set out to develop a substitute for milk from nuts. He found that "the protein

of nuts so closely resembles that of milk that it was by some authors described as plant casein. Oily nuts, as Sherman has pointed out, are the vegetable analogues of meat. They consist almost wholly of fat and protein." Our relatives, the primates, are extremely fond of nuts, and they know how to chew them thoroughly. More than 30 years ago it was found that nut milk is better than cow's milk in promoting the secretion of milk in nursing mothers. Two or three years later, Dr. Kellogg began making Malted Nuts for this purpose, and it is now "regularly prescribed by many physicians for nursing mothers who need assistance of this sort."

"My first experiments in an effort to make nuts more digestible led me to produce peanut butter. This was for several years produced in small quantities by consumers with the aid of small hand mills especially devised for this purpose. It has now come to be a staple food manufactured by numerous companies and may be found in every grocery in the land."

But the peanut is a legume rather than a nut. "Continuing our experiments with other nuts, especially almonds, cashew nuts, pecans, and pine nuts, we finally succeeded in producing a series of nut creams which we found highly satisfactory as substitutes for cow's milk and cream."

608. Cascelli, Giovanni. 1926. Il latte di soja nella tecnica batteriologica in sostituzione del latte animale [Soymilk in bacteriological techniques as a substitute for animal milks]. *Clinica Medica Italiana* (*La*) 57(6):559-65. Nov/Dec. [7 ref. Ita]

• ***Summary:*** Soymilk can be substituted for animal milks with good results for the preparation of culture media. Bacteria grow well in it at 37ºC, and one can study their coagulation. The bacterium coli coagulates soymilk always and clearly at 37ºC and after 24 hours of inoculation. Address: Dr., R. Universita di Napoli. Istituto Pareggiato di Diagnostica Medica, Italy.

609. Hofer-Masard, H. 1926. Concentrated almond and milk syrup for use in foods or beverages. *British Patent* 282,088. (Chem. Abst. 22:1415). *

• ***Summary:*** Almond milk is an emulsion of the extract of ground, dehulled sweet almonds, which as been filtered many times, then mixed with sugar.

610. Mayerhofer, Ernst; Pirquet von Cesanatico, C. eds. 1926. Lexikon der Ernaehrungskunde [Dictionary of dietetics]. Vienna, Austria: J. Springer. viii + 1205 p. Illust. 25 cm. [Ger]*

• ***Summary:*** Included in the long list are: Akamiso, miso, shiromiso, tofukasu [okara], daizu [soybeans], fu [dried wheat gluten cakes], kingyo-fu, kiri-fu, kiri-mochi [frozen and dried rice cake], ame [malt extract], mirin, aburage [tofu fried in vegetable oil], natto–Bohnenkäse, Tofu–Sojatopfen, Tonyu–Sojamilch [soymilk], azuki [small red beans], kwansen-fu, kinako–Sojabohnenmehl, geröstet, amasake [amazake]–unvergorener Sake, umeboshi, koritofu [frozen and dried tofu], midzuame [soft ame = rice syrup], shoyu–Sojasauce, yuba–eine Bohnenspeise. Note that a number of these terms are Japanese.

Note 1. This is the earliest German-language document seen (Nov. 2005) that mentions amazake, which it calls "amasake."

Note 2. This is the earliest German-language document seen (April 2013) that uses the term *Sojatopfen* to refer to tofu.

Note 3. This is the earliest document seen (Aug. 2002) in any language that uses the term *tonyu* (or tônyû) to refer to soymilk.

Note 4. This is the earliest German-language document seen (Nov. 2102) that mentions kinako, which it defines as *Sojabohnenmehl, geröstet.*

611. Pirtle, Thomas Ross. 1926. History of the dairy industry. Chicago, Illinois: Mojonnier Bros. Co. xii + 645 p. Illust. Portraits. Maps. Index. 24 cm. [355* ref]

• ***Summary:*** The section on the "History of the dairy industry in China" states (p. 539-40): In southern China the people eat mostly rice, but mixed with soybean products. "In northern China wheat bread is largely used instead of rice together with large quantities of soybeans. In fact some authorities claim that the soybean is the most universal article in the Chinese diet, taking all the 300 or more varieties.

"The use of soybeans is as old as history in China. It is said to be a well-balanced food, rich in protein, fats, and carbohydrates, as well as vitamin A and B but lacks in minerals."

"A kind of bean curd or bean cheese is made from these beans. In the manufacture of soybean cheese the beans are ground with water, strained, and the residue [okara] used for hog feed. The liquid substance is like milk in appearance and on coagulation becomes the bean curd, or [when fermented], as it is sometimes called, Chinese cheese [fermented tofu]. There is an enormous consumption of bean cheese in China and in Japan. Still it is not made in factories. Every small town has a bean-curd shop. It must be made fresh each day and resembles cottage cheese. It is pressed into cakes about 5 inches in diameter and about an inch thick and sells at about one cent. American money. The cakes may also be salted and dried and they then resemble cream cheese. Tradition says that it was first made about 164 B.C. When the cheese is prepared with sugar it resembles custard and again when salted it resembles scrambled eggs.

"Soybean milk is in composition not so much unlike cow's milk, and in many places in China it is used as a drink, usually sweetened. Soybean sprouts are made ready for use by cooking them in oil and are relished even by Westerners.

The soybean cake is the residue after the expression of the oil or after the making of milk, and is used for animals only. It really has much food value and during the famine in North China in 1920-1921 [in which an estimated 500,000 people died of hunger and related diseases] much of this bean cake was used to save the starving people. From a nutritive standpoint it is supposed to substitute for meat and milk, as the Chinese consume large quantities of bean products and small quantities of meat and milk." Address: USA.

612. Rout, Ettie A. (Mrs. F.A. Hornibrook). 1926. Native diet with numerous practical recipes. London: William Heinemann (Medical Books) Ltd. ix + 140 p. Plus 9 unnumbered pages of plates. See p. 98-107. Preface by Sir. William Arbuthnot Lane. Illust. Index. 23 cm. [4 ref]
• ***Summary:*** On page 98 is a letter to the *London Observer* (17 Oct. 1926) titled "Soy flour in bread" about the work of Dr. L. Berczeller of the Vienna Physiological Institute.

Chapter 13, "The soya bean" (p. 99-107) begins: "This book would be incomplete without a reference to the Soya (or Soy) Bean–one of the most valuable legumes in the world." It discusses. Long use of the soya bean in China by the native races. Introduction into Europe at the end of the 18th century. Over 1,000 varieties have been tested by the USDA and some 20 selected for cultivation. How the Chinese soak, then roast soya beans to be eaten like peanuts [peanuts]. How to cook whole dry soybeans. USDA experiments with cooking whole dry soya beans. Two ways of pressure cooking. Sprouting soya beans. "Vegetable milk and vegetable cheese [tofu] are made from the soya bean." How to make milk from soybeans. "The properties of soya milk and curd are similar to those of the milk and curd obtained from cows,... Lactic ferments also act upon it in the same way, also the ferments of certain European cheeses." Vegetable milk. Tofu. Suggestions for introducing soya beans to Europeans and Americans.

Page 100 states: "Many authorities claim that the soy bean will soon become one of the great foods of the civilized world. It contains a large amount of protein of very fine quality–as valuable as the casein of milk. The soy bean, indeed, takes the place of meat and milk in the diet of many millions of people in different parts of the world."

Page 104-06: "Vegetable milk may be used in the same way as cow's milk. In China this milk is drunk by the Chinese in the early morning, with sugar added; it is also eaten as a thin broth with salted pickles. Throughout China, vegetable milk is extensively used for infant feeding [sic], and it is bottled and delivered each day to regular customers.

"Investigations in America and Europe indicate that vegetable milk can be successfully used to replace cow's milk in numerous preparations–e.g., in bread, cakes, creamed vegetables, custards, chocolate, and cocoa. It has been used to check the spread of summer diarrhoea and other intestinal disturbances among babies. It was found that the milk was easily digested and easily excreted.

"One form of soya bean curd is called *Tofu.* When a mineral salt or acid is added to soya bean milk, coagulation is produced, similar to the coagulation produced in animal milk by the same means. If the precipitated mass is allowed to drain, and is subsequently washed, a kind of white cheese or curd is produced. This cheese is called *Tofu* by the Japanese, *Teou fu* by the Chinese, and *Dan Phu* by the Annamites. It is said to have been originated by the Chinese philosopher Wha Nain Tze [Huai Nan Tzu; Liu An of Huai Nan] before the Christian Era, and introduced into Japan from China by the Buddhists. Ordinarily it has the consistency of cream cheese, but when subjected to pressure and allowed to dry it becomes much firmer, and can be rolled and cut into pieces. It is sometimes fried in oil, or used in omelettes, etc. Various kinds of fragrant dry curd (*Hsiang Khan*) are used sliced in soups and with vegetable dishes. Smoked curd, which keeps very well, is prepared by cooking the curd in soya sauce diluted with about 80 per cent. of water, and then smoking it in the same way as meat is smoked.*"

(Footnote: *"For fullest details of Soya Bean, see *The Soybean* by Piper and Morse (of United States Agricultural Department))." Address: [England].

613. Saito, Akio. 1926. [Chronology of soybeans in Japan, 1900 to 1926, last half of the Meiji period and all of the Taisho period] (Document part). In: Akio Saito. 1985. Daizu Geppo (Soybean Monthly News). Feb. p. 12-14. [Jap]
• ***Summary:*** 1901–Crushing of soybeans starts in Japan. Owada Seisakusho of Tsuruga, Fukui prefecture, Japan, starts making soy oil and soybean cakes using the press method (*assaku-ho*).

1901–Nakahara Kota is issued a patent on his process for making dried-frozen tofu indoors in a freezer (*jinko kôri-dofu*). This makes it possible to produce a good-quality product year round. This year there are 453 makers of dried-frozen tofu in Nagano. Nagano prefecture encouraged production of this product during the Russo-Japanese War as a side home industry.

1901–Soybean production in Japan reaches 525,000 tonnes, topping 500,000 tonnes for the first time.

1905–After Japan's victory in the Russo-Japanese War, it is said that maybe, because of the victorious mood, tofu makers start to blow a horn while selling tofu.

1905–At about this time, soybean cake (*daizu kasu*) passes fish cake to become the main fertilizer for crops in Japan.

1905–Shin Sawamura (lived 1865-1931) discovers the main natto bacteria and names it *Bacillus natto* Sawamura.

1906–Neda Tadamasa of Akita prefecture develops a new type of soybean. Named the Akita, it is a cross between Shirosaya and Itoi's Ani.

1907 March–Nisshin Mamekasu is founded (initial capitalization is 3,000,000 yen). The next year its soybean

crushing plant in Dairen, Manchuria, starts to operate. In 1918 the company merged with Matsushita Mamekasu to become Nisshin Seiyu K.K.

1908–At about this time the retail price of tofu in Tokyo is 1 *sen.* The average cake of tofu weighs over 100 monme (1 monme = 3.7656 gm or 0.1325 oz), so over 376 gm. In 1982 the average price of tofu is 100 yen per cake and the average cake weighs 300 gm.

1914–The Mogi Saheiji family in Noda starts to sell shoyu in 1-sho bottles (1 *sho* = 1.805 liters or 3.81 pints). Before this time a ceramic sake bottle (*tokkuri*) was used.

1914–Yamada Hikozaburo of Nagano prefecture succeeds in making dried-frozen tofu (*Koya-dofu*) for the first time in the *Shimi-dofu* area.

1915–From this year until 1919, the soybean oil industry in Japan is in a period of prosperity. In 1914 Japan produces 7,105 tonnes of soy oil and 92,325 tonnes of soybean cake. Just 5 years later, in 1919, these figures have risen about 13-fold to 30,658 tonnes of soy oil and 353,288 tonnes of soybean cake. Soybean cake becomes very widely used in Japanese agriculture.

1918–The mayor of Tokyo, Tajiri Inataro, recommends that people eat low-fat soybean cake cooked with rice (*mamekasu meshi*) to protect themselves from the rapidly increasing price of rice; he himself eats this dish every day. Hiroetsu? Takako (a woman educator, lived 1867-1949) cooked soybean cake and rice (*mamekasu gohan*). Dr. Saei Tadasuke (1876-1959, a nutritionist) introduces an inexpensive meal (it costs 3 *sen* 5 *rin* for 5 people) using tofu and fish bones for breakfast and dinner at the Inexpensive But Nutritional Cookery Seminar (*Eiyo Anka Ryori Koshukai*). This year 30-50% of Japanese don't have enough to eat. The demand for beef tendons and okara increases. The price of high-quality meat increases faster than the price of tofu.

1919–Artificially cultured pure-culture natto starts to be used. Hanzawa Jun of Hokkaido University (1879-1972), using this method, invents a new "Sanitary Natto Container" (*Eisei Natto Yoki*) made of thin slabs of wood (*kyogi*). He also founds the "Natto Container Improvement Association" (*Natto Yoki Kairyo-kai*)

1919–Soybean production in Japan reaches 502,200 tonnes, and soybean imports rise to 168,000 tonnes. Production of soybean oil reaches 8,853,600 gallons or 33,573,000 liters, equal to that of rapeseed oil.

1919–A machine or kit for making tofu or soymilk easily at home (*kateiyo tonyu-ki*) is marketed.

1920–Soybean production in Japan reaches a record 559,000 tonnes.

1920–Tsugano Akisaburo of Tokyo invents a quick method for fermenting shoyu (*shoyu sokujo-ho*). By adding salt water to soybean koji to make moromi, he is able to make shoyu in less than 10 days.

1922 April–The oil production department of Suzuki Shokai [which went bankrupt in 1922] becomes independent and founds Hohnen Oil Co., Ltd. (*Hohnen Seiyu*).

1923 Sept.–The Great Kanto / Tokyo Earthquake (*Kanto Daishinsai*) strikes. 70% of the miso factories in the area are burned down, causing a shortage of miso. But miso makers in other parts of Japan use this opportunity to ship their miso to Tokyo, and the people of Tokyo come to realize the good taste of miso made elsewhere in Japan.

1924–Kodama Shizutoshi? (or Shintaro) invents another quick method for fermenting shoyu (*shoyu sokujo-ho*) using acid or alkali to hydrolyze soybeans or soybean cake to make shoyu.

Note: This is the earliest document seen (April 2001) that mentions shoyu made by acid hydrolysis. Address: Norin Suisansho, Tokei Johobu, Norin Tokeika Kacho Hosa.

614. Eaton (T.) Co., Limited. 1927. Commencing a three day special selling in the drug section (Ad). *Toronto Daily Star* (*Canada*). Jan. 8. p. 32.

• ***Summary:*** In the upper left corner of this large ad, under "Patents" [meaning patented products] we read: "Vi-Tone, a milk chocolate-soya bean beverage, ½, 1, 5-lb tins. Sale price–29¢, 49¢, $2.39." Address: College St., Toronto. Phone: TR. 3311.

615. Chiu, Yan-Tsz (Chao, En-tz'u). 1927. Studies of the physical and chemical properties of soy bean milk. PhD thesis, Cornell University, Ithaca, New York. iii + 38 p. Feb. In: Library of Congress. Catalog Div. A List of American Doctoral Dissertations Printed in 1912-1932. 1931. [23 ref. Eng]

• ***Summary:*** Contents: Acknowledgement. Introduction. Review of literature. Experimental. Physical properties: Specific gravity and total solids, freezing point and total solids, relation of electrical conductivity and resistance to solids and ash, viscosity and total solids, refractive index of serum and total solids, dialysis and its products, keeping qualities, pH values of soy bean milk.

Chemical properties: General composition as determined by analysis (fat, protein–soluble in water soluble in NaCl solution, carbohydrates, ash), effect of soaking, methods of determining fat, composition of the fat in the milk, character of the fat in the milk, kinds of proteins in milk, composition of the true solution or serum, action of ferments on milk. Biological: General types of organisms that develop in milk, vitamins (from the literature), enzymes (from the literature). Discussion. Summary.

In the acknowledgement, he first thanks Prof. G.W. Cavanaugh for his many valuable suggestions and criticisms. "I also wish to express my thanks to Professor E.M. Chamot, Dr. C.W. Mason and other members of the staff of Instruction of the Department of Chemistry for aid and suggestions they have given."

"Introduction: Soy bean milk, which owes its origin to

Wai Nan Tse, a Chinese philosopher who lived before the Christian era, is a very satisfactory form of artificial milk. In China it takes the place of cow's milk which is rather scarce and expensive. It is a common food drink, the majority of Chinese being more accustomed to its use than to animal milk. Although the Cantonese do not drink it, they consume some of its products... It is an important food in China as it is used for infant feeding... Sweetened with sugar, it becomes a palatable drink. It may be eaten as a broth."

The thesis contains 22 tables (not one has a title) showing the results of various tests, including tests with different soybean varieties, effect of soaking time on specific gravity and total solids for different varieties, etc.

It also contains 9 graphs (also untitled), usually showing the data from a table in tabular form. For example, Figure A is a graph of the total solids in soymilk (x axis) vs. the specific gravity of that soymilk (y axis) for two soybean varieties: Black Eyebrow and Manchu.

On page 26 are two photomicrographs, one showing cow's milk, the other showing soy bean milk, each at 400x magnification.

Note 1. The author was born in 1890. In Cantonese, his name is Chiu Yan-Tsz; in Mandarin it is Chao En-tz'u. In pinyin it is Zhao-Enci. The last two characters (his given names) mean grace or blessing + gift.

Note 2. The following interesting line (p. 1) is difficult to interpret: "It is an important food in China as it is used for infant feeding..." Questions: What is the source of this information? It is in the introductory paragraph to the thesis and no source is cited. This idea is never mentioned again in this thesis, nor is any of the author's other 5 scientific articles on soy bean milk in China. The last of these articles (Chiu 1938) states: "In North China soybean milk has been a common food for both adults and children, while in South China only its products (mostly bean curd [tofu]) are used." Is it ever used with infants as the sole source of nutrition? If yes, for how long? If no, with what other foods is it fed, in what proportions, starting at what age, and until what age? Is this use of soy bean milk for infants routinely and widely practiced in China, or only in times of famine? Under normal circumstances, at what age is the soy bean milk introduced in the diet and how long is it continued? Address: Cornell Univ., Ithaca, New York.

616. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(2):175-92. Feb. [25 footnotes. Eng]

• ***Summary:*** Contents: Soybean cake, soybean meal, and soybean flour for food: Soybean press cake, soybean extraction meal, soybean flour (Berczeller, *Soyama, Aguma, Ehrhorn*), *Sojawurze* (*Suppenwurze*, Maggi cubes), digestibility of soybean flour, value for infants, some medical aspects of the use of soybean flour, soybean flour in diabetes (incl. Sarton).

Concerning soybean extraction meal (p. 177-79): This meal is shipped in bags and traces of benzine are easily removed. The process used at the Suzuki extraction plant in Dairen (the only extraction plant in Manchuria) is described; the solvent is benzine. "A new extraction plant (at the Borodin-Takata Alcohol Factory) is now under construction at Imienpo, in North Manchuria. By the new process, beans are first pulverized, then operated upon with alcohol, for the extraction of the oil content... The owner claims that 'there is no foreign taste left which would make the oil or the bean cakes unsuitable for human food.'" Analyses conducted at the S.M.R. Co. Central Laboratory, Dairen, show that this "bean meal" contains: water 7.90%, protein 57.04%, oil 3.41%, carbohydrates 16.92%, coarse fibre 8.63%, and ash 6.69%.

"The solvent method of extraction, involving the use of benzine or gasoline, is used by many of the large oil mills in European countries, especially England." Mills in the USA do not yet use the solvent method; they use traditional hydraulic and expeller processes. "The new process used by the Hansa Mill at Hamburg (Germany) called the Bollmann process, is so economical that the profits of bean milling can be enormously increased. By this process the beans are first pressed and then extracted. The extracted meal is utilized for the manufacture of a highly valuable soybean flour for food (Footnote: But extracted soybean meal (flour) does not contain any fat soluble vitamin, as shown by Hornemann [1925]). The oil is submitted to refining, during which crude lecithin is extracted. It is purified and sold in a form of pure lecithin.

(Footnote: "The soybean contains 1.64 per cent lecithin (an organic phosphorus compound), the price of which in China is about $18.00 (Mex.) per pound. It shows that the value of the lecithin contained in soybeans is greater than the market price of the beans themselves. Extracted soybean meal is therefore deprived of lecithin, which is a highly valuable food constituent, especially for the nervous system. Ordinary beans (navy beans, etc.) contain only 0.81 per cent lecithin)" (p. 178).

Note 2. This is the earliest English-language document seen (March 2001) that contains the term "crude lecithin."

Page 182 states: "Soybean flour is also utilized in the manufacture of breakfast foods and can be used in the preparation of vegetable milk and bean curd."* (Footnote: *"In the United States some very good breakfast foods and an excellent finely powdered soybean milk powder "Soy Lac" is made by J.A. Chard, Soy Products, 263 W. 12th St., New York City, who has been experimenting for some time with soybeans.)" Note 3. This Soy Lac appears to be the first commercial soymilk made in America.

Berczeller (p. 183-84): "A few years ago the Hungarian food physiologist, Prof. L. Berczeller, elaborated a process for manufacturing a soybean flour containing a large percentage of fat. This does not become bitter if kept for

over a year, and has a very pleasant taste. The process is patented in nearly all the countries of the world. Its chemical composition is given in the above table and its food value in a previous chapter. This flour contains the expensive fat-soluble vitamin which is deficient in the food of the white race. It is of yellow colour, has a sweet, agreeable nutty taste, and does not produce obesity, notwithstanding the fact that it contains a high percentage of fat. According to Berczeller, the uses of this soybean flour "O" are as follows:

"1. As roasted flour, with an equal part of wheat flour for soups or vegetables;

"2. For pastry, 10-15 per cent soybean flour is mixed with wheat flour. In this case no eggs or only a few need be added. The soybean flour gives to the dough a beautiful yellow colour;

"3. As an addition to meat, 25-50 per cent of soybean flour can be mixed with chopped meat for meat balls, sausage stuffing, etc.

"4. All sorts of flour dishes can be baked with the addition of soybean flour. The taste of the dishes thus prepared becomes better and the nutritive value higher (besides the economy in butter, eggs and sugar);

"5. The addition of even 5 per cent soybean flour in making wheat bread causes a much longer keeping capacity of the bread in a fresh state, the fat preventing the bread from getting stale;

"6. The soybean flour can be used also on a large scale in the foodstuff industry, and in different ways; e.g., in the manufacture of paste products (as a substitute for eggs), cakes, biscuit products, milk-bread (10-16 per cent soybean flour instead of milk), sausages and pastry products (as a substitute for meat).

"Berczeller's soybean flours can be manufactured with little trouble in rice mills or pea mills, where they are decorticated. Eighty-five per cent of soybean flour can be recovered from soybeans. The residue forms a valuable food for animals. According to Berczeller, the cost of production of soybean flour in a European country is as follows:

"One ton of soybeans: 245 shillings. Ten per cent milling expenses: 25 shillings. Total: 270 shillings. Subtracting the value of the bran: 20 shillings. Cost of 850 kg of soybean flour: 250 shillings. Or one ton costs: 294 shillings.

"According to Berczeller, soybean flour is an ideal concentrated food for soldiers, sailors, tourists, etc., in the form of biscuits, etc., because it furnishes a substitute for animal foodstuffs which spoil easily. Berczeller points out that soybean flour is not a substitute for wheat flour but a natural vegetable complement to wheat flour, and one which can be substituted for expensive animal foodstuffs for lowering the living rates [cost of living] of humanity to a degree that could not be reached either by potatoes, maize, or by intensive farming. Austria and Hungary are planning to start a very intensive utilization of Berczeller's soybean flour. This flour, being cheap and easy to manufacture in native rice mills, may be of great importance to China."

Note 1. This is earliest document seen (May 2010) showing that Dr. A.A. Horvath was aware of the work of Prof. Berczeller, who patented a process for improving the flavor / palatability of soya flour.

Page 185 states, in a discussion of soybean flours: "In Bollmann's process the oil is completely removed from the soybean material and the flour is therefore deprived of both the lecithin and the fat soluble vitamin."

Sojawurze (p. 187-88): "The profit from Ehrhorn's process could be much increased if part of the soybean flour were used for the manufacture of products similar to beef extracts, called in German 'Suppenwurze.' They are able to give to soup the taste and flavour of beef bouillon. They are used extensively in Germany, e.g., the well-known 'Maggi' cubes, and were manufactured in large quantities in pre-War and War time from soybean flour at the Aguma factory under Ehrhorn's supervision."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

617. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(3):298-309. March. [24 footnotes. Eng]

• ***Summary:*** Contents: Soybean milk for food: Introduction. Preparation of soybean milk. Properties (Yu-P'i is Chinese for yuba; Laxa). Market prices. Composition. Nutritive value. New methods in the manufacture of soybean milk (Prof. Laxa in Prague [Czechoslovakia], Li Yu-ying, Soyama). Some dietetical advantages and applications of the soybean milk. Condensed soybean milk and milk powder (Soy Lac soybean milk powder made in America by Chard). Soybean cake, soybean meal and soybean flour as material for soybean milk. Yu p'i and yu ba (yuba; also fu chu).

"In 1905, Li Yu-ying submitted a paper on the subject [of soybean milk] to the 2nd International Milk Congress in Paris, in which he emphasized that the introduction of soybean milk to Western countries 'will be highly beneficial to public health as well as to the budget of the poor.' Also by those who advocate and urge a vegetarian diet, a very strong case can be made for this Oriental substitute" (p. 298).

According to Prof. Laxa: "Soybean milk, supplemented with lactose and inoculated with a culture of yoghurt [yogurt] bacteria, coagulates at 40º C. in 4 hours and gives a curd-like acid mass" (p. 300).

"Market prices. In Peking soybean milk is sold in small bottles in portions of about 200-220 cc. labeled 'Bean milk, a Chinese product, the most nourishing food, made by...' For such a bottle, delivered daily, the big factories of Peking asked in 1925 $1.00 (Mex.) per month. One liter of such milk costs, therefore, about 15 cts. (Mex.)... A fine soybean milk powder, called *Soy Lac*, has recently been prepared in America by Chard" (p. 300-01). Note: This company (Chard)

was first referred to by Piper and Morse in 1916 in *USDA Bulletin* No. 439, "The soy bean, with special reference to its utilization for oil, cake, and other products." Soy Lac is mentioned again by Horvath on p. 307.

A table (p. 302) compares the composition of soymilk made in 3 locations (Tsinanfu, China; Peking, China; and Japan) with that of human, cow, and goat milk. Human milk has the lowest protein content (1.25%) and ash content (0.25%); soymilk has about the same protein content as cow's milk (3.3%) but an ash content (0.40%) which is higher than that of human milk but lower than that of cow's milk. Footnote: "To supplement the deficiency of the soybean milk in mineral constituents [such as calcium], it is recommended by von Noorden and Salomon to add to it the salt mixture of Pirquet, which consists of: sodium chloride, 0.3 gm.; potassium chloride, 1.1 gms.; calcium glycerophosphate, 1.7 gms.; magnesium lactate, 0.5 gm.; ferrum glycerophosphate, 0.1 gm. This mixture is called *Nemsalz.* If diluted in 1 liter of water it gives the same percentage of salts as in women's milk" (p. 302).

"In Germany the Soyama factory (in Frankfurt) manufactures soybean fresh milk (mostly from soybeans), soybean normal cream, and also condensed bean milk and cream. Soyama bean milk looks like cow's milk, contains the same constituents, even in larger amount and in a state of finer dispersion. Only its taste is different. According to Fuerstenberg, Soyama milk can be qualified as a special, very valuable dietetic nutrient. The high lecithin content of this preparation adds to its value too" (p. 306). A table (p. 306, based on the analyses of Dr. G. Popp of Frankfurt) shows the nutritional composition of 6 types of Soyama milk and cream preparations: Normal milk. Milk for diabetics. Milk for baking purposes. Normal cream. Cream for diabetics. Cream extra rich in fat (especially for diabetics). "According to von Noorden and Salomon, Soyama preparations may be kept as long as almond milk and Paranut milk. Soyama milk looks just like cow's milk. By keeping, cream separates and it must be shaken before using" (p. 306).

"In using Soyama milk and cream preparations, v. Noorden confirms the following statement of Fischer (for vegetable milk in general): '1. In the stomach soybean milk gives a much finer flocculent precipitate than does cow's milk, produced by acid or even rennet. 2. The ingestion of soybean milk results in a feebler (smaller) secretion of gastric juice; the period of secretion is also shorter. 3. The period of stay in the stomach of the finely flocculent precipitate of the soybean milk is shorter than that of the casein-fat coagulum of cow's milk. 4. The peristaltic motion of the stomach is less after the ingestion of soybean milk and more coordinated than in the case of cow's milk, as shown by X-ray investigation'" (p. 307).

"On the basis of these observations soybean milk is recommended by v. Noorden in cases of gastric and duodenal ulcer, states of peritoneal irritation, hypersecretory conditions of the stomach, disturbances of the motility of the stomach, uric acid diatheses, kidney disturbances, conditions with edema where a food poor in sodium chloride is required, Basedow's disease, cholecystitis, cirrhosis of the liver, diabetes, and in cases where a very nutritious diet is required" (p. 307).

"Soybean milk powder will undoubtedly have a successful future in the Orient as well as in European countries and the United States. Its great advantage in comparison with cow's milk powders is its cheapness. Soybean milk powder can be easily stored and transported... It is believed that at present some of the commercial milk powders contain an admixture of soybean milk powder" (p. 307-08).

"*Yu P'i* and *Yu Ba* are the Chinese and Japanese names of the pellicula formed on the surface of soybean milk when the latter is gently heated. Good *Yu Ba* has a bright yellow color when properly dried. The best *Yu Ba* is that obtained after the first heating. In repeating the heating of the remaining soybean milk, pellicules of gradually inferior quality and color are obtained. As much as 30 pellicules can be secured from the same portion of soybean milk. In China, a product called *Fu Chu* is manufactured in a way similar to *Yu Ba* (Footnote: See this journal, Vol. VIII, 1926, p. 179). Recently an improved method for the manufacture of *Yu Ba* was patented in Japan, consisting in the use of an electric fan adjusted over the surface of a kettle containing the soybean milk heated to a temperature of 90ºC.

"*Yu Ba* has a great nutritive value, as it contains a high percentage of protein and fat,..."

A table (p. 309) gives the nutritional composition of five types of yuba: Common yuba, Kyoto yuba, Shimada yuba, Peking yuba, and Fu chu.

Note: The values for Fu chu are based on those previously reported by Adolph. Fu chu contains much more water (53.68%) than any of the other four types of yuba; common yuba contains only 21.85% and Peking yuba only 9.15%. So it is either fresh or reconstituted.

"In Japan, Kyoto and Nikko are noted for *Yu Ba. Yu Ba* is in much demand in China and Japan and is used in numerous ways as an essential ingredient in many very palatable dishes. Its price is high and therefore yuba is used only by the rich."

Reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

618. Horvath, A.A. 1927. The soybean as human food. *Chinese Economic Journal* 1(4):415-25. April. [34 footnotes. Eng]

• ***Summary:*** Contents: Soybean curd (tofu) for food: Preparation and types ("The Chinese classical name for *tofu* is *li chi,* probably meaning 'the morning prayer'"), historical, present state (of tofu in China), chemical composition,

digestibility, utilization (incl. frozen tofu and fried tofu).

Fermented soybean products for food. Soy sauce: Kibiki and sobiki tamari, composition of various soy sauces. Natto. Miso. Conclusion. Bibliography.

Tofu–Historical (p. 416): "The manufacture of soybean curd (*tofu*) was started in China in 164 B.C., during the reign of the Emperor Han Wen, by a man named Liu An, the duke of Hwai Nan. Liu An was a great friend of the Buddhist monks, and it seems quite probable that he made this bean curd to provide a change or delicacy to break the monotony of the monastic ration (Adolph). *Tofu* was introduced into Japan from Korea for the first time during the Toyotomi government, and Buddhist priests and some other people used it for their daily food among others before it was generally used in Japan.

Tofu–Utilization (p. 418-19): "Both the composition and the digestibility of *tofu*, therefore, prove it to be a very nutritious food material. In the Orient *tofu* forms a very popular and almost indispensable dietary article for the Buddhist priests, as well as the strict adherents to Buddhism, who eat no animal food [i.e., are vegans]. A common saying in some parts of China terms 'bean milk the poor man's milk, and bean curd the poor man's meat.' *Tofu* is also called 'the meat without the bones.'

Note: This is the earliest English-language document seen (April 2013) that contains the phrase "the meat without the bones" (or a similar phrase containing the words "meat" and "bones"); it is used to refer to tofu, not to soybeans.

In Indo-China the daily consumption of *tofu* by an adult is about 3/4 of a pound. *Tofu* in its various forms is also used very extensively by all classes of Japanese. In the interior of the country where fish cannot be easily obtained, it is a most important source of protein.

"In the Orient *tofu* is eaten in a fresh condition simply with a little *shoyu*, though it is also frequently cooked in soup. Fried *tofu* is also a very popular article of food. Rape-seed oil, sesame oil or soybean oil are generally used in frying.

"*Tofu* may also be prepared for preservation and transportation. For this purpose fresh *tofu* is cut into smaller pieces and exposed to severe cold weather, to remove the water by freezing, and is then dried in an oven. As thus prepared it can be preserved for several years. When the *tofu* is frozen the water collects in fine needles of ice distributed throughout the mass. When the ice melts and the water runs out, it leaves the *tofu* porous and it may be easily dried. If it is not frozen, it is difficult to dry and the resulting material is dense and horn-like. The *tofu* also cooks very well if cooked in diluted soy sauce and smoked in the same manner as meat. The resulting product forms in the Orient the basis for the manufacture of various 'artificial meat' preparations.*" Footnote: * "In Germany, the Soyama factory prepared during the Great War [World War I] a meat supplement from soybeans. It was cheaper than beef, contained less carbohydrates and had a nutritive value of about 1500 Calories in 1 kilo."

"In Peking, at the Kai Cheng Bean Products Company, various preparations manufactured from tofu may be purchased, such as different kinds of soybean meat, soybean sausages, etc. The company has established a restaurant in Peking (at 86 Morrison Street, the name is written in Chinese characters) where one can get a Chinese dinner of numerous dishes prepared mostly from soybean products (chicken meat, pork, ham and beef, manufactured from *tofu*). Also discusses Dr. Yamei Kin.

A note at the end of this April issue states: "A reprint of Dr. Horvath's paper in booklet form may be obtained from the Bureau of Economic Information. Price $1, Peking Currency.–Ed." Thus, these six articles were reprinted in 1927 as part of an 86-page monograph titled "The Soybean as Human Food" (Peking, China). Address: M.D., Peking Union Medical College, China.

619. Horvath, A.A. 1927. The soybean as human food. Peking and Shanghai, China: Chinese Government Bureau of Economic Information. Booklet Series No. 3. 86 p. May. Reprinted from Chinese Economic Journal, Sept. and Nov. 1926, and Jan. to April 1927. No index. 21 cm. [38 ref]
• ***Summary:*** A very original and important book. Contents: Preface by Macey F. Deming, Tappan New York, from an address at a meeting of the National Soybean Growers', held at Washington, DC, Sept. 1925. Introduction. 1. General ingredients of the various Manchurian beans. 2. Composition of some Japanese soybeans and of the common American varieties. 3. Value of the soybean as food. 4. Soybean oil for food. 5. Refined soybean oil: As substitute for salad or frying oil, as substitute for hardened oil and lard (hydrogenation), in oleomargarine and vegetable butters. 6. Whole soybean as food: Immature or green soybeans, mature or dry soybeans, the digestibility of the boiled soybean seeds, boiled soybeans as a food of predominant importance in China, soybean coffee, soybean chocolate, soybean sprouts.

7. Soybean cake, soybean meal and soybean flour for food: Soybean press cake, soybean extraction meal, soybean flour (Berczeller, Soyama, Aguma, lecithin, Ehrhorn), Sojawurze (Suppenwurze, Maggi cubes), digestibility of soybean flour, value for infants (p. 53, based on the research of Dr. Ruhrah in the USA), some medical aspects of the use of soybean flour, soybean flour in diabetes. 8. Soybean milk for food: Introduction, preparation of soybean milk, properties (incl. inoculation with a culture of yoghurt [yogurt] bacteria to give a curd-like acid mass), market prices, composition, nutritive value, new methods in the manufacture of soybean milk (Prof. Laxa in Prague [Czechoslovakia], Li Yu-ying, Soyama), some dietetical advantages and applications of the soybean milk, condensed soybean milk and milk powder (Soy Lac soybean milk powder made in America by Chard), soybean cake, soybean

meal and soybean flour as material for soybean milk, yu p'i and yu ba (yuba; also fu chu).

9. Soybean curd (tofu) for food: Preparation and types (classical name is *li chi*), historical, present state (of tofu in China), chemical composition, digestibility, utilization. 10. Fermented soybean products for food. Soy sauce: Kibiki and sobiki tamari, composition of various soy sauces. Natto. Miso. Conclusion. Bibliography.

On page 9 we read: "An industry which promises to be of importance in a further utilization of the soy bean is the manufacture of 'vegetable milk.' At the present time a factory in New York State is being equipped for this purpose." Address: Peking Union Medical College, China.

620. Trabut, Louis. 1927. Le soja légume [The soya legume]. *Comptes Rendus des Seances de l'Academie d'Agriculture de France* 13(18):611-13. Meeting of 1 June 1927. [Fre]
• ***Summary:*** For 150 years the question of soybean utilization in the west has been discussed. However only in the United States is the cultivation of this legume practiced, and it is quite popular in certain states, such as Kansas, where the farmers use the soybean plant as forage, and reserve the seeds for feeding their hogs. In addition, American industries use large quantities of soya. The oil is even imported from Manchuria, where certain factories process 50 tonnes/day of soya. England, Germany, Holland, and Italy extract oil from soya and use the cake for feeding animals and even humans. At Trieste, the cake is converted into a flour which, at the 10-15% level, fortifies and improves bread.

In China, for 50 centuries, soya has been used for the production of milk and cheese. Recently in Italy, soymilk has been made and used experimentally for the feeding of young infants at clinics in Turin, Bologna (*Bologne*), Genoa (*Genes;* Ital. = *Genova*), Padua (*Padoue*), and Florence.

In France, soya has been recognized since 1855 as a new legume and a variety named *Soja d'Etampes* is now found in seed catalogs.

In Algeria, for some years, a pressure cooker has been imported from Spain under the name "marmite espagnole." Having observed that chickpeas, which ordinarily remain hard after several hours of cooking, become soft after 15 minutes of pressure cooking, the author tried cooking soybeans (which had been soaked in water for 24 hours) the same way. The result surpassed his hopes, for by this rapid and economical process of cooking, the soybean becomes superior to the Haricot in many ways, including its high nutritional value. The author urges that more attention be paid to the soybean in France. Address: Directeur du Service botanique du Gouvernement général de l'Algérie.

621. Turner, A. Grenville. 1927. The useful soya bean. Commercial possibilities. *Liverpool Trade Review* 26(12):245-47. Dec. 15. Compiled from a report prepared by Mr. A. Grenville Turner, of Messrs. Kelly & Company... Liverpool.
• ***Summary:*** Describes the increasing importance and production of soybeans in the United States, and their food and industrial uses. Address: Messrs. Kelly & Co., 10 Irwell Chambers West, Liverpool, England.

• ***Summary:*** Contents: Introduction. How the bean and its oil can be used. The soybean as a seed crop. Methods of oil extraction. Includes uses for the bean and methods of extraction used in the United States. Photos show: (1) Three children playing in a field of soya beans in Natal, South Africa. (2) A modern crushing machine. (3) A massive horizontal-axis granite roller for crushing the beans. (4) A native [Manchurian] bean press, showing cakes in receptacle and logs driven in to press out the oil. Address: England.

623. **Product Name:** Soybean Milk Powder.
Manufacturer's Name: Henry Bowers Chemical Co.
Manufacturer's Address: Philadelphia, Pennsylvania.
Date of Introduction: 1927.
New Product–Documentation: Horvath. 1927. The Soybean as Human Food. p. 47. "The Henry Bowers Chemical Co., Phila, Pa [Philadelphia, Pennsylvania], are also working on the soybean flour and soybean milk powder, and have some very good products." It is not clear whether or not these were sold commercially.

624. Gandhi, Mohandas Karamchand. 1927. The story of my experiments with truth. Translated from the original in Gujarati by Mahadev Desai. Vol. 1. Ahmedabad, India: Navajivan Press. 602 p. Index. 24 cm. See also Vol. 2, 1929.
• ***Summary:*** This magnificent autobiography opens with a sepia photo of Gandhi (lived 1869-1948), dressed only in a dhoti (a long loincloth worn by Hindu men), sitting on the ground and looking contemplatively downward–a characteristically humble pose for such a great man.

Before Gandhi left India for London on 4 Sept. 1888, 1 month before his 19th birthday, as a shy young man to further his studies in law for 32 months, he took 3 vows before his mother to set her heart at ease and to prevent him from violating the rules of his caste: he would not touch wine, woman, or meat (including eggs). The first friend with whom he lived in London persistently pleaded with him to eat meat, but he refused. The next family with whom he lived knew nothing of vegetarian cookery so Gandhi was always hungry–though he never mentioned it.

Finally, after much searching, he found a vegetarian restaurant on Farringdon Street in London. "The sight of it filled me with the same joy that a child feels on getting a thing after its own heart. Before I entered I noticed books

for sale exhibited under a glass window near the door. I saw among them Salt's *Plea for Vegetarianism*. This I purchased for a shilling and went straight to the dining room. This was my first hearty meal since my arrival in England. God had come to my aid.

"I read Salt's book from cover to cover and was very much impressed by it. From the date of reading this book, I may claim to have become a vegetarian by choice. I blessed the day on which I had taken the vow before my mother. I had all along abstained from meat in the interests of truth and of the vow I had taken, but had wished at the same time that every Indian should be a meat-eater and had looked forward to being one myself freely and openly some day, and to enlisting others in the cause. The choice was now made in favour of vegetarianism, the spread of which henceforward became my mission.

"My faith in vegetarianism grew on me from day to day. Salt's book whetted my appetite for dietetic studies. I went in for all books available on vegetarianism and read them. One of these, Howard Williams' *The Ethics of Diet*, was a 'biographical history of the literature of humane dietetics from the earliest period to the present day.' It tried to make out that all philosophers and prophets from Pythagoras and Jesus down to those of the present age were vegetarians. Dr. Anna Kingsford's *The Perfect Way in Diet* was also an attractive book"–as the writings of Dr. Allinson [probably Thomas Richard Allinson]" (p. 118-21).

As Gandhi set out to try to play the English gentleman, his vegetarianism occasionally led to awkward social situations but he never broke his vows–except for a brief lapse into eating eggs, which he later regretted.

Chapter 17, titled "Experiments in Dietetics," describes Gandhi's growing awareness of the many facets and implications of a vegetarian diet and of the relationship between humans and animals. He met many kindred spirits in vegetarian restaurants, joined a vegetarian society in England and subscribed to its journal. Soon he found himself on the Society's Executive Committee. "Here I came in contact with those who were regarded as pillars of vegetarianism, and began my own experiments in dietetics" (p. 137-39).

"Full of the neophyte's zeal for vegetarianism, I decided to start a vegetarian club in my locality, Bayswater. I invited Sir Edwin Arnold, who lived there, to be Vice-President. Dr. Oldfield who was Editor of *The Vegetarian* became President. I myself became the Secretary. The club went on well for a while, but came to an end in the course of a few months. For I left the locality according to my custom of moving from place to place periodically. But this brief and modest experience gave me some little training in organising and conducting institutions." Gandhi's extreme shyness prevented him from expressing himself on any subject, including vegetarianism, throughout his stay in England.

"It is my firm conviction, that man need take no milk at all, beyond the mother's milk that he takes as a baby. His diet should consist of nothing but sunbaked fruits and nuts... Restraint of the sexual and other passions becomes easy for a man who lives on such food. My co-workers and I have seen by experience that there is much truth in the Indian proverb, that as a man eats, so shall he become." But while "engaged in a recruiting campaign in Kheda, an error in diet laid me low, and I was at death's door. I tried in vain to rebuild a shattered constitution without milk. I sought the help of doctors, *vaidyas*, and scientists whom I knew to recommend a substitute for milk. Some suggested *mung* water, some *mowhra* oil, some almond-milk. I wore out my body in experimenting on these, but nothing could help me leave the sickbed." Finally he started drinking goat's milk; the spirit of his vow was destroyed–but he recovered and admitted that his theory had failed him. Nevertheless, he declared his "firm conviction, that for the seeker who would live in fear of God, and who would see Him face to face, restraint in diet both as to quantity and quality is as essential as restraint in thought and speech." (Vol. II, p. 45-47).

Gandhi wrote most of the history of his struggle in South Africa while in Yeravda jail, and finished it after he was released (p. 155). "I was now anxious to observe brahmacharya in thought, word and deed, and I was equally anxious to devote the maximum of time to the Satyagraha struggle and fit myself for it by cultivating purity... Fasting and restriction in diet now played a more important part in my life. Passion in man is generally co-existent with a hankering after the pleasures of the palate. And so it was with me" (p. 157-58). Gandhi first went to jail in 1908. At one point he voluntarily gave up salt and pulses. His wife observed that "all restraint, whatever prompts it, is wholesome for man" (p. 171-74). In 1912 Gandhi, Mr. Herman Kallenbach, and 4-5 Musalmans [Muslims] lived at Tolstoy Farm, a community started by Gandhi in 1910 in Transvaal (22 miles from Johannesburg), South Africa; all were vegetarians. Gandhi decided to give up milk and cereals, and to live on a diet of uncooked fruit, nuts, and olive oil (p. 180-83).

Note: This is the earliest document seen (Oct. 2010) concerning Gandhi and vegetarianism. Address: India.

625. Horvath, A.A. 1927. The soybean for food and feed. The Manchurian Research Society. *
• ***Summary:*** 1926 articles on soyfoods published in Chinese Bureau of Economic Information.

626. Horvath, A.A. 1927. The soybean as stock feed and human food. *Vestnik Manchzhurii* (*Manchuria Monitor*) No. 8. p. 5-7. English edition. p. 13-23. Russian edition. [19 ref. Eng; Rus]
• ***Summary:*** A brief but good introduction to soybeans and soybean products including soybean meal, soybean flour, soybean oil, bean milk [soymilk], to-fu, frozen to-fu, soy

sauce, and mizo [sic, miso] or tsiang [jiang].

"When boiled with gypsum or chlorate of magnesia bean milk curdles, and is known as 'to-fu.' Its constitution varies dependent upon the method of preparation employed. Fresh soy curd contains on the average, 8% protein and 3% fat. 'To-fu' when smoked or fried, owing to loss of water, becomes somewhat allied to meat, thereby substantiating the Chinese proverb that–'to-fu is meat without bones.'"

"Frozen 'to-fu' prepared during the cold season contains up to 50% protein. Bean curd is almost totally assimilated, and may be used in the preparation of a considerable number of European dishes, the recipes for which have been published by the U.S. Department of Agriculture. The Chinese prepare an unlimited number of dishes based upon this comestible, including artificial meat. In order to obtain the specific taste of meat, smoking soybean sauce is used." Address: Manchuria.

627. Kellogg, John Harvey. 1927. The new dietetics: A guide to scientific feeding in health and disease. 3rd ed. Battle Creek, Michigan: The Modern Medicine Publishing Co. 1031 p. See p. 188-93, 322-28. Illust. Index. 24 cm.
• ***Summary:*** This is an encyclopedia of food, diet, and nutrition. Earlier editions were published in 1921 and 1923. The author, a physician and a vegetarian, lists his credentials on the title page: "Fellow of the Royal Society of Medicine of Great Britain, of the American Medical Association, Member of the American Economic Association, and of the National Geographical Society, Member of the Société d'Hygiene of France, Late Member of the Michigan State Board of Health, Editor of "Good Health," Superintendent of the Battle Creek Sanitarium, President of Battle Creek College.

Table XIV (p. 188) lists soy beans as a food rich in lime (calcium), containing 0.46%. Pages 189-93 discuss "Acids and bases of food–The acid alkaline balance." It begins: "As pointed out by Bunge many years ago, and as further shown by an extensive research conducted by Sherman, of Columbia University, foodstuffs differ in relation to their acid and basic contents. In certain foods, bases or alkalies predominate, while in others the mineral acids predominate.

"The waste products of the body are predominantly acid; consequently it is desirable that the foodstuffs should be predominantly basic. If acids predominate in the ration, and this condition continues for a considerable period of time, the effect will be to disturb the nice balance between acids and bases which is normally maintained in the body fluids and which is essential for life. A deficiency of alkalies constitutes acidosis.

"It is necessary that the alkalinity of the blood should be constantly maintained as the only means by which the acid wastes of the body which are constantly accumulating as the result of all sorts of vital work may be promptly removed." All flesh foods leave highly acid residues. Eggs are also acidic, though less strongly than meat. Cereals and bread are acidic, though much less so than meats. Milk is slightly alkaline. Most fruits, and all green and root vegetables are strongly basic and tend to alkalinize the tissue fluids... Generally it is better to select foods which afford a large basic margin so as to add to the alkali reserve of the body, which always tends toward diminution, especially in old age. A strongly basic diet is especially indicated in cases of arteriosclerosis and disease of the kidneys, in fevers, in pregnant women, in all forms of acidosis, and in old age...

"At the present time all physiologists are agreed that the highest degree of physical vigor and efficiency may be maintained on a diet which excludes flesh foods and physiologists the world over are unanimous in advising a curtailment rather than an increase in meat consumption."

Table XVI (p. 192-93) is titled "Excess of acid or alkali in one ounce and in 100 calorie portions of common foodstuffs." The Soy bean has an excess of base (alkali), 12.0 units per 100 calories or per 1 ounce.

In the chapter on Legumes, pages 322-28 give a detailed and accurate discussion of the soy bean and various soyfoods, including the history and nutritional composition of the soy bean, soy bean milk, to fu [tofu], soy sauce, and soy bean sprouts. On the first page, Dr. Kellogg states: "The soy is the best of all beans."

In the chapter titled "Infant Feeding," under "Vegetable Milk" (p. 956), Dr. Kellogg states: "The Chinese have for ages made from the soy bean a preparation which so closely resembles the dairy product that it may not inappropriately be called vegetable milk. A much better preparation is made from walnuts, almonds, and even peanuts... Milk prepared from walnuts and almonds is used in China, the Philippines and throughout the Orient, as a food for nurslings for whom a wet nurse can not be provided. This custom prevails extensively in those Asiatic countries in which cow's milk is but little used.

"A nut milk commonly known as 'Malted Nuts' has been made in this country for more than thirty years and has come into extensive use... These plant protein milks render great service especially in the treatment of infants and invalids who are sensitized to cow's milk. They are also valuable resources in the treatment of colitis in infants and in cases in which change of the flora is found difficult, so that the suppression of all animal proteins becomes necessary."

Also discusses quinoa, kaoliang, and the adsuki bean.

Note: This is the earliest English-language document seen (Feb. 2004) that uses the word "alkalinize" to refer to making a food more alkaline. Address: Battle Creek, Michigan.

628. Lovell, Philip M.; Press-Lovell, Leah. 1927. Diet for health by natural methods: Together with health menus and recipes. Complete instructions for the cure of the sick without the use of drugs. Los Angeles, California: The

Times-Mirror Press. xiii + 428 + [7] p. No index. 21 cm.
• ***Summary:*** Part I: Treatment and diet, by Dr. P.M. Lovell. Part II. The preparation of health foods, by Leah Press-Lovell (recipes, p. 129-428). Some of the recipes in this book first appeared in the "Care of the Body" section of the *Los Angeles Times,* which Dr. Lovell has edited for the past few years. "This is the pioneer health department of any newspaper in the country, undoubtedly the most widely read and unique, in so far as it advocates drugless, natural therapy" (p. 4). "This book is based on vegetarian principles. Meat recipes... are not included." Many reasons for this are given. Meat includes fish and fowl (p. 8-9).

Soy-related: "Soy sauce or shoyu is made from soy beans and can be bought at Japanese stores. It gives a tasty flavor to gravies and to cereals" (p. 134). Chop suey (3 types), each served with "Soy bean sauce" (p. 290-91). Soy gravy (with soy–also called soy sauce or shoyu, p. 305). Chapter 14, "Legumes" (p. 366-70) discusses chick peas (Garvanza), lentils, peanuts, and "Soy beans: Best known in China and India. Rich in oil. Contain almost no starch. Require slow cooking to bring out flavors. Hulls are difficult to digest. Therefore remove them by rubbing through a colander." "About the soy bean: The soy bean is very important in the Orient. When three-fourths grown it makes a nutritious green vegetable [yes] known as 'bean sprouts' [no]. Products of soy beans are soy bean flour, soy bean milk, soy bean cheese (tofu), soy sauce, soy bean oil, sprouts, etc. Soy bean products can be bought at Japanese and Chinese grocery stores." Contains 3 recipes: Soy roll or bread (replace 25% of the whole wheat flour with soy flour in any whole wheat bread recipe). Soy bean porridge (cook 1 cup soy bean flour with 3 cups water for 2 hours in a double boiler. Cool, slice, roll in corn flour and bake with butter or oil to make croquettes). Soy bean croquettes (with "1 cup soy bean porridge"). Soy bean milk (made from soy bean flour, p. 420; also almond milk and cocoanut milk).

Also discusses: Of the general advice given to patients, "the subject of diet occupies the leading position" (p. viii). Agar flakes (vegetable gelatine) are better than animal gelatine (p. 135). Almonds–How to prepare almond milk, cream, and meal (p. 152). Cocoanut–To prepare cocoanut milk. Peanuts–How to prepare raw peanut butter (p. 153). Garvaza [garbanzo] beans and meal (p. 308-09). Nut loaf (Vegetable turkey) (with peanuts, p. 315). Carqué's unfermented whole wheat bread (p. 351). Carqué's unleavened fruit bread (p. 351). Recipes using Graham flour (different from whole wheat flour, p. 356-59).

629. Nadkarni, Krishnarao Mangeshrao. ed. and pub. 1927. The Indian materia medica. 2d ed. Bombay, India: K.M. Nadkarni. 5 + xviii + 1142 + clxix + lxxxviii p. Index. 20 cm.
• ***Summary:*** The body of this book (1142 p.) appears to be titled *The Indian Materia Medica with Ayurvedic, Unami & Home Remedies.* Soybeans are mentioned in three different places, almost as if each was thought to be different plant.

Page 313-14. "305. Dolichos Soja–(English–Soya bean, German–Soja bohne, Bengali–Gari kulaj, Hindi–Bhatwan, Kumaon–Bhut) is a species cultivated in some part of India for its seeds which are eaten and which contain a high percentage of protein and fat."

Page 399: "396. Glycine Soja & G. Hispida are species (English–Soya bean, Hindi–Bhatwan, Bengali–Gari kulay, Kumaon–Bhut, Eastern Terai–Khajuwa) met with on the tropical Himalayas from Kumaon to Sikkim and Khassia and Naga Hills. A decoction of the root is said to possess astringent properties."

Page 803: "886. Soja Hispida or Glycine Soja (English–Soya bean; Soy-bean) has taken the place of meat in the diet of Chinese, Japanese and other Asiatics. Its notable characteristics are its large proportion of assimilable protein and fat, and its lack of starch and small content of sugar. Being so highly nutritious, it is not adapted for use as a side-dish, like ordinary vegetables, but, like meat, supplies a chief food. Among the preparations mentioned as common in China and Japan are 'tofu' resembling cottage cheese; 'Shoyu or Soya' which has been soaked to remove the skin and then boiled and seasoned; 'Miso' or soy-bean milk, prepared by soaking pulverized beans and straining; and 'Natto' obtained by fermenting the boiled beans. The lack of starch gives the beans favour as a diabetic food, and soy-bean meal and soy-bean bread have been prepared. The beans have been also tried as a coffee substitute–(Popular Science Siftings). For more particulars see also Dolichos Soja etc."

630. Zhang Xiangwen. 1927. Dungu bitan [Chaotic valley essays]. China. Passage on soy reprinted in C.N. Li 1958 #354, p. 251. [Chi]
• ***Summary:*** Wade-Giles reference: *Tun Ku Pi T'an*, by Chang Hsiang-Wên. Republican period. The section titled "Yellow soybeans" (*huangdou*) states: The yellow soybean is a nutritious substance. The milk (*doujiang*) is especially beneficial. Soak the beans in water. When they are swollen, use a quern / mill (*mo*) to grind them. Then filter off the dregs (*zha;* Japanese: okara). Boil the milk (*jiang*) to a certain thickness, then consume it. Its efficacy is like that of cow's milk. (Translated by H.T. Huang, PhD, April 2003).

Dr. Huang adds: The title of this work may involve a humorous "play on words" with the famous *Mengqi Bitan* [Dream pool essays] (1086). Or, Dungu could be a place-name in China.

631. *Miller* (*The*). 1928. The soya bean. 53(2555):832. Jan. 9.
• ***Summary:*** Based on a publication by Messrs. Kelly & Co., Ltd. of Liverpool concerning soybean production and uses. Address: England.

632. Tso, Ernest. 1928. The development of an infant fed eight months on a soybean milk diet. *Chinese J. of Physiology* 2(1):33-40. Jan. [9 ref. Eng; chi]
• ***Summary:*** "Soybean milk is a native food used in certain parts of the country (China) as a morning beverage but is little used as a part of the diet for children. Its nutritive properties as a food for young infants are practically unknown. The following report of a more or less successful attempt to feed an infant six weeks of age for eight months on a soybean milk diet is therefore of interest from both the economical and the physiological standpoints. Soybean milk is five to ten times cheaper than cow's milk."

Describes exactly how the soybean milk was made and the protocol of the experiment, including feeding history, physical development, Roentgen-ray (x-ray) examinations, other clinical data, and metabolism experiment. During the 8 months, the child received daily 600 to 800 cc soybean milk containing 50-70 gm cane sugar and 0.1% NaCl [table salt]. At various times this diet was supplemented with other foods, including one half to one yolk of an egg, cod liver oil (10-20 cc daily), and orange juice (5-10 cc daily).

"This experiment is perhaps the first demonstration that an infant can be successfully fed through the perilous period of the first few months of life on a diet which contains no mammalian milk." However the author found signs of rickets in an infant fed solely on soy bean milk.

Figures show: (1) Graph: The buffer value of soybean milk; it is midway between that of human milk and cow's milk. (2) Graph: Weight of baby fed soy from 1 to 44 weeks of age compared with Holt's average weight curve for several hundred breast fed babies. The soy weight is always lower than the milk weight. (3) Photo of baby Yao at age 9½ months. Address: Div. of Pediatrics, Dep. of Medicine, Peking Union Medical College, Peking [China].

633. Stop & Shop. 1928. Buy your Sunday dinner at this store (Ad). *Chicago Daily Tribune*. Feb. 24. p. 12.
• ***Summary:*** One section is titled "Stop & Shop now offers Battle Creek Sanitarium Health Foods to you–Every day in the year a complete line of standard Battle Creek foods... Battle Creek expert always in charge of this department." Featured: "Savita–a valuable substitute for meat extracts; rich in vitamin–excellent for diabetics. Has the fine flavor of mushrooms and rivals the finest meats. 50¢ jar. Protose–looks like meat, smells like meat, tastes like meat; has the composition of meat yet is purely vegetable. 35¢ jar." An illustration shows 11 products, including Psylla [from psyllium], Gluten Flour, Malted Nuts, Lacto Dextrine, Zo, Savita, Protose, and Laxa. Address: 16 N. Michigan and 12 W. Washington.

634. Vitale, Luigi. 1928. Il latte di soja [Soymilk]. *Rassegna Internazionale di Clinica e Terapia* (*Naples*) 9(3):180, 183-86, 189-92. March 31. [Ita]
• ***Summary:*** Includes a discussion of the value of soymilk in infant feeding.

Note: The *Journal of the American Medical Association* (23 June 1928, p. 2068) summarized this article as follows: "Vitale extols the soy bean from the agricultural standpoint, as it requires little cultivation, thrives on mediocre soil, stands a drought well, and enriches the soil with atmospheric nitrogen. As a food, it is perfectly harmless, and differs from other legumes in that it constitutes a complete food, containing proteins, carbohydrates and fats, also vitamin B. In China, and in other countries of Asia, soy bean milk has been used extensively since remote times in the feeding of children. If prepared under proper conditions of cleanliness soy bean milk is a wholesome food. It keeps better than animal milk, although it also has a rich microflora." Address: Frattamaggiore (Napoli/Naples), Italy.

635. Carque, Lillian R. 1928. Mrs. Carqué's recipe book. Los Angeles, California: Otto Carqué. 32 p. Illust. 15 cm.
• ***Summary:*** Inside front cover: "Dear Friends: This recipe book has been created to fill a deeply felt human need, namely to emphasize the importance of a fruitarian as well as vegetarian dietary, and to encourage the greater use of nature's most wholesome foods..." Signed, Lillian Carqué

(Mrs. Otto Carqué).

This book has no table of contents. However the recipes are divided into "divisions." Fruit & nuts (p. 1-12). Vegetable salads (p. 13-18). Cooked dishes (p. 18-23). Vegetable soups (p. 23-24). Fruit soups (p. 24-25). Fruit cocktails (p. 25). Desserts (p. 25-27). Sandwiches (p. 27-28). Unfired pies [raw] (p. 28-29). Sauces & dressings (p. 29-31). Breads (p. 31). Health confections (p. 32).

Soy related recipes include: Soya bean bread (with 1½ cups Carque's Soya Bean Flour 2 cups whole wheat flour, 1½ cups nut milk, 2 tablespoons Carque's Honey, etc., p. 31).

A photo at the top of many pages shows the dish prepared from the recipe on that page.

The recipes call for many Carque brand products by name–such as: Carque's Almond Butter, Carque's Black Mission Figs, Carque's California Dates, Carque's California Honey, Carque's California Olive Oil, Carque's Celery Salt, Carque's Cracked Wheat, Carque's Deglet Noor Dates, Carque's Dried Apricots, Carque's Fig Paste, Carque's French Dressing, Carque's Gem Peanut Butter, Carque's Granulated Agar, Carque's Lentil Flour, Carque's Natural Whole Rice [brown rice], Carque's Nut Cream Butter, Carque's Nut Fruto, Carque's Nuts, Carque's Onion Salt, Carque's Orange Blossom Honey, Carque's Peanut Butter Dressing, Carque's Peanut Meal, Carque's Pecan Meal, Carque's Pitted Dates, Carque Powdered C-Leaves, Carque's Prunola Dressing, Carque's Raw Hawaiian Sugar, Carque's Ripe Olives, Carque's Savory Nut Loaf, Carque's Seeded Muscat Raisins, Carque's Seedless Raisins, Carque's Shredded Cocoanut, Carque's Soya Bean Flour, Carque's Thompson Seedless Raisins, Carque's Unsulphured Dried Peaches, Carque's Unsulphured Dried Pears, Carque's Whole Wheat Macaroni.

Lillian R. Carqué was born in 1899. This book was published about 7 years before Otto Carqué's death on 9 Jan. 1935.

According to OCLC (Dec. 2010) Helen Evans Brown was a former owner of this book. It was donated to the Huntington Library by Philip S. Brown. Address: 1016 So. Hill St., Los Angeles, California.

636. Grey, Egerton Charles. 1928. The food of Japan. Geneva: League of Nations, Health Organisation. 161 p. May. Index. 24 cm. [82 ref. Eng; fre]

• ***Summary:*** Detailed information and analysis. Contents: Preface. 1. Quantity of food in Japan: Exports, imports, production and consumption of food in Japan in the year 1925. 2. Quality of food in Japan: Definition of quality. 3. Distribution of food in Japan: Natural and artificial distribution. 4. Chemical composition of Japanese foods as consumed: Methods of analysis. 5. Chemical composition of Japanese food as purchased. Appendices: I. Literature relating to the chemical and physical properties of the food of Japan, with list of authors. II. Food materials and the plants and animals serving as sources of food in Japan.

The Preface begins: "This work... was carried out in the Imperial Institute of Nutrition, Tokyo (director, Dr. Tadasu Saiki). It comprises statistical data relating to the food supply of Japan and analytical data derived from the writer's personal examination of the food materials."

Table 7 (p. 25) shows the amounts of major foods consumed in Japan. The percentage of the total food consumed is: Rice 50.83%, barley 10.15%, potatoes 8.63%, wheat 6.63%, soy bean 4.76%, other beans 3.71%, other cereals 3.24%, fish 1.72%, seaweed 1.23%.

On page 54, the author discusses the "Alkalinity of the ash [of foods]. This figure is of considerable importance as indicating the capacity of the food material to produce alkali in the body." On pages 61-111 the author lists the nutritional composition of all major Japanese foods, grouped by food type: 1. Cereals and cereal products. 2. Legumes, pulses, and legume products. 3. Roots, greens, and other vegetables. 4. Mushrooms and seaweeds. 5. Fruits, nuts, and seeds. 6. Vegetable oils. 7. Other vegetable products. 8. Dairy products. 9. Eggs. 10. Meat and animal fat. 11. Fish. 12. Condiments, beverages, etc. The name of each food is given in both English and French, usually with a brief explanation.

In a table (p. 65-69), in category "II. Legumes, pulses, and legume products," the section titled "Fresh legumes" includes (p. 64-65): Edamame (Soy bean in pod) = *Fève de soya en cosse*. The section titled "Dry legumes (pulses)" includes (p. 64-67): Azuki (Small red bean) = *Petit haricot rouge.* Dainagon (Small red bean) = *Petit haricot rouge* Ao daizu (Soy bean [with green seed coat]) = *Fève de soya.* Kuro daizu (Black soy bean) = *Fève de soya noire.* Shiro Daizu (White soy bean) = *Fève de soya blanche.* Rakkasei (Pea nut) = *Pistache de terre.*

The section titled "Bean products" includes (p. 66-69): Aburage (Fried-bean curd) = *Pâte de haricots frite*. Aka miso (Soy-bean paste) = *Pâte de fèves de soya.* Gammodoki (Fried-bean curd) = *Pâte de haricots frite avec mixture d'algues marines.* Kinako (Soy-bean powder) = *Poudre de fèves de soya.* Kori dofu = *Pâte de haricots séchée.* Namaage (Fried-bean curd) = *Pâte de haricots frite.* Natto (Fermented soy bean) = *Fève de soya fermentée.* Sarashian (Red-bean powder) = *Poudre de haricot rouge* [Sarashi-an from azuki beans]. Shiro miso (White soy-bean paste) = *Pâte blanche de fève de soya.* Tofu (Soy-bean curd) = *Pâte de fèves de soya.* Tofu kasu (Soy-bean residue) [okara] = *Déchets de fèves de soya.* To nyu (Soy-bean milk) = *Lait de fève de soya.* Yuba.

Note 1. This is the earliest English-language document seen (April 2013) that contains the word *gammodoki*, which refers to deep-fried tofu burgers, or that contains the word *namaage*, which refers to deep-fried tofu cutlets.

Also: Mushrooms and seaweeds includes (p. 73-75): Arame, Asakusanori [Asakusa nori], aonori, hijiki, kanten, kombu, mozuku, ogonori, tororo kombu, wakame. Fruits, nuts and seeds includes (p. 77): Asanomi (Hemp seed),

Goma (sesame, white and black). Vegetable oils includes (p. 79): Daizu yu (Soy bean oil) = *Huile de fève de soya.*

Condiments includes (p. 92-93): Hamana natto [fermented black soybeans]. Kiriboshi (Dried daikon). Misozuke [miso pickles]. Narazuke. Shoyu [soy sauce]. Takuan (Pickled radish). Umeboshi (pickled plum) = *Prune confite.* Beverages includes (p. 92-93): Amazake. Mirin (fermented rice). Sake (Rice wine).

For each food, the following values are given in both English and French: Water, protein (N x 6.25), fat, carbohydrate, ash, calories, alkali value, total nitrogen, water-soluble nitrogen, phosphoric acid (anhydrous), sodium chloride (salt), water-soluble ash, water-insoluble ash, alkalinity due to soda and potash, alkalinity due to lime and magnesia, calcium oxide, ferric oxide, factor for converting to dry food.

Note 2. In Japan, the typical person is well aware of which foods are alkaline (*arukari-sei*) and which are acidic (*san-sei*). The alkaline foods are generally considered more healthful and health-protecting. For the alkaline values given by Grey for many basic Japanese foods, see SoyaScan Notes. 1991. Sept. 20.

Note 3. This is the earliest English-language document seen (March 2009) that uses the term "soy-bean paste" to refer to miso.

Note 4. This is the earliest English-language document seen (June 2009) that uses the term "Edamame" to refer to [green] soy beans in their pods.

Note 5. This is the earliest English-language document seen (April 2013) that uses the term "kori dofu" to refer to dried-frozen tofu.

Note 6. This is the earliest English-language document seen (Dec. 2006) that uses the term "pickled plum" to refer to umeboshi salt plums.

Note 7. This is the earliest English-language document seen (Nov. 2011) that uses the term "Hamana natto" to refer to fermented black soybeans. Address: M.A., D.Sc., F.I.C., M.R.C.S., etc..

637. Wu, Hsien. 1928. Nutritive value of Chinese foods. *Chinese J. of Physiology, Report Series* No. 1. p. 153-86. July. Issue title: Metabolism. [7 ref. Eng; chi]
• ***Summary:*** The nutritive value of many Chinese foods (water, protein, fat, ash, crude fiber, carbohydrate, calories) is given (with the English name, scientific name, and name in Chinese characters), including the following: wheat gluten, sesame seed (p. 155), yellow soy bean, black soy bean (large or small), green soy bean, soy bean sprout (yellow or green), soy bean flour, soy bean curd, soy bean dregs [okara], bean curd (doufu-gan, boiled in salt and spices and partially dried), oil skin ([yuba], from boiled soy bean milk), bean curd skin ([yuba], dried, or rolled like bamboo), soft bean curd, soy bean milk (p. 156), smoked bean curd, sheet bean curd, fermented bean curd, pickled bean curd, soy bean (fresh) (Characters: hair + bean = mao tou), wild soy bean, red gram bean (red small bean, Phaseolus mungo [azuki bean], p. 157), cucumber pickled in soy bean paste (p. 175).

Condiments: Thick soy bean paste, thin soy bean paste, fermented soy bean, fermented bean (dried), thin soy bean sauce (white), thick soy bean sauce (white), thin soy bean sauce (black), thick soy bean sauce (black), soy bean sauce ("chemical"), sweet flour paste (p. 176).

Table 4 (p. 180) gives the calcium, phosphorus, and iron content of some Chinese foods in percentages of edible portion, including the following: Wheat gluten, job's tear, yellow soy bean, black soy bean, red gram bean [azuki], green soy bean (fresh), soy bean flour, soy bean milk, bean curd (Southern style and Northern style).

Table 5 (p. 182) lists foods as sources of vitamins A, B, C, or D, including the soy bean (an excellent source of vitamin B).

Note 2. This is the earliest English-language document seen (April 2013) that uses the term "doufu-gan" (or "doufu gan") to refer to Chinese-style firm tofu. Address: Dep. of Biochemistry, Peking Union Medical College, Peking, China.

638. Vi-Tone Company. 1928. George Young takes plenty of energy-producing food (Advertorial). *Toronto Daily Star* (*Canada*). Sept. 10. p. 2.
• ***Summary:*** George Young, a well-known swimmer, and Johnny Walker, a trainer of swimmers, both favor foods that are high in energy-producing powers, and "one of the most important of these is Vi-Tone, which many people use and most of us have seen in the stores.

"It is a food tonic beverage, with a delicious malt chocolate flavor and contains the rich proteins and vitamins of the soya bean.

"Taken hot or cold it produces energy almost instantly. In this way it is far better than mere stimulants. For Vi-Tone gives that staying power which can only be obtained from true nourishment." Address: [Hamilton, ONT, Canada].

639. *Good Health* (*Battle Creek, Michigan*). 1928. Soy bean milk. 63(9):41. Sept.
• ***Summary:*** "An article in an Italian medical journal extols the soy bean from the agricultural standpoint... In some Asiatic countries soy bean milk has from remote times been extensively used in the feeding of children. When properly prepared it keeps better than animal milk."

640. Tso, Ernest; Yee, Martin; Chen, Tung-Tou. 1928. The nitrogen, calcium and phosphorus metabolism in infants fed on soybean "milk." *Chinese J. of Physiology* 2(4):409-14. Oct. [10 ref. Eng; chi]
• ***Summary:*** "It has been demonstrated that infants even in their first months of life thrive on a diet free of mammalian milk (Tso 1928)." The basic constituent of this diet is in

artificial "milk" prepared from soybean (*Glycine hispida*)... What is the co-efficient of digestibility of the bean "milk" proteins? "What is the rate of storage of its protein nitrogen? To what extent do the calcium and phosphorous contents in the bean milk meet the requirement of a growing child? Metabolism experiments have, therefore, been conducted in an attempt to gather data on these points."

An infant fed for 4-5 day periods on a daily ration of "bean milk" (720 gm), sucrose (72 gm), and orange juice (4 gm), showed satisfactory nitrogen absorption and retention. The calcium and phosphorus absorption appeared to be inadequate. The calcium content of soybean "milk" is inadequate. The addition of cod-liver oil (10-15 gm) and a small amount of calcium salt markedly enhanced not only the calcium retention but also the phosphorus storage. The phosphorus content of soybean "milk" is apparently adequate but its utilization may be restricted by the limited calcium intake.

Note: This is the earliest English-language document seen (Aug. 2013) that contains the term 'soybean "milk."' Address: Div. of Pediatrics and Dep. of Biochemistry, Peking Union Medical College, Peiping.

641. Dorsett, P.H.; Morse, W.J. 1928. Agricultural explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon (Log–unpublished). Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished typescript log. Illust. Partially indexed. 28 cm.

• ***Summary:*** Also called the "Log of the Dorsett Morse Expedition to East Asia" and (by the National Archives) "Dorsett-Morse Expedition to the Far East, 1929-31," this is one of the most important documents ever produced on soybeans and soyfoods. Covering the period from late 1928 until 1932, it consists of 17 volumes of typewritten unpublished manuscript plus handwritten notebooks.

The two explorers, who were gone on the expedition for a little more than two years, initially planned to be gone for about three years. They took 3,369 photos of which 95% appear in the report; the original prints are pasted on the pages, each with a number and a caption. The first negative number is #43196 (p. 238) and the last is #46514. The last numbered page of the report is #8818, but most of the index pages are not numbered and some special reports at the end of the main report each start with page 1.

The first quarter of the pages (to about page 2,500) are indexed, using 4 separate indexes. The only original and 2 microfilm copies were at the American Soybean Assoc. (St. Louis, Missouri), however as of Aug. 2011 they are on permanent loan to Rare and Special Collections at the National Agricultural Library (Beltsville, Maryland)–which also has 7 photograph albums that accompany the 7 log books. A list of the missing pages has been compiled. One photocopy of a microfilm copy is at the Soyinfo Center (Lafayette, California). One microfilm copy is at the National Archives in Washington, DC, in Records of the Bureau of Plant Industry, Soils, and Agricultural Engineering, Record Group 54. See: "National Archives Microfilm Publication No. M840. Expedition Reports of the Office of Foreign Seed and Plant Introduction of the Department of Agriculture, 1900–1938." Rolls 16-20, volumes 56-73. These microfilm rolls may also be available for viewing or duplication at one of the various regional branches of the National Archives (e.g. San Bruno, California).

A brief itinerary of the trip is as follows: 1929 Feb. 18–The party of 5 people leaves Washington, DC, for Los Angeles by train. It consists of Morse, his wife Edna, their daughter Margaret (age 7), Dorsett, and his daughter-in-law Ruth (Bobbie; the widow of Dorsett's son, she served as Dorsett's secretary and general helper).

March 1–They sail from San Francisco to Yokohama on the S.S. *President Grant* of the Dollar Steamship Lines. March 29–Arrive in Yokohama, proceed directly to Tokyo, establish headquarters with rooms at the Imperial Hotel, and hire an interpreter, Mr. Suyetake, who works with them for the next 2 years. May 21–The Morses go to Hokkaido, the Dorsetts to Kyoto, by sleeper train. Morse returns to Tokyo.

Aug. 17–The entire party arrives in Hokkaido and establishes headquarters in Sapporo to study soybeans. Oct. 8–Leave Hokkaido for the Northeast Provinces, then arrive in Tokyo on Oct. 15. Oct. 22–Arrive in Keijo (Seoul), Korea, then take many side trips. Note: 1929 Oct. 29–Great Depression begins in USA with stock market crash. Dec. 8–Return to Japan via Kyushu, then to Tokyo to study soyfoods. They buy and photograph many!

1930 April 1–Travel by steamer to Dairen, Manchuria, where they set up headquarters. Dorsett very sick from April 11 to June 11; taken to a Japanese hospital in Dairen, he almost dies of double pneumonia. Morse does the work of both men and does not inform USDA of Dorsett's critical condition. June 24–Morse takes a quick trip to northern Korea, via Mukden and Antung (Tan-Tung), to look for Zoysia grass.

July 1–Returns to Manchuria via Mukden. July 21. Dorsetts leave for Peking by train; Morses and Mr. Suyetake stay in Dairen. Aug. 21–Morse party travels to northern Korea, staying in Heijo (Pyongyang / P'yongyang); takes a 4-day side trip to Seoul. Sept. 28–Morse returns to Dairen, Manchuria.

Oct. 19–Morse party leaves Dairen, arriving in Peking the next day. Nov. 9–Morse party returns to Dairen. Nov. 30–Morse arrives in Harbin, north Manchuria, then passing through Mukden, returns to Dairen. Dec. 18–Morses leave Dairen for Japan, passing through Kobe on Dec. 21 and arrive in Tokyo on Dec. 23.

1931 Jan. 12–Travel to Kyoto, Himeiji, and Tatsuno Shoyu. Jan. 16–Visit Okazaki and Hatcho miso. Jan. 17–

Return to Tokyo. Feb. 17–Morse party leaves Tokyo by boat for the USA, arriving in San Francisco on March 4. March 15–Dorsett party leaves Peking for Tientsin, Shanghai, and Hankow. March 27. Dorsetts sail from Shanghai to San Francisco.

Note 1. The title of this report is puzzling since the expedition never went to Taiwan, Singapore, Java, Sumatra, or Ceylon. It was proposed several times that they visit these places, but the plans did not work out.

Note 2. This is the earliest log (unpublished) seen (Oct. 2001) that mentions soy. Address: Agricultural Explorers, USDA, Washington, DC.

642. Ducceschi, V. 1928. La soja e l'alimentazione nazionale [Soya and the Italian national diet]. Milano, Italy: Francesco Vallardi. x + 246 p. (Biblioteca Encyclopedia Vallardi). [117 ref. Ita]

• ***Summary:*** Contents: 1. Introduction. 2. Natural history of the soybean. 3. Chemical composition of soybean seeds. 4. Biological value of the nutrients contained in soybean seeds. 5. Foods furnished by the soybean and their digestibility: Whole soybeans, soy oil, whole soy flour, bread made with soy flour, pasta, soy milk and cheese (Il latte ed il formaggio di soja [tofu]), fermented products (sauces; natto, miso, koji, soy sauce {called *shoyou* or *soyou* in Japanese, *tsiang-yeou* in Chinese}). 6. Medical and therapeutic applications of the soybean. 7. The economic problem of soybeans. 8. Conclusion.

Note 1. This is the earliest Italian-language document seen (April 2012) that uses the words *shoyou*, *soyou*, or *tsiang-yeou* to refer to soy sauce.

Note 2. This book's large bibliography contains more errors than any other soy-related bibliography ever seen. Address: University of Padova, Italy.

643. Maliareffsky, G.I. 1928. [Bean milk and curd]. *Vestnik Manchzhurii* (*Manchuria Monitor*) No. 6. p. 21-23. English ed.; p. 83-91 Russian edition. Data supplied by Manchuria Railway S-ty. [3 ref. Eng; rus]

• ***Summary:*** Detailed descriptions, based on personal observations, of how soymilk, tofu, and yuba are made and used in Harbin and Fuchiatien. Nigari (*lu-shui*) is used as the tofu coagulant. Four methods can be used to preserve tofu: salting, drying, freezing, and steaming. Unpressed soymilk curds are called to-fu-na-erh and are sold in the streets of Fuchiatien for 1 copper per middle-sized cup. The grinding of soybeans to make tofu is done using a stone mill, driven by a donkey. The soymilk is separated from the fiber by filtration through a cloth and pressing before heating. "The ground mass remaining in the cloth after the filtration has been performed forms a very good nourishment for pigs, which are usually kept to make use of such refuses at every mill." Tou-fu-p'i (yuba) is removed repeatedly from the 2.5 foot diameter cauldron while the milk is heated for 90 minutes. A cauldron containing about 2 gallons of soymilk may be skimmed 30 times, the first skim being the best. The yuba is sold. After the milk is boiled, some of it is sold, but most is used to make tofu.

Note: This is the 2nd earliest Russian-language document seen (Oct. 2012) that mentions yuba, which it calls "Tou-fu-pi" and "yuba." Address: Harbin, Manchuria.

644. Richter, V.F.A. 1928. Das Berczeller'sche Sojamehl vom baeckereitechnischen Standpunkte. II. Milchbrot, Gebaeck, Zuckerbaeckereien und Backhilfsmittel [Berczeller's soy flour from a bakery technology standpoint. II. Milk-bread, pastry, confectionery, and bread improvers (self-raising flour)]. In: L. Berczeller. 1928 and 1930. Publications on Berczeller's Soy Flour. Vols. I and III. 4 p. Unpublished manuscript. [Ger; Eng]

• ***Summary:*** Contains many recipes. Address: Laboratorium fuer Ernaehrungsforschung, Vienna, Austria.

645. Diaz, Juan B. 1929. Re: Soybeans in Cuba. Potential for soymilk. Letter to Director of the Station, Santiago de las Vegas, Cuba, Jan. 17. 1 p. [Spa]*

• ***Summary:*** "With respect to this bean (*judea* = soybean), a short time ago I read in the *Havana Post* an article which said that these soybeans contain a large quantity of a substance from which it is possible to make a very good and rich milk. In Korea there are said to be many dairies (*lecherias*) that are devoted exclusively to selling soymilk (*leche de soya beans*) and this milk is very rich and nutritious.

This letter is located in file #565 in the archives, INIFAT, Santiago de las Vegas, Cuba. Another letter in the same file, dated 5 Feb. 1929, describes the use of soybeans for green manure (*abono verde*) in tobacco cultivation. Address: J.B. Diaz & Co. (tobacco store), Habana, Cuba.

646. Carver, G.W. 1929. Re: Preparing peanut milk and soy milk for Mahatma Gandhi. Letter to Mr. [Charles Freer] Andrews, Feb. 24. 1 p. Typed, without signature (carbon copy).

• ***Summary:*** "My Dr. Mr. Andrews: Our various, previous conversations, marvelous lectures, followed by our conference this morning, all convince me that a new day is dawning for India. I believe Mr. Gandy's [sic, Gandhi's] physical strength can be greatly improved by following out the ideas we discussed in the matter of foods."

They must have discussed the method for preparing soy milk, for Dr. Carver concludes: "A peanut emulsion can be made in the same way as that recommended for the soy bean, and is a little richer in food nutrients."

Note 1. Charles Freer Andrews was an Anglican minister who worked with Gandhi, first in South Africa and later in India. See also Carver's letter to R.B. Eleazer dated 29 Nov. 1930, in which Carver discusses Andrews' visit in Feb. 1929

and mentions the development of a menu containing soymilk to help Gandhi. Andrews also knew Tagore and Carver and it is apparently he who is referred to in this letter. B. Chaturvedi and Marjorie Sykes, in their book titled *Charles Freer Andrews: A Narrative* (p. 238) note that Andrews visited Tuskegee in Feb. 1929. During his stay of 10 peaceful days, he attempted to establish ties between Santiniketan in India and Tuskegee in America. *The Tuskegee Messenger* of 9 March 1929 reported: "Tuskegee has had a messenger from the East. His spirit was a spirit of simplicity, of repose, of reflection and peace... One of the boys said it was just like Jesus himself talking to us." For more on Andrews see *C.F. Andrews and India* by Hugh Tinker (Oxford Univ. Press, 1979).

Note 2. This is the earliest document seen (Oct. 2010) that mentions Mahatma Gandhi in connection with with soybeans or soyfoods. Thus George Washington Carver apparently introduced Gandhi to soyfoods. Gandhi first began to write about them, in order to introduce them to India, in Sept. 1935. Address: Dep. of Agricultural Research and Experiment Station [Tuskegee, Alabama].

647. Carver, George W. 1929. Re: Making non-dairy milk from plants. Letter to W.E. Tabb, a Methodist Missionary at Minga Station, Kabinda (M.E.C.M.), Belgian Congo, April 16. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** On Feb. 16, W.E. Tabb wrote to Dr. Carver explaining that he had come to the Belgian Congo in Oct. 1928 as a missionary under the Board of the Methodist Episcopal Church, South. He had first met Carver at a church conference in Macon, Georgia, in 1924. In the Congo, he is now Assistant Head of the Department of Education and his wife is head of the Hospital and Medical Department. The indigenous people in his area have plenty of rice, millet, sugar cane, peanuts, sweet potatoes, etc. "The main question in which I am interested at this writing is the saving of the lives of babies. Infant mortality is extremely high. And an unusually large percentage of mothers die during child-birth... An orphan child has very little chance; it is often buried with the mother... And when we have these babies turned over to us on the mission, we can't afford good baby milk which we have to bring in from America and Europe... Now then, the question is: can we use the peanuts or potatoes or sugarcane, etc., to make a milk that will be an adequate substitute for cow's milk or mother's milk? I know that you have made many discoveries along these lines, and perhaps you can help us out to save the lives of many infants here."

Dr. Carver replies: "My dear Mr. Tabb: I thank you for your most interesting letter. Yes, I am intensely interested in all humanity... I am enclosing directions for the making of a milk from Soy Beans. This milk when properly made is quite rich and palatable, and can be used in many ways the same as cows' milk. I do not know of any exhaustive tests that have been made with this milk for the feeding of infants. I do know, however, from personal experience how valuable it is in the preparation of many foods, and even for drinking."

Under separate cover, Dr. Carver also sends a set of Tuskegee bulletins on the use of sweet potato, peanut, etc. "Please let me hear from you from time to time. I am greatly interested in helping in this very important problem." Address: Dep. Research and Experiment Station, Tuskegee, Alabama.

648. Stockert, Kurt; Gruensteidl, Edmund. 1929. Zur Frage der Schaedlichkeit vegetabiler Kindermilch [Toxicity of vegetable milks for infants]. *Zeitschrift fuer Untersuchung der Lebensmittel* 57(4):326-38. April. [4 ref. Ger]
• ***Summary:*** Vegetable milk is essentially an emulsion of almonds in milk serum (Milchserum). Gives details on preparation of this beverage, its composition, and analysis of its safety. Concludes that this vegetable milk is not harmful to infants through fermentative hydrolysis. Soy is not mentioned. Address: Aus dem Laboratorium der Handelsakademie in Wien III [Vienna, Austria].

649. *Madison Survey* (*Madison, Tennessee*). 1929. Soy-bean products replace dairy products. 11(20):78-79. May 15.
• ***Summary:*** "For many years we have been warned that the increase of disease among cattle would put an element of danger into dairy products. This set us to studying foods that contain the essential elements of dairy foods with [sic, without] this objectionable feature." Describes the post-graduate work with soybeans done by two of the school's teachers, Miss Frances Dittes (Peabody College, Nashville) and Prof. P.A. Webber (Michigan State Agricultural College, Lansing).

"It is intensely interesting to those who are looking for something to replace dairy products, to see the products of the soy-bean cheese is delicious and capable of many variations in the dietary. One of the latest articles sampled is a loaf of yeast bread in which soy-bean milk was used instead of water. The bread is fine of grain, sweet, light, and with a toothsome crust that will appeal to the taste of the most fastidious."

"The soy-bean with nuts will supply every thing we have been obtaining from milk and flesh foods. And the danger that lurks in the products of diseased animals is entirely eliminated by the use of soy-bean products.

"There is a future for soy-bean products. We expect to see hundreds of our people demonstrating the value of these foods. This is a real missionary work for which Madison is preparing."

650. *Madison Survey* (*Madison, Tennessee*). 1929. Soy-bean recipes. 11(20):79. May 15.
• ***Summary:*** The following recipes were developed by Miss Frances Dittes: Soy-bean milk ("This gives creamy, forty-two and one-half pounds of rather heavy consistency, and

resembling cow's milk in appearance").

Soy-bean cheese: "To four quarts of soy-bean milk at 100 deg. F., add ten drops of rennet, dissolved in one-half cup cold water and two ounces of starter. The starter may be whey from a previous making of cheese or some sour soy-bean milk. The rennet needs an acid media in which to do its work. Stir thoroughly and keep the mixture for sixteen to eighteen hours at a temperature of 100 degrees. One gallon of milk will make twenty-four ounces of fine curd, which separates from the whey. This curd should be drawn off, mashed and molded."

Soy-bean omelet (from whole sieved soybeans and eggs).

Soy-bean in tomato sauce: "To one can of soy-beans add 2 cups of tomato juice, 1 small grated onion, a pinch of salt, celery salt, and a piece of butter about the size of a walnut. Bake for one hour."

Cream of soy-bean soup: "Through a sieve rub one can of soy-beans. To this add 3 cups of rich, creamy milk, and a pinch of salt. Serve hot with a few bits of chopped leaves of celery or parsley."

Soy-bean salad.

651. Senior Minister of Cuba in London, Subsecretario de Agricultura, Comercio, Y Trabaja. 1929. Re: All the nutrition that we need is found in the soybean. Letter to Sr. Director de la Estacion Experimental Agronomica, Santiago de las Vegas, Cuba, June 11. 1 p. [Spa]*

• ***Summary:*** This letter, which begins with the heading *"Todo el alimento que nosotros necessitamos en la soya,"* discusses Dr. James L. North of England, fresh soymilk, dry soymilk, soybean meal for use in bread, soy cheese, soy coffee substitute, and soy oil.

This letter is located in file #363 in the archives, INIFAT, Santiago de las Vegas, Cuba. Address: London, England.

652. Dorsett, P.H.; Morse, W.J. 1929. Plans for further exploration (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Pages 2273-75 (30 Aug. 1929) "In view of the number of soybeans we have already collected and the large number which we have been promised by Japanese Experiment Stations this fall, as well as the very rapid increase of the soybean industry in the United States, Morse does not feel that it will be advisable or possible for him to remain in the field away from his work at Washington [DC] for more than two years. Dorsett does not have any special work which needs his attention at Washington and can remain in the Orient for another year or two if that appears necessary or desirable by those in authority at Washington.

"We are considering the following two plans of operation for the remainder of the time Morse feels that he can spend in the foreign field.

"1. Complete the work in Hokkaido which will possible require a month or six weeks longer then return to Tokyo and as soon thereafter as practicable make a trip into Chosen (Korea), and do what we can there within a week or ten days. Return to Tokyo and complete operations there by not later than December 15th or January first, 1930. Then leave for Formosa (Taiwan) and spend the remainder of the winter there. In early spring, April or not later than May 15th, proceed to Dairen and our headquarters there for the remainder of the time Morse can remain in the Orient. From Dairen work southern Manchuria and as far north as Mukden [now Shenyang], even making a short trip up to Harbin and vicinity. Also go from Dairen into Chosen during the spring or summer season and in the fall or early winter of 1930 get over to Peking to clean up the work of soybean milk production and other soybean products, in time for Morse and Dorsett too, if it is deemed advisable, to leave for America so that they will reach there in time for Morse to take up his spring work with soybeans.

#2. Complete our work here within the next six weeks or two months if possible. At any rate return to Tokyo as soon this fall as the work here is completed. Then at the earliest possible opportunity get over to Chosen (Korea) and do what we can there this fall, Return to Tokyo and complete our work there with soybean products, making when practicable excursions of a week or so into other parts of Japan for the purpose of picking up information and seed and pictures where possible or persimmons, green manure and cover crops as well as other features of Japanese horticulture.

"In early spring move headquarters to Dairen and work South Manchuria and the central portion as far north as Mukden and Chen Chung [Changchun], the region which was not worked by the Dorsetts in 1925-26. Chosen (Korea) might also be given additional attention throughout the summer and fall as opportunity permits. Dairen is perhaps the best place in the Orient to data if all kinds on soybean storage, handling, and by-products. Complete this work then get over into Peking to work up soybean products, especially soybean milk production. In the early winter go to Taiwan and work that region until Morse feels its time for him to leave for the states. If it is deemed advisable, Dorsett can return then or he could remain and finish up the work in Taiwan (Formosa) in case that was not done before Morse left. He could get in touch with McClure at Canton, which is nearby Canton, and together they might handle the *Placanea cornea*, edible Chinese acorn, and Tonkin cane proposition. Dorsett could then go to Java and look after the soybean and green manure and cover crop work..." Address: Agricultural Explorers, USDA, Washington, DC.

653. Dimmock, F. 1929. The soybean in Canada.

Proceedings of the American Soybean Association 2:47-50. Tenth annual field meeting. Held 22-23 Aug. at Guelph, Ontario, Canada.

• ***Summary:*** "It is doubtful if the acreage of soybeans in Canada at present exceeds 1,000 acres," and that is limited almost entirely to southwestern Ontario. "As far as the speaker is aware, only one firm in Canada uses the soybean in a commercial way. The Vi-tone Co., of Hamilton, Ontario, uses annually about 5,000 bu in the manufacture of a patent food." [The product name is not given. It may have been Soybean Malter Milk and/or Chocolate Malter Milk.] "During 1922-27 Canada imported annually an average of 5,000,000 lb of soybean oil for use in the manufacture of soaps and paints. This oil represents the product of at least 20,000 acres of soybeans." Some farmers have switched to growing soybeans because of the ravages of the European Corn Borer.

"Soybean work at the Dominion Experimental Station, Harrow, Ontario." The soybean is a comparatively new crop in Canada. It has been grown experimentally at Guelph, Ontario, for upwards of 30 years. At Harrow tests have been carried on for 7 years and have just emerged from a preliminary test stage. Upwards of 25 varieties have been tested; 18 of which have been tested for 4 years or more. The average maturity for the earliest variety tested (Ste Annes No. 92) has been 107 days with an average yield of 21.5 bushels per acre of seed. The average maturity of the latest variety tested (A.K.) has been 126 days with an average yield of approximately 40 bu/acre of seed.

Note 1. This is the 2nd earliest document seen (Jan. 2010) that gives soybean production or area statistics for Canada.

Note 2. This is the earliest document seen (Oct. 2004) that mentions the soybean variety Ste Annes No. 92. Address: Prof. and Agrostologist, The Harrow Experiment Station, Harrow, Ontario, Canada.

654. Nouelle, Georges. 1929. Le soja: Les produits coloniales [The soybean: Colonial products]. *Annales Coloniales* (*Les*) 30(137):1. Sept. 17. [2 ref. Fre]

• ***Summary:*** This is basically a good review of the literature, with no new information. It discusses the history, cultivation, and utilization of soybeans as human food, animal feed and in industry, with some emphasis on utilization.

For a long time, it has been considered in Europe as an object for botanical studies.

The milestone dates in its history are:

1779–The first cultural trials at the Museum of Natural History [Paris].

1868–Experiments are undertaken by the Society of Horticulture of the Côte-d'Or.

1880–Soybean seeds are sold by the house of Vilmorin [a seed company].

1888 [sic]–Introduction of soybeans into the United States, where it is adopted for the feeding of animals.

1906–Use of soybean in English oil mills, to make up for the shortage of cottonseed oil.

1908–Creation at Paris by Mr. Li-Yu-Ying of a research laboratory, later expanded into a factory named the *Caséo-Sojaïne* [soy casein factory = tofu factory].

The soybean is adapted to various climates and can be cultivated as far north as the haricot bean. It resists the cold better than the latter and is very tolerant of drought.

It is said that it grows from the Equator to 60º latitude. It is cultivated in China and from Manchuria large amounts are exported to China, Japan, Formosa, Korea, Indo-China and Siam.

In the Americas, it is cultivated in the United States. In Europe. it is cultivated in France in the area around Etampes, in several provinces of Italy, and in Russia.

In Oceania, it is grown in Philippines, Java, and Borneo.

In Africa, trials have been conducted in Algeria and Tunisia, as well as in the British colonies of southern Africa.

In 1908 about 100,000 metric tons were exported from China to Europe, of which 69,200 went to Great Britain and 21,390 to France. In 1909 England purchased 400,000 metric tons for its oil mills.

The soybean can be used profitably in crop rotations to add nitrogen to the soil for subsequent crops.

It is also widely used as a feed for animals.

For human food, it can be used in various forms, especially in the form of mil and of flour.

Soymilk (*Le lait de soja*), known in China before the Christian era, is obtained as follows: a brief description is given, including the process used at *Caséo-Sojaïne.*

Soymilk bears some resemblance to animal milk and it has analogous properties. It can be coagulated to make soy cheese (*fromage de soja* [tofu]). This is done in China and Japan using the water from salt marshes [nigari], or calcium sulfate (*plâtre*) or sour soymilk (*lait aigri*). At *Caséo-Sojaïne* it is made using a mechanized process, which ensures complete hygiene and uses pure coagulant solutions which leave no taste of bitterness.

They have also been able to make cheeses that resemble European cheeses, fermented or not.

Soymilk, like animal milk, can be concentrated, dried and reduced to a powder. Or it can be fermented to make kefir or yogurt (*Kéfir ou Yoghourt*). The cost of making it renders its use very economical.

Soy flour is obtained in the same way as wheat flour, by grind the seed–preferably dehulled. It is a very rich food which contains 4 times as much protein and 20 times as much oil as typical wheat flour. From it one can make bread (notably a diabetic bread using the formula of Dr. Menudier, 1890). By mixing it with wheat flour one can make biscuits that are easy to digest and have a long shelf life, or cakes, pâtes, etc.

From the seeds one can extract an oil which the Chinese

presently use in their cuisine, and the English use to make margarine or soap. The cake remaining after oil extraction makes an excellent animal feed.

The soybean can also be consumed as a vegetable [green vegetable soybeans]. Its digestibility varies with the means of preparation. It is recommended to boil it (after soaking) in water to which had been added a pinch of sodium bicarbonate [baking soda]. Soy sprouts give salads a very agreeable taste. The Chinese make a bouillon base which can replace the bouillon from meat. And fresh soybeans can be prepared like peas. The Japanese and Chinese make soy sauce, using a complicated process, of which certain types are appreciated in England.

Finally, it can be used in confectionery in the form of a confection similar to *crème de marron*, or in the form of chocolate (with sugar and cocoa butter added). Grilled soybeans are served in certain European countries in place of coffee.

In addition to its alimentary uses, the soybean is used to make candles, paints, and *sojalithe* as an insulator for electrical devices.

The soybean is thus suited for numerous and diverse uses. It would be desirable to develop its culture in our colonies and even in France itself in places where it can be acclimatized. Address: Député de Saône-et-Loire, vice président de la Commission des Colonies, membre de la Commission des Mines.

655. Hill, Lewis Webb; Stuart, Harold C. 1929. A soy bean food preparation for feeding infants with milk idiosyncrasy. *J. of the American Medical Association* 93(13):985-87. Sept. 28. [11 ref]

• ***Summary:*** This article begins: "Human milk is universally granted to be the best food for infants during the first few months of life, and cow's milk in some form or with some modification is recognized as the best substitute when human milk is not available. It has been conceded, however, that for the exceptional infant cow's milk may be contraindicated..." One reason may be infant eczema. One alternative is to use soy bean flour to make a substitute.

"Soy bean flour has been subjected to careful study by a number of workers, and the result of these studies would suggest that it could be used as the sole source of protein in the infant's diet."

The writers solicited the cooperation of Mr. L.D. Johnson of Mead, Johnson and Company. "From the formula presented by us, Mr. Johnson prepared a food under the name 'Sobee,' which we have had an opportunity to use in the feeding of a number of infants during recent months."

Tables show: (1) Comparison of the inorganic [mineral] composition of cow's milk and soy bean meal. (2) Ingredients in the original mixture given to Mr. Johnson: Soy bean flour (ground press cake) 67.5%. Barley flour 9.50%. Olive oil 18.95%. Sodium chloride 1.35%. Calcium carbonate [for calcium] 2.70%. (3) Composition of the dried product (Sobee). (4) Percentage of mineral salts in the reconstituted product. (5) Composition of reliquefied dried food (Sobee). "The product is a light brown flour of moderately fine consistency."

"We have used in the last year a large amount of this food, and we have determined to our entire satisfaction that infants take it well, digest it and thrive on it."

"We have fed about forty babies on this food: one for more than eight months, several others for periods of two months or more. These babies have done well and while we would certainly not advance the opinion that this preparation is as good a food for infants in general as the usual formulas made from cow's milk, we have used it enough to know that it is a quite efficient and practical substitute for milk, when it is not desirable to use the latter.

"We have had some excellent results with eczema and will say at this time that this food may prove to be very valuable as a temporary diet for babies with severe eczema. These cases will, however, be reported later."

Note: This is the earliest document seen (July 2008) with the term "soy bean food" in the title. Address: Both: M.D., Dep. of Pediatrics, Harvard Univ. Medical School, Boston.

656. *Chinese Economic Journal.* 1929. Soya beans and bean oil industry in Manchuria. 5(3):791-805. Sept.

• ***Summary:*** "According to their order of importance, the agricultural products of Manchuria are as follows: soya beans, *kaoliang* millet, corn, wheat, barley, rice, buckwheat, hemp, tobacco, cotton, sugar beets and other minor crops."

The yellow bean (*Huang Tou*) is by far the most common, growing in abundance in North and South Manchuria. When the hilum and seed scar is colored white, it is called *Pai Mei* (meaning white eyebrow) *Huang Tou.* When the hilum is golden hued, it is called *Chin Huang tou.* The seed of this variety is almost globular. When the hilum is black, it is called *Hei Chi Tou* or black belly. All the three varieties produce oil and fat, the first two named being specially good for the preparation of bean-curd [tofu], one of the most palatable vegetable dishes of the Chinese.

"The green bean (*Ch'ing Tou*) has two varieties. When the seed is green and the cotyledon is yellow, it is called *Pi Ch'ing Tou.* It is said that this variety yields more legumine in the preparation of bean curd than the two varieties of the yellow bean, but of inferior quality. When the seed, the epidermis and the cotyledon are all green, it is called *Ch'ing Tou.* The hilum of this variety is generally tawny or black.

"The black bean (Hei Tou or Wu Tou) has three varieties: When the epidermis is black and the inside green, it is called *Ta Wu Tou.* It yields oil or fat, and when boiled with millet or rice it is used for food. When the epidermis is black and the inside yellow and of much smaller size, it is known as *Hsiao Wu Tou.* It yields oil, and is used for horse feed, and

the refuse for pig feed. When the epidermis is black and the inside yellow, the bean assuming a flattened and elliptical shape, it is called *Pien Wu Tou,* and is used for horse feed, and when pickled for human food."

"Yellow or green soya beans are used in the manufacture of bean curd, a product of universal consumption in China. The by-product, bean milk, which is highly nutritious, is drunk as milk by many Chinese in the morning. The bean-curd skin [yuba], or the scum of the bean milk, is used for culinary purposes, and is greatly relished on the table."

"The most important product of the beans is bean oil, which has contributed in no small measure to the prosperity of Manchuria. It has attracted foreign capital, and the annual export of oil is enormous. there are altogether more than 300 bean oil mills in South and North Manchuria, including steam mills and oil-fashion, small plants. In Dairen there are 60 bean oil mills, of which only two are Japanese owned, the rest being Chinese. While other manufacturing industries have passed into Japanese hands with the acquisition of the Leased Territory of Kwantung. Chinese still retain a firm hold on the bean oil industry. Harbin has about 50 oil mills, two of which belong to Russians, the rest being entirely operated by Chinese. Other centers like Mukden, Antung, Newchwang and cities along the Chinese Eastern Railway, the South Manchuria Railway and fourteen other railways have bean oil mills in varying numbers, which go to make the total number of 300 oil mills. Beans harvested in the C.E.R. and the S.M.R. regions and even in the remote hinterland where only mule carts can go, are finally transported to various destinations in freight cars. Each car contains 52,000 catties of beans, which can produce about 5 thousand catties of oil and 1,000 bean cakes, every cake weighing 46½ catties. The 50 oil mills in Harbin consume annually about 490,000 tons of beans, valued at $35,000,000."

"The steam oil-mill and the old-fashioned mill differ from each other in mechanical equipment and in the number of presses employed. The old-fashioned mill has only one or two presses, while the steam mill has over twenty press machines. The largest having as many as a hundred. The screw press much in use in the former mill consists of a primitive wedge, that is now being replaced by the metal screw. The screw is turned by hand by the man in charge of the machine. In modern steam mills a steam pump operates a hydraulic press that puts great pressure on the prepared beans underneath. As the hydraulic presses are of larger dimensions, the cakes produced are greater in diameter and thickness than those made from screw presses."

657. *J. of the American Medical Association.* 1929. Sobee. 93(13):989. Sept.

• ***Summary:*** Describes the product based on a new U.S. trademark 252,477. There is no U.S. patent. A mixture of soy bean flour, 67.5%, and barley flour, 9.5%, to which has been added olive oil, 19.0%, sodium chloride, 1.3%, and calcium carbonate, 2.7%. The approximate analysis of powdered Sobee is: fat 22.50, protein 33.20, carbohydrate (barley and soy bean starches) 32.61, ash 8.51, moisture 3.18. The nutritive value of 500 gm is approximately equivalent to 2,223 calories.

Action and uses: Sobee is used as a substitute in the diet of infants who are sensitive to the proteins of milk.

Dosage: The normal dilution is prepared by adding 1 ounce by weight (6 level tablespoonfuls) of Sobee to 7 ounces of water and bringing to boiling temperature. This dilution represents approximately fat 2.81, protein 4.15, carbohydrate 4.07, salts, 1.06. The nutritive value of 1 fluid ounce is approximately equivalent to 17 calories. Sobee is manufactured by Mead Johnson & Co., Evansville, Indiana.

658. **Product Name:** Sobee (Non-Dairy Infant Food) [Powdered, Based on Soy Flour].
Manufacturer's Name: Mead Johnson and Co.
Manufacturer's Address: Evansville, Indiana.
Date of Introduction: 1929. September.
New Product–Documentation: Hill, L.W.; Stuart, H.G. 1929. "A soy bean food preparation for feeding infants with milk idiosyncrasy." *J. of the American Medical Assoc.* 93(13):985-87. In same issue see "Sobee," p. 989. Sept. U.S. trademark 252,447.

Note: Mull-Soy can be thought of as a first precursor to the modern soy formula, because it was more sophisticated than simply soy flour and water, but lacked many of the nutrients, and the isolated soy protein, found in modern soy formulas. Mead Johnson and Co. was a pharmaceutical company.

Gray. 1936. All About the Soya Bean. p. 123. Says that Mead Johnson and Co., Evansville, Indiana, is the manufacturer. International Inst. of Agriculture. 1936. Manufacturers of soy products. p. 205. States that American Soya Products Corp. in Evansville, Indiana is the manufacturer of this infant food. L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "American Soya Products Corporation, Evansville, Indiana: Sobee (Infant food)."

Sarett. 1976. World Soybean Research Conference. p. 840-49; Shurtleff & Aoyagi. 1979. Soymilk Industry and Market. p. 10, 25. "The world's first commercial soy-based infant formula. Made from a mixture of full-fat soy and barley flours homogenized with olive oil, it had a dark tan color and beany flavor, and contained many oligosaccharides that led to intestinal gas (flatus) and poor-smelling stools, but in 1929 it was a godsend to infants allergic to cow's milk."

659. Lovell, John H. 1929. Soy bean as a honey plant. *Gleanings in Bee Culture* 57(10):646-48. Oct.

• ***Summary:*** The soy bean "belongs to the same family as the

pea, bean, and clovers, plants which produce their seeds in a legume or pod."

"Up to the present time it has been cultivated chiefly as a hay or forage crop; but, with our population increasing twenty times faster than the food production, it must soon become important as a food for the human race.

"Soy beans, before they have fully ripened, may be shelled and used as a green vegetable like green peas. A few hills might well be planted in every garden. They may also be canned and used in winter, or they may be sprouted and the sprouts used like asparagus tips, to which, however, they are much inferior. The dried beans when cooked also make a palatable dish, and more than 100,000 bushels are packed annually by American canning factories. As the seeds are used as a substitute for coffee, soy bean is often called coffee berry."

"By boiling the crushed beans in water a vegetable milk may be obtained, which may be used in making cakes and custards... From the milk a curd or cheese [tofu] is prepared, which is on sale in the Chinese markets of America. This may be flavored with fruits and jams and made into puddings, and used for sandwiches and luncheon novelties.

"But of all the preparations made from the soy bean, none is more widely distributed or better known than soy sauce, a dark brown liquid which in odor and taste resembles a good meat extract. In Japan alone the annual production is more than 2,000,000 barrels. While it is largely consumed by the Chinese and Japanese it has been introduced into both Europe and America and may be purchased at all Chinese markets."

There is conflicting evidence as to whether or not soybean flowers are a source of sugar-rich nectar from which bees make honey. The soy bean plants "grown in my garden, had small inconspicuous flowers, with the corolla hardly visible. They were odorless and apparently nectarless and wholly unattractive to bees. Plants under glass from which all insects were excluded formed pods in great abundance which were well filled with large seeds. The soy bean is self-fertile and not dependent on bees for pollination.

"The flowers, the young leaves, and the stems are densely hairy as can be seen in the illustration [photo], but the older leaves are smoother. The specific name *hispida* was evidently selected because of the roughness of the stems. But this coating of hairs is not sufficient to defend the plants from insect attack."

"If it is honeydew which is stored by the bees from soy bean, then the erratic, scattering and infrequent reports of honey flows would be fully explained." Note: Honeydew is a sugar-rich sticky substance, secreted by aphids and some scale insects as they feed on plant sap.

"Therefore without more reliable evidence than is at present available, the writer does not think that soybean should be ranked as a honey plant."

A photo shows the upper part of a soy bean plant with stems, leaves, and blossoms. Address: Waldboro, Maine.

660. Tso, Ernest. 1929. A vegetable milk substitute for North China. *American J. of Physiology* 90(2):542. Oct.
• ***Summary:*** This "milk" prepared from soybeans contains 4.4% protein, 1.8% fat, 1.5% carbohydrate, 0.018% calcium, 0.057% phosphorus, and 0.41% total ash. "The 'milk' alone is comparable to cow's milk in vitamin A and richer in vitamin B, while vitamin C has to be added. Vitamin D is believed to be absent. Without extra additions, the 'milk' is inadequate in sodium, chlorine and calcium. Six infants, one from birth and the others a few weeks old, were successfully fed six to nine months on this diet. Their weight curves follow very closely the average weight curve of healthy nursing infants in the United States." Address: Peiping, China.

661. Tso, Ernest. 1929. A comparison of the nutritive properties of soybean "milk" and cow's milk. *Chinese J. of Physiology* 3(4):353-62. Oct. [3 ref. Eng; chi]
• ***Summary:*** Feeding experiments on albino rats show that soya-bean "milk" has a vitamin A content approximately equal to that of cow's milk and that it is richer in vitamin B. The deficiency of soya-bean "milk" in minerals can readily be supplied by the addition of suitable salts, while the protein is adequate if sufficient quantities are given. Address: Div. of Pediatrics, Dep. of Medicine, Peking Union Medical College, Peiping.

662. *Nature* (*La*) (*Paris*). 1929. Le lait végétal japonais [Japanese vegetable milk]. 57(Part 2):476. Nov. 15. [Fre]
• ***Summary:*** Describes how to make soymilk in three steps.
1. Soak the soybeans for 24 hours, in pure water, free of limestone / calcium, stirring often.

2. Grind the soybeans (made soft through soaking) coarsely using a wood mill, then put the ground material (*ce mortier*) back in the soaking liquid where it must be stirred often for the next 24 hours.

3. Finally, press this paste (*pâte*) hard with a filter-press; the extracted liquid resembles milk and smells like malt; the product, that by its physical properties to cow milk, contains 3.13 percent casein and 9.89 percent lipids (*matière grasse*) which, however cannot be whipped (*le battage*) into butter (Note 1: *barrate* is an old French term indicating a pot with a stick in it to stir the milk and make butter). It however can be made into cheese which, through special ferments, can be assigned the desired flavor. Further more, this soya milk (*lait de Soja*), being rich in phosphates, is particularly recommended for the feeding of children, according to a German Doctor.

Note 2. This is a poor description of how to make soymilk.

663. **Product Name:** La Sierra Soy Milk.

Manufacturer's Name: La Sierra Industries.
Manufacturer's Address: Arlington, California.
Date of Introduction: 1929. November.
Wt/Vol., Packaging, Price: Can.
New Product–Documentation: Ad in Health magazine. 1934. 1(3):30. June. "La Sierra Soybean Products: Perfect Protein, High Alkaline Ash, Low Starch." Thirteen products are listed, including "Soy Milk."

Ad in Dorothea Van Gundy. 1936. La Sierra Recipes. p. 46. L.B. Breedlove. 1936. *Chicago J. of Commerce and La Salle Street Journal.* June 25. p. 14. "Soy bean–The magic plant. Article XI." "La Sierra Industries, Ontario, California: Soy bean milk.

Two interviews with and two letters from Charlotte Van Gundy Holmes. 1981. The product was canned with beany flavor removed by processing with live steam.

664. O'Brien, Harry R. 1929. Soy beans for profit: Combines and a cash market cause acreage to mount. *Country Gentleman* 94(11):19, 120-21. Nov.
• ***Summary:*** "While soy beans have been known in this country for 125 years, it was about fifty years ago that they were first grown in North Carolina as a farm crop and about 25 years ago when they were first introduced into the Middle West. In 1917 it was estimated that perhaps 500,000 acres were being grown for all purposes. Since then the acreage has increased annually until in 1928 around 3,000,000 acres were being grown in twenty or more states. Rapid as this growth may seem, it has been handicapped by difficulties of harvesting and lack of a commercial market for the beans.

"But within the past two years the situation has been radically changed" because of the combine harvester and the new cash market provided by the Peoria Plan and A.E. Staley. "These things I learned when late in the past summer I drove my car for more than 1200 miles through the Midwest to get the details of what was stirring in soy beans... There are soy beans everywhere, I found."

A star performer in many roles, "Soy beans offer another cash crop for the farmer. They are about immune to chinch bugs and the corn borer. Planted in corn, they shade the ground and protect the corn from the chinch bugs.

"Then there is the use being made of soy beans in industry, as beans, as oil, as meal. The oil is expressed out of the beans by the same process used with cottonseed. A ton of beans yields roughly from 1600 to 1700 pounds of cake or meal and from 250 to 300 pounds of oil.

"The beans are usable for coffee substitutes, soups, baked beans, confections, meat substitutes, vegetable casein, vegetable milk and cheeses. There are now several factories in this country making soy sauce. I know of one plant making chocolate out of soy beans.

"The oil is suitable for use in soap stocks, enamels, varnishes, paints, rubber substitutes, linoleum, waterproof goods, celluloid, explosives, glycerin, salad oil, lard substitutes and edible oils.

"Soy-bean meal, in addition to use as livestock feeds, is used for flour, diabetic foods that are supplanting gluten flour, infant foods, macaroni, breakfast foods, fertilizers and adhesive glue. Much of the glue used in furniture veneering is coming from soybean meal.

"Such are some of the qualities of this many-sided farm legume." The author then gives five reasons why soy beans have made such rapid growth in the past ten years: 1. Farmers have tried them and liked them, and the news has spread. 2. The influence of the agricultural colleges, experiment stations, extension services, and county agents. Experiments have been conducted on varieties, and methods of growing and feeding. 3. There have been "certain focal points where a few farmer pioneer enthusiasts grew them for seed and from these points the acreage has spread in concentric circles. There are a dozen of these points."

4. Improved harvesting methods; "and this is a story that is tied up with that of another focal point, Christian County, Illinois, where Claire E. Hay was county agent from 1918 to 1928. Hay knew beans from boyhood. When he came to Christian County chinch bugs had been bad for several years. So Hay began boosting soy beans as a means of outwitting the bug.

"Now in Christian County among the biggest growers of soy beans are the Garwood brothers, Frank and Harry. They had heard of combine harvesters being used out West for harvesting and threshing wheat in one operation in the field. They had a hunch that maybe this same machine would work with soybeans. Some Indiana farmers had rigged up a homemade affair that had already been used.

"But the manufacturers were skeptical. Two firms turned them down, refused to sell a combine for such a purpose. But a third did sell, and in 1924 what was possibly the first combine ever used in Illinois for any purpose, surely for beans, came to the Garwood farms and a public demonstration was held.

"To most people's surprise, the combine worked. So in one day the Garwood brothers had revolutionized soy-bean harvesting. Other growers were quick to seize on the idea, as were wheat and oat farmers too."

5. The newest development is the creation of a commercial market for soy beans. "Lack of a market was holding back farmers from growing the soys. So a committee of three count agents, headed by Hay, called on A.E. Staley, a feed manufacturer of Decatur, and asked him to use soy beans in his feeds. Staley built an oil mill, began buying beans and a commercial market was opened up.

"Oil mills were built later at Peoria and Bloomington. These mills have bought the beans and thus Illinois has taken the lead in growing them.

"The next step in the story came when along in 1927 Hackleman at the University of Illinois figured out that the marketing of soy beans would be much more stabilized if

farmers could grow them on contract for the mills. He and Doctor Burlison, chief in agronomy, suggested this plan to H.A. Atwood, a feed manufacturer in Peoria. The idea simmered on and several conferences were held.

"In the spring of 1928 Illinois farmers were faced with a wholesale killing out of their winter wheat. A conference was called at Urbana in April to consider what to recommend as an emergency crop, to which farmers, county advisors and feed manufacturers were invited. The advisors said that soy beans was [sic] the logical crop but there was no use to urge them because of a lack of a market.

"Mr. Atwood announced that his firm stood ready to contract at a guaranteed price for a million bushels of beans or the crop from 50,000 acres. A firm at Bloomington was associated with him in the offer.

"Back of the offer was the Grange-League-Federation, representing New York dairy farmers, which farm organization buys its feeds from Mr. Atwood's firm. The G.L.F. representative said in effect that if the Illinois farmers would grow the beans, the farmers of New York would buy the feed made out of them.

"The outcome was that a minimum price of $1.35 per bushel was set, based on farm cost-account records from four states in comparison with the price the G.L.F. had been paying for other protein feeds. County advisors circulated blank contracts through Farm Bureau membership lists, and 1344 farmers signed up to deliver beans from 48,444 acres, which, when marketed, totaled about 1,200,000 bushels of beans [24.77 bu/acre yield]. After paying freight and handling charges, the crop netted farmers around $1.20 a bushel."

A large photo shows two farmers, each with a team of four horses pulling a piece of farm machinery, on the farm of Finis Fouts, Deer Creek, Indiana. The first is cutting soy beans with a binder. The second, 10-15 feet behind, is drilling wheat for the next crop. Address: Central Ohio.

665. Adolph, Wm. H.; Wang, Yu-Mei. 1929. The manufacture and distribution of soy bean milk in Shantung. *Lingnan Science Journal* 8:563-71. Dec. 1 plate at end. [2 ref]

• ***Summary:*** "Bean milk as well as bean curd has been made and used in China for several thousand years. The soybean and particularly its products are more universally used in the Orient than even rice, and it is the soy bean which is China's special contribution to food economics."

"In recent years, attempts have been made to exploit bean milk on an extensive commercial basis. A factory for its manufacture was established in France near Paris, and operating today in most of the larger cities of China are bean milk factories which prepare and serve their bottled product to the community in much the same manner as a modern dairy in the Occident handles cows' milk. Because of its freedom from starch and sugar, it can be used as a diabetic food, and the very latest proposal is a *bean milk powder,* which makes possible the preparation of bean milk at home."

This report is a summary of a study of bean milk as manufactured in Tsinan [or Chinan], capital of Shantung province. Yellow soybeans are soaked in a little water, usually over night. "To the soy beans are usually added a small amount of peanuts and some apricot kernels. The latter are for the purpose of giving the product a pleasant taste." In general, one unit weight of dry beans is required to make 10 units by weight of finished soymilk. The softened beans are then ground to a thick pulp in a stone mill. The pulp is them mixed with a little water and strained through muslin filters. Usually this straining process is repeated until the liquid is of the right consistency. It is then boiled, cooled, bottled, sealed, and delivered (see photos). "Tsinan is famous for the large number of clear bubbling springs throughout the city, and the fame of each bean milk supply house rests upon the excellence of the spring water which is used in making the milk."

Bean milk costs only about half as much as cow's milk in China, i.e. about $0.05 Mex. per catty, but it is 20% more expensive per 100 calories. Bean milk also sours more quickly than cow's milk. "One solution will be the use of one of the recently invented soy bean milk powders."

"The growth of the bean milk industry in China is significant. Up to ten years ago, bean milk was a by-product from the bean curd industry; it could be purchased only from the bean curd factories, and no attention was given to producing a product which was palatable and pleasing to the taste. At the present day it occupies the position of an independent industry, and is advertised by attractive handbills setting forth intelligent interest in foods and their nutritive qualities. The fact also remains that...the taste of cows' milk is well-nigh intolerable to the average Chinese. One large factory in Peking now makes and distributes over a thousand bottles of milk daily; in Shanghai two factories each meet an even greater daily demand. The industry is bound to grow rapidly to greater dimensions.

"The Yen-Shou Bean Milk Company, which is the largest bean milk factory in Tsinan, reported, in 1926, a daily output of 250 bottles; each bottle has a capacity of approximately one-half catty [about 500 ml]. The customer pays $1.00 Mex. per month for one of these bottles delivered to the door each day. This factory started operations in 1923 with a capital of $300 Mex., and was able at the start to invite an expert from a large Peking factory to help introduce the details of the modern bean milk process.

The monthly financial statement showed: Income–sales of 250 bottles daily = $250. Expenses–Wages (6 men) $36. Rent $30. Raw materials, beans, etc. $30. Miscellaneous $30. Total expenses $136. Profit: $114.

Photos show (see next page): (1) A man delivering sealed bottles of bean milk to regular customers. The bottles are all slung over his right shoulder. (2) "Soybeans

being ground in a stone mill to a thick, creamy pulp." (3) A hanging 4-sided sieve over a metal barrel. "The thick, pulpy mass is then diluted with water and filtered. The filtered product is bean milk." Address: Dep. of Chemistry, Chee-loo Univ., Tsinan, China.

666. Chiu, Yan-Tsz. 1929. Suggested improvements in the manufacture of soy bean milk. *Lingnan Science Journal* 8:573-76. Dec. [5 ref. Eng]
• ***Summary:*** "Soy bean milk which has been used in this country for more than two thousand years, is a very satisfactory form of artificial milk made from soy beans. It takes the place of cow's milk which is rather scarce and expensive. It is a common food drink and people in our country are more accustomed to its use than to the use of animal milk.

"Although bean milk has been used in our country since the Christian era, apparently little attempt has ever been made to improve its manufacture." The author then reviews several methods developed in Europe and America. "In order to improve the quality of bean milk the unpleasant odor of the milk, which resembles raw beans, and the color of the beans have to be removed." The next step is to add desirable flavor and missing minerals. Address: Prof. of Chemistry, Lingnan Univ. [Canton, China].

667. Kellogg, John Harvey. 1929. Chinese babies thrive on milk from beans. *Good Health* (*Battle Creek, Michigan*) 64(12):36-37. Dec.
• ***Summary:*** Orphans in China are often "saved from starvation by feeding them milk prepared from almonds, walnuts and other nuts. In North China, the peanut is much used for this purpose," according to a Chinese trained nurse, as is the soy bean. "This bean in its composition resembles a nut more than an ordinary bean. It is richer in protein than any other plant food."

"Dr Tso, a Chinese physician, at the recent International Physiological Conference, held in this country, gave a report of a careful study of the effects of a soy-milk diet in the feeding of infants."

668. Nayler, John. 1929. The wonderful soya bean. *Vegetarian Messenger and Health Review* (*Manchester, England*). Dec. p. 301-02. [1 ref]
• ***Summary:*** The author begins with a brief discussion of growing world soybean trade, and a discussion of soybean production in the USA, based on articles in *Country Gentleman.* "The soya would not grow in the United Kingdom. To your readers the soya bean is of special interest on account of its high protein ratio, and its lack of starch, and the many uses to which portions of it may be put. It is particularly rich in protein and oil...

"The commercial chemist has discovered that the bean is useful in the preparation of coffee substitutes, chocolates, soups, baked beans, confection, meat substitutes, vegetarian sauces, vegetable casein, vegetable milk and vegetable cheese."

"The meal prepared from the bean has also a long list of uses. We have mentioned its use to the farmer and his stock. As a diabetic preparation it is supplanting gluten flour, as it has practically a no-starch content. It is used for infant foods, macaroni, breakfast foods, and in certain matters used by specialised trades."

"It appears to me that it is to the soya bean and the use which clever manufacturers may eventually make of it that the vegetarian may hopefully look forward to the day when really acceptable tasty substitutes will be on the market at a moderate price to take the place of present day dairy supplies, namely, milk, butter and cheese–possibly eggs also. The essentials to be sought for are palatability, a low competitive price, and practical value to the human economy. I am not aware as to how far these points have been realised, so far, but there does not seem any insuperable difficulty in achieving them all." Address: J.P.

669. *Vegetarian Messenger and Health Review* (*Manchester, England*). 1929. The soya bean. Dec. p. 284. [1 ref]
• ***Summary:*** "Our esteemed contributor, Mr. John Naylor, in a communication appearing on a later page, has done us excellent service in drawing our attention to the potentialities of the soya bean. The vegetarian who bases his practice on the principle of humaneness is aware of his inconsistency when taking milk and milk products. To replace cow's milk by a satisfactory milk made from the soya bean would be to replace a food that is provided at the cost of suffering with one free from that taint. The vegetarian strengthens his claim to be a humanitarian whenever he uses a vegetable substitute for an animal product and many have made the first forward

step by using only artificial leather. The soya bean makes it possible to advance still further by giving us not only milk, butter, cheese and meal, but many by-products which will satisfactorily replace by-products of meat. Statisticians have stated that before the close of the present century land will not be available to grow cattle for the meat and milk required, and Dr. Kellogg, of Battle Creek [Michigan], is of opinion that the soya bean will then become one of the great food staples of the world.

"The Vegetarian Society allows members the use of milk, butter and cheese, and for the majority of vegetarians, during the present transitional period, the use of these animal products is both necessary and convenient. Milk and milk products have been aptly called 'protective' foods and it has been demonstrated that they have often made up what was lacking in the dietary of a vegetarian doing hard physical or mental work. The soya bean, however, promises the greatest of possibilities, for by its use the time is brought appreciably nearer when vegetarians will obtain all their food from the vegetable kingdom." Address: The Vegetarian Society, 39 Wilmslow Rd., Rusholme, Manchester, England.

670. Brillmayer, Franz A.; Drahorad, Fritz. 1929. Die Sojabohne, ihre Bedeutung, Kultur und Verwendung [The soybean, its significance, culture, and utilization]. Vienna, Austria: Published by the authors. 62 p. Illust. 21 cm. [Ger]
• ***Summary:*** Contents: Foreword. 1. History of the soybean in its homeland and its introduction to Europe and America. 2. Current area where soybeans are grown worldwide and world production. 3. Soybean botany. 4. Use of the soybean: As a food (in East Asia, in Europe and America [in the form of flour, for making soymilk, as a coffee substitute, a meat substitute, and for making chocolate]), as an oilseed, as a source of fodder. 5. Soybean cultivation: Climate and the northern limit of growth, soil, crop rotation, seedbed [*Saatbeet*], manuring or fertilizing the soil, the seeds, care of the plants, diseases and enemies, harvest, cultivation for hay, green manure or silage, soybean varieties, agronomic trials with 22 varieties, summary of results, root bacteria and inoculation. 6. Significance of the soybean: For agriculture, as a food for the people, economic effects of the use of soybeans in agriculture and as food.

According to Brillmayer (1947, p. 14), the first edition of this work was self-published as a "brochure" in 1928, but it is not mentioned in this 1929 edition.

Note 1. This book was translated into Dutch in 1936 by J. J. Helmus, soya specialist.

Note 2. This book describes the last intensive research on soybean variety improvement in Austria until 1970. Address: 1. Seed breeder in Platt, Austria; 2. Commissioner, Federal Institute for Agronomy and Seed Testing, Vienna.

671. Ferrée, Christian Johan; Tussaud, J.T. 1929. The soya bean and the new soya flour. London: William Heinemann (Medical Books) Ltd. xi + 79 p. Illust. No index. 22 cm. Revised translation from the Dutch by C.J. Ferree and J.T. Tussaud of Die Sojaboon en Duurzaam Sojameel. [29 ref]
• ***Summary:*** Contents: Foreword, by Sir Wm. Arbuthnot Lane, President of The New Health Society. Preface, by C.J. Ferrée (London). 1. Introduction. Literature. Name of the plant. Origin. Botanical particulars. Assimilative power of the soya plant. Inoculation. Soil requirements. Production and cost. 2. General ingredients of the various Manchurian beans. Composition. The value of soya protein. Vitamin in the soya bean. Digestibility of the soya bean and its products. 3. Use in China and Japan: Bean sauce, soy, or shoyu, Chinese chiang (paste), tou-fu or beancurd, beans consumed as a table vegetable, bean refuse and bean cake are used as a fertiliser and for fattening hogs, bean oil is used as an illuminant (where it has not been superseded by kerosene), as a substitute for lard in cooking, and as a lubricant for greasing axles and parts of native machinery, miso and natto. First imports into Europe. Exports during the last five years from China and Japan. Imports during the last five years into Europe and America. The increasing rate of its cultivation. Manchuria–Production. Estimate of the world's production of the soya bean. London the principal market. Future importance.

4. America. Australia. South Africa. Other British possessions and protectorates. Java (Dutch East Indies). Europe. 5. Unsuccessful experiments with soya flour. Ordinary soya flour. Extracted soya flour. Dr. L. Berczeller's discovery. The new soya flour. Comparison with other cereal flour and other foods. Comparison in price with other cereal flour and other foods. Comparison in price of soya protein compared with other cereal foods. Comparative analysis of cereals. 6. Soya milk. Vegetable casein. Lecithin. 7. Increase in food value. Savings. Industrial application in foodstuffs. The importance of Dr. L. Berczeller's soya flour for the food industry. Soya flour and the food laws. Uses of soya flour in: Bread, pastry, cake, biscuits, confectionery, sausages, infant foods and food for invalids, cocoa, chocolate, soup cubes, pudding flour. Uses in the kitchen. Soya flour recipes (for flour made using the Berczeller process), soya flour for diabetics, recipes for diabetics.

The Preface states: "In the following pages the writer has endeavoured to give an account of the numerous uses to which the soya bean has so far been put, and to visualise its future service to humanity through the means of a totally new and practical process by which this legume... may in future be used as an important article of food for general consumption throughout every quarter of the globe.

"In compiling the details relative to the soya bean flour, with which this brief summary principally deals, he trusts that he has succeeded in giving sufficient data to enable the reader to fully realise its value as a staple food from the economic point of view, as well as from the more domestic standpoint, so that the important fact may be fully realised

that a new foodstuff of a very valuable nature... has now been brought within the reach of all nations to serve them in a most practical manner as an economic article of food."

The book includes statistics on the imports and exports from 1923 to 1927 of "soya beans, soya oil, and soya cake in various countries including China, Japan, England, France, Germany, Holland, Norway, Denmark, Sweden, and USA.

The "new soya flour" is that developed by Dr. Berczeller. This book repeatedly praises that flour. "A few years ago Dr. Laszlo Berczeller, a Hungarian physiologist in Vienna, succeeded scientifically in finding a method which enables us to prepare from the soya bean a digestible and pleasantly flavoured flour without detracting from its nutritive value, and this method entirely succeeds in preserving all the good qualities contained in the bean itself. Physiological experts and analysts withhold no praise, as the following extracts will show: -" There follow words of praise from: (1) Dr. Alfred Schwicker, M.P., Royal Hungarian State Institute, Central Depot for Experimental Chemistry. (2) Dr. Stefan Weisser, King's Counsellor, Royal Veterinary Physiological Experimental Station, Budapest. (3) Prof. A. Durig., The Physiological Institute, University of Vienna.

Marakujew (1928) estimates the production of soya beans in "Manchuria at 6 million tons at the utmost, the production of the whole of China at 16 million tons, and he is led to this figure by the conclusions of the Economic Bureau of the South Manchuria Railway, which estimates that the Manchurian crop in 1927 amounted to 37.1 million kobu (5.88 million English tons), of which 2.6 million tons originated from South Manchuria, 3.3 million tons from North Manchuria" (p. 32). A table (p. 33) gives estimated world production of soya beans from 1923 to 1929 (6.6 million tons, forecast). The leading producers in 1929 (in million tons) are: China 5.250. Japan 0.580. USA 0.250. Java and Dutch East Indies 0.120. Other Asiatic countries 0.400. A soya milk factory was recently established in Denmark (p. 54). Although this book contains a bibliography of 29 references, most are very incomplete.

Photos show: (1) A soybean plant with roots, pods, and leaves. (4) Nodules growing on soybean roots. (5) One pod and seed each from inoculated and uninoculated soybean plants. (7) An immense field of soya beans in Manchuria. (8) Soya beans awaiting shipment, in house-shaped stacks under tarps, at Dairen. (13) Seeds of the most important varieties of soya beans now grown in the United States. (10) Two horses and a farmer cultivating a field of soybeans. (11) Harvesting soya beans. (12) Well selected, clean soybean seeds.

A map (frontispiece) shows where soybeans are cultivated worldwide. An illustration (facing p. 2) shows "Shen-Nung. Emperor [of China] in 2838 Before Christ, called 'The Heavenly Farmer.' Reproduced from a print in a Vienna museum."

One bar chart compares the nutritional composition of soya flour with that of cereals and animal products, and other foodstuffs (p. 13), another compares the calories (p. 46), and a third compares the cost of 1,000 calories (p. 48). Marakujew (probably spelled Marakiev or Marakuyev), in "The Export of Manchurian Soya Beans and its Finance" (1928, in Russian, probably an article rather than a book) "estimates the production of Manchuria at 6 million tons at the utmost, the production of the whole of China at 16 million tons, and he is led to this conclusion by the Economic Bureau of the South Manchuria Railway, which estimates that the Manchurian crop in 1927 amounted to 37.1 million kobu (5.88 million English tons), of which 2.6 million tons originated from South Manchuria, 3.3 million tons from North Manchuria. According to the calculations of this bureau, the home consumption of North Manchuria is something like 40 of the production, viz., 1.3 million tons; the remaining 2 million tons are for export. The exports of South Manchuria were estimated at 1 million tons" (p. 32). Address: London.

672. Ferrée, Christian Johan. 1929. De sojaboon en duurzaam sojameel [The soybean and long-lasting soy flour]. Amsterdam, Netherlands: Drukkerij en Uitgeverij. J.H. DeBussy. 96 p. Illust. 24 cm. Translated into English as The Soya Bean and the New Soya Flour (1929). [Dut]*

• ***Summary:*** Johann Christian Ferée was born in 1895.

673. Sprecher von Bernegg, Andreas. 1929. Tropische und subtropische Weltwirtschaftspflanzen; ihre Geschichte, Kultur und volkswirtschaftliche Bedeutung. II. Teil: Oelpflanzen [Tropical and subtropical plants in international commerce; their history, cultivation, and economic significance. Vol. II. Oilseeds]. Stuttgart: Verlag von Ferdinand Enke. See vol. 2, p. 128-70. Illust. Index. 25 cm. [48 ref. Ger]

• ***Summary:*** The soybean (p. 128-70). Contents: Introduction. Name, place of origin and history. Description of the plant: Systematic, morphology, varieties, selection. General conditions for growth: Climate, soil. Cultivation of the plant: Planting, care. Harvest and storage. Composition and products. Utilization: As a fodder plant, as a coffee substitute, industrial non-food uses, as a food (as a green vegetable, soy sprouts, soy chocolate, soymilk, casein, tofu and soybean quark {*tofu oder Sojabohnenquark*}, natto {*Buddhistenkäse*}, hamananatto, yuba, miso, shoyu or soy sauce {*Sojasauce*}). Production and trade.

Concerning green vegetable soybeans, the author states: "Three-quarter ripe soybean seeds yield a good, green vegetable (*Dreiviertelreife Sojabohnen geben ein gutes, gruenes Gemuese*)."

Note. This is the earliest German-language document seen (April 2013) that uses the term *Sojabohnenquark* to refer to tofu. Address: PhD, Titularprofessor an der Eidgenoessischen Technischen Hochschule, Zurich, Switzerland.

674. Vi-Tone Company. 1929. Jack and Jill both love Vi-Ton [sic, Vi-Tone] (Ad). *Proceedings of the American Soybean Association* 2:37.
• ***Summary:*** This half page black-and-white ad is for Vi-Tone, a food tonic beverage based on soy milk and dairy milk in malt chocolate flavor. "No matter whether the boy or girl is two or twenty-two, Vi-Tone will make instant friends.

"You know, as soon as you taste Vi-Tone, that it is different–better and more appetizing than ordinary beverages.

"Vi-Tone is a scientific combination of the Soy Bean with malt extract and milk–rich in protein and vitamin content–and deliciously flavored with chocolate."

An illustration shows a small can of Vi-Tone, which appears to be a powder. Near the top of the label: "Malt Chocolate Flavor." It can be served hot or cold. "A tonic food beverage."

Note: This is the earliest document seen (July 2001) that advertises or markets soymilk. Address: Hamilton [Ontario, Canada].

675. Dittes, Frances L. 1930. Vegetable milk. *Madison Survey* (*Madison, Tennessee*) 12(2):5-6. Jan. 8.
• ***Summary:*** "Milk, for many years known as 'the perfect food,' has now become a point of question, not because in composition it is deficient, but because milk, being easily contaminated, becomes one of the great carriers of disease... Disease is increasing among the animals as well as among humans. Milk obtained from diseased creatures is not always healthful. Since milk is such a good carrier of disease, the public may well be concerned as to the condition of milk offered for its consumption... a number of [soy milk] products are now on the market, such as infant foods, canned milk, condensed milk, powdered milk, flour, and breakfast foods."

"The general method for making vegetable milk followed by the Orientals is to wash and soak the bean. Freshly ground soybean meal may also be used. The length of time of leaving the beans in water is not fixed but depends upon the temperature. When the beans are well softened, they are crushed in a stone mill and the meal washed thoroughly. After crushing, two or three times the volume in water is added to the dense, milky liquid, and the whole is allowed to stand for a while. Finally the mixture is placed in a covered kettle over a slow fire until the mass has simmered well. A filter bag separates the refuse from the white, thick liquid which resembles cow's milk, and which is called 'vegetable milk.'"

"The composition of soybean milk varies somewhat, depending on the process of manufacture. In general, however, it is similar in composition to animal milk.

"The protein of the soybean milk seems to contain all the essential amino acids to make it a complete protein. It is poor in fat soluble and anti-scorbutic vitamins (the juice of soybean sprouts may be used to supplement this deficiency), in sodium chloride and perhaps calcium. Because of its low carbohydrate content, the milk does not possess the sweetness of cow's milk.

"In competition with the bovine milk, soybean milk has in its favor the following facts and dietetic advantages: It may be produced with less contamination, it is free from tuberculosis, it may be produced more cheaply, and its casein breaks down much more readily than the casein of cow's milk.

"Soybean milk is recommended by Y. Noorden in cases of gastric and duodenal ulcer, states of peritoneal irritation, hyper-secretory conditions of the stomach, disturbances of the motility of the stomach, in conditions with edema where food poor in sodium chloride is required, cholecystitis, cirrhosis of the liver, diabetes, and in cases where a very nutritious diet is desired." Address: Madison, Tennessee.

676. Dorsett, P.H.; Morse, W.J. 1930. Tofu in Tokyo, Japan (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Page 3469 (8 Jan. 1930). Tokyo, Japan. "Worked at the office until about 10 or 10:30 then took our camera and went out to get pictures and information about Tofu, soybean curd.

"We visited a place not more than half a dozen blocks from the Sankaido Building and got a nice lot of information about making tofu. Also secured a few pretty good pictures.

An elderly Japanese lady fried (or seared as we would say) the cakes about 3 by 9 by ½ to ¼ of an inch in thickness, over a charcoal fire [to make grilled tofu or *yakidofu*] on the street or side walk in front of their house.

"Detailed information about the making of this tofu will be found in the special report on soybeans and soybean products, which will be a special report added at the end of our exploration work.

"We saw for the first time fried Tofu which had had chopped carrots added to it [ganmodoki]. We had not prior to this known of vegetables of any kind being added to or mixed with the bean curd or Tofu before frying.

Pages 3470 to 3471. Photos show: (1) "Soja max. Tofu, bean curd. Tokyo, Japan. A nearby view of an elderly Japanese lady frying Tofu on the street. Children and Mr. W.J. Morse are looking on." (2) An elderly Japanese lady frying or searing Tofu. To the right, children are watching the operation, and so are Mr. Morse and Suyetake, in the background. (3) "A fairly nearby view of an old Japanese lady fanning a charcoal fire over which she is frying or searing tofu." (4) "Cakes of soybean curd piled upon bamboo

strip supporters [arranged on bamboo mats] and weighted to express the surplus moisture before frying. A metal two prong piece [skewer] is run through each to handle them with" (negatives #44714 to #44717).

Pages 3472 to 3473. Tofu in Tokyo. Photos show: (1) "A fairly nearby of an old Japanese lady turning the cakes of Tofu she is frying [sic, grilling] over a charcoal fire." Note 1. The rectangular charcoal brazier appears to be about 14 inches long, 8 inches wide, and 8 inches deep. This is the same old Japanese lady described on pages 3470-3471. (2-3) "An old Japanese lady fanning a charcoal fire and frying [grilling] Tofu on the street, not far from the Sankaido Building.

(4) A nearby view of five large cakes of skewered tofu being grilled on a brazier over a charcoal fire. (negs. #44718 to #44721).

Page 3476. "Oblong piece of fresh soybean curd which had been toasted over a charcoal fire... This is used in soups and also cooked with vegetable mixtures. Purchased from a bean curd factory, Tokyo, Jan. 8. The piece is 7½ inches long and 2½ inches wide" (neg. #44736).

Page 3477. "*Phaseolus angularis.* Adsuki bean. Packages of adsuki bean flour purchased in a store, Tokyo, December 24, 1929. This is a sweet flour used in making sweet bean soup. Package 3 1/8 inches long; 1½ inches wide. D. & M. #3100 (neg. #44737).

Page 3478. Soybean. This soybean product is sold in tubs from Tokyo small stores, and is known as 'Gomoku Mame.' It consists of a mixture of five cooked products, namely: soybeans, lotus root, fish sausage, seaweed and burdock roots." Purchased at a small grocery stand in Tokyo, Jan. 6. "It is eaten just as it is. Product is on bamboo leaf which measures 8 inches long and 5 inches wide" (neg. #44738).

Page 3481 (8 Jan. 1930). "Fried soybean curd cakes. The round cake (D. & M. #3096) is known as 'Ganmodoki,' and is fresh bean curd mixed with chopped carrots. The cakes are fried in mustard [rapeseed] oil until brown and sell for three sen each. Each cake is 4½ inches in diameter and 3/8 inch thick. The oblong cake (D. & M. #3097) is known as 'Aburage.' It is a fresh bean curd mixed with chopped carrots and fried in mustard oil until brown. The cake is 8½ inches long, 3 inches wide, and 3/8 of an inch thick. Sell for three sen. These forms of fried bean curd are eaten when dipped in soy sauce and also in soups" (neg. #44741).

Note 2. This is the earliest English-language document seen (April 2013) that contains the term "Fried soybean curd" or the term "Fried soybean curd cakes."

Page 3532 (11 Jan. 1930). "A soybean preparation used as a health drink, 'Almen: The Health Food Drink.'" Sold in a can whose front and back are shown. "Manufactured from soybeans by the Nippon Almen Shokuryo Co., Ltd., near Kobe, Japan. This form of flour is also used in making confections. Packages of 3 1/8 inches high and 2 1/8 inches wide" (neg. #44758). Note 3. Soy flour is apparently used to make the canned health drink.

Page 3533. "Dried and frozen bean curd. The fresh bean curd is cut into small blocks, frozen and then dried. Used commonly in soups. Packages 2 5/8 inches high and 2 1/8 inches across" (neg. #44759).

Note 4. This is the earliest English-language document seen (April 2013) that uses the term "Dried and frozen bean curd" to refer to dried-frozen tofu.

Page 3534. Photo of a package of cooked and sugared adsuki beans, 7½ inches long and 3¼ inches wide (neg. #44760).

Page 3535. "Candied soybeans and other products. Sticks of candy in which are imbedded black soybeans (green germ), yellow soybeans, peanuts, peas and sorghum seed. Box 8½ inches long and 6 7/8 inches wide" (neg. #44761).

Page 3537 (13 Jan. 1930). "Got down to the office pretty early and got the pictures made yesterday jacketed and the legends written.

"About 10 a.m. went to the American Consulate with 8 packages to go forward today in the diplomatic pouch to the office. Six of these 100 to 106, contain seed, 107 contains pamphlets and other publications.

"About noon we went down the street and made a few pictures at a soybean curd factory. A little later we developed those, they were only fair, but are about as good as we can get in view of the conditions.

"In the afternoon we packed and sewed up two parcels of soybean products to go forward to Washington [DC] at the first opportunity. We are having really wonderful weather, not very cold and sunshiny and bright."

Page 3538. "Soybean candy. Small cylindrical pieces of candy in which are imbedded medium small roasted soybeans. This picture is natural size" (neg. #44762).

Page 3539. Adsuki bean flour. Box containing 24 small papers of sweetened adsuki bean flour which is used in making sweet soup" (neg. #44763).

Page 3540. "Bean curd factory (soy). "View showing furnace and boiler where ground soybeans are being boiled for making soybean milk. To the left of the furnace is a tub, into which the milk is strained and made into curd. Tokyo" (neg. #44764).

Page 3541. "Bean curd factory. View showing a stack of oblong blocks of fresh bean curd which are to be slightly roasted over a charcoal fire [to make grilled tofu / *yakidofu*] (neg. #44765).

Page 3542. Bean curd factory. View showing stone mill for grinding soaked soybeans into a mash for making soybean milk and bean curd. Above the hopper is a small round tank of water from which flows into the hopper of beans, a small stream of water while the beans are being ground" (neg. #44766).

Page 3543. Soybean curd factory. View showing the

furnace and boiler where the ground bean mash [*gô*] is boiled in making soybean milk. To the left of the furnace is the wooden tub into which the milk is strained, and where the magnesium sulphate solution is added to form the bean curd. To the extreme left is the partitioned rectangular box into which the bean curd is dipped and pressed into blocks" (neg. #44767).

Page 3544. "View inside soybean curd factory showing in background stone mill for grinding the beans; on the right the oblong charcoal fire box for roasting blocks of the fresh bean curd; and in the foreground and on the left stacks of blocks of bean curd ready to be roasted. The tub in the center is where the blocks of bean curd are placed" (neg. #44768).

Page 3545. "Inside the bean curd factory showing a stack of oblong blocks of fresh bean curd with long handled forks [skewers with several prongs] in one end. These blocks are ready to slightly roast over a charcoal fire" (neg. #44769). Address: Agricultural Explorers, USDA, Washington, DC.

677. Morse, W.J. 1930. Soybean utilization. *Farmers' Bulletin* (*USDA*) No. 1617. 27 p. Jan. Revised 1932.
• ***Summary:*** Contents: Introduction. Soybeans for human food: Dried beans ("The Easycook and Hahto varieties, however, cook fully as soft as other beans." Also used as a substitute for coffee or for salted peanuts), green or vegetable beans ("The Hahto and Easycook varieties have been found especially valuable for use as green beans"), soybean flour, soybean oil, soy sauce, soybean sprouts, soybean vegetable milk ("used so extensively in China." Also mentions the residue [okara]), soybean curd. Soybeans for livestock: For swine, dairy cattle, beef cattle, sheep, poultry. Soybeans for oil: Methods of processing beans for oil, utilization of soybean oil. Soybean meal: Soybean meal for human food, soybean meal for stock feed, for swine, for dairy cattle, for beef cattle, for poultry. Soybean meal as a fertilizer. Miscellaneous uses of soybean meal. Soybeans for hay: Soybean hay for dairy cattle, for beef cattle, for horses and mules, for sheep, for swine, for poultry. Soybeans for pasturage: Swine, sheep, or poultry on soybean pasturage. Soybeans for silage. Soybeans for soilage [green crops for feeding confined animals; a term first used in 1928]. Soybeans for soil improvement. Soybean straw: Feeding value, and fertilizing value of soybean straw.

"Soybean milk in the form of a powder is a commercial product in some European countries, and in parts of the United States it has been used in special feeding cases" (p. 5). "In many cities in the United States having a large oriental population fresh bean curd may be found in the Chinese and Japanese markets" (p. 6).

Photos show: (1) Six men steaming soybeans while making miso in Japan. (2) Muffins made from wheat flour and soybean flour. (3) Making soy sauce in a Chinese courtyard. (4) Grinding soybeans with a stone mill to make soybean milk in China. (5) "Blocks of freshly made bean curd, 'tofu,' as sold in the markets of the Orient." (6) Loading soybean oil in tanks at a soybean oil mill, Harbin, Manchuria. (7) Soybean cakes awaiting shipment at a Manchurian port. (8) Hogs in a field of soybeans. (9) "Pasturing soybeans and corn with sheep is a common practice in the Corn Belt states." (10) Corn and soybean plants growing together for use as silage; a boy is standing by the plants. (11) "A fine growth of soybeans to be used for soiling." Address: Senior Agronomist, Office of Forage Crops and Diseases, Bureau of Plant Industry, Washington, DC.

678. Ribadeau-Dumas, L.; Mathieu, R.; Willemin, L. 1930. De l'utilisation des protéines végétales dans l'alimentation du nourrisson [On the utilization of vegetable proteins in infant feeding]. *Nourrisson* (*Le*) 18:65-81. March; 18:209-24. July. [40 ref. Fre]
• ***Summary:*** Part 1 (p. 65-81) of this two-part article focuses on the use of the soybean as the source of vegetable proteins in infant feeding. Part 2 focuses on sunflowerseed meal. The conclusions of the study are on p. 222 and the excellent bibliography is on p. 222-24.

This article is basically a good review of the literature rather than an original scientific investigation.

679. Nouelle, Georges. 1930. Les emplois du soja [Uses of soybeans]. *Revue Agricole* (*Guadeloupe*) 3(4):118-20. April. Reprinted from Les Annales Coloniales, No. 137, Sept. 1929. [Fre]
• ***Summary:*** Describes the various food uses of the soybean, including soymilk, concentrated, powdered, or fermented soymilk, soy flour, soy oil, soybeans consumed as a vegetable (fresh soybeans are prepared like peas), soy sprouts, soy sauces, soy confections, soy chocolate, and soy coffee.

The soybeans also has uses other than for food, in making candles, colors, and in the form of Sojalithe as an electrical insulator.

680. Shen, Chennen. 1930. The importance of soybean. *China Critic* (*The*) = *Chung-kuo Ping-lun Chuo Pao* (*Shanghai*) 3(18):416-19. May 1. [Eng]
• ***Summary:*** Contents: Introduction. Domestic consumption of soybeans. Foreign consumption of soybeans. Future prospects.

Soybean, called yellow bean in China, is "cultivated in all parts of the country, but most abundantly in Manchuria. While in 1913 the export of soybean amounted only to about ten percent of the total export and ranked next to silk and tea in importance, it has in sixteen years increased five times in value, risen to twenty percent of the total export and taken the premier place in our export trade! No other commodity has ever experienced such an overwhelming prosperity in

such a short time in the history of China."

"Everybody knows that we Chinese live on rice and wheat. But not everybody realizes that we live just as much on soybeans. The soybean is consumed in large quantities by the northerners as well as by the southerners. Its numerous forms of preparations are common articles of food found in every household. Recent scientific investigations have shown that the soybean satisfies a particular requirement in the Chinese dietary."

The human body is like a machine. It needs carbohydrates and fats for fuel and motive power, and protein for repairing worn-out parts. A table compares the nutritional composition of soybean, rice and wheat. "It is evident that soybean is entirely different from either wheat or rice. Whereas wheat and rice supply carbohydrates in the form of starch, soybean is mainly the source of protein. It is interesting to note that the poorer class of people in China consumes very little meat but seems to have sufficient amount of protein. Remembering that every Chinese takes a large amount of soybeans in various forms of preparation, we can readily understand how the protein requirement is satisfied. As soybean contains more than twice as much protein as does any meat and is much cheaper, we can satisfy our protein requirement at one-tenth of the cost of meat."

Exact data regarding soybean production in China are lacking. "The Manchurian crop is more accurately estimated at 5,200,000 tons [probably metric tons] in 1928. The production of soybean in all other provinces has been estimated at 2,000,000 tons by Horvath and 10,000,000 tons by Marakujew [in Russian]. The total exports of soybeans, soybean oil and soybean cake is about 3,500,000 tons, leaving 3,750,000 to 11,750,000 tons for domestic consumption. The consumption per capita is thus 20 to 65 lbs. per year. These two figures at least represent the two extremes. Marakujew's figure is probably nearer to the actual. These 65 lbs. of soybean are used: -"

1. As soybean oil. 2. As soybean milk, "a very popular drink in China," "which is to the Chinese as cow's milk is to the Westerners." The process for making this milk is described briefly and a table compares its nutritional composition with human milk and cow's milk. The composition of the three are "very similar. One of the products of "soybean milk is the pellicula (Cc = Chinese characters given) (doufu-pi [yuba]) which is a thin sheet coagulated on the surface of the milk when it is heated. It is especially rich in protein and fat and used as a table delicacy."

"4. As soybean curd (Cc: doufu), one of "the most universal preparations" of the soybean. "It is relished by the poor as well as the rich. When a coagulating agent like gypsum is added to the bean milk, a thick mass separates out." "It is very similar to meat in chemical composition." A table compares the composition (only protein, fat, and carbohydrate on an "as is" basis) of soybean curd, beefsteak, pork chops, and eggs. "Although the protein content of 'tofu' is only half of that of meats, we see the economy of it even if we have to use a double quantity of it. The solid bean curd (Cc: doufu gan) is more like meat as it contains less water than 'tofu' and is also extensively used in China.

Note 1. This is the earliest English-language document seen (April 2013) that uses the term "solid bean curd" to refer to Chinese-style pressed tofu.

"4. As soy sauce, another popular soybean preparation..." "Other fermentation products like the fermented soybeans (Cc: douchi) and the fermented 'tofu' (Cc: furu) serve similar purposes." Note 2. This is the earliest English-language document seen (Nov. 2011) that uses the term "fermented soybeans" to refer to these Chinese-style "fermented black soybeans."

"5. As a vegetable. Cooked [green vegetable] beans are also used by the Chinese but not very extensively. Experience has taught us that the cooked whole beans are not so digestible as 'tofu' or other preparations. However, soybean sprouts, obtained by germination in water, are highly digestible and contains the antiscorbutic vitamin C, which is lacking in the original seed."

"The chief demand for soybean in foreign countries is for the oil and the bean cake." The oil is used for either edible or technical [industrial] purposes and the cake is used as a fertilizer or as cattle feed. "The soybean owes its popularity to its resemblance to cottonseed oil which is widely used in making soap, lard [substitutes] and oleomargarine. The first shipment to Europe was attempted by Japanese in 1908. It was warmly received..."

"Due to its peculiar smell, the raw soybean oil is rarely used in western countries for cooking. But now it is possible to refine this oil and render it entirely palatable to the western taste. It has been put on the market as salad and cooking oils. By the process of hydrogenation, the liquid oil can be transformed into a solid fat, which is an excellent substitute for animal lard" [or butter].

"Thus we see that in a period of twenty years, soybean has extended its usefulness from the Chinese dietary into industries of world-wide importance and is now one of the most valuable agricultural products not only of China but of the whole world."

"In Germany and Denmark artificial milk is regularly manufactured from soybean and sold on a commercial scale. Soybean milk powder is also being manufactured.

"The soybean curd has also a good future, as it can be used to make meat substitutes. Artificial meat has been prepared by a German soybean factory.

"The biggest possibility in the popularization of soybean as a food is the soybean flour. From the bio-chemical point of view, white bread made from the wheat flour is deficient in protein and vitamins. Therefore a substance like soybean should be a valuable addition to the wheat flour. In fact, half a dozen kinds of soybean flour are already on the market in

Europe and America."

"The phenomenal rise of the soybean as a universal article is not a matter of accident: It is the result of years of intensive scientific research. We should be thankful that we Chinese are not only the biggest consumer but also the biggest producer of this valuable article. But in the face of keen competition at the present time, we should look out lest this leguminous seed should fall into the same pit as did our silkworm and the tea plant. Up to the present we have been benefited by the researches of foreign countries and also the laboratories of the South Manchuria Railway and the Chinese Eastern Railway, whose immediate interests are not purely Chinese. Are we going to lead the world in soybean production? The future is by no means bright. Already the Chinese soybean oil mills are suffering due to their out-of-date equipment and inefficient process. America is rapidly increasing the acreage for soybean planting. When the American soybean crop is big enough to supply herself and other countries, China will have a difficult battle to fight. China should take an active part in studying and widening the usefulness of soybean as a food and as an industrial raw material."

681. Tamblyn. 1930. Bargains for the entire week (Ad). *Toronto Daily Star* (*Canada*). May 30. p. 10.
• ***Summary:*** In the upper right corner of this full-page ad is a small display ad: "Vi-Tone–is equal in nourishment to many times its bulk in ordinary food. A soya bean product. 49¢ and $1.99."

An illustration shows a person's hand holding a spoon, used to measure some Vi-Tone from a canister into a steaming cup.

Note: Tamblyn is a chain of drug stores which dates back to the early 1900s in Toronto. Address: Toronto.

682. Morse, W.J. 1930. Utilizacion de la soya [Utilization of soya]. *Cuba* (*Santiago de las Vegas*). *Estacion Experimental Agronomica, Circular* No. 69. 40 p. May. Translation by Emma L. Sena of USDA Farmers' Bulletin 1617. [Spa]
• ***Summary:*** In the introduction, Ing. Francisco B. Cruz, Director of the Agronomic Experimental Station, E.C., praises an imported soy oil named "Aceite comestible de Soya." A full-page ad for this product (just before p. 36), apparently with the brand name Excelsior, is also shown.

Contents: Introduction. Soybeans for human food: Dried beans (*Los frijoles secos.* Also used as a substitute for coffee or like roasted peanuts), green or vegetable beans (*Los frijoles verdes*), soybean flour (*harina de soya*), soybean oil (*aceite de soya*), soy sauce (*salsa de soya*), soybean sprouts (*vastagos de soya*), soybean vegetable milk (*leche vegetal de soya* (including the solid material or residue {*la materia sólida, el residuo*} [okara] which is separated from the liquid soymilk), soybean curd [tofu] (*cuajada de soya*).

Note 1. This is the earliest Spanish-language document seen (Jan. 2013) that uses the term *vastagos de soya* to refer to soy sprouts.

Note 2 This is the earliest Spanish-language document seen (June 2013) that mentions okara, which it calls *la materia sólida, el residuo.*

Note 3. This is the earliest Spanish-language document seen (April 2013) that uses the term *cuajada de soya* refer to tofu.

Soybeans for livestock (*la soya para el ganado*)*:* For swine, dairy cattle, beef cattle, sheep, poultry. Soybeans for oil: Methods of processing beans for oil, utilization of soybean oil. Soybean meal: Soybean meal for human food, soybean meal for stock feed, for swine, for dairy cattle, for beef cattle, for poultry. Soybean meal as a fertilizer. Miscellaneous uses of soybean meal. Soybeans for hay: Soybean hay for dairy cattle, for beef cattle, for horses and mules, for sheep, for swine, for poultry. Soybeans for pasturage: Swine, sheep, or poultry on soybean pasturage. Soybeans for silage. Soybeans for soilage [green crops for feeding confined animals; a term first used in 1928]. Soybeans for soil improvement. Soybean straw: Feeding value, and fertilizing value of soybean straw.

Address: USDA, Washington, DC.

683. *Fortune.* 1930. Soy beans: Which may be glue, milk, cheese, sauce, varnish, axle grease, fertilizer, soap, soup, buttons, artificial leather, enamel. 1(5):102, 104. June.
• ***Summary:*** Discusses the history of the soybean in various countries. Its uses in the United States are outlined. A plastic named Satolite is used to make combs and buttons. In "Paris there is a cheese factory that makes Rocquefort [Roquefort] from soy bean curd." Soy bean "milk has more proteins than cow milk and little danger of contamination. Its flour contains four and one-half times more fat, four times more proteins, half as much water, and nearly half as many carbohydrates as the flour of wheat. These chemical ingredients make it a food, more interesting, perhaps, than palatable. Though the milk is supposed to be good for one (it arrests cases of retrogression, causes normal growth), it has generally to be drunk sweetened with sugar. Soy bean sauces are better spiced. (For the Chinese taste Lean & Perrins Worcestershire is too hot. The Chinese themselves make their sauces by exposing the crushed bean to sunlight and actually melting it. Certain Korean sauces are thus matured thirty years before they are considered palatable.) But if the bean's chemical make-up only indirectly contributes to its success as human food, it is nevertheless the basis of the bean's industrial importance. Because of its nitrogen, the bean is valuable as fertilizer and also as poultry and stock feed. And the bean's hereinbefore mentioned oil has proved of value to many a manufacturer of paints, enamels, lacquers, and even explosives."

The Anglo-Chinese Company at Harbin and the Suzuki Mill at Dairen, both of which use chemical solvent

extraction, have succeeded in extracting virtually all of the oil from the soybean; Manchuria's traditional crude stone presses were able to extract only about half the soybean's oil content.

"Perhaps the greatest economic and industrial triumph of the soy bean occurred, oddly enough, in Denmark. Until some thirty years ago this pleasant country was more than self-supporting in the production of cereals, especially wheat. But U.S. mass production and low prices made for perilous and in some cases disastrous competition, even in Denmark's home markets. The Danes bethought themselves of raising live stock, imported the soy bean (using the oil for its usual purposes), and used it as feed for their live stock and poultry. Today 70 per cent of Denmark's export trade consists of live stock and animal products: milk, butter, cheese, bacon, ham, eggs, and the like. And for their country's regained economic health Danes give thanks to the soy bean...

"In the United States the paramount importance of soy bean is still its agricultural use. But it is significant that 75 per cent of the soy bean oil consumed in United States is being used by paint and varnish industries and in manufacture of linoleum, oil cloth, artificial leather. Lesser quantities are utilized in printer's ink, liquid soaps. Few soy beans are imported into this country."

Note: This is the earliest English-language document (Feb. 2007) seen that contains the term "mass production."

684. Vi-Tone Company. 1930. Ask the man who trained the champion marathon swimmer about Vi-Tone (Ad). *Toronto Daily Star* (*Canada*). Aug. 30. p. 10.
• ***Summary:*** "Johnny Walker knows his job. He's been training athletes for a great many years. He knows the importance of proper diet for healthy vigorous physical condition.

"That is why Johnny Walker specified Vi-Tone for the winner of the 1930 Marathon Swim, and Marvin Nelson agrees with him when he says 'Vi-Tone is the best tonic food beverage I have ever used.'"

Lists other outstanding swimmers who are Vi-Tone boosters.

"Vi-Tone is a scientific combination of health-giving food elements of the Soya Bean, plus Malt Extract and Milk–ingredients which are easily assimilated and provide extra nourishment in concentrated form. Vi-Tone has an appetizing flavor all its own.

"Obtainable at all good grocers and druggists throughout Canada–Ask for Vi-Tone by name.

"Vi-Tone for health." Address: [Hamilton, ONT, Canada].

685. *New York Times.* 1930. Large demand for soybean is quickly created here: An old Oriental product is turned to many uses in the Western markets. Sept. 21. Section 9. p. 13.
• ***Summary:*** Food uses of soybeans are increasing, as in recent years attention has turned from the stalk to the seed. Soybeans are being used by "persons [such as diabetics] requiring a low starch diet. Either green or dried, boiled or baked, the beans may be eaten as a vegetable or made into soup, and special varieties have been developed that are easy to cook." In the Orient they are made into an emulsion similar to milk and into various kinds of vegetable cheeses. "In the West this milk has been produced in the form of a powder, usable in making bread and cake, milk chocolate and custards, and in creaming vegetables. A curd obtained from it has been canned and put on the market."

686. Dorsett, P.H.; Morse, W.J. 1930. Soybean milk in Heijo (Pyongyang), Chosen [Korea] (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.
• ***Summary:*** Pages 5905-06 (22 Sept. 1930, Heijo, Chosen). W.J. Morse's notes. "After lunch we went to the Prefecture Seed and Nursery Farm. On the way we found mature seed of the wild soybean and collected a fair sized sample.

"At the station we met the director, Mr. Shiramura, and asked concerning the harvesting of soybeans. He thought we would have a better chance of seeing the harvest of beans around Junsen, which is an extensive soybean section and is in a mountainous region. When the soybeans are grown alone, the plants are allowed to become fully mature before harvesting.

"After returning from the Seed and Nursery Farm we visited a soybean curd factory. In addition to selling bean curd this factory sells about five gallons of soybean milk daily during the summer months. This factory runs two stone grinders and uses 4-5 bushels of dry beans daily. Various forms of fried bean curd are also sold by this factory. The same process of making bean curd and milk is used on the Main Island. In the milk, however, less water is used, thus giving a higher quality of milk. The milk is used only by the Japanese and sells for 4 sen per bottle (5 bottles to the quart)." Address: Agricultural Explorers, USDA, Washington, DC.

687. Kellogg, John Harvey. 1930. Soybeans as human food. Paper presented to the American Soybeans Grower's Association, Sept. 11. 20 p.
• ***Summary:*** Dr. Kellogg shows that he has an excellent knowledge of the world literature on soybeans and soyfoods, much of which he summarizes in this speech. "Many years ago (1899), the United States Department of Agriculture, called upon me to undertake the preparation of a vegetable meat. The Assistant Secretary, Dr. Charles Dabney, wrote me, suggesting that the navy bean might be used for the

purpose. I found, however, as I expected, that this legume was not suited to the purpose. At that time the soybean was not grown to any extent in this country, I was wholly unacquainted with it, and so naturally sought to find in nuts, especially the peanut, a solution of the problem, and succeeded in producing a vegetable meat, Protose, of which several thousand tons have since been made and consumed. But the introduction of the soybean renders quite unnecessary any other substitute for flesh meats." The author discusses his belief that primitive man subsisted wholly upon plant products (i.e. ate a vegan diet "according to Prof. Elliot of Oxford University, Prof. Ami of Montreal, and other distinguished paleontologists"), and the nutritional value of soybeans and their basic-ash quality. "All meats yield a highly acid ash. The excess of acid in these foods produces a lowering of the alkalinity of the blood and tissue fluids when they are freely used, a condition which is known as acidosis." He also discusses soya sauce (which is now being manufactured in the USA), miso (which like soy sauce has a flavor resembling that of the osmazomes found in meat and meat sauces), roasted soy nuts (resembling roasted peanuts), pressure cooking whole soybeans, adding soy meal (flour) to breads, soy milk (which, in certain parts of China and Japan, "is made in quantities and distributed in bottles like milk in this country"), soy cheese [tofu], and the many health benefits of soy milk described in the medical literature, the many health problems caused by consuming flesh foods.

"Von Noorden, the world famous German physician, has demonstrated that the soy bean is of very great service in changing the intestinal flora." Note 1. This is the earliest document seen (June 2003) concerning soy and changing the intestinal flora. It is also the earliest document seen (June 2003) that uses the phrase "changing the intestinal flora" in connection with soy.

"In spite of the frantic efforts of vested interests to promote the uneconomic live-stock industry, it will no doubt gradually disappear as a true science of agriculture is developed and the country becomes more densely populated. The conversion of vegetable into animal protein by feeding to steers and pigs, is one of the most wasteful of all human activities. Armsby has shown that 100 pounds of digestible vegetable protein are required to produce 3 pounds of meat protein..."

Discusses Stefansson's absurd so-called meat-eating experiment, which was really a publicity stunt. Stefansson took no more than 20% of his calories in the form of lean or muscle meat. The rest of his diet was fat. "Excessive meat consumption is one of the begetting sins of the people of this country. Our per capita meat consumption is 5 ounces per day, just 5 times that of Italy (1.0 oz.) and ten times that of North China (0.5 oz.), while the average native of South China eats no meat at all, and is one of the hardiest and most industrious of workers."

"Thanks to the efforts of our efficient Plant Introduction Bureau, the soybean is beginning to get a start toward recognition and appreciation in this country; but it is evident that a plant possessed of such superlative values and such astonishing versatility and adaptability should receive far more serious attention than has heretofore been given it by the agriculturalists of this country... There can be no doubt that it is destined to play a large part in the feeding of America's millions..."

Note 2. This is the earliest English-language document seen (Dec. 2012) that uses the term "soy nuts" or the term "roasted soy nuts" to refer to soynuts. Address: Battle Creek, Michigan.

688. Morse, W.J. 1930. La utilizacion de la soja en diversas industrias [The utilization of soya in various industries]. *Hacienda* (*La*) (*Buffalo, New York*) 25:298-301. July; 25:347-49. Aug; 25:394-96. Sept. [1 ref. Spa]

• ***Summary:*** This is a translation of USDA Farmers' Bulletin 1617, but with excellent new illustrations. Contents: Introduction. Soybeans in the human diet: Whole dry soybeans, green vegetable soybeans, soy flour, soy oil, soy sauce, soy milk, tofu (*cuajada de soja*). Soybeans in the feeding of domestic animals. Soy oil: Extraction, use. Soybean cake: as a human food, as a livestock feed, as a fertilizer. The value of soybean forage. Soybean in silage. Soya as green forage. Soybeans for the improvement of soils. Soybean straw.

This article contains many interesting photos: 1. A man with a hand turned stone mill in China grinding soybeans to make soymilk. 2. Soybean cakes stacked and partly covered with tarpaulins at a port in Manchuria. 3. Earthenware vats used for making soy sauce in a courtyard in China. 4. Steamed soybeans being cooled to make miso in Japan. 5. Soybeans intercropped with corn. 6. Manchurians outside a soy oil factory in Dairen. The equipment was installed by the French Oil Mill Machinery Co. 7. Carrying round soybean cakes in a cart at the same factory. 8. A soybean mill at Yokohama, Japan. 9. An Anderson Expeller for the extraction of soy oil. 10. A tractor pulling rotary disks for cultivating soybeans in the USA. 11. Harvesting soybeans with a tractor in the USA. 12. A tractor pulling a harvester-thresher combine in the USA. Address: USDA, Washington, DC.

689. Morse, W.J. 1930. Utilizacion de la soya [Utilization of soybeans]. *Revista de Agricultura, Comercio y Trabajo* (*Cuba*) 11:43-60. Sept. [Spa]

• ***Summary:*** This is a translation of *USDA Farmers' Bulletin* No. 1607 titled "Soybean Utilization" (Morse, Jan. 1930). With an introduction by Ingeniero Francisco B. Cruz, Director de la Estacion Experimental Agronomica, de Santiago de las Vegas, Cuba. Translation by Emma Lopez Seña. Contents: Introduction. Soybeans for human food: Dried beans (*los frijoles secos*), green or vegetable beans (*los frijoles verdes*), soybean flour (*la harina de soya*), soybean

oil (*aceite de soya*), soy sauce (*salsa de soya*), soybean sprouts (*vástagos de soya*), soybean vegetable milk (*leche vegetal de soya*), soybean curd [tofu] (*cuajada de la soya*).

Note 1. This is the earliest Spanish-language document seen (April 2013) that uses the term *cuajada de la soya* to refer to tofu.

Soybeans for livestock: For swine, dairy cattle, beef cattle, sheep, poultry. Soybeans for oil: Methods of processing beans for oil, utilization of soybean oil. Soybean meal: Soybean meal for human food, soybean meal for stock feed. Soybeans for hay. Soybeans for pasturage. Soybeans for silage. Soybeans for soilage. Soybeans for soil improvement. Soybean straw.

Note 2. This is the earliest Spanish-language document seen (June 2009) that uses the term *frijoles verde* to refer to green vegetable soybeans. Address: USDA, Washington, DC, USA.

690. *Proceedings of the American Soybean Association.* 1930. Program of joint meetings: American Soybean Association and Annual Illinois Soybean Day. Agronomy South Farm, University of Illinois, Urbana-Champaign. Sept. 10, 11, 12, 1930. 3:3-6. Eleventh annual field meeting. Held 10-12 Sept. 1930 in Illinois.

• ***Summary:*** The Wednesday morning program began at 9:00 with music by a male quartet, followed at 9:20 by a welcome from Dean H.W. Mumford. Then came 13 speeches about soybean production and feeding; their titles and authors are listed. At 12:00 there was a "special soybean lunch" served at the University South Farm and prepared by ladies of the First M.E. Church, Urbana. It consisted of "Soybean fed pork, soybean fed beef, soybean bread, soybean muffins, baked soybeans, a soybean health drink, soybean ice cream, and soybean ice."

On Wednesday afternoon, starting at 5:00 p.m. there was an inspection of soybean production machinery at the Farm Mechanics Building, and the special tour of the Urbana Laboratories.

On Thursday evening at 8:00 p.m. Dr. John Harvey Kellogg, of the Battle Creek Sanitarium [Michigan], presented a paper titled "Soybeans as human food," which was printed in the Battle Creek Hospital Journal, *Good Health.*

On pages 5-6 is the text of the "Address of Welcome," by Dean H.W. Mumford, Univ. of Illinois.

Note: This is the earliest English-language document seen (March 2007) that contains the term "soybean ice cream." Address: Illinois.

691. Dittes, Frances L. 1930. Soybean food preparation for infants. *Madison Survey* (*Madison, Tennessee*). 12(38):151-52. Oct. 1.

• ***Summary:*** A table compares the nutritional composition of soybean milk, cows' milk, and mother's milk. Soybean milk contains the most protein (4.94%) and mother's milk the least (1.5%). Soybean milk is lowest in carbohydrate (0.92%) while mother's milk is highest (7.00%). "In composition the soybean resembles a nut more than an ordinary bean." Soybean milk contains "the six essential amino acids necessary for complete nutrition and normal growth."

Soybean milk works well for treating eczema in infants. "Soy milk is produced at a cost of one-fifth that of cow's milk, besides being free of disease bacteria, such as tuberculosis, typhoid fever, etc. This food product may be found so practical, economical, and adequate, that it will save the lives of many infants..."

Note: This is the earliest English-language document seen (Sept. 2011) with the term "soybean food" (or "soybean foods") in the title. Address: Madison, Tennessee.

692. Carver, G.W. 1930. Re: Preparation of milk from the soy bean. Letter to Miss Elsie M. Irland, The Natal Branch of the Order of the Golden Age, P.O. Box 323, Pietermaritzburg [South Africa], Oct. 10. 1 p. Typed, without signature (carbon copy).

• ***Summary:*** "I am very much interested in your letter which has just reached me.

"I regret to state that our station has done practically nothing with the soy bean in the matter of making butter and cheese. If you write to the United States Department of Agriculture, Bureau of Publications, Washington, D.C., they may be able to furnish you with literature along that line.

"I have made some very acceptable milk from the soy bean, and if you point out your troubles in its manufacture I shall perhaps be able to help you. You probably know more about the difficulties and just what is needed in the way of milk than I.

"Regretting that I cannot be of service to you in the manufacture of butter and cheese from soy beans, I am, Yours very truly, G.W. Carver." Address: Director, Agricultural Research and Experiment Station [Tuskegee, Alabama].

693. Dorsett, P.H.; Morse, W.J. 1930. Soybean sprouts, soybean milk, bean mash [okara], and bean curd [tofu] in China (Document part). In: P.H. Dorsett and W.J. Morse. 1928-1932. Agricultural Explorations in Japan, Chosen (Korea), Northeastern China, Taiwan (Formosa), Singapore, Java, Sumatra and Ceylon. Washington, DC: Foreign Plant Introduction and Forage Crop Investigations, Bureau of Plant Industry, USDA. 8,818 p. Unpublished log.

• ***Summary:*** Page 6252 (23 Oct. 1930, Peiping, China). P.H. Dorsett's notes. "Today we went to the market and saw a number of bean curd [tofu] dealers, also those handling soybean sprouts."

Pages 6264 to 6268, and 6275 (24 Oct. 1930). P.H. Dorsett's notes. "Tomorrow we plan to visit one of the many places around Peiping engaged in bean sprouting and the

making of other bean products."

Page 6265. Photo shows soybean sprouts in a market in Peiping (neg. #46113).

Page 6266. Photo taken in same market. "At the extreme left, back, soybean sprouts and string beans, in front soybeans, cauliflower and radishes. At the back left are dry bean curd [doufu-gan, pressed tofu] and Chinese cabbage" (neg. #46114).

Page 6266. "Chinese curd man shaving from thin sheets narrow strings of soybean curd" (neg. #46115).

Page 6267. "Peiping, China. Very near life sized picture. Fresh bean curd pressed into thin sheets and fried in soy sauce for five hours. These sheets are sliced into fine strings. Chinese name 'Chien chang'" (neg. #46116).

Page 6268. "Peiping, China. Small stand along the street selling various forms of soybean curd that have been fried in soy sauce" (neg. #6268).

Page 6268 (bottom). Peiping. "Most of the baskets contain a greater or less amount of sprouted soybeans; they show in three baskets."

Page 6275. A photo shows: "Soja max. Fried soybean curd. Peiping [Beijing], China. Between 3/4 and life sized picture. Small squares of fresh bean curd are fried in deep fat (sesame oil). Sometimes several of these fried squares are strung on pieces of grass. D. & M. #7256 (neg. #46125).

Page 6276. "Almost life sized picture. Round and oblong pieces of fresh bean curd fried in soybean sauce for 5 hours. The cakes are dark reddish brown. Chinese name 'Toufu kan' [doufu-gan] meaning 'dry bean curd'" (neg. #46126).

Page 6277. "Peiping, China. Life sized picture. Small squares of bean curd that have been boiled in soy sauce for 5 hours. Cakes are dark reddish brown" (neg. #46127).

Page 6280 (25 Oct. 1930). Peiping, China. "In the forenoon we went to the bean sprouting place of Mr. Chang Tzu Hsien, in the southwestern part of the city. His sprouting house or room is just back of the large public well where water is pumped by coolies and sold to big wheel-barrow men for a few coppers per load. Mr. Hsien sprouts mung beans, yellow and green soybeans; about six days are required to sprout the beans. He uses large earthen bowls are wide shallow jars, about two feet at the bottom, three feet on top and 16 to 20 inches deep, in which to sprout the beans.

"About 1 peck of dry beans are required to make one of the above vessels full of sprouts. Green soybeans are grown and sold with shorter sprouts than either the yellow soy or mung beans. We were told that the best beans for sprouting come from the Kalgan region [Zhangjiakou, a city in Heibei province of North China, adjacent to Beijing to the southeast], but that on account of the price he cannot afford to use these and so he gets his stock from the southeast of Peiping [Beijing].

"The beans are first soaked overnight in hot water and then put into vessels and sprinkled two or three times a day with cold water.

"Mung bean sprouts sell for two cents Mex. per cattie. Yellow soybean sprouts for three and one-half cents per cattie. Green soybean sprouts sell for four cents per cattie.

We next went to the Chi Shun Hung Co., 8 Lien Hua Ssu Street, Peiping, soybean curd and milk manufactory where we spent some little time getting information and pictures.

"Mr. Hao produces both dry and fried curd and milk. He sells soybean milk in about 10 ounce bottles at 1.00 Mex. per bottle, one bottle each day, delivered to his customers. He makes square and round cakes of soybean curd. They are from one-half to three-quarters of an inch thick and about three inches in diameter. These are called dry curd because most of the water is pressed out. They also fry these cakes in soybean oil.

"Mr. Hao also told us that the soybeans from the Kalgan region make the best curd, but that on account of their expense he cannot afford to use them, and buys his from local growers in the vicinity of Peiping.

"In the afternoon we finished up the nearby pictures of soybean products and then took the negatives made in the field and at the hotel to the Hartung Photo Shop to be developed and printed."

Page 6282. Peiping, China. "Wheel cart with baskets used by the peddler of sprouts of mung beans and soybeans" (neg. #46132). "Side view of wheel cart and baskets used by the peddlers of sprouts of soybeans and mung beans" (neg. #46133).

Page 6283. "Small grass baskets or forms for shaping fresh bean curd into small round cakes and then from which excess water is pressed out" (neg. #46134). "Small grass basket forms used in shaping small round cakes of soybean curd for pressing out moisture and the cakes are then fried in soy sauce" (neg. #46135).

Page 6284. "Basket of square and round cakes of fresh soybean curd from which excess water has been pressed. These cakes are now fried in soy sauce for five hours" (neg. #46136). "Tub of bean mash [okara] left after straining out the soybean milk which is used in the manufacture of bean curd" (neg. #46137).

Note: This is the earliest English-language document seen (July 2011) that uses the term "bean mash" to refer to okara.

Page 6288 (27 Oct. 1930). P.H. Dorsett's notes in Peiping. "Early this morning we visited the mung bean sprouting of Mr. Chang, at 66 Pei Yang Shih Kou, Peiping. This gentleman uses tubs in which to sprout his mung beans. The tubs are 12-14 inches across, 24 inches long, and 18-20 inches in height, with about eight small holes in the bottom for draining off surplus water..." The process is described and photos given.

Page 6289. "In the afternoon we called on the establishment of Mr. Chiang who makes what is locally known as 'Southern bean curd.' He uses yellow soybeans.

The milk is boiled three times. This curd seems quite different from that ordinarily seen."

Page 6337 (2 Nov. 1930. Peiping, China). P.H. Dorsett's notes. "Tomorrow we plan on visiting Dr. Ernest Tso, of the P.U.M.C. [Peiping Union Medical College] to get such information as we can relative to the making and utilization of soybean milk. We also plan on visiting a soy sauce, soybean jam [jiang] and pickling establishment for the purpose, if possible, of securing still and motion pictures."

Page 6338 (3 Nov. 1930). "In the forenoon we went to the Peking Union Medical College and met Dr. Ernest Tso. The Doctor is especially interested in the food and feeding of young infants, and is experimenting with the use of both cow and soybean milk.

"He showed us pictures of babies fed in part or wholly on cow's milk, as well as those fed on soybean milk and also showed us charts of the results of his work, as well as some of the babies being fed in the hospital.

"Mr. Morse made an arrangement to call on him again Wednesday morning to talk with him about soybean milk and other products and also to learn more about his work."

Page 6607 (5 Nov. 1930. Peking, China). "Inspected soybean milk laboratory and manufacture of soybean milk." Note: No details are given.

Page 6792 (14 Dec. 1930). Peiping en route to Kalgan, China. P.H. Dorsett's notes. "Owing to the fact that when the Morses were in Peiping in November, and Morse, Suyetake, Liu and I, while looking up soybean products, learned that the best soy and mung beans for use in sprouting and making bean vermicelli come from the Kalgan region, we thought it worth while to go there for a collection of soybeans, mung beans and other legumes." Address: Agricultural Explorers, USDA, Washington, DC.

694. *Christian Science Monitor.* 1930. From the world's great capitals–Moscow. Oct. 25. p. 20.
• ***Summary:*** The first section, titled "Soy-bean diet recommended," notes: In Moscow, where "meat, butter, and milk substitutes are in great demand," the soy bean is fondly called "our young revolutionary Chinese ally." The newspapers urge: "Plant soy beans and you plant meat, milk, and egg omelettes." Throughout the year, much effort has been made to introduce "soy bean dishes" to restaurants and homes. In Moscow, a "soy institute" has recently been organized, as well as a "special exhibition of soy foods at which 130 varieties of soy dishes, including cutlets, pastry, salads, candy, beef, were shown. A dinner, prepared entirely of soy beans, was served to representatives of trade unions, factories, Red Army and the Soviet press. The food was unanimously declared excellent. Special courses to train cooks in the preparation of soy foods have been opened throughout the country," and two books of soy recipes have been prepared for publication.

Note: This is the earliest English-language document seen (Sept. 2011) that contains the term "soy foods."

695. Hepburn, Joseph S.; Sohn, Keum Sung. 1930. Do fu: An Oriental food. *American J. of Pharmacy* 102(10):570. Oct.
• ***Summary:*** "The Oriental food, known as *do fu* in Chinese and *doo pu* in Korean, is a soy bean preparation." The beans are soaked in cold water, then ground with the water. "The resulting mass is filtered through a coarse linen bag. The white, milky filtrate is heated in a vessel, with occasional stirring, until it begins to foam. Then a saturated solution of sodium chloride is added until coagulation is complete..."

A sample of *do fu*, purchased in the 'Chinatown' of Philadelphia [Pennsylvania], was found to have the following percentage composition: Total solids: 13.37%. Moisture: 86.63%. Ether extract: 4.65%. Crude fiber: None. Crude protein: 4.22%. Ash: 0.59%. Nitrogen-free extractives: 3.91%.

Note: This is the earliest English-language document seen (Aug. 2013) that uses the term "milky filtrate" to refer to soymilk. Address: John Clifford English Laboratories of Physics and Chemistry; Hahnemann Medical College and Hospital of Philadelphia.

696. Pehkoff, Suzanne. 1930. Salvation seen in soy beans. *Los Angeles Times.* Nov. 15. p. A4.
• ***Summary:*** A summary of: *Christian Science Monitor.* 1930. "From the world's great capitals–Moscow." Oct. 25. p. 20.

697. *Afro-American* (*Baltimore, Maryland*). 1930. 'Kegee savant makes up menu for Gandhi: Dr. Geo. W. Carver asked to help perfect diet for great leader. Gives lectures. New products shown at Morgan and Hopkins. Nov. 22.
• ***Summary:*** Dr. Carver is collaborating in formulating a menu for Mahatma Gandhi, who weighs only 94 pounds. The great leader of India is struggling to help India free itself from British dominion. A friend and representative of Gandhi's [Dr. C.F. Andrews] had come all the way to Tuskegee to consult with Dr. Carver about the menu which, it is hoped, would add strength and perhaps years of life in which Gandhi could engage in the cause of his country's freedom. "Dr. Carver made the announcement during the course of a lecture at Morgan College, where he talked on his 202 products obtained from the peanut. In the evening he lectured on the same subject to a group at Levering Hall of the Johns Hopkins University."

Carter then said in his unassuming manner: "'Possibly you would like to know something of the work I am trying to do, the motive power, the spirit that prompts it, how I began, and where I got the idea. I am going to tell you how my discoveries are made,' he continued. 'I simply tune in with the creative powers–the Great Creator. There are certain things, however, I must do to tune in.'

"While not indifferent to the potential commercial

importance of his discoveries, Dr. Carver's primary interest is the pursuit of useful truth. He seeks to find the purpose suggested in Genesis, which he quoted: 'Behold, I have given you every herb-bearing seed which is upon the face of all the earth. To you it shall be meat.'

"'The Creator asks me what I want to know,' said Dr. Carver, 'and I tell him I want to know about the peanut. With my knowledge of chemistry and physics I set to work to take the peanut apart.'"

Note 1. Other reports of Carter's work at this time show that one of the key elements in the diet he developed for Gandhi was a nourishing milk made from soy beans.
Note 2. Carver was never able to do anything with his original peanut milk formula, developed in 1919, because he discovered that an Englishman already had a patent that might be in conflict. He didn't think it was worth fighting the matter out in court, so he let it go.

698. Carver, G.W. 1930. Re: Preparing soy milk for Mahatma Gandhi. Letter to Mr. R.B. Eleazer, 409 Palmer Building, Atlanta, Georgia, Nov. 29. 1 p. Typed, without signature (carbon copy).
• ***Summary:*** For at least ten years George Washington Carver has been working to develop milk-like beverages from plants. "I have made up many menus and offered suggestions to missionaries, etc. I am now cooperating with the Johns Hopkins University, that is with one of the professors who is very much interested along this line, and is doing some very excellent work with reference to making up food for babies that will take the place of milk, which they do not have in many sections of Africa and some of the other mission fields.

"I have just answered a communication from Miss Elsie M. Irmand [sic, Irland] of the Natal Branch of the Order of the Golden Age, to a milk, made from soy beans, which is very rich and profitable and can be used largely instead of cows milk.

"I have sent out quite a number of these recipes. One hospital has written me that it is working out nicely with them...

"When Dr. Andrews* was here, we made out a menu for Mr. Gandhi, which included the milk from soy beans."

* Note: Charles Freer Andrews was an Anglican minister who worked with Gandhi, first in South Africa and later in India. See letter from Carver to Andrews dated 24 Feb. 1929.
Address: Director, Agricultural Research and Experiment Station [Tuskegee, Alabama].

699. Goessel, Fritz. 1930. Procédé de traitement des graines du soja et autres graines semblables, en vue de les rendre propres à l'alimentation [Process for treating soybeans and other similar grains to make them suitable for food use]. *French Patent* 708,394. 26 Dec. 3 p. Granted 28 April 1931. [Fre]
Address: Germany.

700. *Constitution* (*Atlanta, Georgia*). 1930. Carver's work aid to Gandhi. Dec. 13.
• ***Summary:*** "Tuskegee, Alabama, Dec. 12.–That the discoveries of Dr. George [Washington] Carver, noted agricultural chemist of Tuskegee Institute, may become a factor in India's fight for freedom was revealed here recently when it was learned that Dr. Carver, at the request of a close friend of Mahatma Gandhi, has formulated a menu for the great Indian leader, designed especially to build up his emaciated body.

"The request, it is understood, came to Dr. Carver through Dr. C.F. Andrews, a recent visitor to Tuskegee, who for years has been Gandhi's intimate friend, adviser and associate. The menu prepared, it is said, makes large use of a nourishing milk derived from soy beans. Dr. Carver, it is understood, is co-operating also with a member of the Johns Hopkins faculty in the development of a vegetable baby food that can be used in Africa and other countries where milk is not available."

701. *Observer* (*Moultrie, Georgia*). 1930. Bean milk. Dec.15.
• ***Summary:*** "Dr. George Carver, noted agricultural chemist of Tuskegee Institute, has been called on to prescribe for Mahatma Gandhi, leader and reformer of India. Gandhi is thin and does not respond to food such as is obtainable in his country. Professor Carver has found in Alabama what he thinks will build up the emaciated body of the noted reformer.

"The request, it is understood, came to Dr. Carver through Dr. C.F. Andrews, a recent visitor to Tuskegee, who for years had been Gandhi's intimate friend, advisor, and associate. The menu prepared, it is said, makes large use of a nourishing milk derived from soy beans. Dr. Carver, it is understood, is cooperating with a member of the Johns Hopkins faculty in the development of a vegetable baby food that can be used in Africa and other countries where milk is not available.

"To date Dr. Carver's contributions to science include 202 products derived from peanuts, 118 from sweet potatoes, a large number from other common plants, and 300 colors and tints from Alabama red clay. Among the latter is a blue stronger than any on the market, said to be identical with the long lost blue used to decorate the tombs of the ancient Egyptian kings. He is now on the trail of another lost color, the famous Egyptian purple."

702. Tso, Ernest; Chu, Fu-T'ang. 1930. The nitrogen metabolism in infants on graded intake of soybean "milk" proteins. *Proceedings of the Society for Experimental Biology and Medicine* 28(3):218. Dec. [3 ref]
• ***Summary:*** This is a brief preliminary report of experiments. Address: Div. of Pediatrics, Dep. of Medicine,

Peiping Union Medical College.

703. **Product Name:** Soy Ice Cream (Honey Sweetened) [Strawberry, Chocolate, Vanilla], and Soy Coffee with Soy Cream.
Manufacturer's Name: Scientific Food & Benevolent Association.
Manufacturer's Address: Takoma Park Station, Washington, DC.
Date of Introduction: 1930.
New Product–Documentation: Miami Daily News. 1934. April. "He [Jethro Kloss] exhibited 21 articles made from soy beans" including "ice cream." He invited the public in Miami, Florida, to taste them.

Jethro Kloss. 1935. *Back to Eden.* Page 105 contains a recipe for non-dairy soy ice cream.

Letter from Jethro Kloss, president of this association, to his daughter, Promise. 1936. May 11. The letterhead states that this is "Manufacturers, Jobbers, and Distributors" with "A marvelous line of foods made from the soy bean..." Note: It is not clear when this company was founded, or if it existed in 1930, when Kloss first started making and selling soy ice cream commercially.

Letter from Eden Kloss, son of Jethro Kloss. 1985. Nov. 15. He recalls that in about 1930 he helped his father make soy ice cream (honey sweetened in strawberry, chocolate, and vanilla flavors) and soy coffee with soy cream. They sold it to the public as part of a quick lunch out of a small trailer on Pennsylvania Avenue near the White House.

Note: This is the world's earliest known non-dairy soy ice cream. This is the earliest known commercial soy product made in Washington, DC–in the early years of the Great Depression. It is also the earliest known commercial soy product introduced by a Seventh-day Adventist that contained chocolate.

704. Bragg, Paul Chappius. 1930. Professor Bragg's live food cook book and menus. Hollywood, California: National Diet and Health Association of America; and, Live Food Products. 170 p. No index. 24 cm.
• ***Summary:*** About raw food and vegetarianism. Contents: 1. Why I write this book. 2. Our daily food, is it nourishment or poison? 3. There are no meat recipes in this book. 4. Poisonous white sugar. 5. Dairy products not human food. 6. Coffee and tea are drugs. 7. Don't use condiments. 8. Salt–The enemy of life and health. 9. Pure food. 10. Don't use aluminum cooking ware. 11. Gas, indigestion and stomach trouble. 12. Acknowledgment of recipes and suggestions fork other health food writers. 13. Salads. 14. Fruit salads. 15. Salad dressings. 16. Directions for making nut butter and nut milk. 17. Relishes. 18. Soups (incl. Carque's nut milk soups, made with his nut milk). 19. Cooked vegetables. 20. Meat substitutes and main dishes. 21. Desserts. 22. Breads and bread foods. 23. Sauces and gravies. 24. Drinks. 25. Health confections. 26. Health sandwiches... 30. Baby's diet from birth to 18 months. 31. Diet schedule for the growing child.

Chapter 1 (p. 11) states: "The drug doctor has been a failure. After hundreds of years of his reign there is still universal sickness and suffering which, instead of abating, is unmistakably on the increase."

Chapter 12 (p. 26) acknowledges: "A few of the recipes in this book were taken from the works of some of the most prominent men in the field of Natural Living. I have considered, in giving a cook book to my people, that they should have, not only my own favorite recipes, but also the best of other men who have experimented along this line. I have therefore included recipes from the books of: Dr. John T. and Mrs. Vera Richter, the leaders of the Raw Food movement in the West. Dr. Philip M. Lovell, distinguished editor of the most widely read Health column in the world, the Care of The Body section of the *Los Angeles Times.* Dr. Henry Lindlahr, the great pioneer Nature Doctor. And Otto Carque, chemist, research worker and crusader in the fight for natural foods."

Chapter 16, "Directions for making nut butter and nut milk," begins with a long passage from *Natural Foods: The Safe Way to Health,* by Otto Carqué (1925). It contains recipes for: Cocoanut milk. Nut milk (made by mixing 1 level tablespoon nut butter with 1 cup warm water, plus a little honey or sweet fruit juice if desired). Almond milk for infants. Nut cream (made from unroasted nut butter, warm water, and honey). Combination nut butter (peanuts, pignolias, cocoanuts). Apple and almond butter. Nut meal.

Chapter 20, titled "Meat substitutes and main dishes" (p. 111-18), contains largely cooked dishes, and makes widespread use of the "Battle Creek Sanitarium product, Protose, being available at most fancy grocers." Vegex and Savita are also widely used in recipes. Soy sauce is used to season Vegetable chop suey (p. 114). It "may be purchased at a Chinese store or any fancy grocers."

The National Diet and Health Association of America is located at 1109 North Hudson, Hollywood, California.

Note: This is the earliest document seen (March 2007) by or about Paul C. Bragg that mentions soy. No juicer is mentioned in this book. A portrait photo (just after the title page, p. 5) shows handsome "Prof. Paul C. Bragg." Address: Professor, California [Los Angeles].

705. Capus, Guillaume. 1930. Les produits coloniaux d'origine végétale [Colonial products of vegetable origin]. Paris: Larose. 499 p. See p. 80-83. 26 cm. [Fre]
• ***Summary:*** The soybean (*soja*) is mentioned on 11 pages in this book: p. 1, 74, 78 80-83, 420, 484. 488, 496.

Contents: Introduction. Uses of the soybean (industrial uses and food uses): oil, cake, soymilk, tofu, fermented tofu, sauce, coffee substitute, green vegetable soybeans, whole dry soybeans, soy flour used to make bread for diabetics. The leaves and stems make an excellent green forage. Finally,

in the USA, the soybean is cultivated as a forage plant, for use as silage, and also as green manure to enrich the soil for other plants.

Capus Guillaume lived 1857-1931. Address: Doctor of Science, former Director General of Agriculture in Indochina.

706. Watson, Ernest. 1930. The principal articles of Chinese commerce (import and export) with a description of the origin, appearance, characteristics, and general properties of each commodity; an account of the methods of preparation or manufacture; together with various tests, etc., by means of which the different products may be readily identified. 2nd ed. Shanghai, China: Statistical Dept., Inspectorate General of Customs; sold by Kelly & Walsh [etc.]. ix + 630 p. Illust. Index. 28 cm. The Maritime Customs. II. Special Series No. 38.

• ***Summary:*** The first edition was published in 1923. There are sections on "bean oil" (*tou-yu*), the residual meal from the extraction process (*tou-ping fên*), and cakes (*tou-ping;* p. 85-86), soya beans (p. 320-21) including yellow, black, and green varieties, beancurd [tofu], bean milk (tou-fu-chiang), bean sauce (see soy sauce), and bean vermicelli. The latter product, named *fên-ssu, tou-fên-ssu, hsi-t'iao-mien,* or *kua-mien,* is a "famous vermicelli made in the Chefoo district from [soy] beans, most of which are originally imported from Manchuria. It is exported in great quantities from Chefoo to Hongkong, South China, and the Straits Settlements, and forms a favourite and very nutritious food."

Soy or chiang-yu (p. 538) is the name for a "sauce made in China from the soya bean (*Soja hispida*). In preparing it, a quantity of beans are slowly boiled, an equal quantity of coarsely ground wheat or barley being added. The mixture, after being allowed to ferment for some time, is put into a jar with an equal amount of salt, a few aromatics, and three times as much boiling water as there were beans at first; the whole is then allowed to stand for several weeks exposed to the sun, after which the liquor, which constitutes the soy, is separated by pressing and straining the mass. The finished product is afterward packed into jars or bottles ready for market."

"Soy is thin and, in colour, very dark brown or almost black; it becomes brighter and clearer on being kept, has an agreeable salty flavour, and produces a yellowish froth when even slightly shaken. It is much used by the Chinese as a sauce and condiment, as it creates an appetite and is supposed to counteract the injurious properties of contaminated food; it is also used in medicine as an application for burns, scalds, eczema, leprous sores, etc. Soy is often exported from China to foreign countries, where it is extensively used in the manufacture of many European sauces."

"Wheat gluten (*mien-chin*) is prepared in China by washing starch and is used as a nutritious food. The Chinese also prepare "dextrin" (*mai-ch'ao*) from wheat, using it chiefly as a medicine, and considering it to be very nutritious, antifebrile, and quieting..." Address: Tariff Expert, Chinese Maritime Customs.

707. Found, N. 1931. A cheap substitute for milk. *China Medical Journal* 45:144-46. Feb.

• ***Summary:*** This review of five articles on soybean milk was originally contributed to the *Mansen no Ikai*, June 15, 1930.

"Only in 1900 was it scientifically studied and found to have a high protein content, reaching 44% in the soy bean flour.

"In Japan it was found that nitrogen from this source was easily absorbed, especially if taken in a mixed dietary.

"John Ruhrah of Baltimore first recommended and used it as a supplementary infant food in 1909.

"Dr. Ernest Tso (Peiping Union Medical College) used soy bean milk as the main diet of an infant six weeks old for eight months and showed that this allowed the occurrence of rickets, which, however, could be cured by adding calcium and cod liver oil to the diet.

"In Peiping in 1928 he made metabolic studies on two such infants and confirmed chemically the lack of calcium, sodium and chlorine as well as vitamines other than A and B. He also showed that the phosphorus content was adequate. The nitrogen absorption is up to 90% of the intake and nitrogen retention is from 17% to 26% of the intake. His conclusion was that soy bean milk proteins are easily digested by a young infant and are capable of producing continuous growth. For best results calcium must be added and cod liver oil fed for vitamines.

"Following this, formulae were made out to correct the deficiencies.

"Dr. VanBuskirk has shown that the mortality rate per 1000 Korean children during the first five years of life are, 180, 127, 102, 59 and 39, which is especially high for the second and third years as compared with most other countries.

"Recently at the Evangelistic Center, Seoul, a practical experiment has been made in feeding large numbers of children with this milk and it is found that the cost per feeding is only about three sen as compared with 10 sen for canned cream.

"The method of preparation used is as follows:

"Soak the beans over night in 8 times their weight of water.

"In the morning remove the shells [hulls] and grind in a mill.

"Boil for five minutes.

"Filter through a sieve.

"For 1000 grams of the filtrate:

"Add 20 grams of starch, previously made into a paste with a little of the filtrate and add 60 grams of sugar.

"Add 1.5 grams of calcium lactate.

"Add 1 gram of salt.

"This gives a mixture with 4.4% protein, 1.8% fat and 1.5% carbohydrate, the pH is 6.8.

"Codliver oil [Cod liver oil] must also be given.

"Drs. Hill and Stuart in Boston have also worked out a formula for a dried powder which gives good results in cases where cows milk is not tolerated. They report the main protein in soy bean as *glycinin* and give a detailed chemical analysis." Address: Severance Union Medical College, Seoul, Korea.

708. Kellogg, John Harvey. 1931. Soybeans as human food. II. *Good Health* (*Battle Creek, Michigan*) 66(2):20-22. Jan.
• ***Summary:*** Contents: Introduction. How to cook the soybean (in a stone jug in salt water under pressure). The extraordinary supporting qualities of the soybean (nutritional value, gives stamina). The soybean combats acidosis (basic-ash quality). A wonderful vegetable milk from the soybean (relieves food allergy caused by dairy milk). The great value of soy milk as a remedy. The easy digestibility of soy milk ("The author finds that plant milk is digested more easily than cow's milk"). The soybean, the vegetable analogue of meat ("The soybean differs from other legumes and cereals in the fact that it contains practically no starch. Its food values are protein and fat, as is the case with meat").

Note: This is the earliest English-language document seen (Aug. 2013) that contains the word "plant milk" (or "plant milks").

A large photo (p. 21) shows soybean sauce being made commercially in Japan. Address: M.D., Battle Creek, Michigan.

709. Ziegelmayer, Wilhelm. 1931. Ueber die Wirkung von Pflanzenmilch (Sojamilch) auf die Gerinnung frischer Kuhmilch [On the effect of plant milk (soymilk) on the curding of fresh cow's milk]. *Zeitschrift fuer Fleisch- und Milchhygiene* 41(1):212-17. Feb. 15. [12 ref. Ger]*
• ***Summary:*** Soymilk inhibits the ability of rennet to produce curds in cow's milk. Address: Potsdam, Germany (now in E. Germany).

710. Tihon, L. 1931. A propos d'une variété nouvelle de soja O-too-ton [Concerning a new variety of soybean, O-too-ton]. *Bulletin Agricole du Congo Belge* 22(1):120-23. March. [Fre]
• ***Summary:*** "The management of the plantations has sent us, in the chemical laboratory [at Leopoldville, Belgian Congo], a rather important sample of seeds of the soybean variety O-too-ton [Otootan], recently introduced from Atlanta, Georgia, USA, to the botanical garden at Eala. At the time of a former shipment of two other varieties, we have pointed out in the report of our studies (10 October 1928) the interest in this legume and given some generalities concerning its cultivation and possibilities for various uses." Tables compare O-too-ton with the former two varieties (Jaune [yellow] and Violette) in terms of size, weight, chemical composition, and mineral content. A detailed analysis of the oil of the yellow soybean is given.

The author then discusses the physiological value of the soybean and its by-products. It contains about twice as much protein as locally-consumed beans and much more oil. It can therefore help in improving the diet of the indigenous people, which is deficient in protein (*albuminoides*). It is also a rich source of vitamin E and other key nutrients. As noted in the author's previous report, the people of East Asia use the soybean to make a milk, a curded milk (probably tofu), and various fermented foods such as miso and soy sauce. Various studies have shown the milk to be very nutritious and digestible.

"The information given above has been, in large part, extracted from the *Bulletin de la Société d'Hygiène alimentaire et d'Alimentation rationalle de l'homme* (Vol. 18, no. 1, 1930)."

Note: This is the earliest document seen (Aug. 2003) stating that vitamin E is found in soybeans. Address: Director, Laboratoire de Chimie, Leopoldville [Congo Belge].

711. McCoy, Frank. 1931. Health and diet advice: The Oriental vegetable meat. *Los Angeles Times.* April 7. p. A6.
• ***Summary:*** For centuries Chinese and Japanese have been living on a diet that contains very little meat. They have been able to do this by using the soy bean to supply a large amount of the protein in their diets. "This bean is superior to all other dried beans inasmuch as it contains little or no starch and a very large amount of balanced protein." A table shows the high food value of soy bean flour by comparing its composition with that of spring wheat and lean beef. Soy beans almost always contain less than 2% starch, "the mature beans having no starch. This is one of the reasons why soy bean flour is often preferred over other flours in the diet of those suffering with diabetes." It is not possible to make bread of "entire soy bean flour" because it tends to agglutinate instead of forming a paste.

"The Chinese make a kind of cheese [tofu] of the soy curd which closely resembles our cheese in appearance and food value, but has an entirely different flavor. The Japanese prepare a vegetable milk by grinding the soaked beans and boiling thirty minutes in three times their bulk of water and then straining. This milk compares favorably with cow's milk and is often used for feeding infants."

Soy beans tend not to cause flatulence "because they do not contain much of the hemicelluloses which are abundant in other beans. The carbohydrates of the soy bean seem to be much more digestible."

Also from soy beans the Japanese manufacture a sauce known as shoyu. "This is made by mixing cooked and ground soy beans with salted water and inoculating the

mixture with a rice ferment. The sauce tastes a good deal like a salty meat extract."

There follows a recipe for making soy bean muffins using soy bean flour, baking powder, salt, egg, and milk. No wheat flour is used. Address: Dr., author of "The Fast Way to Health".

712. Hill, Lewis Webb. 1931. Infantile eczema with especial reference to the use of a milk-free diet. *J. of the American Medical Association* 96(16):1277-80. April 18. [11 ref]
• ***Summary:*** "Blackfan, in 1916, was the first to report an extensive series of cases in which skin tests were done, and he found that more than three fourths gave a positive skin test to one or more proteins... In 1916, Blackfan and, in 1920, Schloss fed a number of babies on a milk free food made from soy bean flour, lactose and washed butter. In all cases the eczema disappeared rapidly, but infants were made ill by the food... [Note: We can find no document showing that in 1916 Blackfan fed babies a milk free food made from soy bean flour].

"It seemed to [H.C.] Stuart and me (see Hill and Stuart, 1929) that it would be worth while to try to develop an easily available and digestible milk free food for use in cases of milk idiosyncrasy and eczema, and with the help of Dr. James L. Gamble we worked out a formula. We then got the assistance of Mr. L.D. Johnson of Mead Johnson & Co., who had prepared for us a large amount of the preparation and christened it 'Sobee.' The product is a light brown flour of the following composition: soy bean flour, 67.5%; barley flour, 9.5%; olive oil, 19.0%; sodium chloride, 1.3%; calcium carbonate, 2.7%...

"The first points to determine with regard to such a food are the following: 1. Is it tolerated by the digestive tract? 2. Will it maintain nutrition? We used the food for more than a year before allowing it to be put on the market and satisfied ourselves as to both of these points. There are a few babies, particularly those more than a year old, who will not take Sobee; most babies take it readily. There are also a very few who vomit it...

"The results are variable. If there is a fairly severe sensitization to milk protein, as evidenced by positive skin tests, the results with Sobee are uniformly good, and I have had some truly remarkable and most satisfactory cases in which it has been possible to cure entirely very severe and long standing eczema. I have also sometimes had the same sort of results with Sobee in cases with negative skin tests, and not infrequently when I have discontinued Sobee and have attempted to return to milk the eczema has come back and it has been necessary to return to Sobee, with prompt disappearance of the eczema." Address: 319 Longwood Ave., Boston; Dep. of Pediatrics, Harvard Univ. Medical School and Eczema Clinic, Children's Hospital, Massachusetts.

713. Chiu, Yan-Tsz. 1931. A simple method for the determination of oil in soybeans or soybean milk. *Lingnan Science Journal* 10(1):130-31. April. [Eng]
• ***Summary:*** This method yields results comparable with the usual Soxhlet ether extraction method (within 1%), but requires less time and simpler apparatus. Address: Dep. of Chemistry, Lingnan Univ., Canton, China.

714. Horvath, A.A. 1931. The soy bean as human food. *Industrial and Engineering Chemistry, News Edition* 9(9):136. May 10.
• ***Summary:*** Contents: Historical background. Properties and uses. Growing interest in soy bean preparations in different countries. Soya foundation proposed.

This article begins: "The soy bean is a plant of early cultivation in China. Its use dates back to the beginning of China's agricultural age under the Emperor Shen Nung. It is mentioned in the *Ben Tsao Gang Mu*, the ancient 'Materia Medica' written in the year 2838 B.C. This bean is remarkable for its richness in oil (average 20 per cent), protein (average 40 per cent), and ash (average 5.5 per cent), and the almost complete absence of starch.

"Since time immemorial the soy bean has been the most universal article in the Chinese dietary. It is also extensively used for food in Korea, Japan, Indo-China, the Philippine Islands, the Dutch Indies, Siam, and India. The Chinese make practically no use of dairy products, and the bulk of the people consume a very meagre amount of meat. Yet, in spite of this, they have lived for centuries on what appears to be a remarkably well-balanced diet by the use of the soy bean."

"Soy bean milk has been extensively used throughout the Orient since its discovery by the Chinese philosopher Whai Nain Tze long before the Christian era. This milk does not coagulate on boiling, but acids and rennet produce a curd-like precipitate. According to Fisher, soy bean milk gives a much finer flocculent precipitate in the stomach than cow's milk. Its period of stay in the stomach is shorter. Its ingestion results in a feebler secretion of gastric juice; the period of secretion is also shorter. The peristaltic motion of the stomach is less after the ingestion of soy bean milk and more coordinated than in the case of cow's milk.

"If soy bean milk is boiled with a solution containing magnesium chloride or calcium sulfate its proteins are precipitated. The cheese-like product obtained by pressing this precipitate is generally known as bean curd and is called in China 'tofu.' If fresh, it contains approximately 8 per cent of protein and 3 per cent of fat, and is digested, according to Oshima, to an extent of over 95 per cent. Fried tofu resembles beef in its content of protein and fat, and is called in China "the meat without the bones."

"In the Orient tofu forms a very popular and almost indispensable dietary article." Also discusses: Miso, chiang, Worcestershire sauce ("liquid soy sauce... when spiced, is sold under the label 'Worcestershire sauce.'"), W.J. Morse of the USDA, soy bean foods in Europe, Prof. Berczeller,

and work at the Physiological Institute of the University of Vienna under Prof. Durig and Dr. Wastl.

"In Russia, the soy bean is fondly called 'our young revolutionary Chinese ally.' 'Plant soy beans and you plant meat, milk, egg omelets,' is the newspaper cry. Efforts have been made all year to introduce soy bean dishes to restaurants and homes. A Soy Institute was recently organized in Moscow, as well as a special exhibition of soy foods at which 130 varieties of soy dishes, including cutlets, pastry, salads, candy, and beef, were shown. A dinner, prepared entirely of soy beans, was served to representatives of trade unions, factories, Red Army, and the Soviet press. The food was unanimously declared excellent...

"Soya foundation proposed: There are reasons to expect that the United States will become the leader in introducing the soy bean in the daily diet of the white race. An important step should be the establishment of a soya foundation in order to promote the creation of a national soya food research institute." Address: Health Section, Bureau of Mines, Pittsburg, Pennsylvania.

715. Chang, Ke-Chung; Tso, Ernest. 1931. A soluble soybean milk powder and its adaptation to infant feeding. *Chinese J. of Physiology* 5(2):199-203. May. [1 ref. Eng; chi]
• ***Summary:*** A vegetable "milk" was obtained from the common yellow soybean, *Soja max*. A child born on 27 Aug. 1930 at the Peking Union Medical College Hospital weighed only 2.84 kg (6.25 lb) at birth. He was nursed for one week and then fed alternately cow's milk formula, fresh soybean milk, and three powdered soybean milk formulas (each sweetened and fortified with calcium lactate for 84 days). The child's rate of growth on the powdered soybean milk "surpassed that on either fresh soybean milk or cow's milk feedings. As shown in fig. 2 [a graph] it is even better than the average rate of growth of nursing infants." The apparatus and process for spray-drying the soluble soybean milk is described. Address: 1. Dep. of Chemistry, Nan Kai Univ., Tientsin; 2. Dep. of Medicine, Peiping Union Medical College, Peiping.

716. Rosenberger, E.T. 1931. The soy bean milk as a food. *Missionary Review of the World* 54(5):371-72. May.
• ***Summary:*** Results obtained in feeding milk to infants at the Social Evangelistic Center, Seoul, Korea. A recipe for preparing the milk is included. Address: Child Welfare Dep., Social Evangelistic Center, Seoul, Korea. Phone: GTUL 841-9811.

717. Tso, Ernest; Chu, Fu-T'ang. 1931. Nitrogen metabolism in infants on graded intake of soybean "milk" proteins. *Chinese J. of Physiology* 5(3):287-94. Aug. [3 ref. Eng; chi]
• ***Summary:*** In young infants fed on soya-bean "milk" furnishing 120-150 gm-calorie per kg body weight, adequate nitrogen retention is obtained when 18% of the calories is provided in the form of protein. On cow's milk feeding, in which 10-14% of the calories is furnished in the form of protein, 38-42% of the nitrogen intake was retained, while on soya-bean "milk" in which 8-18% of the calories was provided as protein, 14-30% of the nitrogen ingested was retained. At different levels of intake with soya-bean "milk," the ratio of nitrogen absorbed to nitrogen ingested is approximately constant at 80%, the corresponding figure in the case of cow's milk being 95%. Address: Peking Union Medical College, Peking.

718. Eldred, Myrtle Meyer. 1931. Your baby and mine. *Los Angeles Times.* Sept. 30. p. A6.
• ***Summary:*** If a baby has a personal sensitivity to cow's milk, the mother should try different kinds of milk–such as goat's milk. "Soybean milk, obtainable in commercial form from your druggist, is a preparation designed for babies who develop eczema from cow's milk. This is a nourishing form of protein, and may have no bad effect on baby."

Note: The first non-dairy infant formula sold commercially in the USA was Sobee, introduced in Sept. 1929, by Mead Johnson of Evansville, Indiana. Sold in powdered form, it was based on soy flour.

719. Eldred, Myrtle Meyer. 1931. Your baby and mine: Health and habit problems. *Toronto Daily Star* (*Canada*). Sept. 30. p. 25.
• ***Summary:*** A small percentage of babies are sensitive to cow's milk. "Soybean milk, obtainable in commercial form from your druggist, is a preparation designed for babies who develop eczema from cows' milk. This is a nourishing form of protein, and may have no bad effect on baby."

720. Chiu, Yan-Tsz (Chao, En-tz'u). 1931. Studies of the physical and chemical properties of soy bean milk. *Lingnan University Science Bulletin* (*Canton*) No. 4. 38 p. Sept. [24 ref. Eng]
• ***Summary:*** This article is based on his 1927 PhD thesis, Cornell Univ., New York; it has the same title and is the same length. Address: Prof. Analytical Chemistry, Lingnan Univ., Canton [China].

721. *Madison Survey* (*Madison, Tennessee*). 1931. A valuable but neglected food. 13(41):163. Oct. 21.
• ***Summary:*** "About half of the people of the world obtain their protein from the soybean. The soybean protein is complete and superior in some respects to the protein in milk and flesh foods. The protein of a pound of soybeans is equal in nutritional value to two pounds of beef and costs much less. It contains none of the objectional [sic, objectionable] features found in the protein of meat. The broken-down, worn-out dead matter–the result of metabolism–of flesh foods is injurious to the liver, kidneys, and blood vessels."

"The Madison School family is enjoying the milk made

from soybeans. Already the medical profession is realizing the value of this milk for infant feeding. The milk and cheese of the soybean is a wholesome, delicious food."

"It has been discovered that the average per cent of tuberculous milk in the great cities of England is 7.36. There are over a million tuberculous milk cows in England and Wales. And there are only four hundred dairies in all England and Wales that produce an A-grade milk."

722. Horvath, A.A. 1931. The soybean. *Co-operative Manager and Farmer* 21(2):38-40. Oct. Address delivered at the laboratory of the Harshaw Chemical Co., Cleveland, Ohio. 21 May 1931. [2 ref]

• ***Summary:*** "The following address was delivered by Dr. A.A. Horvath at the laboratory of The Harshaw Chemical Company, 1945 East 97th St., Cleveland, Ohio, May 24th, 1931.

"Twelve years ago [i.e., in about 1919] I had the good fortune to go to China and my first impression was that Occidentals have a number of things to teach the Chinese, but I have found that we have more to learn from them than we have to teach them. If we consider what nation was able to preserve its national character and its independence for a long period of time we must come to the conclusion that really the Chinese nation is the only nation which exists after 5,000 years. So we have to learn from the Chinese how to live and how to live in a reasonable way. China has suffered not once but many times from severe economic depressions but has recovered from them and I think we must pay more attention to the way the Chinese live and what they are using as food."

"During the Civil War in this country, soybeans were roasted and used by the Southerners. They were called 'coffee beans'... Soybean flour is used in ice cream. It is said that manufacturers are using it for the same reasons,– better taste, more smooth and better keeping qualities. (See article in Journal of Confectioners and the Ice Cream World of August, 1930)." Prof. Abel of Johns Hopkins found soy sauce stimulated digestion of carbohydrates.

"The soybean is peculiar for its richness in phosphorus and also richness in a certain substance, lecithin. This lecithin is an organic compound of phosphorus and belongs to a group of lipoids. Soybean contains around 1.6 per cent lecithin. This substance is one of the constituents of egg yolk and is the one which gives it its high value. It is a necessary constituent for the building up of the nervous system of human beings. Dr. Levine, of the Rockefeller Institute in New York, found that in soybean there is cephalin, a constituent of the human brain, and so we have two particular substances, which are used as material for the building of our nervous system."

The Chinese soak soybeans overnight and then grind them between millstones, to get a cream. This cream is filtered through cheesecloth, then diluted with water and boiled. "They get a milk such as almond milk which is made from sweet almonds. Soybean milk contains oil and protein necessary to emulsification.

"This soybean milk has been used in China since time immemorial and in the streets of Peking one can see men carrying bottles labeled similar to our milk here. This soybean milk, if kept at room temperature for hours, will turn acid and coagulate. Curds are formed exactly as curds are formed in ordinary milk. But the Chinese cheese [tofu] is made not by turning the milk acid but by curding it in a special way. They use the mother liquid from sea water after table salt manufacture [nigari] or a little plaster of paris" [calcium sulfate].

723. **Product Name:** Madison Soy Milk (Homogenized Fluid. Renamed Kreme O'Soy Milk by April 1937 and Kreme-O-Soy by 1947) [Plain, or Chocolate].
Manufacturer's Name: Madison Foods.
Manufacturer's Address: Nashville Agricultural Normal Institute, Madison, Tennessee.
Date of Introduction: 1931. October.
Ingredients: Fall, 1948: Soybeans, soy oil, dextrose, calcium phosphate, sodium chloride.
Wt/Vol., Packaging, Price: 15 oz, 19 oz, or 20 oz can.
How Stored: Shelf stable.
Nutrition: Protein 3.5%, fat 3.9%, carbohydrates 4.9%, ash 0.7%, calcium 0.34%, iron 4.4 mg/k.
New Product–Documentation: *Madison Survey* (Madison, Tennessee). 1931. "A valuable but neglected food." Oct. 21. p. 163. "The Madison School family is enjoying the milk made from soybeans."

Hansen, J.E. 1932. "A variety of foods from the soybean." *Madison Survey* (Madison, Tennessee). Jan. 27. p. 15. "Were our readers visiting the Madison Food Factory, they would be surprised to learn of the many ways in which the soybean is used. Bread, crackers, milk, and cheese are made from this important bean."

Madison Health Foods. 1934? *Vegetable milk and cheese. How they are served. Manual No. 2.* Madison, Tennessee. 21 p. Undated. Several recipes call for "soy milk" or "soybean milk." On the last page are listed "Products for sale by Madison Health Foods Inc. (Madison, Tennessee)": These include "Soy milk, 14 or 30 oz... Write for information and prices."

Madison Survey (Madison, Tennessee). 1937. "Experimental work with foods." 19(9):35-36. March 3. "Soy milk, fresh every day, is used in quantities by the institution. Soy milk in cans is one the market, its sale increasing continually as people become acquainted with the value of this product."

Note: We cannot be certain that Madison Foods had canned soy milk on the commercial market before March 1937. The earlier products may have been fresh soy milk, made by Madison Foods in quantity, and served in the

school's dining room and hospital.

724. Siddall, A.C.; Chiu, Y.T. 1931. A feeding experiment with soybean milk. *Lingnan Science Journal* 10(4):387-91. Oct. 1 plate at end. [7 ref]

• ***Summary:*** "For various reasons soybean milk has not found general favor in this [Kwangtung] province, and with the view of emphasizing the great value of this food and perhaps aiding in making it popular the following infant feeding experiment was undertaken at Canton Hospital starting April 1930 and closing June 1931. This period of almost 14 months is perhaps the longest feeding experiment of soybean milk yet presented."

Starting at the age of 6 weeks, a Chinese infant was fed on soybean milk for 13 months and 3 weeks. A graph shows that his growth was normal; at the age of 15 months, he weighed 10 kg and measured 75 cm in length. The soybean milk was supplemented with rice porridge, vegetables, eggs, and cod liver oil. The somewhat disagreeable taste of the soybean milk and its laxative factor were partially overcome by the addition of agar-agar, malt sugar, or rice water. Refined soybean oil added to the whole soybean milk in quantities of 10 cc daily caused no digestive disturbance.

Photos show (see next page): (1) Baby Sz Ling, age 6 months. (2) Baby Sz Ling, age 13 months. Address: Canton Hospital and Dep. of Chemistry, Lingnan Univ., Canton, China.

725. Webber, P.A. 1931. Facts concerning the soybean. *Madison Survey* (*Madison, Tennessee*). 13(45):177-78. Nov. 18; 13(46):181-82. Nov. 25.

• ***Summary:*** "The soy bean is the only seed, as far as we know, which contains both the water soluble and the fat soluble vitamins."

"In 1917 during the World War, a special committee appointed by the Department of Agriculture, while searching for a cheaper source of protein for human consumption, discovered the soy bean. Shortly afterwards, soy bean in the form of flour was manufactured and this has been on the market now for some time. The entire soy bean ground into flour contains double the amount of protein and calories present in beefsteak."

"The soy bean is also very rich in lecithin. It has been clearly shown the soybean oil contains fat soluble vitamins A, D, and E."

A soybean milk can be prepared "in the same way as almond milk... Many tests have been made in the pediatrics departments of various universities in the United States showing that soybean milk can be used as the only source of protein in the nutrition of young infants." Also gives details on tofu. "In the Orient, 'tofu' forms a very popular and almost indispensable dietary article. This 'tofu' can be used in many different dishes, taking the place of meat or eggs. It is delightful as a constituent of roasts, omelets, etc."

"In Russia the soybean is taking prominence in the dietary of the people there. 'Plant soybeans and you plant meat, milk, egg omelets,' is the newspaper cry. A Soy Institute was recently organized in Moscow as well as a special exhibition of soy foods at which one hundred thirty varieties of soy dishes, including cutlets, pastry, salads, candy, and beef were shown. There is every reason to believe that the United States will become the leaders in introducing the soybean in the daily diet of the white race."

"The following are a few of the ways in which it is being prepared and used in the United States at the present time: Soybean flour is being used by large bakeries as a constituent of bread, rolls, pastry for pies, cakes, etc. Baby foods are coming on the market containing certain percentages of soybean milk. Chocolate malted milk containing a good per cent of soybean products is now manufactured and sold by several companies. For some time, manufacturers of diabetic foods have been placing on the market productions made largely from the soybean. The soy sauce, otherwise known as Oriental 'Shoyu' has been popularized by the Chinese chop suey restaurants, and is now being used in many dishes made in the home. The bean curd is being canned and manufactured in various other ways and sold on the market. Powdered soybean milk has become a commercial product."

"For several years the Health Food Department of the Nashville Agricultural Normal Institute has been experimenting with this most interesting legume, and is now offering two basic products which may be used in many nutritious and appetizing dishes: the soy cheese and soybean flour. These two products have been used in scores of recipes tested out at the Madison Rural Sanitarium, the Nashville Vegetarian Cafeteria, and other health food places. Just recently several different recipes for the use of soybean flour bread, rolls, and cakes have been perfected. These with other recipes, will be sent free to those who inquire for them."

"A move to substitute vegetable proteins for animal proteins is a move in the right direction, and there is no plant so promising as the soybean. A soybean research foundation has been suggested. Large space at the coming World's Fair in Chicago [Illinois] will do much to bring this important but neglected food to the attention of the American people."

Note: This article was reprinted as a little 8-page booklet (15 x 9 cm, undated) by T.A. Van Gundy of La Sierra Industries. This shows that Van Gundy was aware of the pioneering work of Madison Foods at an early date. On the last page of Van Gundy's booklet is the following paragraph which does not appear in P.A. Webber's original article: "For some time the founders of La Sierra Industries, Arlington, California, have been experimenting with this most interesting legume and are now prepared to offer a number of products which may be used in many nutritious and appetizing dishes: canned soys, soy soup, soy flour, soy cheese, soyco (a coffee substitute), smoein (vegetable smoked meat), soy breakfast food and soy-loaf." What a

shame that this little booklet is not dated! At least we know it was printed after November 1931. Address: PhD, Madison, Tennessee.

726. *Food Manufacture* (*London*). 1931. Trade notes: Edible soya flour. Soyolk in health drinks and foods. 6(11):334-35. Nov.
• ***Summary:*** "The pure edible soya flour (Soyolk) with a 20 per cent. fat content, prepared from the soya bean by the Berczeller process, is meeting with a ready response from many of the leading food manufacturers in U.S.A. After importing Soyolk from the British company for just over a year, the American concessionaires operating this process, we are informed, have commenced milling activities in a large plant at Nutley, New Jersey, and are supplying numerous bakers, confectioners, and food manufacturers with their product, known under the trade name of Soyex." Discusses the many types of American foods in which Soyex is used.

"A new field which Soyolk is said to be invading is that of the ready-to-take health food drink... A breakfast food in which soya bean flakes or puffed beans appear is one of the latest applications of this valuable food material, and salted soya beans promise to compete with salted almonds, the new invader being not only considerably cheaper in cost, but also easier to digest.

"English manufacturers will not be slow to follow the lead given by those in the American food industry..."

Note: This is the earliest English-language document seen (Dec. 2012) that uses the term "salted soya beans" to refer to soynuts. Address: UK.

727. Genin, G. 1931. La caséine végétale: Propriétés et emplois. I. [Vegetable casein: Properties and uses. I.]. *Industrie Chimique* (*L'*) 18(214):784-85. Nov. Abstracted in Le Genie Civil 100(14):352. April 2, 1932. [1 ref. Fre]
• ***Summary:*** In this article are described the preparation of the vegetable milk from soybeans from which the casein is derived, the preparation of casein in industry, and its industrial uses. To make vegetable casein the oil is first removed from soybeans. Carbon tetrachloride can be used. The protein is then extracted from the defatted cake and precipitated, using acetic acid or soda. (The Chinese and Annamites prepare vegetable casein in sheets, which are very delicate and yellow in color.) The coagulated liquid is separated from the liquid supernatant, washed and dried. The resulting product (which may be treated with formol) can be used to make galalithe/galalith (a hornlike or plastic, often transparent substance), adhesives, porcelain, oil-based paints, paper coatings or sizings (to make paper more resistant to and impenetrable by water), soap, insecticides, and cellulose-type products. Address: Ingenieur Chimiste E.P.C.I.

728. Wan, Shing. 1931. A comparison of the dietary properties of "soybean milk" and cow's milk. *Chinese J. of Physiology* 5(4):353-62. Nov. [12 ref. Eng; chi]
• ***Summary:*** "It is evident... that before soybean milk can be recommended as a general substitute for cow's milk, further work is necessary.

"We have therefore conducted some further experiments to compare soybean milk with cow's milk and repeated some of Tso's experiments.

"The nutritive value of soybean milk has been compared with that of cow's milk (Klim). The fresh soybean milk is poorer in vitamin A but richer in vitamin B than cow's milk..." Address: Dep. of Biochemistry, Peiping Union Medical College, Peiping.

730. Lane, Dorothy Engelhard. 1931. The nutrition of twins on a vegetable diet during pregnancy, the nursing period and infancy. *American J. of Diseases of Children* 42:1384-1400. Dec. [35 ref]
• ***Summary:*** The writer contends that while cow's milk has many advantages, it also has disadvantages" which are then summarized.

She arranged an experiment with an expectant mother who gave birth to healthy twins. The twins were nursed with mother's milk, supplemented at first by lactic acid cow's milk. A little orange juice and cod liver oil were given at each feeding. Gradually a vegetable milk was substituted for that from the cow and became the only milk used. This artificial milk was prepared by grinding unblanched almonds to make three level tablespoonfuls, and unroasted peanuts to make half a tablespoon. To these were added one half tablespoonful of wheat flour, one-fourth tablespoonful of shorts, one tablespoonful of soy flour, and one half tablespoonful of corn starch. Vegetable water was prepared from celery, chard carrots, string beans and lettuce according to season. One tablespoon of dextri-maltose and a little salt were added. The milk was rubbed through a fine purée sieve, so that it could be fed from an ordinary nursing bottle. A twenty-four hour supply could be prepared in half an hour.

At the age of two years and eleven months, they have made sturdy physical and mental progress. Their great endurance and strength call for special comment. Note: This vegan diet proved satisfactory in all respects for the nutrition of the mother during pregnancy and for her twins. Address: B.S., Berkeley, California.

• ***Summary:*** Mentions almond milk. Dame Alice de Bryene lived from 1360 to 1434 or 1435. Address: England.

740. Ochse, J.J. 1931. Vegetables of the Dutch East Indies. Buitenzorg (Bogor), Java: Archipel Drukkerij. xxxvi + 1005 p. See p. 366, 389-93, 398, 407-08, 732, 943-71. An entirely revised and greatly enlarged second edition of his Tropische Groenten (1925). Translated by Mr. C.A. Backer. Illust. 25 cm. Index. [10 ref. Eng]
• ***Summary:*** This translation (by Mr. C.A. Backer, the reputed ex-Botanist for the flora of Java) of Ochse's classic "may be taken as an entirely revised and much enlarged second edition of *'Tropische Groenten'* (Tropical Vegetables), which booklet was published in July 1925." The author, a Dutchman who confined his research to Java and Madoera, described the tempeh-making process in detail, saying that the mold used was *Aspergillus oryzae* and that it was obtained from a former batch of tempeh.

Page 366 discusses ontjom (témpé boongkil in Javanese), tetèmpè, and dagè, all made from peanuts. Page 372 notes that the pigeon pea (*Cajanus cajan*) can be used to make témpé bosok.

Pages 389-93 discuss the soya bean, which has various names in local languages. Malay: Katjang djepoon or Kedele. Javanese: Dekeman or Dekenan, Dele, Demekan, Gadele, Kedele, Kedoongsool, or Dangsool. Sundanese: Kadele, Katjang booloo, Katjang djepoon, Katjang kadele. Madura: Kadhele, Kadhellee, or Kedeleh. A description of the plant is given.

Illustrations show: (1) A young soybean plant with leaves and pods (half size). (2) A bamboo scaffolding or curing frame, in tripod form with 3 horizontal supports, used for drying bunches of soybeans.

Soybeans come in two main forms: Light yellowish-brown seeds, and black seeds. The latter are used to make *ketjap* (Indonesian soy sauce). "Of the ripe seeds *pélas* (Jav.) is made, by mixing them with grated young coco-nut [coconut], salt, and other ingredients. The mixture is wrapped in a banana leaf and steamed.

"The seeds can also be roasted and afterwards pounded. The *boobook, boobook delé* or *boobookan* (Jav.) is eaten in the shape of powder, usually with the addition of lombok and other ingredients."

Note 1. This is the earliest English-language document seen (Nov. 2012) that mentions Indonesian roasted soy flour, which it calls *boobook, boobook delé* or *boobookan.* As of Nov. 2012 this roasted soy flour is usually called *bubuk kedele* or *bubuk kedelai.*

"The seeds are mixed with a porridge of rice-meal and water and afterwards fried in coco-nut oil. This dish is called *rempeyek* (Jav.). It consists of brown slices in which the black *kedele*-seeds are scattered. *Rempeyek* is eaten either as a delicacy or with the rice table. "Témpé [tempeh, p. 391] is a much used product. In East- and Central-Java it takes the same place as the ontjom in West-Java. It is prepared in much the same way as *ontjom,* and the reaction is brought about by the same fungus, *Rhizopus Oryzae,* Went et Prinsen Geerligs, which is transmitted by *ragi.* The seeds are cooked and, after they have cooled, put in a basket. By stirring, rubbing and even by treading, coupled with repeated washing with fresh water, one tries to remove the testa [seed coat / hull] from the seeds. When this has been done, the seeds are put on hurdles (*sasak*) covered with banana- or waroo-leaves. Now the so-called *beeang,* i.e. rests of the fungus used for a former batch, is sprinkled over them and the mass is turned over on other sasaks. The *témpé*-cakes treated in this way are kept indoors and after two or three days the fungus has spread sufficiently for giving a light grey colour to the cakes, which then are soft and dry and ready for use. They are sold on the markets either cut into small pieces or divided at pleasure, according to the amount of money the buyer wishes to spend. *Témpé* is used, fried, in the *sayor* or prepared with all sorts of ingredients.

"Other products for the native market are *tahoo* [tofu] and *takoäh* [pressed tofu; Chinese: doufugan]. Both are eaten either boiled or cut into small slices, fried and added to *gado-gado* or, lombok rawit being added, as a side dish.

"For the preparation of *tahoo* or *takoäh* the seeds are soaked, ground fine, boiled and pressed through a cloth. The juice which is pressed out is mixed with salt, vinegar, coco-nut milk or with unburned gypsum (so-called *batoo tao*), imported from China. By this treatment a white gelatinous mass is formed, which, after cooling, can be cut into pieces."

"Wet *tahoo* does not keep well for a long time. For this reason it is soon made into *takoäh.* For this purpose the *tahoo* is cut into pieces, folded in pieces of cloth, pressed in order to remove part of the water and next boiled in a decoction of koonir [turmeric]. The product obtained in this way has an intense yellow color and is a much relished delicacy, especially with lombok rawit [fiery dwarf chilies]."

Taotjo [Indonesian-style miso] is a porridge made of soybeans and rice meal. The soybeans are soaked, dehulled (the testa removed), cooked, and left to cool. Then they are mixed with the meal of rice (regular or glutinous), which has been previously roasted. "The porridge obtained in this way is poured on winnows (*tampah* [winnowing trays]) covered with waroo-leaves, sprinkled with *ragi* or *beeang,* probably of *Aspergillus Wentii,* Wehmer, and covered with leaves. The filled tampahs are piled on each other and left alone till the cakes are very mouldy. Then they are dried in the sun, soaked in brine and mixed with sirup of *arèn* [sugar palm] and with *tapè* [*tapai;* a sweet fermented cake] of rice or glutinous rice. Next the porridge is placed out of doors. After the seeds have become soft by this treatment, which takes three or four weeks, the *taotjo* is ready for use.

"*Taotjo* must be boiled, otherwise the smell is to strong. It is eaten with cooked or raw vegetables. It is used for dressing some dishes of meat or fish, whilst it is also a material of which diverse side dishes are made."

Note 2. This is the earliest English-language document seen (March 2009) that uses the word "taotjo" to refer to Indonesian-style miso.

"According to De Bie (1901), *tao djee* [*tao dji; doushi, douchi*] is *taotjo* alternating with layers of cooked whole *kadelè*-seeds. This stuff is put into a pot or basin with some salt and boiled arèn-sugar. The mass is left to itself during a few days till the *taotjo* has become pervaded by the salt and the sugar and has assumed a uniformly brown colour. Note 3. *Tao djee* [*doushi*] is fermented black soybeans, which are not the same as *Taotjo* [Indonesian-style miso]. De Bie (1901) seems to have made a mistake.

"Of the black *kadelè*-seeds *soya* [soy sauce] is made, exclusively by the Chinese and the natives. First the seeds are cooked in a strong solution of salt. After diverse manipulations the cooked seeds are mixed with arèn-sugar and so-called soya-condiments and the mixture is concentrated till the salt begins to crystallize. By diluting this product with more or less water one obtains the diverse qualities of *kètjap* or *soya* found in commerce."

The "Pemimpin Pengoesaha tanah" of 15 Jan. 1915 lists various ingredients that can be used with black soybeans in making ketjap. "Young seedlings, obtained, like *taogè* [*taugé,* bean sprouts], by fermenting, are called *ketjambah kedele;* they are cooked and eaten as *petjel* (Jav.) with the rice (*ganteng,* Jav.)"

"Finally young leaves of *Kadele* can be eaten, raw or steamed, as *lalab.*

Page 398 describes *dagè* and *témpé bengook* made from these seeds of the velvet bean (*Mucuna pruriens*). Roasted tempeh are also discussed.

Pages 407-08 states that the seeds of the *Katjang oji*

(rice bean) can be used for the preparation of tempeh.

Pages 414-15 state that, when they have no soybeans, the Chinese use mung beans (*Katjang eedjo*) to make tofu and takoah, but they are most widely used to make mung bean sprouts (*taogè*).

Page 634 mentions témpé bosok (overripe tempeh) made with the foul-smelling bruised leaves of the plant *Paederia foetida*. Page 732 also mentions overripe tempeh.

Note 4. This is the earliest English-language document seen (Dec. 1998) which contains detailed information about tempeh, or which refers to tempeh as "témpé."

Note 5. This is the earliest English-language document seen (April 2013) that uses the word "tahoo" or the word "takoäh" to refer to tofu. Address: Buitenzorg (Bogor), Java, Indonesia.

• ***Summary:*** Includes a section on the feeding of soy milk to animals, with tables showing results. Address: Institut de Physiologie generale de la Faculte des Sciences de Strasbourg.

742. Yang, Ximeng; Tao, Menghe. 1931. A study of the standard of living of working families in Shanghai. Peiping: Institute of Social Research. 86 + lvi p. See p. xxxii. 23 cm. Series: Social Research Publications, Monograph No. III. Facsimile edition reprinted in 1982 by Garland Publ. Co. (New York). [40 ref]

• ***Summary:*** Note 1. On the title page, the authors' names are given as Simon Yang and L.K. Tao.

Contents: Part I: General results. Part II: Statistical tables.

In Part I, section IX is titled "The standard of living food" (p. 47-55). The 2nd most important type of food, after "(a) Cereals and products" is "(b) Legumes and products," which states (p. 48): "Of beans, the young soy bean (Chinese characters: mao dou) formed the principal kind, but among the bean products, bean sprouts, bean curds of various makes and mung bean starch were consumed in considerable quantities."

Page 49: "(g) Fat and oil: Bean oil [soy] formed the most important article in this class, of which the average consumption was 4.78 catties (2.8 kg) per family per month. Lard, the second in order, lagged far behind..."

"(h) Condiments: Salt and soy sauce were the principal articles of this class."

Page 50: Whereas rice accounts of 44.6% of total expenses, legumes and products account for only 7.6%. More rice and legume statistics appear on page 53.

In Part II, "Statistical tables," six long tables mention soy as follows: I. "Average quantity of and expenditure for the principal articles purchased per family per month, by income groups" (p. ii-iii): Yellow soy bean sprouts, 0.15 expenditures. Soy bean curd, 0.26. Sheet bean curd, 0.18 [pressed tofu sheets, pai-yeh or ch'ien-chang]. Bean curd, fried, 0.10. Bean curd, dried [doufu gan] 0.16. Soy bean oil, 1.19. Soy bean sauce 0.38.

II. "Average quantity of and expenditure for the principal articles purchased per family in each of the twelve months under investigation (p. viii-xxx): There are entries for: Yellow soy bean sprouts, 1.87 annual expenses. Soy bean curd, 3.14. Sheet bean curd, 2.15. Bean curd, fried, 1.19. Bean curd, dried [doufu gan] 1.95. Yellow soy bean, 0.38. Young soy beans with pods [mao dou, edamame], 0.81.

III. "Average quantity of and expenditure for the "other" articles of food purchased per family in a year" (p. xxxii, xxxvii). Bean curd, fermented, odorous, 0.05 annual expense [ch'ou toufu]. Soy bean milk, 0.17. Fried beans, with salt, 0.21. Fermented bean curd, fried, 0.05. Bean curd skin, 0.02. Bean curd, fermented, with fragrant malt, 0.05. Bean curd, frozen, <0.005 [tung-toufu, ping-toufu]. Bean curd skin, cooked in skein forms, <0.005. Dried bean curd, fried, 0.005. Bean curd, fermented, 0.6. Soft bean curd, 0.05. Soy bean dregs, 0.02 [okara?]. Sheet bean curd, in skein [netlike] forms, > 0.005. Soy bean paste, 0.01.

Note: This is the earliest English-language document seen (Oct. 2011) that uses the word "odorous" or the term "Bean curd, fermented, odorous" to refer to *ch'ou toufu*.

VI. "Average quantity and fuel value of food consumed per family in a year" (p. l-li). This table has 6 columns. (1) Classes and articles of food. (2) Quantity, total (grams). (3) Quantity of protein, grams. (4) Quantity of fat, grams. (5) Quantity of carbohydrates, grams. (6) Fuel value, calories. Note 2. For soy products we will give only the quantity / amount purchased each year per person in grams. Yellow soy bean sprouts, 34,229. Soy bean curd, 55,080. Sheet bean curd 8,34. Bean curd, fried, 6,163. Bean curd, dried, 13,218. Yellow soy bean, 2,407. Mung bean sprouts, 15,257. Note 3. The weight of mung bean sprouts purchased was less than half (44.5%) the weight of yellow soy bean sprouts purchased. Young soy beans with pods, 7,180. Bean curd, fermented, odorous, 364. Soy bean milk, 6,963.

At the end of the book is a very interesting bibliography of the best books on China's economic and social development, divided into these periods: China during the interregnum [Republic of China] (1912-1949). Modern Chinese economy: The late imperial period (late 19th and early 20th centuries), the agrarian economy, foreign trade and investment, 20th century economic development, labor and the economy. The wartime economy and postwar problems.

Note 4. This book would have been much more useful if the Chinese names of these foods (in both Chinese characters, and transliterated) had been given. We are unsure of the exact identity of: (1) Fried beans with salt. Are these

salted, oil-roasted soybeans? (2) Bean curd fermented with fragrant malt vs. bean curd, fermented, odorous. Address: China.

743. La Sierra Industries. 1931? La Sierra soy bean products (Leaflet). Arlington, California. LSI. 3 panels each side. Each panel: 22 x 9 cm. Undated. [2 ref]
• ***Summary:*** Gives a 6-7 line description of each of the following products prepared by the company in Arlington: Soy Beans (canned, plain or with tomato sauce), Soy-Co, Soy Flour, Mamenoka [roasted soy flour], Soy Milk, Soy Cheese, Soy Loaf, Soy Bologna, Soy Sandwich Spread, Smoein, Soy Bean Butter [soynut butter], Soy Bean Breakfast Food.

"Smoein is a smoked vegetable protein made from legumes which have been toasted and smoked in the old fashioned way, giving the flavor of smoked meats. It is an excellent seasoning for soups, gravies, entrees, eggs and any food in which a smoked flavor is desirable.

"Soy Bean Butter is similar to peanut butter, however it does not contain any nuts. It may be served plain or mixed with water to dilute. A delicious spread is made by mixing equal parts of honey and soy bean butter." Note 1. This product is almost surely soynut butter. If so, this is the earliest English-language document seen (Dec. 2012) that uses the term "soy bean butter" to refer to soynut butter.

Note 2. This is the earliest published document seen (Sept. 2000) related to T.A. Van Gundy or his company, La Sierra Foods. Note 3. This is the earliest English-language publication seen (April 2013) that uses the term "Soy Cheese" to refer to tofu. T.A. Van Gundy coined and later frequently used the term "soy cheese" to refer to tofu.

Note 4. This is the earliest English-language document seen (Nov. 2012) that uses the word "Mamenoka" to refer to roasted soybean flour. It is a variation on or misspelling of the Japanese term *mame no ko* meaning "flour of [soy] bean."

Note 5. This is the earliest English-language document seen (Nov. 2012) that uses the word "toasted" in connection with roasted soy flour. Address: Arlington, California.

744. Hansen, J.E. 1932. A variety of foods from the soybean. *Madison Survey* (*Madison, Tennessee*). 14(4):15. Jan. 27. [1 ref]
• ***Summary:*** "Were our readers visiting the Madison Food Factory, they would be surprised to learn of the many ways in which the soybean is used. Bread, crackers, milk, and cheese are made from this important bean. The flour is ground on the hammer mill in the factory... Roasts, bean loaf, and croquettes are made from it. Ice cream made from the soybean is delicious." Address: Madison College, Tennessee.

745. Ch'en, Shen-Chao; Adolph, William H. 1932. Bone building potency of soy bean diets. *Chinese J. of Physiology* 6(1):59-62. Jan. [6 ref. Eng; chi]
• ***Summary:*** "Read before the Fifth Annual Meeting of the Chinese Physiological Society... at Peiping, February 16-18, 1931.

"In connection with our interest in the use of soy bean milk in nutrition, experiments were projected for the purpose of evaluating the bone building properties of soy bean product and comparing them with cows' milk."

Cow's milk, soy bean milk, and soy bean curd (tofu) were added to a rachitic diet. Cow's milk was shown to be decidedly superior to soy bean milk in preventing rickets. Cow's milk itself does not rank high as an anti-rachitic food. Thus soy bean milk, when used in infant feeding, should be amply supplemented with both calcium and vitamin D. Soy bean milk seems to be slightly superior to soy bean curd in bone-building capacity. Address: Dep. of Chemistry, Yenching Univ., Peiping, China.

746. Chiu, Yan-Tsz. 1932. Analyses of Chinese foods. II. Determination of pentosans in soybeans and soybean milk. *Lingnan Science Journal* 11(1):1-3. Jan. [3 ref. Eng]
• ***Summary:*** "It is found that the amount of pentosans present in the milk varies with the filter used in making the milk and also the size of the bean particles ground in the mill..." The beans contained 4.41-5.24% pentosans, and the milk 0.051-0.149%. Address: Prof. of Chemistry, Lingnan Univ., Canton, China.

747. Genin, G. 1932. La caséine végétale: Propriétés et emplois. II. [Vegetable casein: Properties and uses. II.]. *Industrie Chemique* (*L'*) 19(216):6-8. Jan. Abstracted in Le Genie Civil 100(14):352. April 2, 1932. [1 ref. Fre]
• ***Summary:*** This article describes the preparation of the vegetable milk from soybeans from which the casein is derived, the preparation of casein in industry, and its industrial uses. Address: Ingenieur Chimiste E.P.C.I.

748. André, E.; Hou, Kia-wo (Hu, Chia-mo). 1932. Sur la présence d'une oxydase des lipides ou lipoxydase dans la graine de soja, *Glycine soja* Lieb. [On the presence of a lipid/lipoid oxydase or lipoxydase in the soy bean]. *Comptes Rendus des Seances de l'Academie des Sciences* (*Paris*) 194(7):645-47. Feb. 15. (Chem. Abst. 26:3004). [Fre]
• ***Summary:*** The authors coin the term "lipoxydase" [in French] based on comparing the composition of oil extracted from soy flour, tofu, and okara. Exposure to the air of the unboiled residue from the preparation of soya-bean "milk" causes an increase in density and acetate value and a decrease in iodine value of the ethyl ether extract as compared with the corresponding values for the boiled material. This is believed to indicate the presence of a lipid oxidase.

Note: This is the earliest document seen (July 2003) that mentions "lipoxydase" (or "lipoxidase"), an enzyme which

was first reported in soybeans. Address: France.

749. Wan, Shing. 1932. Comparison of soybeans and milk in contents of vitamins B-1 and B-2. *Chinese J. of Physiology* 6(1):35-40. Feb. 15. [8 ref. Eng; chi]
• ***Summary:*** Soybeans contain only 2/3 as much vitamin B-2 (anti-pellagric factor) but 3 times as much vitamin B-1 (anti-neuritic factor) as Klim (whole cow's milk powder). The tests were conducted on rats using yellow soybeans (dried and finely ground) and Klim. Many growth curves are plotted. Address: Dep. of Biochemistry, Peiping Union Medical College, Peiping.

750. Concepcion, Isabelo. 1932. The greater significance of soy bean in the Filipino dietary. *J. of the Philippine Islands Medical Association* 12(3):97-106. March. [9 ref]
• ***Summary:*** "Read in the Symposium on Nutrition... Manila Medical Society on January 25, 1932." The Philippine diet is considered deficient in animal protein, calcium, vitamins (especially thiamine, leading to beriberi), and fat. One of the foods which can help solve these nutritional problems "and which is available in large quantities in this country is the soy bean (*Glycine max*), or what is commonly known as Chinese *balatong.* Since time immemorial this article of food has been well known in this country but people have not sufficiently taken advantage of its good dietary qualities... Dr. Manuel L. Roxas, Director of the Bureau of Plant Industry, says 'soy beans are grown in large quantities in Batangas [on the southern tip of the main Philippine island of Luzon] and will grow almost anywhere in the Philippines. The green pods are harvested in October and November and the dried seeds may be had in bulk in December and January.' Statistics show that the production of soy beans in the Philippines increased from 2,481 tons in 1921 to 4,218 tons in 1930, and importations from 1924 to 1930 gave a recorded increase of 4,657 tons. These figures indicate that consumption of soy beans has grown faster than production. They also clearly indicate a growing appreciation of the soy bean in this country. I am convinced, however, that greater efforts toward its popularization among the laity should be exerted, so that we might make it one of our staple foodstuffs."

Tofu is shown to be a good source of minerals, especially calcium. A diagram from Piper and Morse (1923) shows the various ways in which the plants and seeds of soy beans are utilized. A detailed discussion of the value of soy flour and soy milk is given. "The introduction of soy-bean flour as a constituent of bread, muffins, macaroni, biscuits, crackers, etc. not only is desirable but also will diminish tremendously our importations of flour, which are increasing every year."

"Compared with cow's milk, soy-bean milk has in its favor the following points: (1) Soy bean milk can be produced with less contamination; (2) it is free from infection by tuberculosis; (3) its casein breaks down much more readily than the casein of cow's milk and does not form curds in the stomach in the same degree; (4) it is much cheaper than cow's milk. At the present market price the cost of a liter of soy-bean milk is only 0.03 pesos compared with 0.30 pesos for either fresh or artificial milk."

"With a well-laid-out campaign to promote the intelligent use of soy beans, it is probable that inside of ten years the food and population problem will be well out of the way for centuries to come." Address: Dep. of Physiology and Biochemistry, College of Medicine, Univ. of the Philippines.

751. Donath, W.F. 1932. De voedingswaarde der sojaboon en enkele daaruit bereide specifiek Indische voedingsmiddelen [The nutritive value of soybeans and some specifically East Indian foods prepared from them]. *Landbouw* (*Buitenzorg, Java*) 7(9):705-40. March. English-language summary, p. 759-61. Also in: Dutch East Indies Dept. of Agriculture..., ed. 1932. Kedelee. Buitenzorg, Java: Departement van Landbouw, Nijverheid en Handel. Afdeeling Landbouw. p. 139-74, 193-95. [48 ref. Dut; eng]
• ***Summary:*** Discusses the composition of the soybean. "In contrast with Manchuria, where it is a common article of diet, the soybean is rarely used as such in these parts; but by means of various operations, among which is the action of certain fungi, several products are prepared from it.

"These products, such as *tempe kedele, taotjo, tahoe, taokoan* and *ketjap* are important items in the native diet. Except for the last mentioned, the preparation of these products is such that the albumins are preserved practically intact, so that, especially in tempe, as we were able to point out, the biological albumin value is very high...

"*Soymeal,* which is prepared by removing the husks and then pounding what is left, has the drawback that it tastes somewhat bitter and, in consequence of the high percentage of fat, soon becomes rancid... Berczeller, however, seems to have succeeded in obtaining an improved soy meal...

"Finally, in discussing the importance for the native diet of these beans and the products prepared from them, the author arrives at the conclusion that it is especially the albumins that are important, the people being practically vegetarian and these foods being, in addition, rich in carbohydrates.

"Thus the author expresses his approval of the fact that of late years the *Department of Agriculture, Industry and Commerce* has advocated the growing of the soybean and the consumption of the products prepared therefrom."

Note 1. This is the earliest English-language document seen (the summary) (Sept. 2005) that contains the word "soymeal," which apparently refers to whole (full-fat) soybean flour.

Note 2. This is the earliest document seen (April 2001) that contains the word *taokoan.* Address: Hoofd van het Analyselaboratorium te Buitenzorg, Java.

752. Dugard, Jean. 1932. La valeur alimentaire et industrielle du soja [The food and industrial value of soya]. *Genie Civil* (*Le*) 100(17):419-20. April 23. [3 ref. Fre]
• ***Summary:*** Contents: Introduction. *USDA Farmers' Bulletin* No. 1617, by W.J. Morse. Botanical characteristics of the soybean. Composition and food value of the soybean. Products derived from soya eaten by humans: Tofu, soy oil, shoyu [soy sauce] (called "soy" in English), soy flour, soy sprouts, miso, natto. The use of soya as forage. Industrial uses of soy oil and cake. The soybean in western Europe: Hansamuehle in Hamburg, Germany; Englehardt & Cie. in Frankfurt, Germany (making powdered soymilk, soy caseine, soy lecithin, etc.); Soybean cake used for animal feed in England, Denmark, Holland, Sweden, and–above all–in Germany, where more than 2 million tons/year are consumed.

753. Squirrell, W.J.; Laughland, J. 1932. Soybeans in Ontario. *Ontario Department of Agriculture, Bulletin* No. 366. 16 p. April.
• ***Summary:*** Contents: Origin and importance. Description. Composition. Climatic adaptation. Rotation. Soil and soil preparation. Manures and fertilizers. Varieties. Seed selection. Inoculation. Harvesting. Threshing. Uses of the crop: Hay, as a soiling crop, ensilage, pasture, soil improvement, ripe seed, straw, soybean oil, meal, other products. What farmers think of soybeans (Extracts from reports by 21 men who have grown and fed the crop from the following places (mostly counties): Durham, Dundas, Brant, Elgin, Frontenac, Grenville, Halton, Hastings, Kent, Lambton, Middlesex, Oxford, Perth, Simcoe, Welland, Wellington).

"Soybeans were first tested in the experimental plots at the Ontario Agricultural College in 1893 and first distributed for co-operative tests from the College to farmers in 1901."

"More than one hundred varieties of soybean have been tested for fodder and grain production by the Field Husbandry Department of the Ontario Agricultural College. Some of these varieties matured sufficiently early to be successfully grown in Ontario. Many, however, are too late for the climatic conditions of the Province and do not even reach the best fodder conditions before the arrival of killing frost."

Two tables (p. 6-7) show the average results for 6 years in testing 21 varieties of soybeans for fodder and for grain by the Department of Field Husbandry at the Ontario Agricultural College. In each table the varieties are sorted by descending yield of green fodder or grain [seed]. The varieties are: O.A.C. No. 211, Habaro No. 20405 (Wash. [Washington, DC]), Ito San Soja, Black Eyebrow (Jeffrey), North's, Minnesota No. 167 (Minnesota Exp. Station), Manchu, Early Yellow (O.A.C. No. 111), Elton, Medium Green (O.A.C.), Mandarin, Chestnut, Tsurunoko, Oyaji, Shiro Kotsubu, Early Yellow, Black Ontario, Quebec No. 92, Black Manchurian (Jeffrey), Brown, Ogema. For fodder, the "O.A.C. No. 211, which stands first with an average yield of 10.16 tons of green fodder per acre for the 6-year period, is a plant selected strain, developed by the Ontario Agricultural College, from the Habaro variety and is the only variety of soybeans eligible for registration in Canada." The plants were cut on Sept. 7. For grain/seed production Black Ontario has the highest average yield over the 6 years at 28.47 bushels/acre, followed by North's (28.42), O.A.C. No. 211 (27.73), and Black Manchurian (Jeffrey; 27.12). The plants were cut for harvest between Sept. 23 and Oct. 9. The Black Ontario was received from a grower in the Manitoulin Island in 1924. It produces small, black grain and straw of medium length. "The O.A.C. No. 211 has proven to be the best general purpose soybean tested at the College."

Soybean oil "is used in the manufacture of soaps, paints, rubber substitutes, printers ink and other articles. It is also used as a salad oil and as a substitute for butter and lard."

"In China and Japan soybeans are used in many ways as human food. The green pods, dried seed cakes, soy sauce and soybean milk, all have their place. In America soybean flour is made into cakes, biscuits, muffins, and being low in starch it has a special place as a diabetic food."

The article contains 11 photos, including one of 2 horses pulling a rotary hoe, and fields of soybeans growing in Peel, Welland, Dundas, Kent, Middlesex, and Lincoln counties. Address: Dep. of Field Husbandry, Ontario Agricultural College, Guelph.

754. Cruz, Aurelio O.; West, Augustus P. 1932. Composition of Philippine soy beans and soy-bean oil. *Philippine J. of Science* 48(1):77-88. May. [32 ref]
• ***Summary:*** In 1930 the Philippines produced 4,218 tons of soybeans. In 1911 O.W. Barrett, Chief of the Division of Experiment Stations, Philippine Bureau of Agriculture, strongly encouraged the Philippine Agriculturist to "to take up soy bean culture in earnest." But 20 years "after this advice was given we find the Philippines are producing an annual yield of only a few thousand tons of soy beans although, as shown by experiments, this is a very suitable and appropriate crop for this country. With this idea in view," in 1931 staff members of the Philippine Bureau of Science wrote various newspaper articles to popularize soybeans and gave a display of food products made from soy beans at carnival in Manila.

A short survey of the nutritional factors of soy beans is given. The Philippine beans are rich in fats (20%), proteins (39.1%), and carbohydrates (24.96%). The oil had iodine value 128.4, saponification value 193.3, unsaponifiable matter 1.0%, unsaturated fatty acids (corrected) 81.5% (iodine value 151.3), saturated fatty acids (corrected) 12.65%. The composition of the fatty acids is given as: (α-)linolenic 2.1%, linoleic 53.0%, oleic 30.1%, palmitic

8.9%, stearic 3.8%, and arachidic 0.6%. Address: Bureau of Science, Manila.

755. Stegman, Henry M. 1932. Babies thriving on vegetable milk. *Good Health* (*Battle Creek, Michigan*) 67(5):38-39. May. [1 ref]
• ***Summary:*** "Nutritionists place milk first among foods. They urge that every child should have a quart a day and every adult a pint–some say a quart." There follows a detailed summary of: Lane, Dorothy Engelhard. 1931. "The nutrition of twins on a vegetable diet during pregnancy, the nursing period and infancy." *American Journal of Diseases of Children* (Dec. 1931, p. 1384-1400). "At the age of two years and eleven months, they have made sturdy physical and mental progress. Their great endurance and strength call for special comment."

756. Tsen, Edgar T.H.; Sung, Shih-Hung. 1932. Soybean culture media: A preliminary report. *Chinese Medical Journal* 46(6):603-06. June. [Eng]
• ***Summary:*** "At present meat and peptone form the principal basis of nearly all culture media employed for the cultivation of pathogenic bacteria... They naturally constitute a heavy item of expenditure. So we have found it necessary to find a cheap and yet suitable substitute." A substitute was made as follows: Soak 100 gm dry yellow soybeans in cold water overnight. Finely grind, add enough tap water to make 1,000 ml, boil the beans and soak water for 1 hour, and filter off the residue through cotton and gauze to give soybean milk. Add dilute HCl (hydrochloric acid), boil for 15 minutes and filter through paper. Adjust the reaction of the filtrate with NaOH (sodium hydroxide) to the proper pH required by the different bacteria, heat to about 60ºC for 10 minutes, and filter through paper. Dissolve 5 gm NaCl (sodium chloride; table salt) in the filtrate, which is then tubed, sterilized, and used as soybean broth. For the preparation of solid medium, add 15 gm of agar to each liter of the soybean broth. After the agar has been melted and its reaction adjusted in the usual manner, it is tubed, sterilized, and slanted.

The ordinary meat-peptone medium costs from 37 to 60 times as much as its soybean counterpart. "We have found in the soybean a cheap and satisfactory substitute for the expensive peptone and meat." Address: National Epidemic Prevention Bureau, Peiping.

757. Adolph, Wm. H.; Chen, Shen-Chao. 1932. The utilization of calcium in soy bean diets. *J. of Nutrition* 5(4):379-85. July. [10 ref]
• ***Summary:*** "A dairy industry in China is essentially non-existent and at present is economically impossible. Moreover, the cost of raw milk, or of imported milk, either in tins or in the form of dried powder, is far beyond the reach of the average purse. The dangers of calcium of calcium deficiency are somewhat mitigated by the fact that breast feeding is continued till the infant is three or four years old, but for the remainder of the growth period and for the entire period of adult maintenance the individual is dependent upon calcium derived from vegetable sources. A very considerable amount of this calcium is supplied by soy bean products. Soy bean curd (soy bean cheese) would seem to have filled, in part, the place which milk has occupied in the Occident. Recent years have seen an extended use of the closely related food product, soy bean milk, which has been successfully applied to infant feeding."

Using the method of metabolic balance in experiments with human subjects, the authors reported good utilization of the calcium in soybean curd. They also found cows' milk and soya bean to be equally effective sources of calcium for Chinese adults. The attainment of a calcium equilibrium was facilitated by increasing the protein intake. Address: Dep. of Chemistry, Yenching Univ., Peiping, China.

758. *Good Health* (*Battle Creek, Michigan*). 1932. Plant milks. 67(7):20. July.
• ***Summary:*** "A simple plant milk which has borne the test of use in China for several thousand years may be prepared from the soybean by the following simple process." The process is described in two paragraphs.

Another "excellent plant milk may be prepared by grinding blanched almonds in a mortar."

759. Winokurov, S.I.; Palladina, L.I. 1932. Biochemistry of soya milk (Abstract). *Nutrition Abstracts and Reviews* 2(1):30 (Abst. #85). July. Published in Russian in 1931. Title: *Biochimiji sojevogo moloka.* [Eng]
• ***Summary:*** "The protein of soya milk is digested as easily as that of cow's milk or human milk, and more easily than egg or muscle protein. Soya milk contains more tryptophane than cow's milk. It also contains the following enzymes: amylase, protease, peroxidase, catalase. Vitamin D is not present. The iron content is greater than that of cow's milk. The soya milk used was made from Manchurian beans." Address: Biochemistry Div., Inst. Research in Nutrition, Kharkov, USSR.

760. Adolph, William H.; Kao, Hsueh-chung. 1932. Hemoglobin-building properties of soy bean products. *Chinese J. of Physiology* 6(3):257-63. Aug. [5 ref. Eng; chi]
• ***Summary:*** "Our attention was recently directed to a statement that soy bean cheese (soy bean curd) has been regarded by the Chinese as a cure for anemia... Examination of the mineral constituents of the soy bean, and also of soy bean cheese and soy bean milk, has revealed the fact that these materials all contain decided amounts of both copper and iron."

Soya-bean products had a curative action on rats rendered anemic by an exclusive diet of cows' milk. Analyses of these products indicated an appreciable iron

and copper content. The rate of recovery appeared to be approximately proportional to the iron and copper content of the ingested food, but it could not be said that the soya-bean products owed their curative activity to the presence of these metals.

Note: *Webster's Dictionary* defines anemia (derived from New Latin, via the Greek *anaimia* = bloodlessness), a word first used in 1807, as "1a: a condition in which the blood is deficient in red blood cells, in hemoglobin, or in total volume; b: Ischemia. 2: lack of vitality." Address: Dep. of Chemistry, Yenching Univ., Peiping, China.

761. Burlison, W.L.; Whalin, O.L. 1932. The production and utilization of soybeans and soybean products in the United States. *J. of the American Society of Agronomy* 24(8):594-609. Aug.

• ***Summary:*** Contents: Introduction. Acreage. Yield per acre. Acreage harvested for beans. Acreage harvested for hay. Acreage harvested with livestock. Imports of certain soybean products. Production of important oils in the United States. Net imports of oils and fats into the United States. Import duties levied on soybeans and soybean products. Utilization of soybeans in United States. Soybean products. Summary.

"Soybean acreage harvested for beans has expanded rapidly in the United States since 1925, reaching an estimated production of approximately 18,000,000 bushels for 1931. More than half of the acreage grown each year has been cut for hay. The acreage harvested with livestock has not shown any increase since 1927.

"Imports of soybeans and soybean cake and meal have always been of minor importance. Soybean oil imports represented significant quantities at the close of the World War, however, but have since diminished to negligible amounts as import duties have become effective. The imports of such competing oils as cocoanut and linseed have been of greatest importance.

"Approximately one-fourth of the soybean oil being utilized in the United States is going into paints and varnishes, another one-fourth is finding its way to the soap kettle, nearly one-fifth is being used in edible products, and about one-eighth is being consumed in linoleum and water-proofing products. The number of commercial products being placed on the market that contain soybeans or soybean products is increasing rapidly. A most encouraging feature of soybean progress has been the research development in utilization of soybeans and soybean products within the last two years and the corresponding expansion in demand along commercial lines." Contains numerous statistical tables illustrating these facts. Tables show: (1) Production of soybeans harvested for beans, selected states and the United States, 1924-31, 1,000 bushels. (2) Total equivalent solid acreage of soybeans, selected states and the United States, 1922-30, 1,000 acres. (3) Yield in bushels per acre. (4) Acreage of soybeans harvested for beans, selected states and the United States, 1922-31, 1,000 acres. (5) Acreage of soybeans harvested for hay, selected states and the United States, 1922-30, 1,000 acres. (6) Acreage of soybeans harvested with livestock, selected states and the United States, 192230, 1,000 acres. (7) Imports into United States of soybean oil, soybean meal and cake, and soybeans, 1915-31. (8) Domestic production of soybean oil and other oils and fats from domestic materials, 1916-30, 1,000 pounds. (9) Net imports of animal and vegetable oils and fats, with special reference to soybean oil and five other kinds of vegetable oils, oil equivalent being used for imported materials, United States, 1916-30, 1,000 pounds. (10) Exports of soybean oil and other leading vegetable oils, United States, 1919-31, 1,000 pounds. (11) Duties levied on soybean oil, soybean cake and meal, and soybeans by the tariffs of 1909, 1913, 1921, 1922, and 1930. (12) How the 1929 and 1930 crops of soybeans were utilized in the United States. (13) Utilization of soybeans and soybean products in the United States, 1930 crop. (14) List of soybean products produced in the United States.

Table 13 (p. 607) "Utilization of soybeans and soybean products in the United States, 1930 crop." The 13,323,000 bushels of soybeans were used as follows: Crushed 4,800,000 bu, seed 4,623,000, feed 3,500,000, ground 400,000 (half used for feed and half for food). The 37,200,000 lb of soybean oil was used as follows: Edible: Oleomargarine 750,000 lb, lard substitutes [shortening] 500,000, other food products 4,750,000. Industrial uses: Paint and varnish 9,000,000 lb, soap kettle 8,500,000, linoleum and oil cloth 4,000,000, other 3,500,000. Increased stocks including oil equivalent 5,700,000. The 110,000 tons of soybean meal was used as follows: Commercial feeds 89,100 tons, other feed 20,000, edible soy flour 850, diabetic foods 50. The 100,000 tons of soybean meal was very small compared to its competing products: Cotton seed meal 2,350,000 tons, and linseed oil meal 1,750,000.

Table 14 (p. 608) "List of soybean products produced in the United States." The accompanying text states that this list "does not pretend to be complete. Attention is called to the large number of food products actually being placed on the market in the United States from soybeans at the present time. This list has grown rapidly during this last year." The extensive list includes commercial food, feed, and industrial products derived from soybeans. Some products have brand names and others only generic names.

"Food products–USA: Soybean flour. Soybean meal flour. Refined edible soybean oil. Soybean salad oil. Chocolate bars (30% soybean flour). Cocoa (up to 60% soybean flour). Sausages (up to 50% soybean flour). Bread (7½% soybean flour). Rolls (10% soybean flour). Macaroni (20% soybean flour). Soybean muffins. Soybean cookies. Soybean doughnuts. Vegetable shortening. Infant foods. Diabetic foods. Oleomargarine. Lard substitutes. Filled sweets. Soybean sprouts. Soybean cheese. Soybean milk.

Soybean buns. Soybean ice cream [perhaps that served in Sept. 1930 in Illinois at the American Soybean Association's annual meeting]. Soya cream biscuits. La Choy-soy sauce. Soyolk (flour). Soy biscuits. Soy flour. Vi-Zoy. Lektizoy. Zoy soup. Zoybeans (cooked beans). Bacon and Zoy beans. Zoy bouillon. Soy bean biscuit. Casein gluten flour. Non-fat mayonnaise. Fatless spread. Fluffo.

Canadian food products: Milqo (soy milk). Vi-Tone (chocolate). Soya flour. Soyex-Malt-Cocoa drink. Soyex. Macaroni

"Feed products: Cake or meal. Commercial feed. Dairy feed. Hog chow. Poultry chow. Dog chow. Chicken chowder. Steer fatena. Calf chow. Lay chow. Rabbit chow. 34% protein chow chow. 24% protein chow chow. Chick startena. Chicken fatena. Olelene. Grainola.

"Industrial uses: Paint. Varnish. Enamels. Oil cloth. Linoleum. Printers ink. Glycerine. Celluloid. Lauxtex plastic wall coat. Lauxein waterproof soybean glue. Lauxein emulsifier (all 3 made by I.F. Laucks, Inc., Seattle, Washington). Soap (liquid). Soap (potash). Core binders. Rubber substitutes."

Note 1. This is the earliest document seen that mentions the following commercial soy products: La Choy-soy sauce. Soyex-Malt-Cocoa drink. Zoybeans (cooked beans). Lauxtex plastic wall coat. Lauxein waterproof soybean glue. Lauxein emulsifier. All were on the market by late 1931.

Note 2. This is the earliest English-language document seen (Feb. 2008) that uses the term "vegetable shortening" to refer to shortening made without animal products. Address: Univ. of Illinois, Urbana.

762. Richardson, J.W. 1932. La soja y el conflicto Sinojaponés [Soya and the Sino-Japanese conflict]. *Hacienda* (*La*) (*Buffalo, New York*) 27(8):294-95. Aug. [Spa]
• ***Summary:*** It is said that this plant, which plays such an important role in nourishment and in modern industries, forms the axis around which revolves the struggle for dominance of Manchuria. Slight reference is made to the increasing soybean importance in the United States. Photos show: (1) Round soybean cakes piled on the docks at Dairen. (2) An interesting Chinese hand-turned stone mill, with a metal hopper on top, being used by a Chinese man to grind soaked soybeans for soymilk. The slurry falls into an earthenware pot.

763. Horvath, A.A. 1932. El frijol "Soya" como alimento nacional [The soybean as a national food]. *Revista de Agricultura, Comercio y Trabajo* (*Cuba*) 14(3):43-56. Sept. [Spa]
• ***Summary:*** This is a translation of Horvath 1927, "The Soybean as Human Food." Address: Peking Union Medical College, China.

764. Maillet, Marcel; Yeu, Lucie; Yeu, K. 1932. Le lait de soja dans l'alimentation des nourrissons [Soymilk in the feeding of infants]. *Bulletin de la Societe de Pediatrie de Paris* 30:488-98. Meeting of 18 Oct. 1932. [8 ref. Fre] Address: Paris.

765. *Los Angeles Times.* 1932. Health aid and diets on program: Food specialist to assist director of 'Times' Home Service at meeting. Oct. 19. p. A6.
• ***Summary:*** Marian Manners, director of the [Los Angeles] Times' Home Service Bureau, announces a program for today at 3 o'clock in the auditorium of the Southwest Building, 130 South Broadway, held especially for those who are interested in "foods from the standpoint of diet and health."

"Hazel Denis, dietitian for La Sierra Industries, manufacturers of the complete line of soy bean products, will prepare soy cream pie and Boston roast, showing two novel and delicious ways of introducing this health food into the diet."

Note: This is the earliest published and dated document seen (Oct. 2004) concerning La Sierra Industries, founded by T.A. Van Gundy.

766. Dittes, Frances L. 1932. Soy milk in infant feeding. *Madison Survey* (*Madison, Tennessee*) 14(37):146-47. Sept. 28; 14(38):150-51. Oct. 5. [2 ref]
• ***Summary:*** "It is a fact definitely proved on many occasions, that for the normal baby, good breast milk from a healthy mother supplies the type of food, both as to quantity and quality, best suited to develop the ideal infant."

Two facts about breast milk stand out prominently: "First, breast milk protein, by its lack of buffer and formation of flocculent soft curd, favors both rapid and efficient gastric and intestinal digestion; and secondly, the protein, or element of growth, of breast milk contains the kind and amount of amino-acids best suited to the infant's growth."

"As a substitute for breast milk, when artificial feeding is necessary, cow's milk has long been recognized as the best. There are, however, conditions under which cow's milk may be undesirable, particularly since animals are becoming more and more diseased. Science is showing that a milk made from the soy bean is a splendid substitute for mother's milk. (To be continued)."

Part 2 (Oct. 5, p. 150-51): Two tables compare the composition of cow's milk, soy milk, and mother's milk. Mother's milk has 1.5% protein, soy milk 3.3%, cow's milk 4.94%. "The salts in cow's milk are chiefly phosphates, which absorb or buffer hydrochloric acid." Mother's milk is the lowest in salts (minerals), with soy milk in the middle. "Since soy milk contains less salts than cow's milk, it requires less secretion of gastric hydrochloric. According to Fisher [sic, Fischer 1914], soy milk gives a much finer flocculent curd in the stomach than cow's milk and by its lack of buffer action forms both rapid and efficient gastric

and intestinal digestion. Its period of stay in the stomach is shorter. Its ingestion results in a shorter period of gastric secretion. The peristaltic motion of the stomach is less after the ingestion of soy milk than in the case of cow's milk. These qualities make the soy milk more desirable as a food for delicate infants than is cow's milk."

"The protein of the soy milk has been shown by authorities to contain five of the essential amino-acids necessary for complete nutrition for infants, cystine being the absent amino acid."

"Soy milk is produced at a cost of one-fifth that of cow's milk, besides being free from disease bacteria such as tuberculosis, typhoid fever, etc. This food product may be found so practical, economical, and adequate that it will save the lives of many infants, particularly in cases where the use of cow's milk is not advisable, and in sections where cow's milk is unsafe for use." Address: Madison College, Tennessee.

767. La Sierra Industries. 1932. Soy bean (Ad). *Los Angeles Times.* Nov. 6. p. J20.

• ***Summary:*** This small, square ad reads: "One of the most perfect foods on the market today. Perfect in protein and practically free from starch, with an Alkaline Reaction.

"Soy bean products are offered in twelve different varieties: Soy-Co Breakfast Beverage [soy coffee], Soy Milk, Cheese [tofu], Butter, Bologna, Loaf, Spread, and Others.

"On sale at health food stores. Manufactured by the La Sierra Industries. 'Packers of superior foods.'" Address: Arlington, California.

768. *Good Health* (*Battle Creek, Michigan*). 1932. The soybean an excellent source of food lime [calcium]. 67(12):20-21. Dec. [1 ref]

• ***Summary:*** A summary of an article titled "The utilization of calcium in soy bean diets" by Adolph and Chen, published in the *Journal of Nutrition* (July 1932, p. 379-85).

Good Health adds: "Soybeans are now turned into about fifty products in America; while in the Orient two hundred and fifty products are made of them."

769. Rittinger, Fred R.; Dembo, Leon H. 1932. Soy bean (vegetable) milk in infant feeding. Preliminary report. *American J. of Diseases of Children* 44(6):1221-38. Dec. [18 ref]

• ***Summary:*** Fifty infants fed on soy bean milk for more than a year grew well and remained healthy. This influential article begins with a review of the literature on feeding soy and other vegetable milks to infants. "In recent years great interest in the study and use of soy bean preparations has been manifested throughout the world. Prominent forces in this country are the Bureau of Home Economics and W.J. Morse of the United States Department of Agriculture. Von Noorden in Germany, Ducceschi in Italy and Berczeller in Vienna [Austria] are giving their support to the use of the soy bean as a source of food."

The authors then discuss: The nutritional composition of the soy bean, soy bean milk powder as an exclusive food for animals, preparation of soy bean milk flour (dried soy milk) and its composition, their clinical study. Numerous growth curves are given for infants fed breast milk, soybean milk, and cow's milk. The babies fed on soy bean milk alone (plus daily doses of 4 cc cod liver oil and adequate amounts of orange juice) had normal growth curves (i.e. parallel the Holt line). The general health and condition of these babies was good and their resistance to infection was on a par with milk-fed babies. The fat, protein, and vitamin contents of the soy milk are approximately equal to those of cow's milk. "The stool flora resembles that of the normal, breast-fed baby. The economic features (mass production and low cost) are especially significant in a consideration of soy bean milk as an infant food. It compares favorably with the milk of animals from the standpoint of nutritional availability and biologic value. An additional 100 babies are at present under observation on a diet of soy bean milk, either as a complement to breast milk or as an exclusive food." Address: Pediatric Service, St. Ann's Hospital, Cleveland, Ohio.

770. Stewart, C.L.; Burlison, W.L.; Norton, L.J.; Whalin, O.L. 1932. Supply and marketing of soybeans and soybean products. *Illinois Agricultural Experiment Station, Bulletin* No. 386. p. 425-544. Dec. [34 ref]

• ***Summary:*** Loaded with statistics, graphs, tables, maps, and photos, this is one of the best reports on soybeans in America published to date. Contents: Introduction. The supply of soybeans and soybean products: Domestic production of soybeans, production of soybeans in Illinois, soybean varieties in Illinois, costs and returns in producing soybeans, imports of soybeans and soybean products (soybeans, soybean oil meal and cake, soybean oil, net imports, exports including reexports, export-import balance), import duties levied on soybeans and soybean products, supply of soybean oil and competing oils and fats. Consumption of soybeans and soybean products: Disposition of the domestic crop, utilization as beans, utilization of soybean oil meal, utilization of soybean oil (in food and industrial products), methods of processing soybeans for consumption (expeller, hydraulic press, solvent extraction), competition from other oils, distribution of gathered soybeans by uses. Practices in marketing soybeans and soybean products: Sources of market information, time of movement, varieties marketed in different sections of Illinois, selling soybeans for seed, selling soybeans for industrial uses (the Peoria Plan of 1928-29, Grange League Federation Exchange of Ithaca, New York, the Soybean Marketing Association of Illinois formed in Oct. 1929 {p. 490-91}), selling soybean oil and oil meal (National Soybean Oil Manufacturers Association of Chicago). Elements of cost in marketing soybeans:

Marketing mill beans, processing beans, marketing seed beans, exporting beans. The inspection system and soybean grades. Special considerations applying to the valuation of soybeans and soybean products: Use-values of soybeans and soybean products in feeding, derivative products as factors in the market valuation of soybeans. Prices of soybeans and soybean products: Prices of seed beans, prices of soybean oil, prices of soybean oil meal, use as affected by prices. Meeting the price risks in marketing. International trade in soybeans and soybean products. Summary. Literature cited. Sources of data.

"In Manchuria in 1930 there were 13 districts in which over 40% of the crop land was devoted to soybeans, the highest proportion being 65%. The proportions for the three Manchurian provinces as units were as follows: Kirin (eastern) 33.2%; Hailungkiang [Heilungkiang] (northern) 30.7%; and Liaoning (southern) 22%." Some soybeans were grown in Inner Mongolia.

Illinois was the largest soybean producer in 1924, followed by North Carolina, Missouri, and Indiana. "Few soybeans were grown in Illinois previous to 1890, when J.C. Utter of Mt. Carmel, Wabash county, began production of this crop. Frank Hurrelbrink of Taylorville, Christian county, known because of his work with the Hurrelbrink variety of soybean, started his work in 1897. He has grown soybeans continuously since that time, experimenting with many varieties. C.A. Rowe and his father, of Jacksonville, Morgan county, grew soybeans about 1899. Somewhat earlier than this the late Ralph Allen of Delavan, Tazewell county, became interested in soybeans and furnished seed beans to Illinois farmers as well as to interested persons in other states, in Hawaii, and in Alaska. C.L. Meharry of Attica, Indiana, who owns a large tract of land near Tolono, Champaign county, Illinois, has been an active soybean grower since 1909. The year following the Meharry venture, John T. Smith, also near Tolono, began to grow soybeans on a very limited scale, and in 1921 undertook active production. During the last decade soybeans have become an increasingly popular crop on Illinois farms."

Of the 1915 U.S. soybean crop, 52% of the entire crop acreage was used for hay, 15% was grazed, 4% was plowed under, and only 29% was harvested for beans; 18.2% was used for seed, 0.9% for human food, and 9.9% as beans for feed.

In 1930 some 11,975,000 bushels of soybeans were gathered or harvested in the U.S. Of these soybeans, 40.1% were crushed, 33.6% were used as seed, 23.0% were used whole directly as feed, 1.7% were ground and used as feed, and 1.7% were ground and used as food.

From the soybeans crushed in 1930, some 37,200,000 lb of soybean oil were produced. Its four main uses were: (1) Paint and other industries: Paint and varnish 24.2% of the total oil, linoleum and oil cloth 10.8%, other uses 9.4. (2) Soap kettle 22.8%. (3) Edible uses: Oleomargarine 2.0%, lard substitutes 1.3%, other food products 12.8%. (4) Increased stocks including oil equivalent 16.7%.

In 1930 some 110,000 tons of soybean meal resulted from crushing. Of this, 76.5% was used in commercial feeds, 13.6% in other feeds, 0.8% as soybean flour for food, 0.045% as infant and diabetic foods, and 9.0% as other uses including glue.

Page 460 lists the types and brand names of many commercial soybean food, feed, and industrial products. Consumption of soybeans as foods has increased appreciably since 1930. U.S. food products include chocolate bars (30% soybean flour), cocoa (up to 60% soybean flour), sausages (up to 50% soybean flour), bread (7½% soybean flour), soybean cheese, soybean milk, soybean ice cream, Soya Cream Biscuits, La Choy Soy Sauce, Soyolk (flour), V-Zoy, Lektizoy, Zoy Soup, Zoybeans (cooked soybeans), Bacon and Zoy Beans, Zoy Bouillon, Soy Bean Biscuit, etc. Canadian food products are: Milqo (soy milk), Vi-tone (chocolate), Soya Flour, Soyex-Malt-Cocoa Drink, Soyex, Macaroni.

"In the foreign trade of the United States imports of soybean oil have appeared since 1910 and of soybeans since 1914. The United States exported domestic soybeans to Europe in quantity for the first time during the fall of 1931, more than 2 million bushels being shipped from the 1931 crop." Address: 1, 3-4. Dep. of Agricultural Economics; 2. Dep. of Agronomy. All: Univ. of Illinois.

Traité d'agriculture générale et de cultures spéciales des pays tempérés, subtropicaux et tropicaux [Treatise on general agriculture and special crops for temperate, subtropical, and tropical countries. 3rd ed. 2 vols]. Louvain, Belgium: Librairie Universitaire. Vol. 2, 796 p. See p. 306-07. 25 cm. [Fre]
• ***Summary:*** The author classifies the soybean among the leguminous forage plants, among starchy (*féculentes*) plants, and among oilseeds. "Soybean seeds have a nutritive value for humans greater than that of all other seeds, except peanuts." The peoples of East Asia prepare soybeans and their flour in 100 different ways, many of which are now also known in Europe. The Chinese make from soybeans an artificial milk and a cheese [tofu]. Soy flour is easy to digest and can be mixed with wheat in making bread and pastries. The soybean is used in the production of so-called "English sauces" [such as Worcestershire], which are widely consumed in Europe and America. Finally, soybeans are imported into Europe at the rate of 600,000 tonnes/year and the oil is used to make soap and margarine. Address: Prof. à l'Univ. de Louvain, Directeur général de l'Agriculture au Ministère des Colonies.

• ***Summary:*** Contents: Introduction (preliminary notes). Part I: Cultivation and applications of soya. Chart of utilization of the soybean seed. Agronomic notes and details on soybean cultivation. Part II: Soya as a food. Nutritional value, soya as a vegetable (green vegetable soybeans; *Soja, como verdura*), soy sauce (*salsa de soja*), soymilk (*leche*), condensed soymilk (*leche concentrada / condensada*), powdered soymilk (*leche en polvo*), fermented soymilk (*leche fermentada*), soy cheese (*queso de soja*) [tofu], soy casein (*caseina de soja*), soy flour (*harina de soja*), soy bread (*pan de soja*), Soyolk (soy flour made by Dr. Berczeller), whole-grain soy bread (*pan integral*), soy flour tablets (*comprimidos*), pastries, biscuits, puddings, etc. (*pasteles, bizcichos, puddings*), soy oil (*aceite de soja*), fermented soy products (*productos de la soja fermentada: natto, miso, shoyu*), confectionery products (*productos de confiteria*), chocolate (*chocolate*), coffee (*café*), soy ferments/enzymes (*fermentos de soja*), products made by Caséo-Sojaïne (*Caseo-Sojaina de Paris*). Soy as a livestock food. Appendix.

"As early as 1918 a Spanish public official, Don Julio de Palencia, the Spanish Consul in Shanghai, sent the State Department (*Ministeria de Estado*) a magnificent report specifying the great attention that representatives of the principal countries of the world were giving to this crop [the soya bean], and the relevance that it would have in the agricultural economy of the future. What a pity that Spain has been the only civilized country to ignore the study of the soya bean and its exploitation on a large scale" [p. 5].

"Finally we must make public our thanks to the spokesmen of this foundation/board (*Patronato*) for the special work they have done in writing this booklet: Don José Maria de Soroa, secretary of the Special School for Agricultural Engineers (*Escuela Especial de Ingenieros Agrónomos*), and Dr. Don José Abadal, chief of the Bureau for the Inspection of Pharmaceutical Services of the Ministry of War (*Negociado de la Inspección de Servicios Farmaceuticos del Ministerio de la Guerra*)" [p. 6].

"In 1917 the Spanish Consul in Shanghai, Don Julio Palencia, sent to the State Department a study on cultivation of soya, proposing that tests be done to acclimatize this valuable crop to our country.

"In Motril and later at the southern agricultural station of Malaga, the agricultural engineer D. Arsenio Rueda has been cultivating soya for the past 10 years [i.e. since 1923] in plots of 5 ares [1 are = 100 square meters], obtaining 60 liters (each liter weighing 780 gm) in each one.

"The white as well as the black varieties give good results, though the white ones do best. The seeds have been distributed to farmers who have noticed that, even though at first the goats that were given them as food rejected them, after a few days of getting used to this grain preferred them to such an extent that one must avoid growing this plant near the herd's path lest the herd be attracted and devour it all.

"Although soya is a legume which draws many nutrients out of the soil (*esquilmante*), it has according to Mr. Rueda, sufficient interest since it allows usage of terrains where field beans cannot be used due to the invasion of the pest called *Orobanche speciosa*, commonly called 'Jopo.' This parasite does not attack soya...

"Besides the quoted trials, it has been more than 25 years since soy has been grown in Spain with success due to the interest and zeal that in their patriotic work, the agricultural engineer Mr. Eduardo Noriega undertook with his partner, Mr. Ortiz, on the farm of 'Jerez.'

"He was successful during many years using the yellow and black varieties, later on also cultivating it in the Spanish central region.

"We think it useful also to state in writing the following data about soy grown by Dr. D. Jose Abadal in Lerida during the years of 1925-1926.

"The experiment was done only out of curiosity, with the intention of seeing if it could be grown in said province. Japanese seeds of the hirsute soy variety, yellow seed, used as food for diabetes, were used. The planting was done in a garden with seeds that had been soaked for ten hours, with no more care or fertilizers than those used for all the existing plants of that garden. The terrain of course was one of easy irrigation and located in Lerida where it is very hot all during the summer.

"This brief essay demonstrates that soy can be grown in irrigated terrain in very hot places and with little care.

"Fifteen years ago, the agricultural Engineer D. Jesus Andreu, in the province of Pontevedra [in the northwest corner of Spain, just north of Portugal, bordering the Atlantic ocean], did some tests with good results on growing soy as a forage plant.

"We also have news, though not concrete, of other successful tests done in the provinces of Madrid and Toledo." Address: 1. T.C. Farmaceutico Militar; 2. Ingeniero Agronomo e Ingeniero Sanitario, Spain.

776. Arnold, Julean. comp. 1932. China through the American window. Shanghai, China: The American Chamber of Commerce. 85 p. Illust. Map. No index. 23 cm. [Eng; Chi]
• ***Summary:*** This book is written in both English and Chinese, with two vertical columns on each page. The English-language column is 6.7 cm wide and the Chinese-language column 4.0 cm wide. The book was compiled for the U.S. Dept. of Commerce.

In the chapter on "Statistical contrasts." Page 27: Soybeans production (long tons): USA–540,000. China–7,000,000.

Average size of cultivated farm in acres: USA–80. China–2.

Percentage of school age children in school: USA–81%. China–10% (p. 26).

In the chapter titled "Interesting facts regarding China." Page 31: "7. Dairying does not figure in the economic life of the Chinese people. The soy bean can apparently give them the ingredients of cow's milk."

"Page 33: "13. China is the world's largest producer of soy beans, kaoliang, millet, sweet potatoes, peanuts, sesame, rape and perilla seeds,... bamboo, tea, ramie fibre, vegetable tallow, tung oil,... chickens, ducks and pigs. It ranks second in the production of rice, wheat, silk, corn, tobacco, cigarettes,...

Julean Herbert Arnold lived 1875-1946. Address: Commercial Attaché in China.

777. Grote, E.G. 1932. Experimentelle Untersuchungen ueber die Verwendbarkeit des Sojamehls in der Kinder- und Saeuglingsernaehrung [Experimental investigations on the suitability of soy flour in the feeding of children and infants]. Thesis, for Doctor of Medicine, Wismar, Germany. [Ger]*
• ***Summary:*** Whole soy flour worked well as a milk substitute for nursing infants. Address: Wismar.

778. Heibonsha. 1932. Dai hyakka jiten [Japanese encyclopedia]. Tokyo: Heibonsha. 15 vols. [Jap]
• ***Summary:*** For roasted soybeans (irimamé), see Vol. 1, p. 1025. For green vegetable soybeans (Edamamé) see Vol. 2, p. 237. For soynuts and mamé-maki, see Vol. 4, p. 899. For tofu, see Vol. 9, p. 284-85. For soymilk, see Vol. 9, p. 1169. Address: Tokyo, Japan.

779. Kellogg, John Harvey. 1932. How to have good health through biologic living. Battle Creek, Michigan: Modern Medicine Publishing Co. vii + 498 p. See p. 88-89, 209-10. 21 cm.
• ***Summary:*** For Dr. Kellogg, biologic living includes a vegetarian diet (which includes dairy products and eggs). A section titled "The soy bean and the peanut, high quality proteins" (p. 88-89) states: "The soy bean and the peanut are notable exceptions to other legumes. Their proteins are of the same high quality as those of eggs and milk."

The next section, titled "Proteins of animal origin" (p. 89) starts by noting that animal proteins are "of the complete or balanced sort." It concludes: "Lean meat is protein more or les saturated with blood and with a small admixture of fat. Such fat may constitute as much as one-half or more of fat meats. Meat contains uric acid urea, and other waste products. Newburgh has shown that toxic products constitute about one-fourth of lean meat solids."

A section titled "Soy milk" (p. 209-10) notes: "Soy milk is in some respects superior to cow's milk and its use in this country should be encouraged. Three quarts of excellent milk may be made from a pound of soy beans and the food value of the residue [okara] will be greater than that of a pound of beefsteak. A pound of wheat and a pound of soy beans will supply energy sufficient for a laboring man, and at a cost of less then three cents a day. Soy milk protein is of the superior quality necessary to supplement that of cereals and is of the basic or alkaline-ash type, and so corrects the acid-ash effects of cereal proteins.

"Soy milk is of special value in helping to change the intestinal flora. A very superior quality of acidophilus milk may be prepared from it*." (Footnote: *"For information, address Battle Creek Diet Service, Battle Creek, Michigan.").

"To fu [tofu], a curd prepared from soy milk, in China and Japan serves as the basis for a great number of meat-like and most delicious dishes."

Note 1. This is the earliest document seen (Sept. 2012) that mentions an "acidophilus milk" made from soy milk or that discusses Dr. Kellogg's work with it (one of two documents).

Note 2. This is the earliest English-language document seen (June 2002) that uses the term "animal origin" in connection with vegetarianism. Address: Battle Creek, Michigan.

780. Orosa, Maria Y. 1932. Soybeans as a component of a balanced diet and how to prepare them. *Manila* (*Philippines*) *Bureau of Science*, *Popular Bulletin* No. 13. 53 p. [16 ref]
• ***Summary:*** Contents: Introduction. The cooking of soy beans (89 Filipino recipes, p. 7-35), incl. roasted soy beans, soy-bean soups etc.–most recipes use whole soybeans, but quite a few use tofu (*tokua*), soy sauce (*toyo*), soy-bean flour, or soy-bean milk, and a few use *tahuri* (brine fermented tofu) or soy-bean sprouts. Some common foods made from soy beans and methods of preparing them (p. 35-53): Soy-bean milk, condensed soy-bean milk, soy-bean milk powder, soy-bean casein, soy-bean curd (tofu; *tokua* or *toqua*). *Tahuri* or *tahuli* (fermented tofu). Frozen tofu. Bean curd brains or *tofu nao*. Dry bean curd or *topu khan* (tofu-kan, dipped in

burnt millet sauce and rubbed with fine salt). Fragrant dry bean curd. Thousand folds (thin layers of fresh tofu pressed in cheesecloth. "On standing, the thousand folds mold and develop a meatlike flavor. This is fried in sesame oil and served in place of meat"). Fried bean curd. Soy sauce (called by the Chinese "ch'au yau," or drawing oil; or "pak yau" or white oil; by the Japanese "shoyu"; and the Filipinos, "toyo"). Natto. Hamanatto (p. 49). Yuba. Miso. Soy-bean flour. Soy-bean oil (used in the manufacture of lard and butter substitutes; also in paints, printing inks, etc.). Soy-bean meal. Soy-bean coffee. Soy-bean sprouts.

Note 1. This is the earliest English-language document seen (Oct. 2008) that uses the term "soy-bean casein" (or "soy bean casein" or "soybean casein"), probably to refer to soybean protein.

"When and by whom the soy bean was first introduced into the Philippines, no one can ascertain. The Filipino people have long known some important soy-bean preparations, such as soy sauce, or 'toyo,' bean curd, or 'tokua,' fermented bean curd or 'tahuri,' not knowing that they were prepared from this bean. The seed is known in some parts of the Philippines, where it is grown, as 'utao.'"

"The main object of this pamphlet is to encourage the Filipino people to use more soy beans, and preparations made from them as food" (p. 3-4).

"Soy beans are grown in some parts of the Philippines. According to Doctor Roxas, Director of the Bureau of Plant Industry, 2,481 tons were grown in Batangas in 1921 and 4,218 tons, in 1930. However, the importation of soy beans in 1924 was 4,657 tons. Doctor Roxas says that soybeans can be grown in all parts of the Philippines" (p. 6). "Immature soy beans may be cooked in the same way as lima beans (*patani*)" (p. 7).

"The soy-bean curd was first produced by Whai Nain Tze, before the Christian Era and was introduced into Japan from China by the Buddhists. It was introduced into the Philippines by the Chinese and has become a very popular food in Manila and in places where there are Chinese who manufacture it for sale. 'Tokua' on account of its high fat, protein, and mineral content, is called by the Chinese as 'meat without bone,' or 'the poor man's meat.'" The Chinese use burnt gypsum (about 1.5% by weight) as a coagulant. In some cases, the curds are wrapped in individual pieces of fine cheesecloth about the size of a small handkerchief, then pressed lightly for a few minutes. They are "unwrapped, spread on shallow bamboo trays (*bilao*) and partially dried at room temperature. Then they are dipped in a weak solution of turmeric to coat the outside in light yellow coloring. Some manufacturers soak the small cakes of curd in brine solution for a short time, then dip them in a solution of burnt sugar or molasses and bake them slightly before putting them on the market." 100 gm of dry soybeans typically yield 350 gm of tofu (*tokua*) (p. 41).

The section titled "'Tahuri' or 'Tahuli'" begins with 2 paragraphs and ends with a table very similar to those from Gibbs and Agcaoili (1912): "'Tahuri' is manufactured in China and exported to the Philippines in large stone jars or in small tin cans. There are some 'tokua' manufacturers in Manila that manufacture 'tahuri' for local consumption. Those that are imported from China are preserved in strong brine solution and the cakes are broken during the shipment so the liquid becomes like a thick emulsion containing pieces of the cured curd." It then contains a new paragraph: "In Manila, the Chinese method of manufacture is to pack the large pieces of soy-bean curd, about 5 inches long, 4 inches wide, and 2.5 inches thick, with much crude salt, in empty gasoline cans. The curd is allowed to cure for a period of several months. During the curing period the bean curd changes from white to a brownish yellow color and develops a peculiar salty flavor to which the Chinese and many Filipinos are educated" (p. 42). Note 2. No information about a fermentation microorganism or process is given.

"The bean curd brains known to many Filipinos as 'tojo' is the unpressed soy-bean curd. The method of making 'tojo' is almost the same as the method used in making 'tokua', only that a smaller amount of the coagulating agent is used, and the very soft but solid mass formed is left undisturbed in the wooden container until used. The Chinese used to peddle this preparation in a wooden pail-shaped container, through different parts of Manila, but on account of the Philippine Health Service regulations, this product is now sold in the markets only. / "The 'tojo' is served with a few tablespoonfuls of medium thick brown-sugar syrup, which gives it flavor, the 'tojo' being almost tasteless. Sometimes it is eaten with sweet oil, sauce, and vinegar, or with finely cut meat and spices." (p. 43).

Note 3. This is the earliest English-language document seen (April 2013) that contains the term "tojo" which is used to refer to unpressed curds made from soy-bean milk.

"Dry bean curd: The fresh bean curd when dipped in burnt millet-sugar sauce and rubbed with fine salt will keep longer than the 'tokua' and is called 'topu khan.' This preparation is usually eaten is soups."

Fragrant dry bean curd or *hsiang khan* ("fragrant dry") has the consistency of smoked sausage. "It is made by subjecting the fresh bean curd to great pressure, which eliminates much of the water content. The pieces of semidry curd are soaked in a weak brine solution in which is dissolved burnt millet-sugar and to which is added powdered spices. The curd is then dried to hardness. This preparation keeps indefinitely and is used in soup making and in vegetable dishes" (p. 43).

Note 4. Cruz and West (1932, p. 78) state that as part of a campaign by the Bureau of Science to encourage the Filipino people to use more soy beans, Miss Orosa "has made excellent cakes, cookies, puddings, sauces, soups, custards, ice cream, and other tasty preparations from Philippine soy beans."

Note 5. The author pioneered the branch of the branch of the Home Extension Service in which home demonstrators helped women in solving their home problems. She started the organization as a food preservation unit under the Bureau of Science in 1923, starting with six home demonstrators that she herself trained. That group became the forerunner of the Home Extension Service in the Philippines. For details on her work see: In: A Half Century of Philippine Agriculture. Manila, Philippines: Liwayway Publishing. p. 236-37.

Note 6. This is the earliest English-language document seen (Nov. 2003) that contains the word "meatlike." Address: Chief, Div. of Food Preservation, Bureau of Science, Manila.

781. Rowe, Albert H. 1932. Food allergy: its manifestations, diagnosis and treatment with a general discussion of bronchial asthma. Philadelphia, Pennsylvania: Lea & Febiger. xi + 18-442. Illust. Index. 24 cm. [300+* ref]

• ***Summary:*** The Preface begins: "Food allergy as a common cause of human symptomatology is gaining increasing recognition, as emphasized in the literature of the last decade and in my experience as an internist as well as an allergist. Such allergy not only enters into the etiology of many conditions necessarily treated by the general practitioner, but also into the cause of many symptoms demanding relief by all specialists."

A marvelous (but unnumbered) two-part bibliography appears on page 413-430. Albert Holmes Rowe was born in 1889.

Soy or soy-bean is mentioned throughout this book: Page 69: In the chapter on "Treatment by elimination diets and general measures," Diet No. 6 states: "For patients with a wide variety of sensitizations the following "elimination diets" may be necessary:... 2. A choice of one of the following proteins: lamb, beef, chicken, soy bean, lima bean, dried peas."

Page 93: In the section "The milk-free diet in infants," Hill and Stuart point out:... "The only food substance providing in suitable concentration all of the amino-acids specifically needed by the infant for continued normal development are animal milks, certain of the animal meats and soy-bean flour."

Page 94: In the same chapter, in the section titled "The milk-free diet in infants," Hill and Stuart [1929] "report the successful use of a soy-bean formula which is produced in dry form under the name of Sobee by Mead, Johnson & Co. Schloss, in 1920, suggested the use of soy-bean flour in an improvised formula for the control of milk sensitization. Ruhräh originally suggested soy-bean flour as a gruel in infantile diarrhea in 1910 and since then it has been shown to contain adequate amino-acids for the nourishment of infants. The ingredients of the mixture of Hill and Stuart [1929] are as follows: Soy-bean flour (ground press cake) 67.50%, olive oil 18.95%, barley flour 9.50%, calcium carbonate 2.70%, sodium chloride [table salt] 1.35%. Total: 100.00%.

Page 95: In the same section: "I feel that this formula is a most satisfactory one. I have used lima-bean flour and split-pea preparations in one infant, aged eighteen months, who had eczema with good results, the child now being on milk after nine months of relief, and I can report the successful use of this soy-bean formula as a substitute for milk in several infants and young children. It is important to state that sensitization to barley or even to soy bean must be thought of and that skin reactions to them might well be tried before the use of this formula. A general sensitization to cereals may arise, and it must be remembered that sensitizations at times are acquired in utero. If sensitizations exist to barley or soy bean other formulas containing a different starch or bean flour or meat protein must be prepared."

Page 187: "Lactic acid milk, melons and grapes were added. In another month the mother reported that improvement persisted. Lima bean, soy bean and figs were added. In another month the mother reported that immediately after the last visit weakness began and an attack of cold sores around the mouth developed. Because of her family history of idiosyncrasy to milk and its recent addition, this was excluded from the diet."

Page 197: "In milk sensitization in infants Schloss recommended a formula containing soy-bean flour, washed butter, potato flour and sugar of milk, which controlled an eczema in a baby who gave positive reactions to milk, wheat, oats and barley. Relief occurred in five days, and the general addition of milk some weeks later was tolerated without a return of eczema. This formula is similar to that recently suggested by Hill and Stuart, which has been described in Chapter III on treatment under the milk-free diet." Schloss (1920) reported: "Thirty-four cases reacted to egg, though it had never been eaten; 11 gave definite symptoms when egg was included in the diet; 36 reacted to milk; 6 patients who reacted to milk were given a formula containing lactose, mineral salts, washed butter and soy-bean protein. The eczema disappeared in three days. The mixture, however, caused diarrhea and vomiting."

Page 217: "Skin tests to all types of food showed positive reactions to egg, chicken, parsnip, pea, potato, soy bean, spinach, tomato, clam, halibut and lobster. She was placed on an 'elimination diet' modified by her positive reactions."

Page 265 (Literature): "Cutaneous skin testing with all types of allergens showed the following reactions:

"Foods: Dusts:
"Whole wheat + Dust No. 13 +
"Spinach +
"Oyster + +
"Pollens:...
"Egg-whole +
"Cocoa +
"Tea +

"Soy bean +
"Dust No. 23 +..."

Page 269 (Literature): "In addition to the pollen therapy a diet which contains tapioca, sago, eggs, lamb, beef, chicken, pork, artichokes, asparagus, beets, carrots, peas, white potato, sweet potato, soy bean, string beans, squash, tomato, butter, salt, olive, tea and coffee has been prescribed, with marked relief to her indigestion. Nasal congestion which was present during the winter in previous years, and which persisted until the institution of this diet, has also been relieved."

Page 329-330: The section titled "Statistics on food sensitization," begins "A careful tabulation of the records of 500 patients who have been tested completely with food allergens with the scratch method and, in most instances, intradermally with from three to fifteen common food extracts, to which negative cutaneous reactions had occurred with the cutaneous test is presented in Table 23." The most widespread food allergens are: Wheat 211. Spinach 124. Egg 110. Milk 86. Cabbage 52. Tomatoes 51. Cauliflower 50. White potato 50. Black pepper 50. Onion 47. Rice 46... Soy bean 13. Address: M.S., M.D., Lecturer in Medicine in the University of California Medical School, San Francisco, California; Chief of the Clinic for Allergic Diseases of the Alameda County Health Center, Oakland, California,....

782. Winton, Andrew Lincoln; Winton, Kate Barber. 1932. The structure and composition of foods: Vol. I. Cereals, starch, oil seeds, nuts, oils, forage plants. New York, NY: John Wiley and Sons; London: Chapman & Hall, Ltd. xiv + 710 p. See p. 512-24. Illust. Index. 24 cm. [67 soy footnotes]
• ***Summary:*** Volume 1 of this 4-volume set contains 274 superb illustrations by the authors. The book is divided into three parts: I. Cereals. II. Oil seeds. III. Forage plants.

In the chapter on "Seeds of the pea family (Leguminosæ)" (p. 497+) the section titled "Soy bean" (p. 512-24) has the following contents: Scientific and common names. Introduction. Macroscopic structure. Microscopic structure: Spermoderm, hilum cushion, endosperm, embryo (palisade cells, oxalate crystals, starch, aleurone grains and fat), chief structural characters. Chemical composition: Changes in composition during growth, soy bean cake, meal, and flour, proteins, carbohydrates, phosphorus-organic compounds, saponins, enzymes, mineral constituents, minor mineral constituents.

The chapter begins: "A native of the Far East, the soy bean has been cultivated since the dawn of civilization in China and Japan, where the seeds furnish millions of human beings with food. From the seeds are prepared soy cheeses (tofu, natto, miso [sic, none of these three are "soy cheeses"]), soy milk, and soy sauce, the latter being used in chop suey. Because of the absence of starch in many varieties soy bean flour has come into use in the Occident as a diabetic food. Soy bean oil is of growing industrial importance."

An illustration by Winton (p. 512; Source: Winton 1906, p. 248) shows the outer portion of the soy bean seed in cross section, with each of the layers (X 160 magnification).

In the introductory section on "Forage legumes," soy beans are discussed under the following headings (p. 642-45): Comparative macroscopic structure, comparative microscopic structure (table), comparative chemical composition of green fodder (p. 644) and of hay (p. 645). The section titled "Soy bean" (as forage plant, p. 666-67) has the following composition: Introduction. Macroscopic structure. Microscopic structure: Stem, petiole, petiolule, leaf, stipule, flower, chief structural characters. Chemical composition (values from Pellet, Schwackhöfer, and Haskins for: Total ash, potassium oxide, sodium oxide, calcium oxide, magnesium oxide, ferric oxide, phosphoric acid, sulfur trioxide, silicon dioxide, and chlorine).

Note: This is the earliest English-language document seen (Jan. 2004) that uses the word "petiolule" in describing the soybean plant.

This book also discusses: Lecithin (p. 8, 14). Kudzu starch (*Pueraria hirsuta* Schneider, p. 37). Gluten (p. 57-59, 72-73, 199-200, 211-25). Coix (Job's tears, p. 100-04). Hemp seed (p. 413-21). Almond (p. 476-85). Peanut (p. 497-512, 642-43, 663-66). Linseed (p. 525-35). Sesame seed (p. 598-605). Alfalfa (p. 642-43, 646-59).

Note: Andrew L. Winton lived 1864-1946. Kate Grace Barber Winton was born in 1882. Address: 1. Sometime state and federal chemist; 2. Sometime state and federal microscopist.

783. *Commerce and Finance.* 1933. Jap and the bean-stalk. 22(6):147. Feb. 8.
• ***Summary:*** Discusses the soy bean in East Asia, soy bean oil, soy bean milk ("fed to thousands of Chinese and Japanese babies"), tofu, soy bean coffee, and soy bean flour. "It is not generally known that the soya bean was used during the American Civil War as a coffee substitute."

"Soya bean flour is a concentrated food... In soups it resembles beef extract; one of the most famous European brands of soup cubes has a soya bean base.

"For troops in the field the bean is almost indispensable. Soya bean oil is used in the manufacture of explosives. Bean soups, curd, flour, meal and coffee can be a field diet in themselves. Many a city besieged by bandits has survived on stores of bean cake originally intended as fertilizer." Note: This is the earliest English-language document seen (June 2008) which states that bandits survived on soybeans–in this case bean cake in a besieged city.

784. *Good Health* (*Battle Creek, Michigan*). 1933. The soybean cures rickets. 68(2):16. Feb.
• ***Summary:*** This editorial states: "Various observers report the successful use of soybean milk in the treatment of rickets. Bischoff, an eminent German authority, calls attention to the

fact that the soybean is rich in phosphorus, the lack of which is a frequent cause of rickets.

"Many physicians are recommending the giving of cod-liver oil to all infants as a precaution against the development of rickets. Soybean milk may be found in many, perhaps in most, cases, equally as protective as cod-liver oil and because of its agreeable flavor and high nutritive value, may be found preferable to fish-liver oil."

Note: As of 1999 nutritionists believe that rickets, a deficiency disease characterized by soft and deformed bones, is usually caused by failure to assimilate and use calcium and phosphorus normally due to inadequate sunlight or vitamin D.

785. Hansen, Louis A. 1933. The soy bean as human food. *Life and Health* 48(2):21-23, 27. Feb. Also in J. of the Jamaica Agric. Soc., March 1933, p. 147-50.
• ***Summary:*** This is a good introduction to the soybean, based largely on information provided by Dr. A.A. Horvath (until recently of the health section, U.S. Bureau of Mines) and William J. Morse (senior agronomist at the USDA Bureau of Plant Industry). Discusses: History of the soy bean in Asia (especially China), nutritional benefits, soy bean flour, soy bean milk, and soy sauce.

Photos show: (1) Two men standing in a field of tall soybeans. (2) A person grinding soybeans with a stone mill to make soy bean milk in China. (3) A "Chinese courtyard with pots of fermented soybeans and brine from which the well-known soy sauce is made." (4) Steamed soy beans about to be made into miso in Japan.

Note: In 1968 Hansen wrote a book titled *From So Small a Dream,* about Madison College (Madison, Tennessee), which pioneered soyfoods in the United States.

786. *Madison Survey* (*Madison, Tennessee*). 1933. Soybean on exhibition at World's Fair. 15(10):39-40. March 22.
• ***Summary:*** "According to Sherman R. Duffy, the soybean will be the only vegetable crop having an exhibit all to itself at the Century of Progress Exposition, and will occupy 6,000 square feet of space in the Agricultural Building."

The soybean is known to urban dwellers only as the "material from which chop suey sauce is made... In the soybean exhibit will be soybean flour, diabetic foods, infant foods, macaroni, breakfast foods, and a vegetable milk which is being used in a variety ways in the manufacture of foods and confections."

787. Hansen, Louis A. 1933. The soy bean as human food. *J. of the Jamaica Agricultural Society* 37(3):147-51. March.
• ***Summary:*** This is a reprint of an article first published in *Life and Health,* Feb., 1933 (p. 21-23, 27).

788. Kellogg, John Harvey. 1933. Nutrient value of the soybean. *Good Health* (*Battle Creek, Michigan*) 68(3):25. March. [1 ref]
• ***Summary:*** *Nutrition Abstracts* reported that two Russian investigators who studied soy milk "found that its protein is equally as digestible as the protein of cow's milk and that it contains more tryptophan and so is able to balance up a larger amount of incomplete cereal proteins. Soy milk was found to digest more easily than egg or muscle protein (lean meat). Its lack of vitamin D is easily made good by the use of spinach and other greenstuffs which are the natural sources of this vitamin."

789. Klein, J. 1933. Vegetable milk in infant feeding. *Archives of Pediatrics* 50(3):205-10. March. [7 ref]
• ***Summary:*** The use of a soybean flour diet in the treatment of seborrheic eczema in infants is described. Address: Chicago.

790. L'Heureux, L. 1933. Le soja [Soya]. *Congo: Revue Generale de la Colonie Belge* 1(2):214-36. Feb.; 1(3):365-83. March. (Bulletin de l'Office Colonial, Bruxelles). [14 ref. Fre; eng+]
• ***Summary:*** This early publication on soyfoods in Africa describes food uses and methods of preparing soymilk, in both condensed and powdered forms. Tunisia was a French protectorate from 1881 to 1956, when it became independent. France grew soybeans there, apparently at about the same time it started growing them in Algeria (p. 214).

At the exposition of Nanking in 1910 some 400 varieties of soybeans were assembled (p. 214).

In 1908 the firm of Mitsui was the first to try to transport, by sea, soybean seeds from Dairen to Liverpool. It was the beginning of a new industry in England (Liverpool and Hull), in Germany, Denmark (Copenhagen), and Holland (Rotterdam & Amsterdam).

A former Belgian missionary in Jehol (West Mongolia), Father De Preter (*Le T.R.P. Fl. De Preter, Supérieur de la Maison des Pères de Scheut à Yvoir*) has corresponded with the author about soybeans, tofu, and soybean cake in that city. Soybeans are not cultivated on the best soils, which are reserved for wheat. One of his colleagues at Jehol, Father Cyr. De Puydt has worked to improve the soybean crop (p. 219).

Father De Preter has often helped in making tofu (*fromage de soja*), using magnesium chloride as a coagulant. If one uses calcium sulfate, the tofu is softer and the taste seems better. Father de Puydt has improved the manufacture of tofu by using magnesium salts (probably Epsom salts) in place of magnesium chloride. The tofu is eaten after being boiled in water or fried in fat. It is best when fresh. In winter, it is allowed to freeze [frozen tofu in northeast China] so that it can be kept for a long time; it becomes spongelike. But fresh tofu has a special aftertaste to which the European palate finds it difficult to get accustomed. This taste does

not come from the coagulant but from the soybeans. When one eats more than two pieces of tofu in succession, one experiences indigestion. It does not produce gas like the beans. Notes that the factory of the Caséo-Sojaïne near Paris, of which Mr. Li Yu-ying is the director, makes tofu and various tofu products. Cooked with eggs, tofu makes an excellent omelet. Cooked with the juice of meat, it takes on entirely that flavor. It can be used to make patés or smoked. Use firm tofu and cook in a mixture of 4:1 water to soy sauce. Then smoke it like meat. This can, for example, replace ham or bacon in an omelet. Tofu paté has much the same consistency and taste as paté de foi gras. Thus, there are many ways that tofu can replace meat (p. 221-24).

Using caséine or légumine of soymilk, the French pioneered industrial soy protein isolates in 1911 (see Beltzer). They were used in various glues, and in coating paper (p. 224-25).

The margarine industry employs only the finest quality oils. Soy oil was not introduced to margarine manufacture in Europe until about 12 years ago [i.e., 1921], but it has rapidly taken an important place on account of its good properties and low cost. Describes how to make synthetic rubber from soy oil. One of the main uses of soy oil in Europe is in making soaps. Some is also used to make explosives. Mr. Tihon is the distinguished director of the Laboratory of Industry and Commerce at Leopoldville, Belgian Congo (p. 227-28).

Soybean cake (*Tourteau*)*:* Father de Preter in Jehol has assured me that soybean cake is used there to nourish and fatten beasts. For horses, this cake has a surprising effect. If a horse, returning from a trip lean and exhausted, is put on a regimen of soybean cake, it will return to normal in 15 days (p. 230).

Just like the oil, the cake is more and more in demand in Europe, and in certain countries the effect of soybeans on the economy is quite remarkable. Until about 30 years ago, Denmark was a super producer of wheat. But Dutch products were defeated by the lower prices of American goods. Aided by soybeans, the Danes were able to expand their livestock. Soybeans are now imported, the oil is extracted and used to make margarine, while the cake is used to feed livestock–some 18.5 million heads in 1926, not including poultry The result has been the development of an enormous trade in animal products, butter, cheese, ham, bacon, lard, eggs and even livestock–all accounting for about 70% of Danish exports. Holland is in a similar position (p. 230-31).

In 1912 the "Dairen Mill Owners Association" was founded, By June 1923 all but 7 of the mills in Dairen were members of the association. The oil in the Suzuki mill is extracted using benzine solvent, the most modern method. 32 of the mills, mostly owned by Japanese, use hydraulic presses, while those owned by the Chinese generally use hand-turned screw presses (p. 231-32).

A large table (p. 323) shows exports of soybean seeds, cake, and oil from the ports of Dairen, Newchwang, Vladivostok, and total, from 1908 to 1917. During this time, because of Manchurian mills, the amount of seed decreased, while the exports of cake and meal increased.

Condiments: Shoyu (*shoyou*) is the main one. Several processes for making soy sauce are described in detail. Lea & Perrins Worcestershire Sauce is nothing but a highly seasoned soy sauce (p. 234).

Continued (p. 365): Mr. L. L'Heureux is director of the chemical service of the Belgian Congo. Let's see what the soybean is doing in the Congo. M. Tihon of Leopoldville, said in an interesting report titled *A propos du soja hispida:* Encountered 30 years ago [i.e., about 1903] at Stanleyville by commander Lemaitre, it figured in the collection of the botanical garden of Eala and was the object of experiments at Sankuru in 1914-15 (p. 365).

In this report, Tihon analyzed 3 varieties of soybeans from the plantations of Eala. The soybean would be good for all our [Belgian] colonies; it could replace meat and be used in the rations of black workers (p. 366-67).

Soymilk: Describes how to prepare it and its properties. According to Prof. Laxa of Prague, fresh soymilk has an acid reaction. Mentions the work of Li Yu-ying. Notes that by adding lactose and a bacterial culture, Yogourth [yogurt] can be made from soymilk (p. 370).

In Peking, soymilk is sold in small bottles of 200-220 cc carrying the title *Lait de pois–Un produit chinois. La nurriture la plus nourrissante. Préparé par* ___. In 1925 one bottle of soymilk daily cost 1 dollar Mex per month. In 1919 in Shanghai, Peking and Dairen, Chinese companies furnished hospitals and private individuals 8-10 oz of concentrated soymilk in bottles (p. 371-72).

A table (p. 373) compares the composition of 3 types of soymilk with mother's milk, cow's milk, and goat's milk; all but the cow's milk (87.00%) contain 90.71% water. The soymilks are: (1) From Tsinan fu, China. (2) From Peking, China. 3. From Japan. The soymilk from Peking was low in fat, so yuba had probably first been removed from it (p. 372).

In China, soymilk is habitually drunk sweetened with sugar. Li Yu-ying reports that one of his parents was nourished from birth with soymilk and for 37 years he has always been in excellent health (p. 374).

A new method for making soymilk. In 1916 Prof. Laxa of Prague develop a method for making soymilk in homes in Europe. The cost of a liter of soymilk in Prague in 1916 was estimated by Laxa as being about 40 centimes if it was homemade. Before the war, there was in London a soymilk factory which intended to place its products regularly on the market. Plans were made to construct two other plants, one in Manchester and one in Liverpool. The synthetic milk syndicate launched a soymilk on the market that was adapted to European tastes. The syndicate's factory, established in Liverpool, used the method of F. Goessel to make 100 liters of soymilk using the following formula (which is given). A

Dutch patent (No. 2122 of Sept. 1917) and a Japanese patent (No. 28346) are also cited (p. 375-77).

A table shows the composition of 6 types of Soyama soymilk according to the analyses of Dr. G. Popp of Frankfurt. The protein ranges from 2.5% to 3.77%. Normal soy cream contained 11.5% fat, whereas that which was extra rich for diabetics contained 30% fat. It is very difficult to tell the difference between tea, coffee or chocolate to which one has added Soyama soy cream compared with regular dairy cream (p. 379).

In using the Soyama milk and cream, von Noorden confirms the following statement of Fischer, who studied vegetable milks in general: 1. In the stomach, soymilk gives a flocculent precipitate which is finer [smaller clumps] than that produced by cow's milk. 2. The digestion of soymilk requires only a weak secretion of gastric juice; the period of secretion is therefore short. 3. The time that soymilk protein resides in the stomach is shorter than that of cow's milk protein. 4. The peristaltic action of the stomach is less after ingestion of soymilk and better coordinated. Therefore, based on these observations, von Noorden recommended soymilk over cow's milk (p. 380).

Hatmaker made powdered soymilk. A table shows its composition, as analyzed by a laboratory in Paris (p. 380).

Yu P'i and Yu Ba are the Chinese and Japanese names of yuba, respectively. Recently a new method for making yuba has been patented in Japan. It consists in the use of an electric ventilator [or fan] placed above the surface of the cooking pot containing soymilk that is not heated above 90ºC. A table (based on analyses of the Tokyo Laboratory of Hygiene, of Embrey, and of Adolph) then gives the nutritional composition of 5 types of yuba, including Fu Chu (dried yuba sticks) which (surprisingly) contain 53.68% water.

Note: Maybe this Fu Chu was either fresh or reconstituted yuba. Address: Directeur du Service Chimique du Congo Belge.

791. *J. of the American Medical Association.* 1933. Soy bean milk in infant feeding (Abstract). 100(15):1205. April 15.
• ***Summary:*** This is a brief summary of a study by Rittinger and Dembo, who conducted a preliminary study of 50 infants for more than one year by feeding them soy bean (vegetable) milk. "The progress in weight and the state of nutrition shown demonstrated that the soy bean, with the addition of sugars and various mineral salts, can be made an adequate food for infants. The preparation used contained adequate amounts of the essential vitamins. The stool flora resembled that of the normal, breast fed baby. The economic features (mass production and low cost) are especially significant in a consideration of soy bean milk as an infant food. It compares favorably with the milk of animals from the standpoint of nutritional availability and biologic value. The authors have an additional 100 babies under observation on a diet of soy bean milk, either as a complement to breast milk or as an exclusive food. They will report their studies at a later date."

792. Adolph, William H.; Yang, En-Fu. 1933. The estimation of soybean milk used as an adulterant in cow's milk. *J. of the Chinese Chemical Society* 1(1):29-34. April. [3 ref. Eng]
• ***Summary:*** Soybean milk (vegetable milk) is used in the Orient as both a substitute for and an adulterant of cow's milk. "In nutritive value, it is inferior to cow's milk. Therefore the development of a simple method for its detection and estimation as an adulterant becomes a matter of importance."

In general appearance the two types of milk are similar, except for "a distinct *beany* taste in the case of the soybean milk."

Two methods are proposed: (1) Reaction with alkali. (2) Determination of iodine number. Address: Dep. of Chemistry, Yenching Univ., China.

793. Battle Creek Sanitarium. 1933. Menu. Breakfast, Tuesday, April 18 1933. Battle Creek, Michigan. 1 p.
• ***Summary:*** At the bottom of each typed menu is a space for the dietitian's name. "Good morning!" is printed near the top of the menu, which is in the form of a table with 8 columns. Col. 1 are the menu items divided into main types: Fruits, cereals, entrees, breads, beverages. Cols. 2-8 give, for each menu item, the weight, the calories from protein, fat, and carbohydrates, and the total calories. Cols. 7-8 give the reaction of the food (acid or basic).

Only vegetarian foods are offered. These include soy milk, soy acidophilus [cultured soy milk], cereal coffee, whole wheat toast melba, cooked whole wheat cereal, bran flakes cereal.

794. *Washington Post.* 1933. Milk from soy beans is new economy food. Inventor [Jethro Kloss] claims product is more nutritious than dairy article. May 21. p. 24. Sunday.
• ***Summary:*** Jethro Kloss makes soy bean milk at home for his family. His own daughter, Mrs. Harry C. Engelhard, was raised on nut milk before he perfected the soy bean milk. Her daughter, Joyce Joan Engelhard, was raised exclusively on the soy bean milk. In Mr. Kloss' method, the strong flavor is removed. The beans are soaked overnight, then ground, to give a product costing about 2 cents for 3 quarts. Mr. Kloss, who lives at 109 Varnum St. Northwest, says that buttermilk and cheese may also be made from soy bean milk.

Two small portrait photos show (see next page): (1) Mrs. Harry C. Engelhard (left), wearing a white hat and dress. Jethro Kloss' youngest daughter, she was born Naomi Kloss, but later changed her first name to Joan. (2) Jethro Kloss (right), wearing a dress suit with a white bow tie. An original of this photo (shown here) was sent to Soyfoods Center in 1985 by Doris Kloss Gardiner of Loma Linda, California.

Note 1. This is the earliest document seen (Oct. 2004)

concerning Jethro Kloss and his work with soyfoods.

Note 2. This is the earliest article on soy seen (Aug. 2002) in the *Washington Post.*

795. Goessel, Fritz. 1933. Process for converting soya beans and the like seeds into a condition suitable for nutrition. *U.S. Patent* 1,912,895. June 6. 2 p. Application filed 23 Dec. 1930.

• ***Summary:*** Describes heat-treatment of soya beans with a hot liquid (such oils or fats) at 100ºC for about 5 minutes to remove the "repulsive taste" and/or smell. The oil is then removed by centrifuging.

Note: This process of oil-roasting or deep-frying soybeans in oil and/or Crisco to reduce their beany flavor is sometimes called "Goesselizing" (See Nelson 1935). Address: Frankfurt-am-Main, Germany.

796. Asiaticus. 1933. Sojas de Mandchourie: Production–exportation [The soybeans of Manchuria: Production and exports]. *Revue Internationale des Produits Coloniaux* 8(90):230-33. June. [Fre]

• ***Summary:*** Soymilk is made in Germany and Czechoslovakia.

797. *Boletin de Agricultura y Trabajo* (*Nicaragua Ministerio de Agricultura y Trabajo*). 1933. Soya o soja (Soja Híspida Moench) [Soya or soja]. 5(48):19-20. June. 2nd Series. [Spa]

• ***Summary:*** Contents: Introduction and history of the soybean ("it is also called 'soya'"), with its extension in the United States. Climate. Soil. Fertilizer. Inoculation. Varieties widely cultivated in the USA (Biloxi, Peking, Virginia and Wilson Five for hay and ensilage. Ito-San, Manchu, Mandarin, and Tokio [Tokyo] for seed. Hahto for use as a food legume at the table {*legumbre de mesa*}). Uses of the plant: Green manure, forage, pasture (*pastaderos*), hay, green forage. Food products made from the seeds: Flour, oil, soy sauce, cooked whole soybeans, coffee substitutes, soups, soybean roasts or steaks (*soyas asadas*), porridge or mush, soymilk (*leche vegetal*), condensed soymilk, fresh soymilk, casein, confections, soy cheese (tofu; fresh, dry, smoked, or fermented; *queso fresco, seco, ahumado, fermentado*).

Food products: Dry soybeans (*semillas secas*) are used to make soy sauce (*salsa de soja*), cooked soybeans (*sojas cocidas*), coffee substitutes (*sustitutos del cafe*), soups (*sopas*), roasted soybeans (*soyas asadas*), porridge / pap (*gacha*), vegetable milk [soymilk] (*leche vegetal*), condensed milk (*leche condensada*), fresh milk (*leche fresca*), casein (*caseina*), confections or sweets (*dulces*), and soy cheese ([tofu] fresh, dried, smoked, or fermented {*fresco, seco, ahumado, fermentado*}), and green vegetable soybeans (*semillas verdes*) are cooked and canned or served in salads. Enemies of the soybean.

Note 1. This is the earliest document seen (Feb. 2009) concerning soybeans in connection with (but not yet in) Nicaragua.

Note 2. This is the earliest Spanish-language document seen (Oct. 2011) that mentions fermented tofu, which it calls *queso fermentado.*

Note 3. This is the earliest Spanish-language document seen (Oct. 2011) that mentions roasted soybeans / soynuts, which it calls *soyas asadas.*

Note 4. This is the earliest Spanish-language document seen (June 2009) that uses the term *semillas verdes* to refer to green vegetable soybeans.

798. Kellogg, J.H. 1933. Lime and longevity: From the editor's pen. *Good Health* (*Battle Creek, Michigan*) 68(6):16-17. June. [1 ref]

• ***Summary:*** Dr. H.C. Sherman of Columbia University, in rat feeding experiments, has shown that the addition of milk and lime or calcium to their diet increased longevity by 10%. "For those who cannot take cow's milk, and there are many such, soybean milk is a very satisfactory substitute. It is, indeed, more than a substitute, for in some respects it is superior to cow's milk.

"Best of all is the soy acidophilus milk, a culture of the *bacillus acidophilus,* the protective germ which Nature plants in the intestine of every young mammal to protect it against the invasion of harmful bacteria. Unfortunately, many

adults have lost this bodyguard which Mother Nature kindly provides. In such cases, a new implantation of the protective flora is necessary. This can best be done by the use of the soy acidophilus milk. One or two pints of this milk, used in connection with lactose, will quickly change the flora even in cases where the protective organism has wholly disappeared. The protective flora keeps the intestinal tract in an acid state, the normal condition which encourages the absorption of lime" [calcium].

799. USDA Bureau of Home Economics. 1933. Nutritive value of soybean and soybean products (Leaflet). Washington, DC. 2 p. June 10. [5 ref]
• ***Summary:*** Table 1 gives the nutritional composition and fuel value of soybeans and soybean products: Green shelled soybeans, soybean sprouts, dry whole seed soybeans or whole ground meal, soybean flour (sifted, from the whole bean, from the press cake), soybean curd or cheese (fresh), soybean milk, soy sauce. Includes recipes for: Whole wheat bread with soybean flour, and White bread made with soybean flour. Mentions that Soyex Co., Inc., was at 60 John St., New York City, on 5 May 1931; An analysis of their flour made from whole soya beans is given.

Note: This is the earliest English-language document seen (June 2009) that uses the term "Green shelled soybeans" to refer to shelled green vegetable soybeans. Address: Washington, DC.

800. Adler, Max. 1933. [Manufacture of soy milk and its derivatives]. *French Patent* 749,137. July 18. [Fre]*

801. Dittes, Frances L. 1933. The soy bean as human food. *J. of the Tennessee Academy of Sciences* 8(3):323-28. July. [12 ref]
• ***Summary:*** "Read before the Tennessee Academy of Science at the Nashville meeting, November 27, 1931." Food products from soybeans and their value as food. Concludes: "Thus, there are significant reasons for expecting that the soy bean will become one of our most stable and prominent sources of fat and protein. There are reasons to expect also that the United States will become the leader in introducing the soy bean in the daily diet of the white race."

Tables: (1) Composition of soy bean seed compared with that of other legumes. (2) Comparisons of soy milk with other milks. (3) Composition of soy bean milk compared with cow's milk compiled from various sources. Address: Nashville Agricultural and Normal Inst., Madison.

802. Stearns, Genevieve. 1933. Soy bean flour in infant feeding: A study of the relation of the comparative intakes of nitrogen, calcium, and phosphorus on the excretion and retention of these elements by infants. *American J. of Diseases of Children* 46(1):7-16. July. [15 ref]
• ***Summary:*** Infants maintained on diets of soya-bean foods containing calcium, phosphorus, and nitrogen in approximately the same proportions as in cow's milk retain adequate quantities of these elements. Increase in the relative intake of calcium results in insufficient retention of phosphorus and calcium and of other fixed bases. Address: Dep. of Pediatrics, College of Medicine, State Univ. of Iowa.

803. *Chinese Medical Journal.* 1933. Annotations: Soya-bean milk in infant feeding. 47(9):943-44. Sept. [1 ref]
• ***Summary:*** "Long popular in the Orient where it occupies a prominent place in the dietary, the soya bean is not usually regarded in this country as an important foodstuff, still less as a possible source of material for the feeding of infants. Nevertheless it has been tried for the latter purpose with favourable results in certain centres in England, while in America many workers are now speaking well of the so-called 'vegetable milk.'"

There follows a summary of an article by Rittinger and Dembo (*American Journal of Diseases of Children,* Dec. 192, p. 1221-38). Note. This is the earliest English-language document seen (Aug. 2013) that contains the term "soya-bean milk," which is used in both the title and the long summary.

804. Miller, Carey D. 1933. Japanese foods commonly used in Hawaii. *Hawaii Agricultural Experiment Station, Bulletin* No. 68. 43 p. Nov. See p. 1-10, 28-43. [18 ref]
• ***Summary:*** Contents (p. 1-10): Introduction. Soybean products. Edamame (green soybeans). Tofu (soybean curd). Kirazu (tofu residue) [okara]. Tonyu (soybean "milk"). Aburage (fried soybean curd). Miso (fermented rice and soybeans). Natto (fermented soybeans). Shoyu (soybean sauce). Koji (fermented rice). Pages 24-15: Kinoko (mushrooms). Fu (gluten cakes). Goma (sesame seeds).

Pages 28-43: Recipes with the nutritional composition of each: Miso soup with tofu. Miso soup with wakame. Miso soup with daikon. Miso soup with [cow's] milk. Tofu soup with lemon. Tofu shoyu soup. String bean shirae [shira-ae] (with tofu and miso). Carrot shirai. Konnyaku shirai. Eggplant with miso. Green onions with miso. Fish cakes with miso. Sesame seed sauce for vegetables (with shoyu). Nishime (with shoyu). Nigome (with aburage and shoyu). Kirazu with vegetables (with okara, aburage, shoyu). Noodles (somen or udon, with shoyu). Vinegar sauce for sushi. Inari-sushi (with aburage and shoyu). Maki-sushi.

Note: This is the earliest English-language document seen (June 2013) that calls for okara [which it calls *kirazu*] as an ingredient in a recipe.

Appendix: Composition of some Japanese foods used in Japan.

Concerning edamame: "The Japanese use several varieties of fresh green soybeans. In Honolulu whole plants are purchased from the vegetable market. The pods are removed from the plants, placed in boiling salted water,

and boiled for about 25 minutes. They are then drained and cooled, and the beans are kept in the pods until eaten. Often children eat them out of bags as they would candy. The fresh green soybeans appear to be an excellent food. They are good sources of calcium, phosphorus, and iron, yield a basic ash, and, as compared with other fresh vegetables and fruit, have a remarkably high protein content. Vitamin tests in progress at the nutrition laboratory of the Hawaii Agricultural Experiment Station show that the cooked beans are very good sources of vitamins A, B, and G. The more general use of green soybeans should be encouraged in the home, and their consumption may be increased by selling them in school cafeterias."

Concerning Kirazu (tofu residue) (p. 5): "Kirazu, or the residue of the soybeans left when tofu is made, has a crude fiber content of 3 to 4 percent, contains 4 to 5 percent of the protein of the beans, more than 1 percent of the fat, and 5 to 6 percent of the carbohydrate. Only a small part of kirazu is used for human food in Hawaii, by far the greater part being used as hog feed. Kirazu, however, is a utilizable, inexpensive food and might be more generally used than it is... Kirazu is used in combination with vegetables, or with fish, or dried shrimp, and seasonings."

Concerning Tonyu (soybean "milk"): The milky liquid obtained by grinding soybeans with water and heating and straining off the insoluble residue has the appearance of skim milk. Early reports from China and from Japan stated that soybean milk may be used as a substitute for cow's milk for children, but Wan (16, p. 360), in more recent scientific reports from China, indicated that, whereas soybean milk is richer in vitamin B than is cow's milk, soybean milk is lower in vitamin A and still lower in calcium content. The biological value of the protein of the soybean milk is not comparable with that of the protein of cow's milk. Chemical analyses of local soybean milk obtained from the tofu-manufacturing shops showed it to be low in fat and in carbohydrates. Chang and Tso (3, p. 199) demonstrated that, when properly supplemented with the necessary minerals, vitamins, fat, and carbohydrates, soybean milk can be used successfully for infant feeding where cow's milk is not available or where the infant is anaphylactic to the protein of cow's milk. In Hawaii there is no need to use soybean milk as a substitute for cow's milk and, considering its dietary qualities, it should not be so used without the needed supplements"

Concerning natto: Describes the process for making natto on a commercial scale in Honolulu. After cooking (without soaking) for about 8 hours in a large iron kettle, the "beans are thoroughly drained and placed on paper plates covered with wax paper. The plates are stacked one above another in large wooden boxes, covered with rice straw mats, and kept at a temperature of approximately 30ºC. for 35 to 36 hours, when the product is ready for use... The fermented product is covered with a gray, slimy substance that forms strings or threads when the beans are pulled apart, indicating good quality... Although no molds or yeasts are added to the cooked soybeans, O.N. Allen, of the botany department of the University of Hawaii, who examined several samples of fresh natto from Honolulu, found 2 molds, 4 bacteria, and an aspergillus present. The enzymes of some of these organisms probably caused the conversion of a small part of the protein to simpler substances."

Concerning Inari-sushi (p. 37): The "ingredients required for this dish are rice, water, salt, aburage, carrots, mushrooms, string beans, gobo, flaked bonito, water, sugar, shoyu, and vinegar sauce." A detailed recipe is given.

Photos show the following (each food accompanied by its Japanese name written in both Chinese characters and *katakana*)*:* Edamame, in the pods on the plant, and shelled in a dish. Tofu kasu [okara] on a plate. Tofu on a dish. Tonyu (soybean "milk") in a glass. Three triangles of aburage on a dish. Miso on a dish. Natto in a white rectangular commercial paper tray about 3½ by 6 by 1 inch deep. Koji on a plate.

Note 1. This is the earliest English-language document seen (June 2009) that uses the term "fresh green soybeans" to refer to green vegetable soybeans.

Note 2. This is the earliest document seen (July 2003) that mentions commercial natto production in Hawaii.

Note 3. This is the earliest English-language document seen (Jan. 2012) that uses the term "tofu residue" to refer to okara.

Note 4. This is the earliest English-language document seen (Jan. 2012) that uses the word "strings" or "threads" in connection with natto. Address: Specialist in Nutrition, Honolulu.

805. Pollak, J. 1933. Soy bean is a source of food and milk for diabetics. *Industrial and Engineering Chemistry, News Edition* 11(23):347. Dec. 10. Translated by W.L. Hill.
• ***Summary:*** "The process worked out by L. Berczeller in Vienna for purifying the soy bean, which is known to be especially rich in protein and fat, has made possible the production of a soy bean meal [whole soy flour] that still shows the total fat and lecithin content of the bean and yet does not become rancid. Later, E. Kupelweiser [sic, Kupelwieser] in Vienna utilized and perfected this process on a technical scale." By the addition of the necessary technical baking supplements to edible soy meal, a soybean bread has been produced in Austria. It contains only "one-fourth as much sugar-forming substance as normal bread. In taste and appearance this bread comes so near to ordinary whole-grain bread that it can scarcely be distinguished from it. Moreover, there is the practical advantage that this new bread, now being manufactured for diabetics on a factory scale, is markedly cheaper than most of the baked products hitherto used by diabetics.

"Another old problem of the production of soy milk

has also been worked out recently in Austria. By suitable preliminary treatment of soy beans, M. Adler has been able to produce a soy milk which is completely neutral to the taste and can scarcely be distinguished from cow's milk. Moreover, in chemical composition and physical properties it appears to be quite equal to animal milk. On account of its low cost this product could assume importance in the food-processing industries. The process is also probably suitable for the production of milk for diabetics." Address: Vienna, Austria.

806. Adler, Max. 1933. Manufacture of soy milk and its derivatives. *British Patent* 402,948. Dec. 14. Application filed 12 Jan. 1933. *

• ***Summary:*** Objectionable flavors are removed from soybean products by partial preroasting, extraction with ethanol, and heating an aqueous suspension while passing a stream of superheated steam or air.

"The original harsh and bitter taste is changed to an almond-like sweetness by subjecting the beans in the first place to a light roasting, followed by peeling and removal of the germ. Bodies imparting an astringent taste are dissolved out with the aid of alcohol or other suitable organic liquid. Not less than 10 minutes' heating of the soy mass in aqueous suspension destroys the raw leguminosic taste. This operation is immediately followed by passage of a stream of superheated steam or other indifferent gas heated to the same temperature in order to drive off substances responsible for the characteristic odour of the raw beans. This last operation should not occupy more than 30 minutes at a temperature not exceeding 120ºC, so as to avoid decomposition of fats and albuminoids. The final product can be incorporated with other ingredients or diluents and thereby rendered approximately equivalent to cow's milk or human milk. Emphasis is laid upon the value of soy milk as a diet for diabetics." (Quoted from Food Manufacture).

807. Crane, Helen R. 1933. The story of the soya. *Scientific American* 149:270-72. Dec.

• ***Summary:*** The article begins: "During the Civil War the Union soldiers were fed a coffee which they did not like very well. It tasted 'so-so' but it failed to whip them on and keep them awake as did the coffee they had back home. No one bothered to tell them it was soybean coffee, and if they had been told what it was, the news probably would have meant nothing to them, for few people in this part of the world had ever heard of the soybean in that time." This "Civil War coffee" was "brought back by some of our traders to the East..."

"Time went on and then, in 1915 a shortage of cottonseed in the South coincided with a surplus of North Carolina's soybeans that were being cultivated for live-stock. The Department of Agriculture began to dream dreams of an American soy-oil. Had not the Orient been using this oil for thousands of years in making lacquers, varnishes, paints, soaps, printing-inks, candles, waterproofing, and all such?"

Americans discovered that soybean "oil could be extracted by grinding the beans and then placing them in some chemical solvent such as benzol, naphtha, or ether. The solvent was later evaporated, distilled, and used over again..." The Orientals have made comparatively "little use of soy meal for animal feed."

"It was not until as recently as 1917, when conditions brought on by the World War forced the Department of Agriculture to search for a cheap source of proteins for human consumption, that the soy bean was 'discovered' as a real food. More than 400 different recipes exist in Chinese cook-books, some of them dating back to about 3000 B.C., but we Americans did not find them. Our scientists went to work directly on the bean itself–although they may have accepted ideas from the Orient of using it as a flour, a curd, milk, oil, and meal."

"Our food experts, too, have taken with enthusiasm to this new 'almost perfect food... it fills a crying need in our dietary,' they say, and they add that, '... for some strange reason, our knowledge of foods has lagged far behind our other technical accomplishments and we have only just begun to realize the deficiencies of our present foods... the soya will be come a very important accessory.'"

"Soy-milk, which is prepared in a similar manner to almond-milk, is reported by several of our universities to be suitable for use as the only source of proteins in the diet of babies, as well as being adequate for promoting normal growth in children. It is further stated in these reports that invariably better results are obtained from its use in such cases than from cow's milk."

"As for the cheese, or curds, they do not appeal greatly to Occidental taste at first. They seem a trifle strong in flavor and are sponge-like in consistency, but it is prophesized [prophesied] that they will undoubtedly come to be looked upon as the delicacy they are considered to be in the Orient. These curds, prepared in an infinite number of ways, may appear in one form as the 'meat' course, in another as the salad, and in still another as the dessert."

"Flour is now an important product from the soy, and is being manufactured in various parts of the country by the ton. It is used for making breads, cakes, and pastries. To diabetic patients and others in need of a starch-free diet it comes as a blessing, as well as adding a very palatable and nutritious item to the pantry list of any housewife."

"'Ice Cream by the Mile' is the title of an article, to be published soon, which tells the story of the development of a new and better process for making that frozen delicacy."

Photos show: (1) A field of Oo-too-ton [Otootan] soybeans in Orangeburg County, South Carolina. (2) William Morse of the USDA holding a round soybean cake made by pressing the oil from the beans. (3) Laredo soybeans cocked up in the field for curing in White County, Arkansas. (4)

A soybean plant growing taller than a man, with corn, in South Carolina; they are used for soil building and "hogging down."

Note 1. This is the earliest document seen (Jan. 2000), published in the USA, that uses the term "the soya" as a noun.

Note: This is the earliest English-language document seen (Sept. 2006) contains the term "soy-oil." It is used as a noun.

808. Bogatskii, V.D.; Storozhuk, M.K.; Muromtsev, V.A. 1933. Technologie der Herstellung und Methoden der Desodorierung der Sojamilch [Technology for the production and methods for the deodorization of soymilk]. *Schriften des Zentralen Biochemischen Forschungsinstituts der Nahrungs- und Genussmittelindustrie* (*Moscow*) 2(9):410-30. (Chem. Abst. 27:5438). [3 ref. Rus; ger]
• ***Summary:*** Describes the commercial preparation and methods of deodorization of soy milk. "Detailed directions are given for preparation and grinding soy beans, emulsifying, boiling and deodorizing by blowing with hot air..." Address: USSR.

809. Kostuirke, D.S.; Maryash, T.K. 1933. Die Mikroflora der Soja und ihre Rolle in der Technologie der Sojaprodukte [Soybean microflora and their role in the technology of soy products]. *Schriften des Zentralen Biochemischen Forschungsinstituts der Nahrungs- und Genussmittelindustrie* (*Moscow*) 2(9):431-36. (Chem. Abst. 27:5438). Also in Zentralblatt fuer Bakteriologie Series 2. 90:279-, 1934. [1 ref. Rus; Ger]*
• ***Summary:*** Bacteriological examination of soya-bean revealed the presence of *B. perfringens, B. megatherium* and various strains of *E. coli* and *Bact. lactis-acidi Leichmann* (now called *Lactobacillus Leichmanii*). Mild fermentation usually sets in when the beans are soaked in water, the aerobic or the anaerobic organisms being active according to the conditions. The putrefactive spoilage of soya-bean milk is initiated by *Escherichia coli*, proteolyzed by *B. megatherium* and *B. mesentericus vulgatus.*

The authors prepared alcoholic and lactic acid fermentation products from soya-bean milk by using *Lactobacillus leichmanii* and a torula yeast isolated from kefir.

Pasteurization and Tindalization during the production of soymilk and soy lactic acid products (kefir, sour milk) is not suitable / applicable. Address: USSR.

810. *Unknown newspaper* (*Miami, Florida*). 1933. Scientist extracts milk from soy bean. Unknown.
• ***Summary:*** A facsimile copy of this article appears on page 341 of the revised 1981 edition of Back to Eden. A large photo shows "Dr. [sic, he was not an M.D.] Jethro Kloss" with glasses in what appears to be a tuxedo and white bow tie. The subtitle states: "Dr. Jethro Kloss of Washington, D.C., says product tests 3.15 per cent butter fat and can e obtained much more cheaply than from cow; soy bean products to be exhibited." The article continues: "Milk from contented soy beans. This may sound like a joke or prophetic, but it's a fact, according to Dr. Jethro Kloss of Washington, D.C., who has devoted 18 years to the study of the soy bean, and from it has derived so many products that an enumeration of them sounds like a dairy menu.

"'Milk so pure that it can hardly be detected by the taste alone can be taken from the soy bean,' Dr. Kloss said. 'From this milk more than 20 products already have been made, and have stood the test of careful analysis.

"'Soy bean milk tests 3.15 per cent butter fat against 4.50 butter fat for the best of cow's milk. It will sour just as the cow's milk, and after this it may be made into cheese, buttermilk or anything else for which cow's milk is used. And it may be produced for about 2 cents per quart.'

"Dr. Kloss said that he first became interested in the soy bean when he noted its fattening effect on cattle. He began an intensive study of the bean, and after many years of research, perfected processes by which the milk could be extracted. From this the by-products developed.

"' The milk can hardly be detected by taste alone. Most people expect it to be slightly bitter, but it isn't,' Dr. Kloss said. 'My own 4-year-old granddaughter has never tasted cow's milk, and she has been pronounced an almost perfect specimen of childhood.'

"Dr. Kloss will exhibit the products of the soy bean in Bayfront park tomorrow evening after the band concert."

Note: Kloss' 4-year-old granddaughter referred to here is Doris Kloss Gardiner, who was born on 28 Feb. 1933 in Miami, Florida. Thus the article must have been published after that date, probably sometime during 1933. Bayfront park (which still exists in 1990 and has a large amphitheater) is in northern Miami, Florida, on the waterfront on Biscayne Blvd.

811. Carqué, Otto. 1933. Vital facts about foods: A guide to health and longevity with 200 wholesome recipes and menus and 250 complete analyses of foods. Los Angeles, California: Published by the author. 208 p. Index. 24 cm. [20+* ref]
• ***Summary:*** This manual of food reform discusses the importance of a simple vegetarian diet of natural foods, sunlight and sunbaths, fresh air, pure water, exercise and rest. Also talks about acid and alkaline foods, the influence of mind on health, the failure of synthetic foods, why refined sugar is injurious, the dietetic value of sea plants, table salt is unnecessary and harmful, fruit is man's best food, sulphured and unsulphured fruits, nut butters, food preparation, and the treatment of disease.

"Dedicated to my dear wife, Lillian, who through her sincere and earnest spirit of cooperation has greatly assisted the author in his work of food reform."

The germ theory of disease has not been proven since potentially harmful germs are omnipresent yet often fail to harm healthy individuals (Pasteur was a chemist and laboratory worker, not a physician. Germ action is always secondary; "when germs invade a living organism it is a sign that the organism is enervated and its chemistry perverted." p. 114-15).

The section titled "'Meat substitutes' not essential" (p. 130) states: "Those persons who want to adopt a meatless diet should not look for artificially prepared meat substitutes as a source of protein. A food constituent required in such a limited amount as protein is easily supplied by the various products of the vegetable kingdom. Such combinations as 'roast vegetable turkey' or 'vegetarian steak' seem to be the result of the belief that meat is a necessary food and must be replaced in some form. Indeed, vegetarians, who live largely on foods in which the protoplasmic cells have been more or less disorganized by prolonged cooking, have very little advantage over mixed eaters.

"All other factors being equal, a judiciously selected meatless diet is far more conducive to health than the usual mixed diet, consisting, for the most part, of animal and starch-bearing foods deficient in alkaline elements. We should understand that the proteins of fruits and vegetables, supplemented by a small amount of the proteins of nuts, legumes (especially soy beans), or dairy products, are fully able to maintain health and efficiency. It is entirely feasible to live on an exclusive diet of fresh ripe fruits and green-leaf vegetables for many weeks and months, thereby purifying the blood and greatly improving the keenness of our senses. In fact, in many pathological conditions such a restricted diet is more helpful than an absolute fast.

"Among the legumes which contain a large amount of protein, the soy bean takes first place. Its protein content, nearly 40%, is higher than that of any other food. Moreover, this protein is of excellent quality, as valuable as the casein of milk; it contains all the essential amino acids. It contains a sufficiency of vitamins A and B, and in this respect it is superior to all seeds. It contains very little carbohydrate, only about 6%, and is practically free from starch. The soy bean fills the place of meat as well as milk in the dietary of many millions of sturdy Orientals; it is destined to become one of the great food staples, not only of this country, but of the world. A number of recipes for the preparation of the soy bean are given in Chapter XXI."

The section titled "Fruit and nut confections" (p. 133-35) begins: "Fruit and nut confections made without refined sugar and glucose should take the place of candies." These "sweet-meats"... "should be the only kind of confections allowed to growing children, which have a natural craving for sweets." Recipes include stuffed dates, date caramels, nut fruitose, carob confection, raisin-nut balls, and honey cocoanut balls. For Nut fruitose: Mix dates, figs, raisins, almonds and walnuts. "Run through a food chopper twice. Press the mixture into a flat pan in a layer about 1 inch thick, let stand overnight, and cut into convenient sizes." Note: Carque was a pioneer in the development of healthy, natural treats. The last recipe could be considered a forerunner of the less-healthful "nutrition bar" of the 1990s.

The next section, titled "Nuts and nut butters," states that "salting and roasting greatly impair the nutritive value of nuts and prevent their proper assimilation. The proteins become coagulated by roasting, and the fats split into glycerine and free fatty acids, while the vitamins are destroyed. Nut butters made from salted nuts should, therefore, have no place in our dietary." Rather, the peanuts or almonds should be blanched (scalded or parboiled in water or steam). "Since few people, on account of defective teeth, can masticate nuts well enough to be acted upon by the digestive juices, the mechanical emulsification of nuts by means of nut butter mills is quite dispensable."

The section titled "Melba toast" and "Melbettes" (p. 156) states: "These are delicious dextrinized whole wheat products made by the Cubbison Cracker Co., Los Angeles." Melbettes are also made from whole rye. "Calavo Melba Toast is another tasty whole wheat product; it contains the natural fruit fat of the California Avocado or Alligator Pear as shortening."

The section titled "Natural whole rice" (p. 156) notes: "Whole rice, also called brown rice, contains the bran, cuticle, and germ of the cereal. In milling nothing has been removed but the husk and dirt."

The section titled "The Soy Bean, a Remarkable Food" (p. 158-61) discusses boiled soy beans, soy bean milk, tofu ("it is called by the Chinese 'the meat without a bone...' Other preparations of the soy bean, which are but little known in this country, are *natto, hamananatto* [*hamanatto*], *Yuba* and *Miso*. The principal use of miso, which is a slightly [sic] fermented mixture of soy beans and rice or barley, is for making soups and for cooking vegetables"), soy sauce, soy bean sprouts, and various recipes.

Under "Boiled soy beans" we read: "The dry beans are best soaked in soft water over night or for at least 20 hours and then cooked with sufficient water in a waterless cooker or Pressure cooker until tender. This may require as much as 2 hours or more, according to the variety of beans used. The best results are obtained if the beans are allowed to simmer rather than boil quickly. Onions, tomatoes, celery, parsley and other seasoning vegetables increase the palatability of the soy bean. A fireless cooker may also be used in preparing soy beans for the table."

Under "Ready made soy bean products" (p. 161) we read: "As the preparation of the soy bean in the average household is often not convenient, the author has arranged to supply the following products at reasonable prices: Canned Soy Beans, Soy Bean Spread, Soy Bean Stew, Soy Bean Loaf, Soy Vegetable Onion Soup, Soy Bean Vegetable Bologna, Soy Bean Tasty Lunch, to which others

will be added in the course of time. These products have met with ready approval, as they fill a long felt want for tasty, nutritious and wholesome vegetable protein foods to substitute meat and dairy products."

The author's signature appears at the end of the Preface. Address: Los Angeles, California.

812. Hou, Kia-wo (Hu, Chia-mo). 1933. Contribution à l'étude de l'action des ferments de la graine de soja sur les lipides [Contribution to the study of the action of soybean enzymes on soybean lipids]. PhD thesis, Faculte des Sciences, Paris. 76 p. Printed as a book by Les Presses Modernes, Paris. No index. 28 cm. [92 ref. Fre]

• ***Summary:*** Contents: Introduction. 1. The soybean from botanical, agricultural, chemical, physiological, and biochemical viewpoints. 2. Soy-based food and industrial products. 3. Study of the transformations undergone by lipids in the production of soymilk and tofu. 4. The existence of oxidative ferments of lipids or "lipoxydases" in soybean seeds and in common beans. 5. Study of soybean lipoxydase. 6. Comparative study of normal soy oil and that oxidized by soy lipoxydase. 7. The action of soy lipoxydase on various other animal and vegetable oils (non-drying, semi-drying, drying, from marine animals, from terrestrial animals). 8. Gas-volumetric studies concerning the action of lipoxydase. Conclusion. Bibliography.

In the book, the author (who is from Kirin [later called Jilin], Manchuria) pays homage to Gabriel Bertrand (his "president of thesis") and his "maitres" Richard Fosse (a professor) and Emile Andre.

In the Introduction we read: "It was right after the first foreign threats that a group of young Chinese decided to come to Europe to study under the patronage of the Franco-Chinese Society for Education (Société Franco-Chinoise d'Education) in order to acquire the new knowledge which would better allow us to assure the defense of our country. Let us render a just homage to the founders of this society: Tsai Yuen-Pei, Li Yu-Ying, Painlevé and Herriot... At the time of my return to China 4 years ago (i.e. 1929) it was thanks to the recommendations of Doyen Maige and of professors Pelabon, Pariselle and Fosse that I was able to find a good welcome near to Presidents Li Yu-Ying and Li Shou-Hua, and to obtain a grant / scholarship from the Academie Nationale de Peiping which had just been created at this time... My thanks go also to the address of presidents Li Yu-Ying and Li Shou-Hua for the aid and encouragement which they have so well accorded me.

This study has as its point of departure a study of the transformations which are undergone by the lipids in soybeans in the production of soy milk and cheese [tofu]. That study, conducted under the direction of Emile Andre, was published (with Andre as the primary author) in 2 articles in 1932 in the *Comptes Rendus des Seances de l'Academie des Sciences* (*Paris*). Address: Paris.

813. Kellogg, John Harvey. 1933. The new method in diabetes. Fourth revised ed. Battle Creek, Michigan: Modern Medicine Publishing Co. 300 p. See p. 90-91, 177-80, 295. Illust. 21 cm.

• ***Summary:*** A section titled "Insulin–Its discovery and use" (p. 90-91) states: "Every diabetic suffers from intestinal toxemia and needs to have his intestinal flora changed... Gluten preparations and soy bean products should take the place of meat and eggs, and milk prepared from the soy bean may be advantageously used in place of ordinary milk. Soy milk is almost wholly free from carbohydrates... The soy bean encourages remarkably the growth of the protective acidophilus flora. Soy acidophilus milk is especially useful in cases in which the protective flora has been entirely lost. By its continued use, the flora may be restored and maintained.*" (Footnote: *"Information concerning soy acidophilus milk may be obtained by addressing the Battle Creek Food Company, Battle Creek, Michigan.")

In a chapter titled "Directions for Making Soy Acidophilus Milk at Home" (p. 177-80), Dr. Kellogg begins by noting that he discovered the "remarkably stimulating effect of soy bean milk on the growth of B. acidophilus, the germ which forms the protective flora in the human intestine..."

Page 295 gives a recipe for making soy bean milk at home. The first step is to grind the beans to a fine flour and sift.

Gluten-related recipes (all calling for gluten flour) include: Gluten bread (p. 273). Gluten bran bread (p. 273). Gluten bran puffs (p. 273). Gluten griddle cakes (p. 274). Gluten wafers (p. 274). "Southern" gluten biscuits (p. 274). Soy bean biscuits (with soy bean meal, gluten flour, and starch-free bran, p. 275). Oatmeal and gluten gems (p. 275). Sandwiches (all on gluten bread, p. 268-71). Gluten bran bread sandwich (on gluten bran bread, p. 270). Cream of gluten cereal (p. 272). Address: Battle Creek, Michigan.

814. Kroener, Waldemar. 1933. Proteine [Proteins]. In: Emil Abderhalden. 1933. Biochemisches Handlexikon. XIV. Band (7. Ergänzungsband) [Biochemical pocket dictionary. Vol. 14]. Berlin: Julius Springer. 339 p. See p. 38-39, 192. Index. 26 cm. [13 ref. Ger]

• ***Summary:*** Contents: Introduction. Plant proteins. Animal proteins. Decomposition products (*Abbaustufen*) of proteins. Glycinin (a globulin from the soybean) is discussed on p. 38-39. Page 192 states that (according to Ziegelmayer 1931) soymilk inhibits the ability of rennet to produce curds in cow's milk. Address: Zurich, Switzerland.

815. Morse, W.J. 1933. Soybeans now a major crop in United States; Few grown before 1898. *Yearbook of Agriculture* (*USDA*) p. 198-205. For the year 1933.

• ***Summary:*** Contents: Variety adaptation. Variety utilization

(incl. bean curd, bean milk, soy sauce, miso (bean paste), bean sprouts, green vegetable beans, bean flour, roasted beans, bean confections [made using roasted whole soy flour], beverages, oil and meal, special fermented bean products). Soybean oil and meal industry. Soybean meal. Soybean oil. Soybeans for human food. Soybeans as an export crop.

"Variety adaptation: The Virginia, Laredo, Manchu, and Biloxi have a greater range than most other varieties. The Virginia, Mansoy, and Harbinsoy varieties excel on the less productive types of soil, while on better soils the Mansoy and Harbinsoy give inferior results.

"Since the Department of Agriculture began to introduce soybean varieties more than 7,000 samples of beans have been collected from Japan, Chosen [Korea], Manchuria, China, Taiwan (Formosa), Java [in today's Indonesia], Sumatra, and India. There are more than 2,000 distinct types in this large collection, ranging from 75 to more than 200 days in reaching maturity. At present about 40 varieties are generally grown in the United States."

"In Japan, where the soybean is used extensively as a green vegetable, more than 60 varieties, ranging in maturity from 75 to 160 days and differing in flavor, are grown solely for this purpose. The soybean in used in the United States primarily as forage, being preserved either as hay or silage, or cut and fed green as soilage, and is also pastured extensively with hogs and sheep."

"Soybeans for human food: In Asiatic countries the soybean is grown primarily for the beans, which are used largely in the manufacture of numerous food products that supply the principal source of protein in the Asiatic diet as that in the diet of western people is furnished chiefly by meat and dairy products. "Oriental people use very few dairy and meat products, yet for many centuries they have lived on an apparently well-balanced diet of which the protein is derived largely from the soybean.

"The most commonly used soybean foods in the Orient are soy sauce, miso or bean paste, bean curd, bean milk, bean flour, roasted-bean confections, green-vegetable beans, bean sprouts, roasted bean flour, boiled beans (with rice, millet, or sorghum), coffee substitute, and health drinks made from roasted soybeans.

"In the United States the soybean and its products have attracted attention as an article of food at various times, but only within the last three or four years have there been any extensive investigations along this line by commercial interests. Soybean flour, made by grinding either the whole bean (preferably yellow-seed varieties) or the press cake after the oil has been removed from the beans, is finding increasing favor in the manufacture of various products, such as malted milk, macaroni, vermicelli, spaghetti, noodles, crackers, cookies, ice-cream cones, breakfast foods, health foods, diabetic foods, and infant foods. Within the last year several large baking companies have began using 15 to 20 per cent of soybean flour in making bread and cakes." Address: Bureau of Plant Industry, Washington, DC.

816. Yeu, Lucie. 1933. Le lait de soja dans l'alimentation du nourrisson [Soymilk in infant feeding]. Paris: Les Editions Véga. 105 p. Based on her 1933 PhD thesis in Medicine, Faculte de Paris. 28 cm. [34 ref. Fre]

• ***Summary:*** Describes feeding studies on 100 infants who took soymilk (*lait de soja*) for 1 to 20 months. States that soymilk was introduced to Africa by Catholic fathers in the Congo. Contents: Introduction. Soymilk in the diet in China. History. Soymilk: Preparation, physical characteristics, qualitative composition, quantitative composition (table, p. 21-22), conclusion. Method of administration. Clinical study: Age of infants, duration of trial, tolerance, stools after soymilk consumption, erythema of the buttocks, effect on growth. Non-dyspeptic and dyspeptic infants (tables). Conclusions. Bibliography.

The author was born on 1 Oct. 1896 in France at Auzelles (Puy-de-Dôme). "In France, until recently, only soy flour had been used in infant dietetics, following the work of Mr. Ribadeau-Dumas (1930). It is only recently that Mr. Maillet, in collaboration with us, has undertaken the use of liquid soymilk. We did this work at the Centre d'Hygiene Infantile Paul Parquet, under the direction of Mr. Marcel Maillet, who for several years has been studying the reduction of milk in the diets of dyspeptic infants and who wanted to work with us in using soymilk." Their first article on the subject was published in 1932. The first part of their work deals with the method of preparing soymilk, a study of its composition (qualitative and quantitative), and the method for administering it to infants. The second part gives their clinical results. The research attempted to answer two questions: (1) Could soymilk fed to healthy infants replace cow's milk; (2) Could dyspeptic infants tolerate soymilk, and grow properly.

Historically, Paillieux (1880) was the first person to make a detailed study of the soybean and its milk. It was also mentioned by Champion (1885) and Prinsen Geerligs (1896), then many others after 1900. O. Laxa in Czechoslovakia was the first to study soymilk as a substitute for cow's milk. It was only in 1928 that researchers began to foresee the use of soymilk in special diets. Pioneering work was done by L. Vitale in Italy (1928) and E. Tso in China (1928).

In preparing soymilk, Yeu dried the soybeans to facilitate dehulling. "Its peculiar savor is generally not much appreciated by the European palate," she observed. The density of her soymilk was 1.105, slightly heavier than water and slightly lighter than cow's milk (1.032) or mother's milk (1.032). Before feeding soymilk to infants, she added sugar, rice cream, calcium carbonate, and salt (sodium chloride).

Of the infants in the clinical studies, 80% were under 1 year of age; 22 were in a good nutritional state, 59 showed pronounced subnormal growth, 13 were sick and in a state

of serious undernutrition, and one was atrophied. Of these, 38 had no digestive problems and 68 had digestive problems (dyspepsia) and resisted the use of other milks and regimes. The diet was generally only soy (milk and pap), but in some cases rice water was included. The soymilk was generally well accepted. The resulting stools were unusual–less numerous, dark, and with a strong, persistent odor. There was some abnormal redness of the skin. Of the 83 infants who accepted and tolerated the milk well, 70% had a satisfactory growth rate. Of the 38 non-dyspeptics, 25 grew well, 8 had insufficient growth, 4 refused soymilk, and 1 did not tolerate it. Of the 62 dyspeptics, there were 30 fetid (heavy offensive smell) dyspeptics and 20 mucus dyspeptics. Of the former 30, 10 improved, 14 were unchanged, 4 refused soymilk and 2 did not tolerate it. Of the 20 mucus dyspeptics, 5 improved, 10 were unchanged, 1 refused, and 4 were intolerant.

Conclusions: Soymilk was generally well accepted and well tolerated. Soymilk, such as they used, cannot replace cow's milk for raising normal infants. For dyspeptic infants, some improved, many were unchanged, and a few had their problem aggravated.

Recherches biochimiques sur les grains et le lait de soya [Biochemical investigation on soybeans and soybean milk]. *Godishnik na Sofiiskiia Universitet, Fiziko-matematicheski Fakultet* (*Anuaire de l'Universite de Sofia. II. Faculte physico-matematique*) 29:341-76. (Chem. Abst. 28:7376). French-language summary p. 369-70. [137 ref. Bul; fre] Address: Bulgaria.

818. *News and Observer* (*Raleigh, North Carolina*). 1934. Food products from soy beans: Chemist from Washington makes interesting demonstration in Belhaven [North Carolina]. Jan. 21. Sunday morning.
• ***Summary:*** Belhaven, January 20, 1934. Dr. Jethro Kloss, expert food chemist from Washington, DC, gave a demonstration of food products that can be made from soy beans to a packed and enthusiastic crowd in Belhaven's City Hall Tuesday. He came to Belhaven at the invitation of F.P. Latham, Beufort County's master farmer.

"In 1932, Mr. Latham went to Washington, D.C. to a National Soy Bean Convention and witnessed Dr. Kloss making milk, cheese, buns, cakes, pies, vegetable roasts, butter, salad dressings and even a very healthyful medicinal liniment from soy beans. Mr. Latham's community is a great soy bean country and he immediately had a vision of Dr. Kloss visiting his community and showing it his experiments with soy beans. After 2 years, that vision at last has materialized and the people in Hyde County and Belhaven communities not only saw and tasted delicious foods made from the soy bean, but Dr. Kloss showed them how the products can be made in any home kitchen at a nominal cost."

"Dr. Kloss's little granddaughter came to Belhaven with him. She is 4 years old and 100% perfect. She never has drunk any other milk than soy bean milk.

"Dr. Kloss says there is no limit to the delicious foods that can be made from the soy bean. He is now working on a book of recipes made from soy bean products. He uses the Mammoth Yellow soy bean for most of his products. He became interested in the soy bean food products in searching for a food for diabetics."

819. Mader, A. 1934. Milk-free diet in pyuria and eczema of children. *Indian J. of Pediatrics* 1(2):99-103. Jan.
• ***Summary:*** Milk made from the soy bean is excellent as a replacement for animal milks in the diets of children with either these 2 conditions. Mentions a soy milk product named "Soyabasan" used for the dietetic treatment of eczema; this product "makes it possible to eliminate milk and its curative action is immediate" (p. 102). Address: Director, Univ. Children's Clinic, Frankfurt-am-Main, Germany.

820. Lovell, Philip M. 1934. Care of the body. *Los Angeles Times.* Feb. 4. p. G20-22. Sunday magazine.
• ***Summary:*** The section titled "Beverages" (p. 22) contains simple recipes for "ten health drinks" including "Soy bean milk." Mix 1 cupful soy bean flour with 2 quarts water. Boil for 5 minutes, taking care not to let it burn. Strain through a cloth. "This milk has proved to be the same as cow's milk in its food value and appearance and, adding a little honey, it tastes similar."

Also includes recipes for almond milk, cocoanut milk, rhubarb tonic drink, berry drinks, and celery, parsley, and tomato juice. Address: N.D. [Naturopathic Doctor].

821. Hepburn, Joseph Samuel; Sohn, K.S.; Devlin, L.P. 1934. Biochemical studies of soy bean milk and chicken protein. *J. of the Franklin Institute* 217(2):213-21. Feb. (Chem. Abst. 28:2042). [5 ref]
• ***Summary:*** "In Korea, soy beans are used extensively as a foodstuff. They serve as the basis of two foods, Doo Pu [known as Do Fu in Chinese] and soy bean milk... The Korean people passed immediately from a primitive condition to the status of an agricultural community without the intervention of a pastoral age. For this reason, soy bean milk was the only milk used by the Koreans as an accessory food until the introduction of cows in comparatively recent times. Even at the present time, soy bean milk is much used as a food and beverage especially during the summer months."

"Soy bean milk" gives results of feeding tests on albino rats, showing that soybean milk had about the same protein content as cow's milk, and that other nutrient compounds were present to a lesser extent. Values given for soybean milk and cow's milk (in parentheses) are: Protein 3.5% (3-4%); carbohydrate 0.61% (4.6-5.0%); fat 2.35% (3-6%);

calcium 0.034% (0.120%); phosphorus pentoxide 0.091% (0.23%). It curdled at a lower acidity than cow's milk, and in feeding, the ration containing soybean milk produced gain in weight less rapidly and with less efficiency than that containing cow's milk. Chicken protein is a less efficient protein than caseinogen in the diet of young rats. Address: John Clifford English Laboratories of Physics and Chemistry, Hahnemann Medical College and Hospital of Philadelphia.

822. *Good Health* (*Battle Creek, Michigan*). 1934. Have you lost your protective germs? 69(3):20-21. March.
• ***Summary:*** "Many adults are suffering seriously because they have lost their protective germs and so are defenseless against the germs of putrefaction and infection which are being constantly introduced in the air and in certain foods, such as fresh meat, fish, oysters, etc., which are fairly alive with harmful germs. In such cases, as in the case of the infant, a *new implantation of the protective germs is necessary.* The remedy employed for the infant is of course not available for the adults. A thoroughly efficient means of recovering lost acidophilus is available through the fortunate discovery of soy acidophilus milk, a highly active culture of the acidophilus, by the use of which it is possible to restore the friendly germs in any case in which it is possible to restore the friendly germs in any case in which they have been lost or have become so nearly extinct that they no longer serve as efficient means against invading bacteria."

"The new culture is prepared from milk made from the soybean, a product little known in this country, but which has been in use in China for many thousands of years, and in South China completely takes the place of cow's milk, which the average Chinaman has never tasted.

"When placed in soybean milk, the acidophilus germ grows with great vigor and develops rapidly, and in a few hours produces a highly palatable, slightly acid product closely resembling buttermilk both in appearance and taste. Its food value is greater than that of buttermilk and it has the advantage that the acid-forming germs, which contain many millions in every teaspoon, are able to live and thrive in the intestine, while the germs of ordinary buttermilk die almost immediately after being swallowed into the stomach."

823. Howell, G.C.L. 1934. The soy bean: A dietary revolution in China. *China Journal* 20(3):140-46. March.
• ***Summary:*** A Chinese proverb states that "Bean-milk is the poor man's milk, bean-curd is the poor man's meat." The Chinese "use practically no dairy products and the bulk of the nation eats little meat. The meat consumption of China is estimated at about 20 grams per head per day, as against 149 grams in the United States of America, 130 in Great Britain, 92 in France, 29 in Italy, and 25 in Japan." But the author contends that the Chinese have never learned to make sanitary products which keep well. "The flour, oil, and milk made in China quickly become rancid and unpalatable." Thus China is starving in the midst of plenty. No country in the world has had less benefit from the soy bean as treated by modern methods as that of its origin. In northern China, soy flour is used in a ratio of 2 or 3 to 8 with millet flour to make wo-tou steamed bread, and in a ratio of 1:5 with wheat flour to make man-tou steamed bread. A modern factory, such as the Aguma Works in Germany, could be established in China to make these products on a large scale at low cost. High quality soy-fortified macaroni, rice flour, soy oil and soya milk should also be produced. "Research has done its work. And China only awaits the pioneer, a commercial man, who will use the discoveries of science on a commercial scale. His coming is certain. The time of his coming rests on the knees of the gods."

824. Reid, Eric. 1934. A preliminary report on the preparation of an infant food, a soybean milk-egg powder. *Chinese J. of Physiology* 8(1):53-64. March. [18 ref. Eng; chi]
• ***Summary:*** "In the present investigation, the preparation of a soybean milk powder... will be reported. In addition, we shall present the results of our investigations on the digestibility of the powder, relative to that of cow's milk." The preparation of a perfectly miscible soybean-egg milk powder, with satisfactory keeping properties, is described. First prepare soybean milk, boiling it for 15 minutes in a steam pan, "thereby ridding it of most of the objectionable bean odour and taste." to each litre of this milk add 50 gm cane sugar, 30 gm egg yolk, 1 gm sodium chloride, and 2.5 gm calcium lactate. Filter again; the mixture is then "spraydried at a temperature of 50-55ºC..." The powder was found to be perfectly miscible with water in a 12% solution, yielding a permanent emulsion with only a slightly beany flavour." A table (p. 54) gives the nutritional composition of the soybean milk-egg powder and of its reconstituted milk (which contains 3.44% protein and 1.97% fat; the "egg yolk is rich in iron" and "the calcium content is about the same as that of human milk).

Compared with cow's milk, unsprayed soybean-egg milk forms a softer, less compact curd in the stomach. The buffer capacity of soybean-egg milk is lower than that of cow's milk. Address: Div. of Physiological Sciences, Henry Lester Inst. of Medical Research, Shanghai, China.

825. The wonder of the 20th century. Come and hear Dr. Kloss astonishing and interesting free lectures (Poster). 1934. Dr. Jethro Kloss, 500-44th St., N.W., Miami, Florida. 1 p.
• ***Summary:*** "Dr. Jethro Kloss of Washington, D.C. food chemist and scientist..." Dr. Kloss will show how to make soy bean milk and soy bean bread at the Miami School of Applied Arts, 406 N.E. 2 Avenue. These 2 exceptional food demonstrations have never yet been given to the public. "Dr. Kloss is one of the best informed chemists on the soybeans, which is fast coming to the front in food lines.

"Dr. Kloss makes more than 20 palatable edible table foods from the soybeans, they are very inexpensive and can be made in any home by a simple, practical method of which Dr. Kloss is the originator...

"Dr. Kloss' demonstration is truly amazing when one knows and considers that the soybean is a perfect food, and contains a high quality protein. Soybeans and their products perfectly take the place of meat, milk, and eggs. Soybean roast is better than the best beefsteak... Soybeans furnish the most economical supply of protein to be found, also contains all the other necessary elements of nutrition.

"Dr. Kloss' classes in the preparation of these foods will begin, Thursday afternoon, March 28 at 2:30 p.m." Address: Miami, Florida. Phone: Edgewater 1128-J.

826. *Miami Daily News.* 1934. Food products of soy bean urged for daily table use: Milk, cheese, roasts, bread and other preparations made from herb claimed to have high nutritive values. April 8. Sport section. p. 5. Sunday. Facsimile printed in Back to Eden by Jethro Kloss, 1982 ed.
• ***Summary:*** Two photos by Rinc above the article show: (1) A small insert portrait of Dr. Jethro Kloss. (2) His daughter, Mrs. Harry C. Engelhardt, standing next to her daughter, Joyce, age 5. The caption states that "Dr. Jethro Kloss is devoting his life to the dissemination of knowledge pertaining to soy bean milk." Both his daughter and granddaughter were raised on this milk."

"Dr. Kloss prides himself on having once been a 'farmer.' He is credited with having spent a fortune in philanthropic work, the greater part having gone toward introducing a bean which he feels is destined to eventually revolutionize the economic structure of this country and become of incalculable value in time of war.

"Approximately 6,000 persons recently heard Dr. Kloss in Bayfront park explain how he apparently performs miracles when he transmutes beans into 24 or more different foods which in addition to being delectable also retain various life-giving elements usually attributed to cow's milk...

"He exhibited 21 articles made from soy beans and invited the public to taste them. These were soy bean milk, bread, pie, cakes, buns, cookies, roast, buttermilk, coffee, cottage cheese, cream cheese, yellow cheese, soy bean sauce, pancakes, broth, butter, 'mashed potatoes,' mayonnaise, soy bean roast not like that from meat, ice cream, sprouted beans. None of these contained white flour nor cane sugar, making such foods especially valuable for diabetics. Soy bean foods are also recommended for arthritis.

"He advocates the teaching of edible food preparation from soy beans as part of school curriculum and drew a parallel tending to show how the government spends millions to spread hog and other stock-feeding knowledge while almost ignoring the phases which would create well-fed humans.

"Dr. Kloss pointed out that he was merely in this country revealing something which for centuries had been common knowledge throughout the Orient... He quoted Dr. S. [sic, A.] Horvath of the Rockefeller institute as one of the world's leading authorities who said: 'The Chinese nation exists today because of the use of the soy bean as a food.'"

A sidebar at the lower left of the article shows another portrait photo of Dr. Kloss and announces: "By the request of thousands who heard Dr. Kloss speak in Bayfront Park, he has consented to give further instructions in the preparation of the wonderful Soy Bean Products.

"He will give two food demonstrations in the Miami School of Applied Arts, 406 N.E. 2nd Ave., Monday afternoon at 2:30 and Monday evening at 8, April 9.

"Dr. Kloss makes more delicious table foods from soy bean than any one else known. The soy bean is a complete food, and is highly alkaline. Following is a partial list of the foods he makes:

"Soy bean milk, soy bean buttermilk, cottage cheese, ice cream, bread, buns, pies, cake, cookies, roast, coffee, pancakes, butter [probably soynut butter], mayonnaise, broth. These foods do not contain any cane sugar or other harmful ingredients. They are most economical, simple to prepare, and very healthful and inexpensive. The use of the articles would mean a great saving of money, and preserving of health. They must be seen and tasted to be appreciated."

Note 1. This is the earliest document seen (March 2000) that mentions soy mayonnaise.

Note 2. This is the earliest document seen (March 2007) that mentions a "cream cheese" or "yellow cheese" made from soy beans (one of two documents).

Note 3. This is the earliest document seen (March 2007) that mentions Jethro Kloss' work with soy bean ice cream.

Note 4. As of Nov. 1990 the *Miami Daily News* no longer exists. Its name was changed to the *Miami News,* it was owned by Cox, and it went out of business in about 1988. Back issues would probably be available at the Univ. of Miami.

Note 5. This is the second earliest document seen (March 2007) that uses the word "miracles" (or "miracle" or "miraculous") in connection with soy beans. Address: Florida.

827. Come and see: The wonders of the 20th century (Poster). 1934. Dr. Jethro Kloss, 500-44th St., N.W., Miami, Florida. 1 p.
• ***Summary:*** By special request Dr. [Jethro] Kloss is giving two more free lectures and food demonstrations at the Miami School of Applied Arts, 406 N.E. 2d Avenue, Monday, April 9, in the afternoon and evening. Following is a list of food Dr. Kloss prepares from the soybean. They do not contain any cane sugar, white flour, or other harmful ingredients: Soy bean milk, bread, buns, pies, cakes, roast, buttermilk, ice cream, jelly, sauce, cream cheese, cottage cheese,

yellow cheese, coffee, pancakes, broth, mashed potatoes, mayonnaise, butter.

"Learn to make this alkaline milk from soybeans, it taste's [sic] better than other milks, and has a better analysis than cow's milk, or goat's milk. Dr. Kloss will show a table of comparative analysis prepared for him by Dr. LeClerc, Senior Chemist of the Government. This milk can be made in any home, and costs less than 2 cents per quart... Dr. Kloss' ice cream made from the soybean milk is as delicious as any on the market, and very inexpensive and healthy. Learn to make these products in your own kitchens."

Note: This is the earliest document seen (March 2007) that mentions a "cream cheese" made from soybeans (one of two documents). This cream cheese was developed by Jethro Kloss. Address: 500 44th St., N.W., Miami, Florida. Phone: Edgewater 1128-J.

828. Morris, H.T. 1934. Story of soybeans. *Flour & Feed.* 34(11):9. April; 34(12):9. May.
• ***Summary:*** This two-part article begins with the [probably mythical] story of the A.E. Staley Company's role in pioneering the soybean industry in America. The soybean first came to America in 1804. Then, about a half century ago [i.e. about 1884], "a missionary, returning to his home in America, brought with him some peculiar looking beans. These, by chance, fell into the hands of an observant chap [A.E. Staley] who was a tiller of the soil. Upon being told that these beans were the main crop of the Orient and furnished sustenance to both man and beast, the observer planted the seed and from actual experience saw that it enriched the ground and that livestock relished the beans and hay. Little did he realize that half a century later his intimate knowledge of the soybean would perhaps be a factor in shaping the destiny of the industry.

"The farms of Illinois had been worked overtime. The ground had been 'corned to death.'" The observer "began to preach 'diversify with soybeans.' He was so sincere and intent that this gospel should be spread that through the Staley company [which he owned] a promotional department was created. This staff had one specific job–that of selling the farmers on the possibilities of soybeans. In conjunction with the Staley company, soybean trains were operated throughout the country–stopping at all stations and demonstrating soybeans and soybean products.

"From a comparatively few fields, the seed took root." "Ten years ago, the Staley company built its first crushing plant with sufficient capacity to more than take care of all beans offered for sale. Prospects of an adequate supply of raw material, an organization, an up-to-date crushing plant and oil refinery, all called for action, as there had to be an outlet for the finished product. The same method of introducing soybeans was applied to soybean products" such as soybean oil meal.

A portrait photo shows "A.E. Staley, Sr., Founder of A.E. Staley Mfg. Co., Decatur, Illinois."

Note: This is the earliest document seen (April 2001) that tells the story of A.E. Staley first obtaining soybeans from a missionary. The story gets embellished each time it is retold during the years ahead. See especially: Staley. 1947. *The Wonder Bean.*

Part two of this article discusses: Soybean oil meal. Poultry rations. Milling methods. The writings of Dr. A. Horvath. Soybean milk, tofu, and soy sauce in China. Address: Staley Sales Corp.

829. Morse, W.J. 1934. Utilizacion de las habas soya [Utilization of soybeans]. *Revista de Agricultura, Comercio y Trabajo* (*Cuba*) 14(52):77-90. April. [Spa]
• ***Summary:*** Contents: Introduction. Soybeans for human food: Dried beans, coffee substitute, toasted soybeans, fresh green or vegetable beans (*Habas frescas o legumbres*), soybean flour, soy sprouts (*retoños tiernos*), soy sauce, soybean vegetable milk, tofu (*cuajada o queso de habas soya*), soy oil. Soybeans for livestock: Soybeans for hay, for pasture, for ensilage, for fresh forage, for grain. Soybeans for oil. Soybean flour and cake. Soybeans for soil improvement. Address: USDA, Washington, DC, USA.

830. Torres Herrera, José M. 1934. El haba soya, su cultivo y beneficio [The soybean, its culture and benefits]. *Boletin Agricola* (*Medellin, Colombia*) 8(189):1180-92. April. [Spa]
• ***Summary:*** Contents: Introduction. Climatological conditions. Soils appropriate for this crop. Inoculation with bacteria. Preparation of the soil. Soya in crop rotations. Sowing the seeds. The work of cultivation. Calculation of the cost of production for 6,400 square meters (Data taken from the Palmira Agricultural Experiment Station, Bulletin No. 1; the cost is $0.45 per arroba = ca. 25 lb). Soybean varieties ("Agriculturists interested in planting this crop which has no equal, can obtain seeds free of charge from the Pamira [sic, Palmira] Agricultural Experiment Station or the Antioquia Agricultural Society [Sociedad Antioqueña de Agricultores, Colombia]"). Production of seeds. Yields of various varieties. Harvesting and threshing of the grain. The uses of soya (*la soya*).

Utilization of the plant and seeds of the soybean (*de las habas soyas*)*:* I. The plants as hay, pasture, green forage, ensilage, green manure. II. The seeds as: 1. Whole dry soybeans (*habas secas*, for making infant foods, flour, soup, butter, diabetic foods and breads, cooked whole soybeans, confections, health foods (*alimentos para sano*)*:* soymilk, soybean roasts or steaks, soy sprouts. Breakfast foods: Vegetable curd or cheese (*cuajada o queso vegetal*), soy sauce, malted milk, soy coffee cakes, flour, livestock feed). 2. Green vegetable soybeans (*habas verdes*). 3. Soy flour (*harina de habas*). 4. Soy oil (*aceite de habas*).

Soya as human food. The composition of various legumes. Soy flour. Soy oil. Soy milk (*leche de soya*)*:*

Nutritional comparison of soy milk and cow's milk, powdered soymilk, fermented soymilk, tofu (*queso soya*), soy casein (*Caseína*).

Whole dry soybeans: Roasted soybeans (*habas tostadas*), soy coffee (*café de soya*), soy chocolate (*chocolate de soya*). Green-seeded soybeans (*habas soyas verdes o legumbres*)*:* Soy sprouts, soy sauces. Edelsoya (soy flour made by Berczeller).
